Diamond Drill Report

Canamera Property

1. Inroduction

Minnova Inc. optioned the Canamera property from Canamera Exploration Inc. in June, 1986. The claim group is located between Minnova's Mt. Sicker property and Abermin's Lara property. It was acquired to evaluate the strike extent of Abermin's polymetallic Coronation zone. This report summarizes the results from diamond drill hole CM-1 which was drilled on the eastern part of the property during the period May 25th to May 27th, 1987.

1.1 Location and Access

The Canamera property is located on Vancouver Island approximately 12 km northwest of Duncan (Figure 1). The property is readily accessible from Highways 1 and 18 using a network of logging roads.

1.2 Mineral Rights

Drill hole CM-1 is located on the Copper Canion claim which is part of the Cu Canyon group (Figure 2,3). The claim status of the property is as follows:

Cu Canyon Group

Name	No. of Units	Record No.	Month of Record
Copper Canion	1	1113	Nov.
Victoria	1	1114	Nov.
Elmore Fraction	1	1115	Nov.
Copper Mint No. 1	1	17566	Aug.
Copper Mint No. 2	1	17567	Aug.
Copper Mint No. 3	1	17568	Aug.

1.3 History

Initial work was done on the claims following the discovery of the Lenora-Tyee ore-bodies in 1897. Pits and adits were driven on 2 showings - the Copper Canyon showing located on the western side of the Chemainus River and the Victoria showing located in the center of the Victoria claim. Both showings consist of quartz-pyrite-chalcopyrite stringers. The latter occurrence is reported to have yielded 120 tons of ore grading 4% Cu and 79 tons grading 0.05 oz/T Au. Little work was done on the property between the turn of the century and 1970 when it was acquired by a group of people who subsequently formed Viva Ventures. Between 1971 and 1973 they carried out soil geochemical, geological and geophysical surveys (JEM, VLF, magnetics, IP, seismic, gravity, SP). Umex acquired the property in 1979 and they conducted soil sampling, VLF and magnetic surveys. Canamera optioned the claims in 1985 and they did linecutting, a limited amount of IP, soil sampling, a "Genie" EM survey, 3 trenches and 5 diamond drill holes totalling 670 m. No significant zones of mineralization were located.

In June, 1987 Canamera and Minnova Inc. entered into a joint venture agreement to explore the property with Minnova as the operator. They carried out VLF, magnetic, geological, soil and litho-geochemical surveys, a limited amount of trenching and 6 diamond drill holes totalling 892 meters.

1.4 Work Done

This report summarizes the results of diamond drill hole CM-1 which was part of a 6-hole program testing geological and geophysical targets on the property. Hole CM-1 which is 175.6 meters deep was drilled on the Copper Canion claim (record #1113).

2. Canamera Area Geology

The Canamera property is underlain by volcanic rocks of the Paleozoic Sicker Group and sediments of the Cretaceous Nanaimo Group (Figure 2,3). Muller (1980) has subdivided the Sicker Group as follows:

1. Buttle Lake Formation
2. Sediment - Sill Unit
3. Myra Formation
4. Nitinat Formation

Although outcrop density on the property is less than 5%, geological mapping has indicated that felsic and intermediate volcanic tuffs and ashes of the Myra formation are the most common rock type on the claim group. These units are cut by two northeasterly trending faults and one northwesterly trending fault which have been

defined on the basis of magnetic data. The amount of movement along these faults is unknown due to the lack of a distinctive marker horizon.

Two old mineralized showings occur on the property - the Copper Canyon showing and the Victoria showing. The mineralization at each is characterized by quartz-pyrite-chalcopyrite stringers of subeconomic grades. The property is strategically placed along strike and east of Abermin's polymetallic Coronation zone and to the west of Minnova's Mt. Sicker property which includes the old Lenora-Tyee Mines which yielded 300,000 tons of ore grading 3.31% Cu, 7.51% Zn, 2.75 oz/T Ag and 0.13 oz/T Au.

3. Diamond Drill Results

Hole CM-1 tested a VLF anomaly located 100 meters west of pyrite-chalcopyrite stringer mineralization exposed at the old Copper Canyon workings on the west side of the Chemainus River (Figures 2,3). A 7.7 meter wide pyritic stringer zone was intersected but metal values of this zone are low. A detailed log and assays for hole CM-1 are included in Appendix I.

4. Conclusions

The VLF conductor which CM-1 was testing is explained by the 7.7 meter wide pyritic stringer zone that was intersected. Low metal values in this zone and throughout the hole indicate that there are no economically significant sulphides associated with this conductor. Further work in the Copper Canyon area is not warranted at this time.

Gary Wells

5. Statement of Costs

Copper Canion claim - hole CM-1 filed for $14,563.67

CM-1

Footage Costs		7,751.25
Casing (124 ft)		1,912.65
Casing shoe		393.08
Drilling additives		268.80
Drill bits		1,497.89
Man hours (44 hrs. at $24)		1,056.00
Drill hours (22 hrs. at $22)		484.00
M. Gray 4 days at $300/day	1,200.00	
	total:	$14,563.67

Statement of Qualifications

I, Gary S. Wells, hereby certify that:

1. I hold an Honours Bachelor of Science degree in combined geology and chemistry (1975) from Carleton University, Ottawa, Ontario and a Ph.D degree in geology (1980) from Queen's University, Kingston, Ontario.

2. I am an associate member of the Geological Association of Canada and a member of the Canadian Institute of Mining and Metallurgy.

3. I have practised my profession in exploration continuously since graduation in 1980.

4. I have based conclusions contained in this report on knowledge of the area, my previous experience and results of field work conducted on the property.

Date: October 23, 1987
