TABLE OF CONTENTS

1.0 - LIST OF FIGURES

2.0 - INTRODUCTION

2.1 - OBJECTIVES

The chief purpose of the August 4 to November 9, 1987 exploration of the Bayonne claims was to locate any structures adjacent to the mined out Bayonne/A-vein system. Once structures were delineated then more detailed work could commence in order to assess their potential for gold mineralization. More general reconnaissance of the claim group was also undertaken in order to examine old long since abandoned workings and assess their potential as well. These include the Summitt Belle group as well as the Montana claim. Detailed mapping and sampling was also done on what is being called the west grid - across the valley from the Bayonne Mine. The purpose here was to locate the possible western extension of the Bayonne Main Vein.

Mapping is done on 1:2000 for grid work, 1:10,000, 1:15,000, and 1:43,000 for traverses covering the claims, listed in section 2.4, over an estimated 80 square kilometres.

2.2 - LOCATION AND ACCESS - figures 1, 2, 3, 4

Part of the Nelson Mining Division in south eastern British Columbia, the Bayonne claim group is located about 5.5 kilometres north of the Salmo-Creston Highway and is accessible by a 10 kilometre gravel road in good condition which follows Bayonne Creek, shown in figure 1. The turnoff from the main highway is located approximately 46 kilometres from Salmo and 33 kilometres from Creston. The mine site is located on the western flank of John Bull Mountain (2225 metres), part of the Selkirk Range.

2.21 - EAST-WEST CLAIM GROUPINGS - figure 2

The claims have been split into an east and a west grouping for the purpose of assessment, shown in figure 2. While the body of this report treats both groupings as one, and itemized cost statement for each grouping is included in sections 14.0 and 15.0.

2.22 - BAYONNE GROUP

The claim area is extensive covering more than 40 square kilometers. Most of the work was done on the east grid which includes the Bayonne Mine and the Echo and St. Elmo structures. The Bayonne claims are located in alpine to subalpine area with

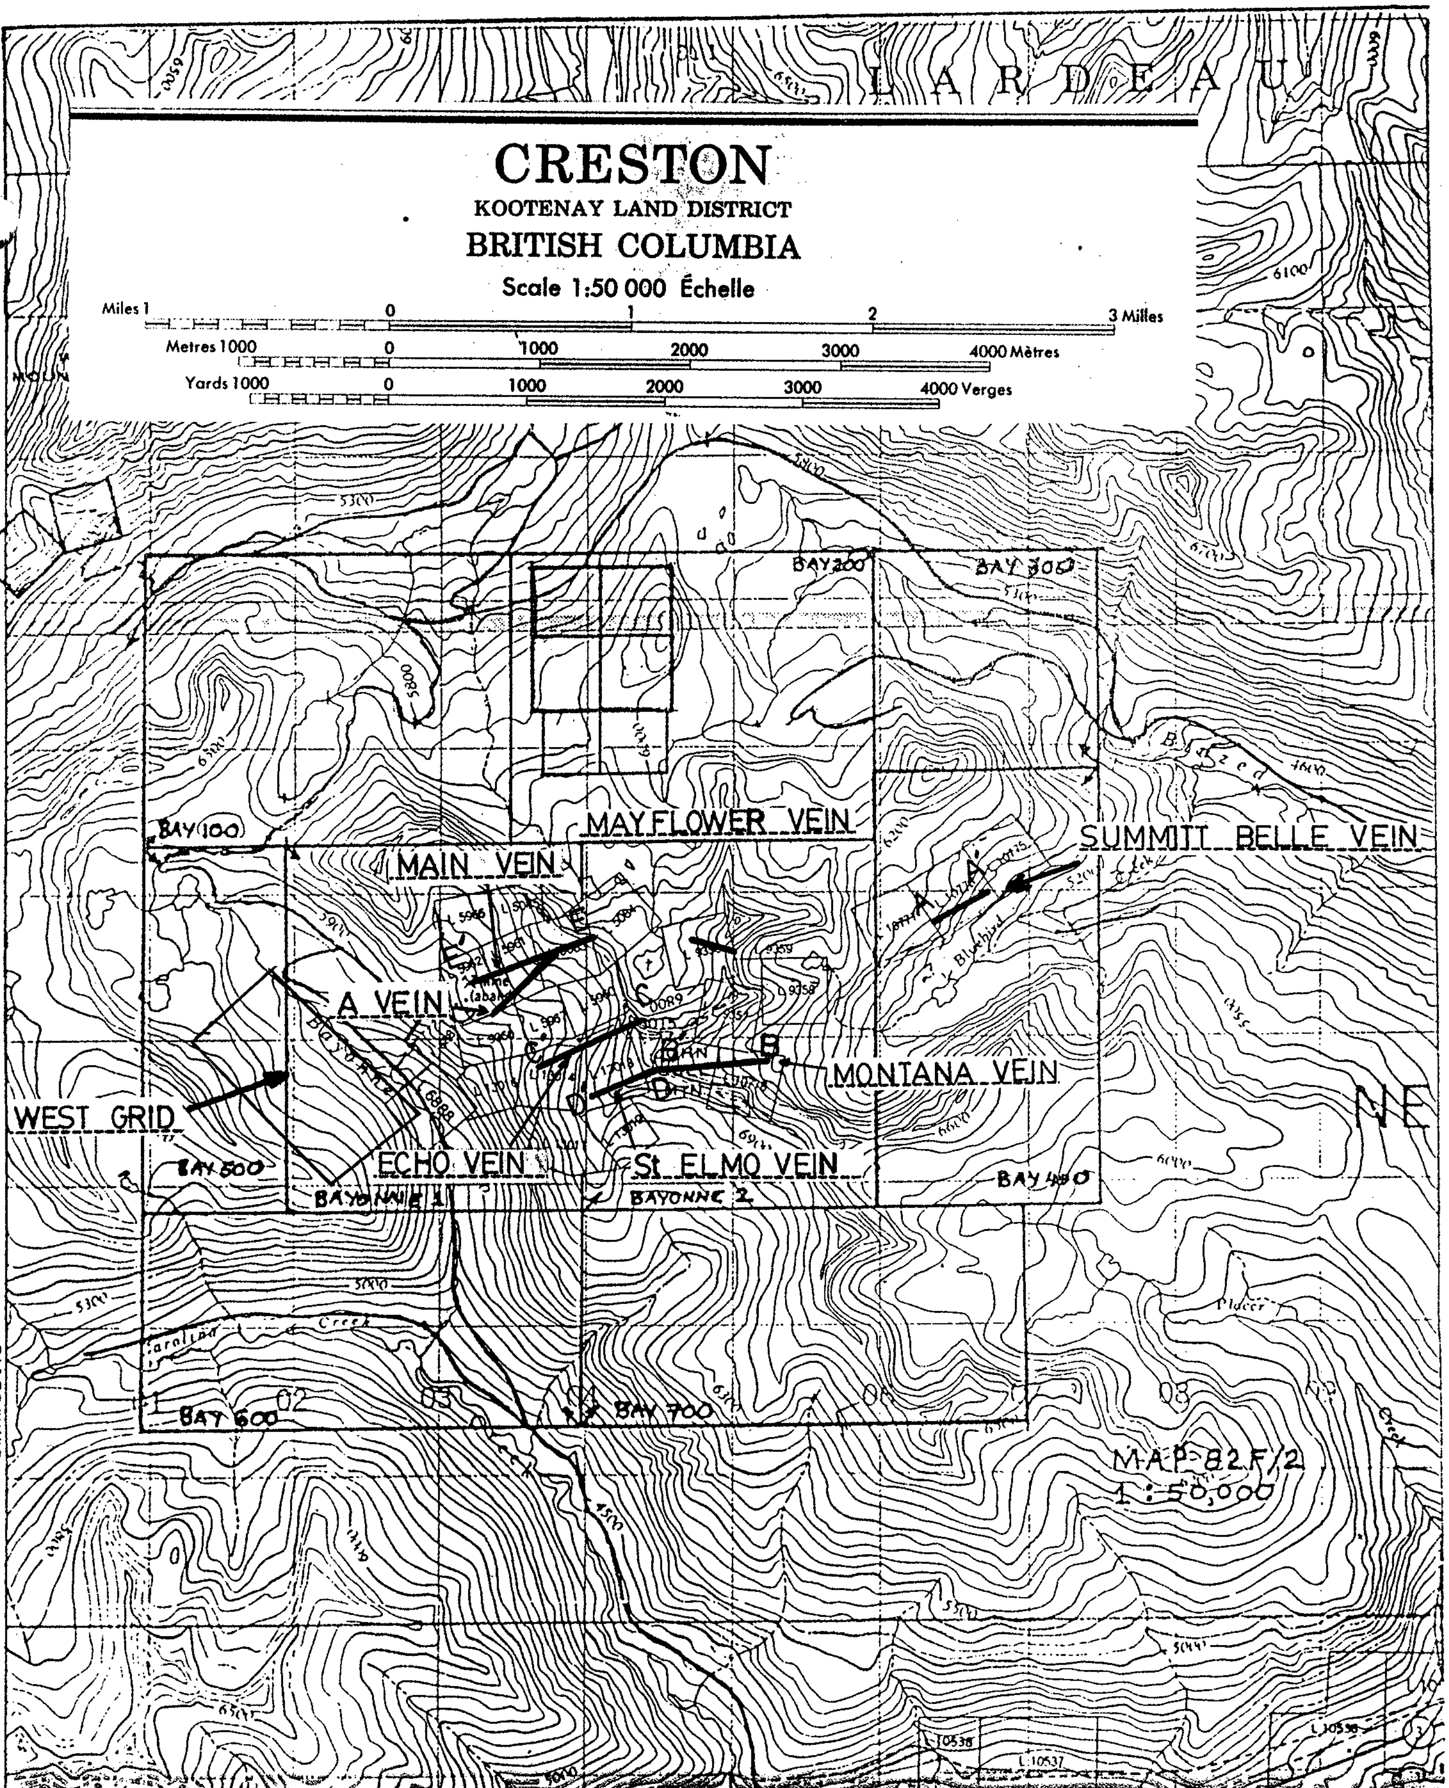
FIGURE 2



TOPOGRAPHY FIG 4

sparse to dense forest depending on elevation. The 8-level portal is collared at the 1900 metre elevation. At lower elevations alders become dense impeding progress substantially. Logging has been ongoing in the area for some time. The area had been burned at some time in the past and is growing back. The area is rugged and contains large talus deposits and shear cliffs. Snow fall during an average winter ranges from between 4 to 5 metres. The Bayonne area appears to be more arid than much of the surrounding area.

The east grid, south west of the Bayonne Mine is logged off. Where untouched, the bush becomes heavily overgrown with underbrush.

2.23 - MONTANA CLAIM

The Montana claim is located at the head of Bluebird Creek in a lightly treed grassy alpine area surrounded by talus slopes to the north and south. There is no road access to the claim, but is accessible via John Bull Mtn.

2.24 - SUMMIT BELLE GROUP

The property is located in the eastern periphery of the Bayonne group north of Bluebird Creek. There is no road access to the adit, and it is apparent no one has been there for quite a long time. The adit is situated approximately 300 metres north of a recent clear-cut at the top of a series of rock bluffs above a talus slope. At the top of the bluffs it is relatively flat, but steepens as one moves south away from the adit and toward the clear-cut. The area is heavily forested with mature growth, but little underbrush.

2.3 - HISTORY

2.31 - BAYONNE GROUP

Almost all activity in the Bayonne region centers around the Bayonne mine. In its long history the mine produced a total of 85,000 tons at .470 opt Au and 1.12 opt Ag.

The first known work began with trenching and drifting on the Bayonne and Echo veins from 1901 to the start of the first world war. By 1935 Bayonne Consolidated Mines Ltd. acquired 17 crown grants leading to full production by 1936. Considerable underground development as well as construction of the 60 ton per day cyanidization plant was undertaken. Production continued until 1942 when it was shut down as with most mines in the camp. The mine remained shut down until the end of the second world war. In 1946 the mine was reopened, but labour and material shortages lead to an early closure in that same year. In the period from 1947 to 1951 a number of leasees produced 673 tons at .670 opt Au and 4.75 opt Ag.

Torquest Resources Ltd optioned the property in 1963 and initiated a program of mine rehabilitation, diamond drilling, and resampling. The following year the company completed the road from the mine site to the Salmo-Creston Highway. It also built a new 50 ton per day leaching plant based on a reserve estimate of 12,450 tons at .790 opt gold.

In 1968 the property was optioned by Liberty Mines Ltd. though the company did little work with it. The property was later optioned by Goldriche Resources Ltd. in 1980 which undertook a program of mine rehabilitation and test stoping. Results of the stope were .150 opt Au and 1.2 opt Ag.

Lightning Minerals Ltd. optioned the property in 1987 and completed a detailed geologic and soil sampling program, the results of which are the subject of this report.

2.32 - SUMMIT BELLE AND MONTANA CLAIMS

These claims were originally crown grants owned privately and acquired by Goldriche Resources in 1980. The first known reference is found in the Minister of Mines Report of 1917. Work prior to 1937 consisted of four hand trenches and about 30 metres of drifting. The workings were located during the summer of 1987 and preliminary sampling and mapping were completed.

2.4 - CLAIMS INVESTIGATED

Work of a geological and geochemical nature was done on the following claims:

CLAIM	LOT/RECORD #	CLAIM	LOT/RECORD #
Kentucky	5966	Maryland	5085
Ohio	5362	Columbus	5961
Bayonne	5083	Oxford	5084
Virginia	6887	Skookum	9360
New Jersey	5967	Delaware	5960
Echo	13014	Echo Fr.	729
Ontario	13016	St. Elmo	13018

Bay #700	3117		

2.5 - SUMMARY OF PRESENT WORK

- Geological survey: mapping and sampling - see figure 2 for groupings.

east grid	26,150 metres
west grid	11,250 metres
traverse	20,000 metres
east grouping:	
soil samples	302
silt samples	4
rock samples	42
west grouping:	
soil samples	606
silt samples	21
rock samples	78

- Geochemical survey: soil sampling

east grid/east + west grouping	26,150 metres
west grid/west grouping	11,250 metres

- Geophysical survey: EM and magnetometer

east grid/east grouping	6,000 metres

- Line establishment: ______ 26,150 meters

3.0 - GENERAL

3.1 - PROCEDURES

Mapping is reliant on air photo control as none of the original claim posts have been located. The 1:2000 grid maps are generated from air photo blowups and further controlled by compass and hip chain. All grid lines were run with silva compass and flagged at 50 metre intervals. Tie lines were run to increase the degree of accuracy. The west grid is controlled by air photo and hip chain. Traverse is controlled by air photo triangulation and hip chain.

Mapping of outcrop involved measuring orientations of joints, noting alteration of granodiorite as well as float, and noting and sampling veins.

3.2 - INSTRUMENTS USED - GEOPHYSICS

The VLF-EM unit used in the Lightning Minerals surveys was a Geonics EM16 which is a battery powered very low frequency receiver equipped with two built-in antennas for measuring horizontal and vertical field components of radio signals. The instrument is able to utilize radio emissions from military and time standard transmitters operating in the 15 to 25 Khz frequency range. Electromagnetic propagation in this frequency range is such that signals can be received over distances of several thousand miles in a consistent manner. The Seattle station was used for work at the Bayonne. These primary signal fields induce secondary vertical fields in local conductive bodies that can be detected by the EM16 unit, hence its usefulness for detecting such conductors. By analyzing in phase and quadrature components of secondary signals emitted by local conductive bodies it is possible to estimate the depth of the conductor and also determine the possible characteristics of it.

A magnetometer was also used at the Bayonne, but the type and make are not available as the instrument is presently in use in the United States.

3.3 - GEOCHEMICAL PROCEDURES

Both rock and soil samples were sent for assay. In the case of soils, the oxidized "B" horizon was sampled consistently occurring at 5 to 10 cm depth.

Assaying of samples was done by Acme Analytical Laboratories Ltd. of 852 East Hastings Street, Vancouver B.C., V6A 1R6 (ph: (604) 253-3158). All samples were subjected to 30 element ICP and gold atomic absorption. Details of the procedures are noted in the geochemical analysis certificates located at the back of this report. The analysis assayed for the following elements: Mo, Cu, Pb, Zn, Ag, Ni, Co, Mn, Fe, As, U, Au, Th, Sr, Cd, Sb, Bi, V, Ca, P, La, Cr, Mg, Ba, Ti, B, Al, Na, K, and W.

4.0 - REGIONAL GEOLOGY

The entire claim group is situated within the Bayonne Batholith which intrudes clastics and carbonates of the late Proterozoic Horsethief series. The intrusive is medium grained and of granodiorite composition. It is equigranular and white with less than 20% mafics. It is intern intruded by narrow (1 cm to 1 metre wide) aplite dykes of discontinuous strike length which are predominantly north-south trending. A few narrow lamprophyre dykes are also known consisting mainly of biotite and amphibole. The batholith contains numerous mafic xenoliths of less than 30 cm. Larger less rounded and more gneissic xenoliths are found near the periphery of the body retaining apparently relict sedimentary structures. The intrusive is affected by a penetrative jointing fabric which tends to be of similar orientation locally, but changes on the order of several hundred metres.

The principal known structure is the Bayonne vein and the A-vein splay. The Main Vein strikes at an azimuth of 80 degrees. It is believed that the Echo and St. Elmo veins strike similarly while the Montana and Maggie Aikens structures vary by approximately 20 degrees.

5.0 - BAYONNE MINE - figures 5, 6, 7

The Bayonne vein is exposed for 750 metres and the A-vein, for 550 metres. The structures are very linear with a mild sinuosity. Vein material is quartz which intrudes along dilatencies within a strongly oxidized shear zone measuring anywhere from 1 to 5 metres in width. The vein itself varies from 5 cm to 3 metres in width. Splaying and horsetailing into both ribs is fairly common. The shear zones are expressed as gentle recessives due to their soft and broken up nature. The obvious rusty limonitic alteration found along joint surfaces and into the host intrusive has been long used as a pathfinder for finding new structures in the area.

Gold is associated with limonitic quartz and heavy sulfide bearing quartz. An axial zonation is apparent as the limonitic zone extends to a depth of 140 metres. Little sulfide remains in this zone. Quartz is often vuggy showing that pyrite was once present. Limonite is commonly observed to pseudomorph pyrite. At the 140 metre depth there is a relatively abrupt transition to a 50 metre thick massive and generally unaltered sulfide zone. The suite in hand specimen contains pyrite, galena, chalcopyrite, and sphalerite. Pyrolusite stain is often evident.

Long sections of both structures (figures 6 and 7) show a propensity for stoping in proximity to the surface. Infact, the stoping in both cases seems to parallel the surface topography. This may not be coincidental because the granodiorite is deeply weathered. In some areas the weathering is more than 2 metres in depth and while preserving primary structures, the major rock forming minerals show extreme argillic alteration. In such areas the rock is only slightly more competent than the soil above it. Very little erosion has occurred, non of it glacial The supergene enrichment model does seem appropriate in this context.

5.1 - NORTH VEIN - figure 5

The North Vein is located approximately 100 metres north of the Bayonne Main Vein and is exposed by a series of trenches and old workings for approximately 400 metres. No detailed work was done on the structure during the 1987 field season, but work done in 1983 is shown in figure 5. The gold assays range from .007 opt to 2.100 opt for an average of .394 opt. The vein is not known to have been worked from underground nor diamond drilled. Its slight difference in strike with respect to the Main Vein indicates a junction to the east which enhances the possibility of locating large tonnages of ore, perhaps even on the order of that found on the A-Vein.

6.0 - EAST GRID: BAYONNE, ECHO, St. ELMO

6.1 - GEOLOGY - figure 8

The map area is entirely situated in granodiorite. The predominant joint direction is north-south while the predominant direction of the shear zones is east-west. The mapping turned up two structures which were studied in detail - these being the Echo and St. Elmo structures. The soil geochem results (discussed in section 6.2) were also factors in locating the structures.

6.11 - ECHO STRUCTURE

Two adits have been driven on the Echo structure some time after the turn of the century. The main adit is located on line 53E. A road was constructed in 1983 or 1984 to provide access to the Echo adit. It crosses the structure at a point about 20 metres east of the adit. A considerable amount of old hand trenching was done to the east of the adit in order to locate the structure. The best trench assays were as follows:

2.330 opt from quartz (54E 43.5N)
.029 opt from quartz (55E 43.5N)

These assays lead in part to the cat trenching program which did not confirm the 2.330 opt assay.

It is not known how far the Echo adit went in or what the results were. Assays of quartz vein in the dump turned up the following results:

.133 opt - > 20 cm vein, heavy limonitic alteration
.204 opt - quartz vein with brick red oxidation
.060 opt - quartz vein with heavy limonite alteration

No sulfides were found in the quartz suggesting that the adit did not go in far enough to intersect any possible unoxidized sulfide zone. The fact that values do occur on the structure indicates strongly that ore grade material is possible at depth especially when considering the fact that the inferred strike length of the structure is about 1 kilometre. There is a large area on vein to hide a substantial orebody.

The second adit on the structure is found on the east side of the ridge to the east of the Echo adit. The adit goes in for only 5 metres, but is unsafe to enter. Assays from quartz in the blast rock returned assays of only .001 opt. The best assay is .016 opt which was found further up the shear zone where in situ quartz vein is found. At this point the 3 metre wide heavily oxidized shear zone is clearly visible on the ridge top as well as from the ridge peaks running north-east from John Bull Mtn.

A traverse was run between the two adits. It turned up a number of new trenches and intermittent areas containing oxidized float. These trenches were found between lines 59E and 59.5E at 44N and carried values of .036 and .043 opt in quartz float.

6.12 - St. ELMO STRUCTURE

The St. Elmo structure is exposed in two major areas: the adit, situated between 56.5E and 57E at approximately 41N, and on the ridge top south-east of John Bull Mtn. The gold geochem anomaly also helps to outline it (see figure 9).

The dump contains a great deal of oxidized and sheared granodiorite indicative of a wide shear zone. All of the unoxidized granodiorite contains 10% alteration of feldspars to epidote. This alteration also occurs on the ridge top. The dump is roughly equivalent in size to that of the Echo and contains about 5% quartz vein most of which is very strongly limonitic. The degree of the limonitic alteration is in excess of any seen at the Bayonne dumps and is most similar to the material found at the Montana workings. In addition, some of the samples contain from 5% to 15% galena - the only visible sulfide.

The galena did not run appreciably however, and the other types of quartz carried only erratically:

.016 opt - 2-5% galena in quartz
.051 opt - 5-10% limonite, vuggy
.182 opt - 5-10% limonite, vuggy
.048 opt - 10-20% limonite
.051 opt - milky quartz, 5-10% limonite
.006 and .004 - 30% limonite, 5-15% galena

Trenches about 50 metres to the east were also found to contain quartz vein material:

.043 opt - milky quartz with 30% limonite
.030 opt - moderately oxidized quartz

The best assay at the ridge top was .009 opt. Obviously none of these assays is ore grade, but they do indicate that the structure is gold bearing. The presence of unaltered galena suggests that the deposit should relate to the middle levels at the Bayonne mine.

6.2 - GEOCHEMISTRY - figures 9-14

Contour plots of Au, Ag, Cu, Pb, Zn, and As can be found in the back of this report. All the contour plots show one or several very strong anomalies over the Bayonne Mine workings. The shear size and element concentrations are the inevitable result of over 50 years of contamination and dispersion.

Two strong linear Au (ppb) anomalies were identified in the vicinity of the Echo adit. These anomalies are not the result of contamination from the Bayonne Mine as there is a deep ravine separating the two areas. Oddly enough, the A-Vein only shows a single point anomaly and there is nothing whatsoever to suggest that the bulk of the ore mined from the Bayonne came, in fact, from the A-vein.

6.21 - ECHO GEOCHEM ANOMALY - figures 9-14

The first anomaly is directly associated with the Echo adit (see figure 9). The strongest value (650 ppb) is found at the Echo dump and therefore due to contamination. A high value (560 ppb) occurs below and to the south of the dump which is probably also caused by contamination. The anomaly has the same strike above and below the dump which would suggest that the anomaly below the dump is not completely the result of contamination. The anomaly also parallels the strike of the A-vein. In fact trenching the structure represented by the anomaly confirmed it as a splay from the main Echo structure (see section 6.4).

The gold anomaly has a total length of 450 metres, 300 metres of which is above (east) of the adit. This is the portion which was trenched. While the other elements which have been contoured show contamination anomalies on the Echo dump they do not show good anomalies associated with the rest of the structure. This of course suggests that the gold is not strictly associated with chalcophile elements or arsenic - this seems reasonable in view of the fact that the surface is located in or just above the oxidation zone.

6.22 - St. ELMO GEOCHEM ANOMALY - figures 9-14

The anomaly associated with the St. Elmo is much longer than that of the Echo, but generally weaker and more erratic. It tends to bifurcate and truncate between the two structures. The anomalies strictly associated with the St. Elmo total approximately 1 kilometre in length. Oddly, only the weakest of anomalies is expressed in proximity to the St. Elmo dump. It seems possible that the anomaly below (west) of the dump is the result of contamination. On the basis of the strength of the anomaly, trenching was commenced, but never completed on the structure.

The erratic, but sinuous appearance of the anomaly suggests that structures may exist between the two major veins. In fact a quartz sample from a trench equidistant between the two veins carried a grade of .187 opt.

Contour plots of the other elements are generally inconclusive in clarifying the gold anomalies. The two exceptions are at 59.5E 44.5N on the Echo and at 50E 40E on the St. Elmo. The consistent highs suggest a possible zone of mineralization. In the case of the St. Elmo this anomaly is located at the very corner of the grid. The grid should be extended in this area even though the terrain is very steep and covered with slide alder.

6.3 - GEOPHYSICS - figure 15

Figure 15 shows magnetometer readings. Both mag and EM16 were run over the Echo and St. Elmo structures is hopes of better delineating them. No such results were obtained and they appear to be essentially random and so are inconclusive.

6.4 - ECHO CAT TRENCHING - figure 16

Trenching of the Echo splay vein consisted of digging four cross trenches at 50 metre intervals east of the adit. When the shear zone was exposed the cat could begin trenching along vein. Only the lower 100 metres of the trenched area was trenched along vein as the vein was difficult to locate higher up. Once the cat was finished the hardpan and weathered rock were laboriously removed by hand. The exposure was then hand swept so that the structure was clearly visible. Figure 16 shows the mapping and assay results of the work.

The shear zone ranges from 1 to at least 15 metres wide. Trench 2/3 exposed the splay structure while trench 1/2 and 2 exposed the Echo vein proper. The veins are numerous but narrow, rarely reaching 15 cm wide. The highest assay was .128

opt which is located very near the old hand trench where the 2.330 opt assay occurred. All other assays were uninteresting and some could at best be called only anomalous.

The almost complete lack of grade from the veins is unsettling when one considers the magnitude of the geochem anomaly directly associated with it. The extreme weathering could be a factor. All or most of the gold could have been leached out over two or more epochs of time and is presently dispersed throughout the unglaciated soil profile. This of course raises questions as to the validity of the recommencement of trenching. To this author drilling would be a more useful tool than continued trenching.

7.0 - WEST GRID

Nothing of major interest was found on the west grid and certainly no obvious sign of the Bayonne extension was found. The only point of interest was a 1.020 opt gold assay from a narrow pyrite and galena bearing vein from a boulder on BL1. It seems likely that the boulder had come from that side of the valley, but could easily have been transported glacially.

7.1 - WEST GRID GEOLOGY - figure 17

As with the east grid, the west grid is comprised entirely of granodiorite. There are relatively few outcrops and those present contain little structure other than two predominant joint sets striking at 45 and 90 degrees azimuth. There are a few minor oxidized shears with the 70 to 80 degree strike common on the east side of the valley, but none are more than 1 metre wide or carry any quartz veining of any consequence.

7.2 - WEST GRID GEOCHEMISTRY - figures 18-23

The results of the soil survey are the same. There are a few very weak and isolated gold anomalies, but nothing that would suggest an ore bearing structure beneath the overburden. This side of the valley does show more evidence of glacial deposition which may impede element dispersion. Geochem maps of silver, lead, zinc, copper, and arsenic are equally inconclusive. No further work is warranted in this area. The more interesting geochem anomalies on the ridge to the west of the present work is discussed in section 10.0.

8.0 - MONTANA CLAIM GEOLOGY - figure 24

The Montana workings, as shown in figure 24, consists of a series of 12 hand and blast trenches on a single structure with a known strike length of 300 metres. Assays of the vein range from .004 opt to .828 opt for an average grade of .267 opt for the vein. Vein material contains both strong sulfides and limonitic alteration. The higher gold values are associated with vuggy honeycombed quartz with medium to heavy limonite and a heavy black oxide alteration. Like the St. Elmo dump, the galena and sphalerite bearing quartz does not carry as well and can infact be very low (.067, .095, .006 opt). Vein width in situ and as blast rock averages about 20 cm.

Assuming that the host carries no gold, the inferred grade over a 1 metre mining width is .053 opt. This is not economic, but does suggest potential at depth and further along strike. There is also a possibility of parallel structures hidden under the talus as in the Summitt Belle Group.

9.0 - SUMMITT BELLE GROUP GEOLOGY - figure 25

Consistently high gold assays have been found on the quartz vein of the Maggie Aikens workings. Silver values are negligible. The dump produced the highest gold assays of 6.411, 4.742, and 3.200 opt. These values are all associated with 20% to 40% sulfides consisting of galena, pyrite, and to lesser extents sphalerite and chalcopyrite. The limonite altered quartz also carries high values. Apparently barren vein material carries values of between .015 and .254 opt. There is noticeably little of this barren variety anywhere on the property.

The three trenches nearest the adit also carry high gold values ranging from .176 to 1.199 opt. A lesser amount of sulfides, 10% to 20%, was observed at these trenches.

A fourth trench is located 47 metres to the west of pit #3. This produces a combined mineralized strike length of approximately 100 metres. Quartz is sulfide and limonite bearing as before and the barren variety remains uncommon. The average grade for the quartz in this pit was .178 opt ranging from .001 to .378 opt. One large quartz boulder was found in the pit on its side. The vein was measured to be 0.63 metres (2.1') in width and contained heavily sheared and oxidized granodiorite. The quartz carried .249 opt while the host carried .064 opt.

Figure 25 is taken from the Report of the Minister of Mines 1937. It shows two subparallel structures ranging from .2 to .5 metres in width. Pits #1 - #3 are on the southern structure. Pit #4 could be on either vein. Judging from the consistency of the assays throughout the workings it is reasonable to assume that both structures are carrying gold. The report states that pyrite and gold values occurred in the host - this was not observed by the author. Of particular interest is the possibility that one of the veins might be a splay of the other - a situation similar to that of the Bayonne Main Vein and the A-vein.Overall averages of grade and inferences of grade over 1 metre mining widths are listed as follows:

.990 opt - average grade for all assays
.710 opt - average grade (cut to 2.000 opt)
.272 opt - grade over 3 foot width - (.2 metre vein)
.320 opt - grade over 3 foot width - (.5 metre vein)

The grade of the host shear zone is assumed to be zero for these calculations. Indications are, however, that they are up to .05 opt. This could produce a significant increase in the grade of the above inferences.

Grab samples from the 1937 report ran as follows:

.96 opt - grab sample from underground
.72 opt - grab from pit #3
.14 opt - grab from pit #2
.43 opt - grab from altered granodiorite host

10.0 - MISCELLANEOUS AREAS - figure 3

10.1 - MAYFLOWER ADIT

An old adit was found just north of the boundary of the Mayflower claim. As per normal the structure consisted of a rusty shear zone containing quartz stringers. Galena lenses were commonly found in the quartz. The vein material was less vuggy than normal. A grade of .034 opt was obtained for galena bearing quartz while .057 occurred in a more oxidized, vuggy quartz.

The adit has a bearing of 110 degrees which is not too dissimilar to the Montana structure. The structure is roughly on strike with a shear zone exposed on the ridge to the east. On the ridge the oxidized float covers and area 10 metres wide. The area appears as an obviously gossanous zone from the summit of John Bull Mtn. looking north. Some 3-5 cm quartz vein is exposed in situ within the shear zone and is observed to strike at 148 degrees. The quartz carried a value .001 opt only.

On the basis of the information available only a brief amount of follow-up prospecting is warranted in this area.

10.2 - WEST RIDGE GEOCHEM ANOMALIES

Out of pure speculation a geochem line was run on the west ridge west of the west grid and the Bayonne Mine (see figure 3) and is referred to as L14. The line produced two noticeable anomalies - one at L14+850 (106 ppb Au) and one at L14+1250 (410 ppb Au). The more southerly anomalies is located near the road is extremely dense forest. Neither of these anomalies is on strike with any structure on the east side of the valley.

The magnitude of the anomalies along with the fact that there is no sign of contamination on the ridge top suggests that the results are valid and are on the order of the anomalies found over the Bayonne Mine and the Echo vein. This would suggest that two hitherto unknown structures are found here which definitely require a follow-up.

11.0 - INTERPRETATION OF RESULTS - figures 26, 27

Five structures are suspect of containing ore deposits. These include the Echo, St. Elmo, Montana, Summitt Belle, and North Vein structures. All are similar to the Bayonne structurally and mineralogically. Of these, the two Summitt Belle structures and North Vein contain the highest grade material and greatest likelihood of obtaining ore grade material with the least effort. Since the author spent little time following up on the North Vein it should be examined closer before a final judgment is presented. These are followed by the Montana vein which, though narrow, has a number of high assays and could widen at depth. The Echo and St. Elmo are of lower priority because of their lack of ore grade values. Great potential does exist at depth, especially as they are proximal and subparallel to the Bayonne Main Vein.

Also of interest are the two geochem anomalies on the east ridge which must be followed up.

11.1 - NORTH VEIN

The values on the structure obtained int 1983 suggest strongly that it is ore bearing. Since it is proximal to the Bayonne Main Vein and appears to intersect it, the structure can be expected to have the same or similar geochemical environment as the Main Vein. For these reasons further work should be undertaken.

11.2 - ECHO STRUCTURE

Trenching exposed a complex splay structure with no economic potential whatsoever. This is inconsistent with the strong gold soil anomaly directly associated with the splay. Gold does occur on the Echo structure at surface as detailed above in section 6.4. The lack of gold in the deeply weathered and incompetent shear zone could be attributed to dispersion over the millennia as there is no significant glacial activity evident. If this is true one might have to go to some depth before meaningful values are found.

In any case the structure as it appears on surface is uneconomic as the veins are narrow. This may be more of a function of the stress field at the junction of two shear zones. Most of the veins in the exposed shear zone are oriented obliquely to perpendicularly to the Echo structure as one approaches the actual junction. At such points the stress is usually better accommodated than in a strict shear stress field so wide veins do not get expressed. The final caveat is that the exposed shear zone resembles the upper Bayonne vein near the ridge top.

At these same types of splay junctions in other deposits one often finds mineralization. Since values do occur in the Echo one may have to go to depth before finding sufficiently wide vein with an acceptable grade. My reasoning for suggesting this is that gold and silver camps with subparallel veins tend to carry their precious metal deposits in a pattern which is roughly perpendicular to the prevailing orientations of the those veins. Since the Bayonne area is in an essentially structurally isotropic intrusive it is possible that this model does not hold - the Bayonne and A-vein might just be the only local deposit, but it is doubtful. It is more likely that the exposure of the Echo may just represent a heavily leached and weathered top of a substantial deposit beginning at relatively shallow depth.

Figure 27 shows a composite topographic long section of the Echo, Bayonne, St. Elmo, and Montana structures. The Echo is shown to follow the topography of the Bayonne fairly closely. Since parallel ore shoots on parallel veins rarely have identical elevations, it is quite possible that ore should occur at some depth below surface.

11.3 - St. ELMO STRUCTURE - figure 27

The interpretation of the St. Elmo structure is virtually the same as that for the Echo (11.1). It is somewhat more complex than the Echo in some ways though. The occurrence of galena at the St. Elmo adit along with strong limonitic alteration is confusing in comparison to the Bayonne, but consistent with what is found at the Montana. Galena is somewhat less susceptible to oxidation than copper or iron sulfides and in fact no such sulfides were found at the dump. Figure 27 shows the structure to be 50 to 100 metres higher in section than either the Bayonne or Echo so if the same inferences hold here as with the Echo, then one might expect mineralization at greater depth.

The complexity of the gold anomalies between the Echo and St. Elmo suggests the strong possibility that other splay structures which could lead to gold accumulations.

11.4 - MONTANA STRUCTURE - figure 27

The Montana exposure is situated similarly to the St. Elmo dump and mid levels of the Bayonne in terms of elevation. Its mineralization bears the greatest similarity to the St. Elmo dump and infact the two appear to be the same structure - producing a combined known strike length of 1.5 kilometres. While not economic at the surface, the vein does have potential further along strike and at depth. There is also the possibility of adjacent structures or splays hidden under the talus which might be ore bearing. In fact the cliff face to the west contains galena bearing quartz in a narrow weakly defined shear zone. Its orientation is nearly perpendicular to the Montana vein and so can be expected to intersect it.

11.5 - SUMMITT BELLE STRUCTURE

The quartz vein from the workings on the Maggie Aikens claim contains proportionally more and fresher sulfides and most resembles material from the lower workings of the Bayonne and A-vein dumps. The presence of vuggy oxidized quartz suggests that the workings, in terms of elevation, are on the boarder between the purely oxidized and purely unaltered zones. If the Bayonne represents a reasonable model then it would appear that the adit is located relatively near the middle of the ore deposit. This is partially supported by figure 28 which shows the adit to be about 150 metres below the lowest workings at the Bayonne Mine. It seems apparent that elevations for ore zones are not uniform throughout the Bayonne property. This should still leave an estimated 200 metres of ore below the surface. The fact that only 100 metres of strike length has been exposed, all with excellent results, could mean that a few hundred more metres of good grade material could be present. The fact that there are two structures involved (and possibly more) only enhances the probability of obtaining high tonnages of ore on the order of that mined at the Bayonne.

11.6 - WEST RIDGE GEOCHEM ANOMALIES

The actual elevations of the anomalies are not known, but do appear to be roughly the same altitude as the Bayonne eighth level. On the basis of the anomalies it is evident that the inferred structures strike more or less east-west as do the other veins in the camp. Until more detailed work is complete on the area nothing definite can be said about the geology of the area.

FIG 25

12.0 - CONCLUSIONS AND RECOMMENDATIONS

While the probability of obtaining ore on all of the five structures is good the priority should be the Summitt Belle and North veins, followed by the Montana, and finally both the Echo and St. Elmo structures. In any case, continued trenching is not recommended on the Echo or St. Elmo structures in view of the probable leaching of the weathered bedrock.

In all cases drilling is necessary. A rotary percussion drill with a range of 70 to 150 metres and capable of producing chips of around 5 mm would be the optimal tool. If a drill is produces only rock powder it will be of little use as it will require continuous sampling, will not be amenable to examination, and will cause a greater degree of contamination due to clogging of the bit. The drill described above type of drilling could be a useful tool in this type of ground for the following reasons: 1) initially, at least, most holes would be less than 150 metres in depth in order to test for shallow ore deposits, 2) the host rock is essentially uniform locally so documentation of lithology is unimportant, 3) large shear zones would be easily recognizable and could be preferentially sampled negating the need for sampling continuously down hole. The quartz is easily distinguishable in the shear zones, 4) holes can be stopped upon exit of the shear zone if desired, 5) it would allow a greater number of holes (even grid drilling) which are drilled faster and at less expense than diamond drilling.

Diamond drilling could be introduced at a later date to follow up on encouraging results and go to greater depth to probe the bottom of the ore zone.

Additionally, in the case of the Summitt Belle structures, diamond and percussion drilling can be done from below the rock bluffs providing an additional 50 metres of vertical on the veins. Prior to drilling though, soil geochem would be of importance in assessing the total strike lengths of these known structures and delineating new parallel ones.

A program of soil geochem is not possible at the Montana claim because the entire area surrounding the trenches is covered by thick talus containing huge boulders. In fact it is amazing that the structure is exposed at all.

The east grid should be extended to the south so as to locate any other structures. Of particular interest is the clarifying of the anomaly at 50E 40N.

More detailed work involving drilling is recommended on the basis of the 1983 results.

Finally the two anomalies on the west ridge will require more detailed work. A grid should be laid out and sampled parallel to the ridge. Mapping will also be required, but will be difficult because of the lack of outcrop and heavy undergrowth. Proper linecutting will probably be a requirement.

14.0 - BAYONNE ITEMIZED COST STATEMENT - EAST GROUPING -1987

COSTS:

- Geologists ______________________ $200/day ea.
- Geophysical Operator #1______________ $125/day
- Geophysical Operator #2______________ $100/day
- Technical Field Assistant____________ $125/day
- Geological Technician_______________ $110/day
- Field Assistants____________________ $80/day ea.
- Truck (Mileage + Leasing)____________ 60/day
- Room and Board (Geologists + Technicians)_$30/day ea

August 3 - (2) Field assistants: flag southern halves of lines 5500E and 5600E.
subtotal: $95

August 4 - (2) Field assistants: correct and complete the southern halves of lines 5600E and 5700E.
subtotal: $95

August 5 - (2) Field assistants: flag the southern halves of lines 5500E, 5800E, 6000E south.
subtotal: $95

August 6 - (2) Geologist: map the southern halves of lines 5500E, 5600E, 5900E, and 6000E south. (3) Field assistants: flag the southern halves of lines 6000E and 6100E south.
subtotal: $380

August 7 - (2) Geologist: map the southern halves of lines 5700E, 5400E, 6000E, and 6100E south. (3) Field assistant and (1) Geophysical operator #1: flag the south halves of lines 5300E and 5400E.
subtotal: $442.5

August 8 - (1) Geologist: map the southern halves of lines 6000E and 6175E. (2) Field assistants: flag the south half of line 6175E.
subtotal: $225

August 9 - (2) Geologist: map the ridge to the summit of John Bull Mtn. and the southern half of line 5300E.
subtotal: $210

August 10 - (1) Geologist: map John Bull Mtn. (1) Field assistant: soil sample the southern halves of lines 6000E and 6175E.
subtotal: $292

August 15 - (1) Geologist: map traverse from summit of John Bull

east. Map the area (talus) below the mountain. (1) Field assistant: soil sample southern halves of lines 6100E, 6000E, 5900E, and 5800E south.
subtotal: $315

August 16 - (2) Geologist: sample Echo dump and do general reconnaissance of the area. (2) Field assistant: soil sample the southern halves of lines 5500E, 5600E, and 5700E.
subtotal: $340

August 17 - (1) Field assistant: soil sample the southern halves of lines 5400E and 5300E south.
subtotal: $120

August 18 - (2) Geologist: map ridge and valley area east of John Bull and ridge south of John Bull.
subtotal: $490

August 20 - (1) Geologist: mapping and reconnaissance of the ridge south of John Bull.
subtotal: $260

Sept 18 - (1) Geologist and (1) Geological Technician: investigate the nature of the three geochem anomalies in the vicinity of the Echo adit.
subtotal: $430

Sept 19 - (1) Geologist and (1) Geological Technician: map, run line , and soil sample the southern half of line 5650E south.
subtotal: $215

Sept 20 - (1) Geologist, (1) Geological Technician, and (1) field assistant: map, run line, and soil sample line 5750E and the southern half of 5950E.
subtotal: $255

Sept 22 - (1) Geologist and (1) Geological Technician: map and follow oxidation from the Echo adit to the shear zone near the summit of John Bull. This does appear to be the same structure.
subtotal: $430

Sept 23 - (1) Geologist and (1) Geological Technician: map and follow oxidation along the anomaly 3 structure. An old dump and adit found on the structure. It is being named the St. Elmo adit.
subtotal: $430

Sept 28 - (1) Geologist and (1) Geological Technician: map and note oxidation of anomaly 2. Oxidation and some quartz float was found, but there is little concrete evidence of a structure present. (1) Geophysical operator #2 and (1) Technical field assistant: run EM on lines 53, 54, 55, 56 from 45N to 40N.

subtotal: $685

Sept 29 - (1) Geologist and (1) Geological Technician: map the Bluebird and Montana claims. Some old trenching with in situ quartz veining found. (1) Geophysical operator #2 and (1) field assistant: base-line 43.5N run for mag. Mag. run on lines 53E and 54E.

subtotal: $610

Sept 30 - (1) Geologist and (1) Geological Technician: detail map and sample the Montana trenches. (1) Geophysical operator #2 and (1) field assistant: run mag. and EM on the southern halves of lines 55E, 56E, 57E, and 58E.

subtotal: $610

Oct 1 - (2) Geologist: map the Oxford claim and Mayflower claim. An old adit was found at the Mayflower with in situ galena bearing vein material. (1) Geophysical operator and (1) field assistant: run mag. and EM on lines 60, 61, and 61.75.

subtotal: $700

Oct 3 - (2) Geologist and (1) Geological Technician: map, sample, and prospect the Summit Belle group to the west.

subtotal: $660

Oct 5 - (1) Geologist, (1) Geophysical operator, and (1) field assistant: extend, map and sample lines 61.75E, 61E, 60E to 3800N.

subtotal: $470

Oct 16 - (2) Geologist and (1) Technical field assistant: detail sample and map the workings at the Maggie Aikens claim.

subtotal: $675

Oct 20 - (2) Geologist: flag and blaze 800m for trenching on the Echo and St. Elmo structures as well as a road between the end of the Echo trenching to the St. Elmo dump.

subtotal: $520

Oct 23 - (1) Geologist: watch cat, hand muck overburden from trench #1. Cat: clear overburden from trench #1 - cat down with sheared bolt on the blade arm

subtotal: $290 (cat work included later in report)

Oct 24 - (1) Geologist: watch cat, hand muck overburden from trench #1. Cat: complete work on trench #1 - cat down with broken pin. Work started on trench #3.

subtotal: $290

Oct 26 - (1) Geologist and (1) Field assistant: clear off overburden by hand and trench #1 - sample. Cat: complete trench #3 and work on trench #4 - make access road.

subtotal: $370

Oct 27 - (1) Geologist and (1) Field assistant: watch cat - clear overburden n from trench #1 as well as #3 and #4 by hand - begin sampling. Cat: complete trench #4 and commence work on trench #2 - complete access road.
subtotal: $370

Oct 28 - (1) Geologist, (1) Geological Technician, and (1) Field assistant: watch cat - hand muck overburden from trench #2 - sample. Cat: complete trench #2 and start the trench between #2 and #3 (trench #1-2).
subtotal: $510

Oct 30 - (1) Geologist and (1) field assistant: watch cat and hand muck in trenches #1-2. Cat: complete trench #1-2. Cat (D6) down. (1) Geologist, (1) Geological Technician, and (1) Technical field assistant: At the Maggie Aikens workings - locate a fourth trench and detail sample it. Two trucks used.
subtotal: $955

Nov 2 - (2) Geologist and (1) Field assistant: hand muck overburden in trench #1-2 - near completed sampling. Cat: work on trench #2-3.
subtotal: $600

Nov 3 - (2) Geologist and (1) Field assistant: hand muck overburden from trench #1-2 and complete sampling - start clearing overburden from trench #2-3. Cat: Extend trench #4 - no shear zone found - complete work on trench #2-3.
subtotal: $600

Nov 4 - (1) Geologist and (1) Field assistant: hand muck overburden from trench #2-3 and sample. Cat work on road and trench #4 - still no shear zone.
subtotal: $370

Nov 5 - (1) Geologist and (1) Field assistant: hand muck overburden, sample and map trench #2-3. Cat: work on road.
subtotal: $370

Nov 6 - (1) Geologist and (1) Field assistant: hand muck and sample trench #2-3. Cat: road work.
subtotal: $370

Nov 7 - (1) Geologist and (1) Field assistant: map and sample trench #2-3. Cat: work on first trench on the St. Elmo just below the dump.
subtotal: $370

Nov 8 - (1) Geologist, (1) Geological Technician, and (1) Technical field assistant: map and sample trench #2-3. Cat:

work on trench at St. Elmo - cat down.
subtotal: 585$

Nov 9 - (1) Geologist, (1) Geological Technician. and (1) Technical field assistant: complete mapping and sampling of trench #2-3. Cat: down

Total cat moving expenses:______________________________$1585.50

15.0 - BAYONNE DAILY JOURNAL - WEST GROUPING - 1987

COSTS:

- Geologists ________________________________ $200/day ea.
- Geophysical Operator #1____________________ $125/day
- Geophysical Operator #2____________________ $100/day
- Technical Field Assistant__________________ $125/day
- Geological Technician______________________ $110/day
- Field Assistants___________________________ $80/day ea.
- Truck (Mileage + Leasing)__________________ 60/day
- Room and Board (Geologists + Technicians)__ $30/day ea

July 30 - (1) Geologist, (1) Geophysical operator #1, and (2) field assistant: flagging and soil sampling lines 5500E, 5600E, 5700E, 5900E north. Other costs: air photos - $50, hip chain thread - $70, mylar - $165, flagging - $50.
subtotal: $910

July 31 - (1) Geologist: map and tie in cultural features to the 5000N base-line between 5000E to 5150E and 4800N to 5100N. (2) Field assistants: flag and soil sample lines 5300E and 5400E north. These lines were rechecked.
subtotal: $450

August 2 - (2) Geologist: map half of line 5400E north and prospect the western flank across the valley from the Bayonne (west grid). (2) Field assistant: flag lines 5100E, and 5200E north.
subtotal: $680

August 3 - (3) Geologist: prospect Virginia claims and gossanous showing - map lines 5600E and 5700E north - complete mapping line 5400E and 5300E north. (2) field assistants: flag lines 5500E, 5600E, and 5700E north halves.
subtotal: $815

August 4 - (2) Geologist: map lines 5500E and 5200E north - commence mapping of 5800E, 5900E, and 6000E north.
subtotal: $585

August 5 - (2) Geologist: map lines 5500E and 5600E north halves - complete mapping of 5800E, 5900E, and 6000E north. (2) Field assistants: flag north halves of 5500E, 5800E, and 6000E south.
subtotal: $490

August 6 - (2) Geologist: map north halves of lines 5500E, 5600E, 5900E, and 6000E south. (3) Field assistants: continue base-line to 6175E - flag north halves of lines 6000E and 6100E south.
subtotal: $380

August 7 - (2) Geologist: map north halves of 5700E, 5600E, 5900E, and 6000E south. (3) Field assistant + (1) Geophysical operator #1: flag 5200E, 5000E, and the north half of 5300E and 5400E

subtotal: $443

August 8 - (1) Geologist: map north halves of lines 6100E and 6175E south. (2) Field assistant: flag line 5100E and the north half of 6175E

subtotal: $225

August 9 - (2) Geologist: map north half of lines 5300E and 5200E south - map the north half of the ridge to the summit of John Bull Mtn.

subtotal: $310

August 10 - (1) Geologist: map lines 5100E and 5200E south. (1) Field assistant: soil sample the north halves of lines 6175E and 6000E south. Soil sample 5800E, 5900E and 6000E

subtotal: $308

August 11 - (2) Geologist: tie in roads on line 5100E and tie in base-line to the roads - commence mapping ridge to Virginia Mtn. (2) Field assistant: soil sample lines 5300E, 5400E, 5500E, 5600E, and 5700E north.

subtotal: $680

August 12 - (1) Geologist: sample and examine the Bayonne dumps. (1) Field assistant: soil sample lines 5000E, 5100E, and 5200E north.

subtotal: $370

August 15 - (1) Field assistant: soil sample the north halves of lines 6100E, 6000E, 5900E, and 5800E south.

subtotal: $455

August 16 - (2) Geologist: sample lower dumps at Bayonne mine. (2) Field assistants: soil sample the north halves of lines 5500E, 5600E, and 5700E south.

subtotal: $340

August 17 - (2) Geologist: map the ridge from the junction of 5500E to the southern ridge south of the Virginia Mtn. - reconnaissance of the mountain north of Carolina Creek. (2) Field assistant: soil sample the north halves of lines 5400E and 5300E south. Sample line 5200E

subtotal: $490

August 18 - (2) Field assistant: soil sample lines 5000E and 5100E.

subtotal: $190

August 19 - (2) Geologist: map and show field assistants how to sample logging roads on the west grid - flag lines 2,3,4, and 6 - mapping on the east grid. (2) Field assistant: soil sample BL1 and BL2. Flag and sample L3 on the west grid.
subtotal: $680

August 20 - (1) Geologist: flag and map line 1 and cut brush. Field assistant: soil sample lines 1,2,3, and 6.
subtotal: $340

August 21 - (1) Geologist: map line 7 and base-lines 3, 4, and 5. (1) Field assistant: flag and soil sample same.
subtotal: $370

August 23 - (2) Geologist: map BL6, L8N, L9S, L9N, L5 and L10 - mapping near ridge. (1) Field assistant: flag and soil sample same.
subtotal: $600

August 24 - (2) Geologist: map L11 and L12 - mapping the ridge. (1) Field assistant: flag and soil sample same.
subtotal: $600

August 25 - (2) Geologist and (1) Field assistant: map and soil sample L13 and L14.
subtotal: $600

Sept 19 - (1) Geologist and (1) Geological Technician: map, run line, and soil sample the north half of 5650E and 5750E south over the anomalous area.
subtotal: $600

Sept 20 - (1) Geologist, (1) Geological Technician, and (1) Field assistant: map run line, and soil sample north half of 5950E south.
subtotal: $225

Sept 21 - (1) Geologist and (1) Geological Technician: map, run line, and soil sample line 5050E south.
subtotal: $430

STATEMENT OF QUALIFICATIONS

I, Leonard Austin Hitchins, do hereby certify that:

1) - I am a geologist employed by Lightning Minerals Inc. of # 202, 7608-103 street, Edmonton Alberta, T6E 4Z8.

2) - I am a graduate of the University of Alberta holding a B.Sc (specialization) in geology (1983).

3) - I have practiced my profession since graduation and was engaged in exploration prior to graduation.

4) - My previous employers include Terra Mines Ltd., The University of Alberta, Aquarius Resources Ltd., and U.S. Borax Corp.

5) - I have experience in the various aspects of narrow vein mine geology. I have been employed in two mines and have experience with 7 others. I have conducted geological and geochemical research of one mine. I have conducted a surface exploration program. I have supervised underground drilling programs. I have constructed drilling proposals for both underground and surface drills. I have experience in the Slave Archean and Bear Aphebian provinces as well as the cordillera.

L. Austin Hitchins

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG.C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE CA P LA CR MG BA TI B W AND LIMITED FOR NA AND K. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: SOILS -80 MESH   AU* ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: SEPT 2 1987 DATE REPORT MAILED: Sept 11/87 ASSAYER. D.Toye... DEAN TOYE. CERTIFIED B.C. ASSAYER

GEOCHEMICAL ICP ANALYSIS

Bayonnie West Grid

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG.C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE CA P LA CR MG BA TI B W AND LIMITED FOR NA AND K. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: SOIL AU* ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: AUG 26 1987 DATE REPORT MAILED: Sept 4/87 ASSAYER D. Toye ..DEAN TOYE, CERTIFIED B.C. ASSAYER

ACME ANALYTICAL LABORATORIES   852 E. HASTINGS ST. VANCOUVER B.C. V6A 1R6   PHONE 253-3158   DATA LINE 251-1011

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG.C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE CA P LA CR MG BA TI B W AND LIMITED FOR NA AND K. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: SOIL   AU# ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: AUG 21 1987   DATE REPORT MAILED: *Aug 3/87*   ASSAYER. *D. Toye*..DEAN TOYE, CERTIFIED B.C. ASSAYER

ACME ANALYTICAL LABORATORIES 852 E. HASTINGS ST. VANCOUVER B.C. V6A 1R6 PHONE 253-3158 DATA LINE 251-1011

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG.C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE CA P LA CR MG BA TI B W AND LIMITED FOR NA AND K. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: SOILS -80 MESH AU* ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: AUG 17 1987 DATE REPORT MAILED: Aug 27/87 ASSAYER. D. Toye ..DEAN TOYE. CERTIFIED B.C. ASSAYER

GEOCHEMICAL ANALYSIS CERTIFICATE

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE CA P LA CR MG BA TI B W AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: P1-SOIL P2-ROCK AU* ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: OCT 13 1987 DATE REPORT MAILED: Nov 2/87 ASSAYER. D. Toye..DEAN TOYE, CERTIFIED B.C. ASSAYER

GEOCHEMICAL ANALYSIS CERTIFICATE

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE CA P LA CR MG BA TI B W AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: Rock Chips AU* ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: NOV 11 1987 DATE REPORT MAILED: Nov 23/87 ASSAYER. [signature] ...DEAN TOYE, CERTIFIED B.C. ASSAYER

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG.C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE CA P LA CR MG BA TI B W AND LIMITED FOR NA AND K. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: STREAM SED AU* ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: AUG 15 1987 DATE REPORT MAILED: Aug 26/87 ASSAYER D. Toye ....DEAN TOYE. CERTIFIED B.C. ASSAYER
