Rebagliati Geological Consulting Ltd.

SUMMARY

The HC claim, comprising 12 units, is located in South Central British Columbia, 22 km northwest of Little Fort. Highway 24 lies approximately 5 km south of the claim. Good quality logging roads leading from the highway traverse the claim and provide easy two-wheel drive vehicle access. Numerous small streams and lakes are ready sources of drill water.

Triassic-Jurassic volcanic units and derived sediments, lying on the eastern flank of the central volcanic core of the Quesnel Trough, underlie the claim.

The first mineral exploration within the claim area was directed towards the evaluation of base metal-rich veins located along the western side of the claim. This work, undertaken sometime around the 1930's, is not well documented and consisted of the sinking of hand-excavated pits and shallow shafts. In the 1960's and 1970's, the area immediately to the west of the claim was extensively explored for porphyry copper-molybdenum deposits by several companies. From 1981 to 1985, the same area received extensive exploration. During this later period, the zinc veins on the HC claim were relocated and three previously unknown zones of carbonate alteration were discovered.

Lancer Resources Inc. optioned the HC claim from BP Minerals Canada Ltd. and in 1987 conducted a detailed soil geochemical survey to trace and define the zones of mineralization. Strong zones of multi-element anomalies were identified. A program of diamond drilling is proposed.

INTRODUCTION

This assessment report is based on the writer's knowledge of the area gained by the study of available government and private reports; regional studies; the supervision of exploration on the adjacent Ta Hoola property during the period 1980-1982; an examination on July 13, 1986 of trenches excavated by BP Minerals; and the supervision of the geochemical survey conducted by the company in July-August 1987.

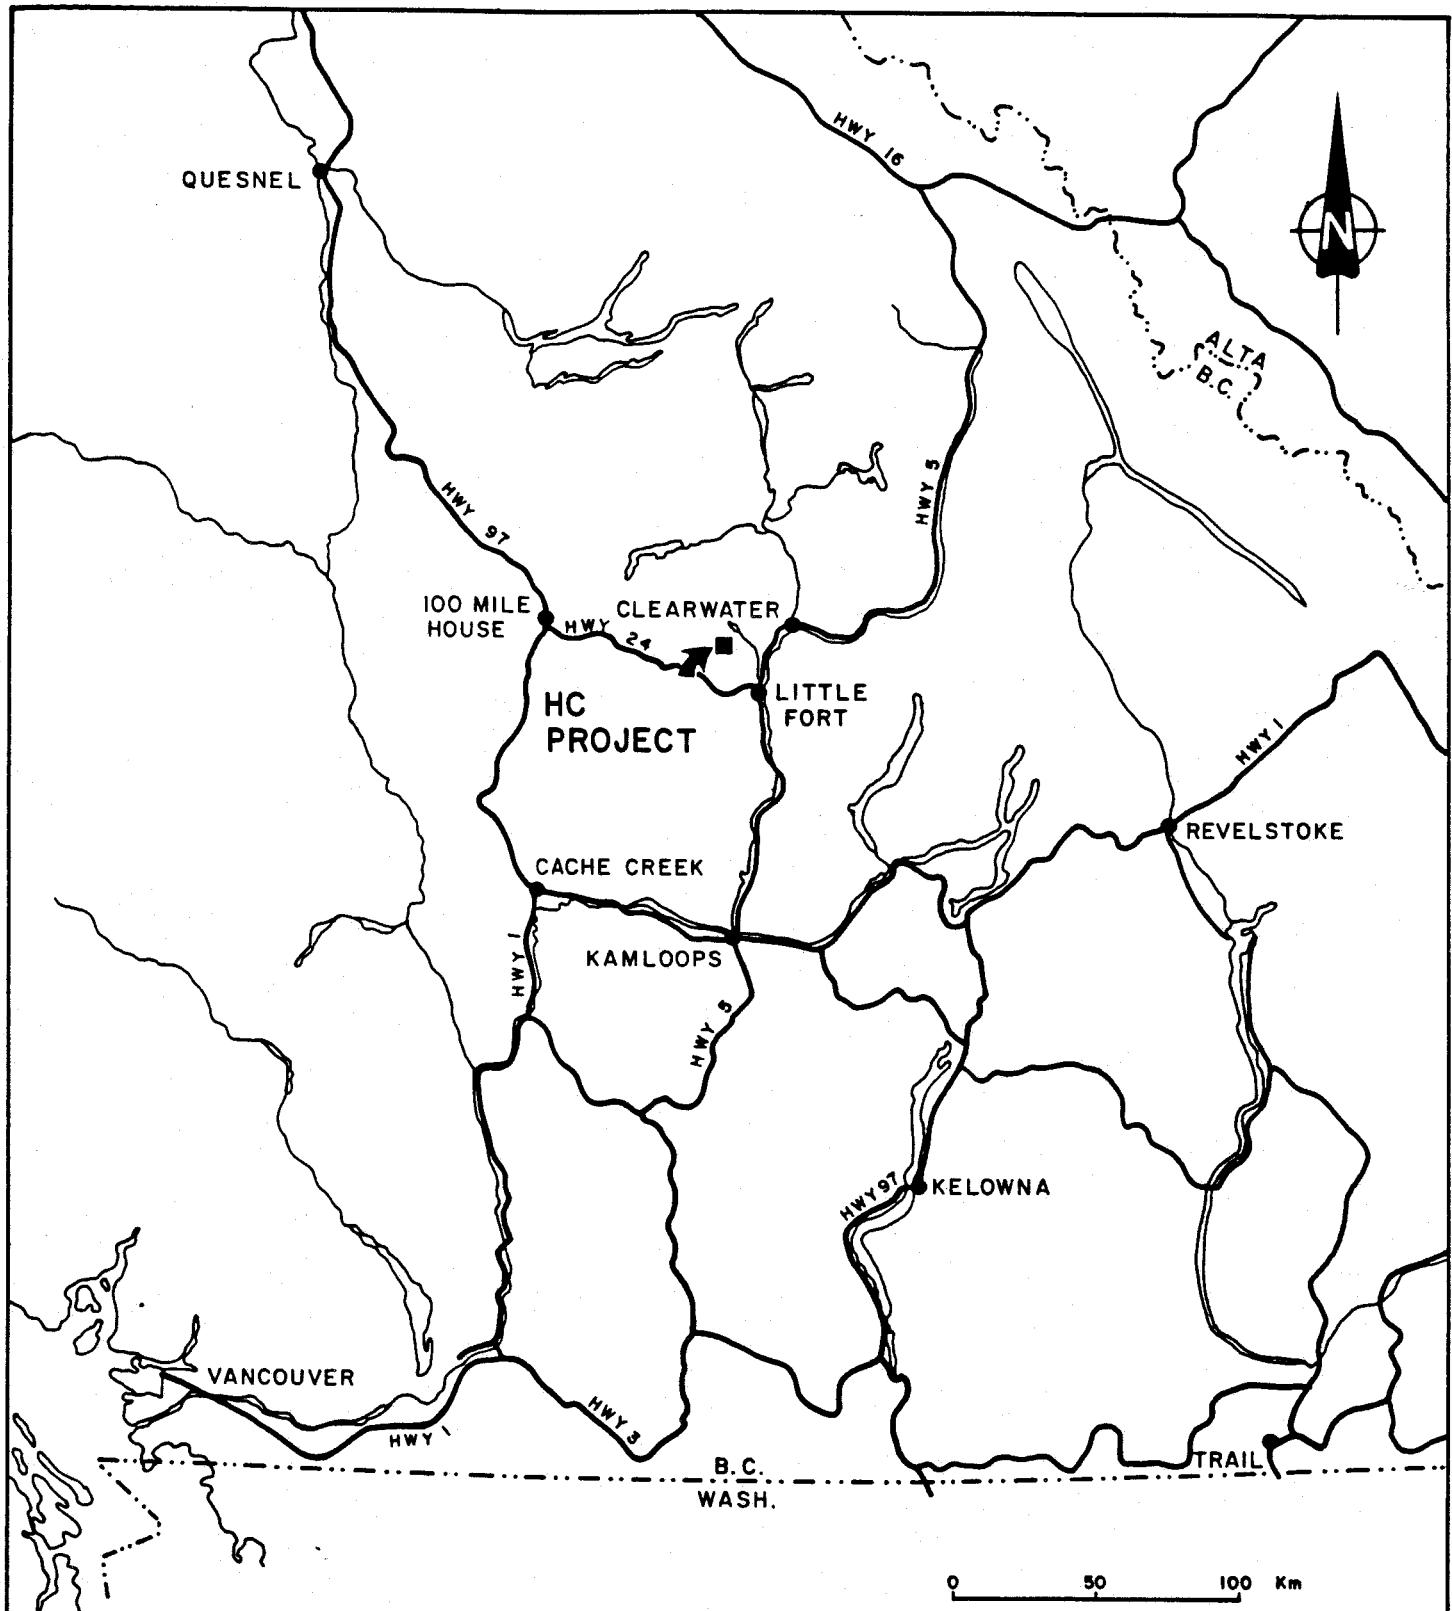

The property is held under option from BP Minerals Canada Ltd.

LOCATION AND ACCESS

The HC claim is located approximately 22 km northwest of Little Fort, British Columbia on NTS Map Sheet 92P/9 at latitude 51°34'N and longitude 120°21'W (Figure 1).

A network of good quality logging roads provides easy access to the property from Highway 24, which links the Yellowhead South Highway (No. 5) along the North Thompson River at Little Fort to the Cariboo Highway (No. 97) at 100 Mile House.

The property lies within the Thompson Plateau, a part of the Interior Plateau characterized by rolling uplands with rounded hills and numerous small lakes. Topography within the claim is moderate and elevations range from 1,340m along the eastern boundary to 1,560m at the top of a hill near the western boundary.

LANCER RESOURCES INC.
HC PROJECT

LOCATION MAP

Rebagliati Geological Consulting Ltd.

Vegetation consists of a mature spruce, fir and jack pine forest. Underbrush is moderately thick near the moist valley bottoms and thins at higher elevations where drainage is better. Two small portions near the southern edge of the claim have been logged.

CLAIMS

The 12-unit HC claim is owned by BP Resources Canada Limited. Lancer Resources Inc. holds an option to earn an interest in the property.

The writer has not inspected all of the claim posts and can pass no opinion on the manner of staking nor can he verify the location as depicted on the claim map (Figure 2). Essential claim data are as follows:

Claim Name	Record No.	No. of Units	Mining Division	N.T.S.	Recording Date	Expiry Date
HC1	4363	12	Kamloops	92P/9	Feb.25/83	*Feb.25/92

*upon the acceptance of this assessment report.

EXPLORATION HISTORY

The first documented exploration on ground now covered by the HC claim is in an assessment report filed in 1974 by Imperial Oil Ltd. However, old hand-excavated shafts and several pits are located on the western side of the claim. It is speculated by the writer that this work was undertaken in the 1930's following the discovery of copper skarn mineralization at the Lakeview property situated approximately 3 km to the southwest on the southwest shore of Deer Lake.

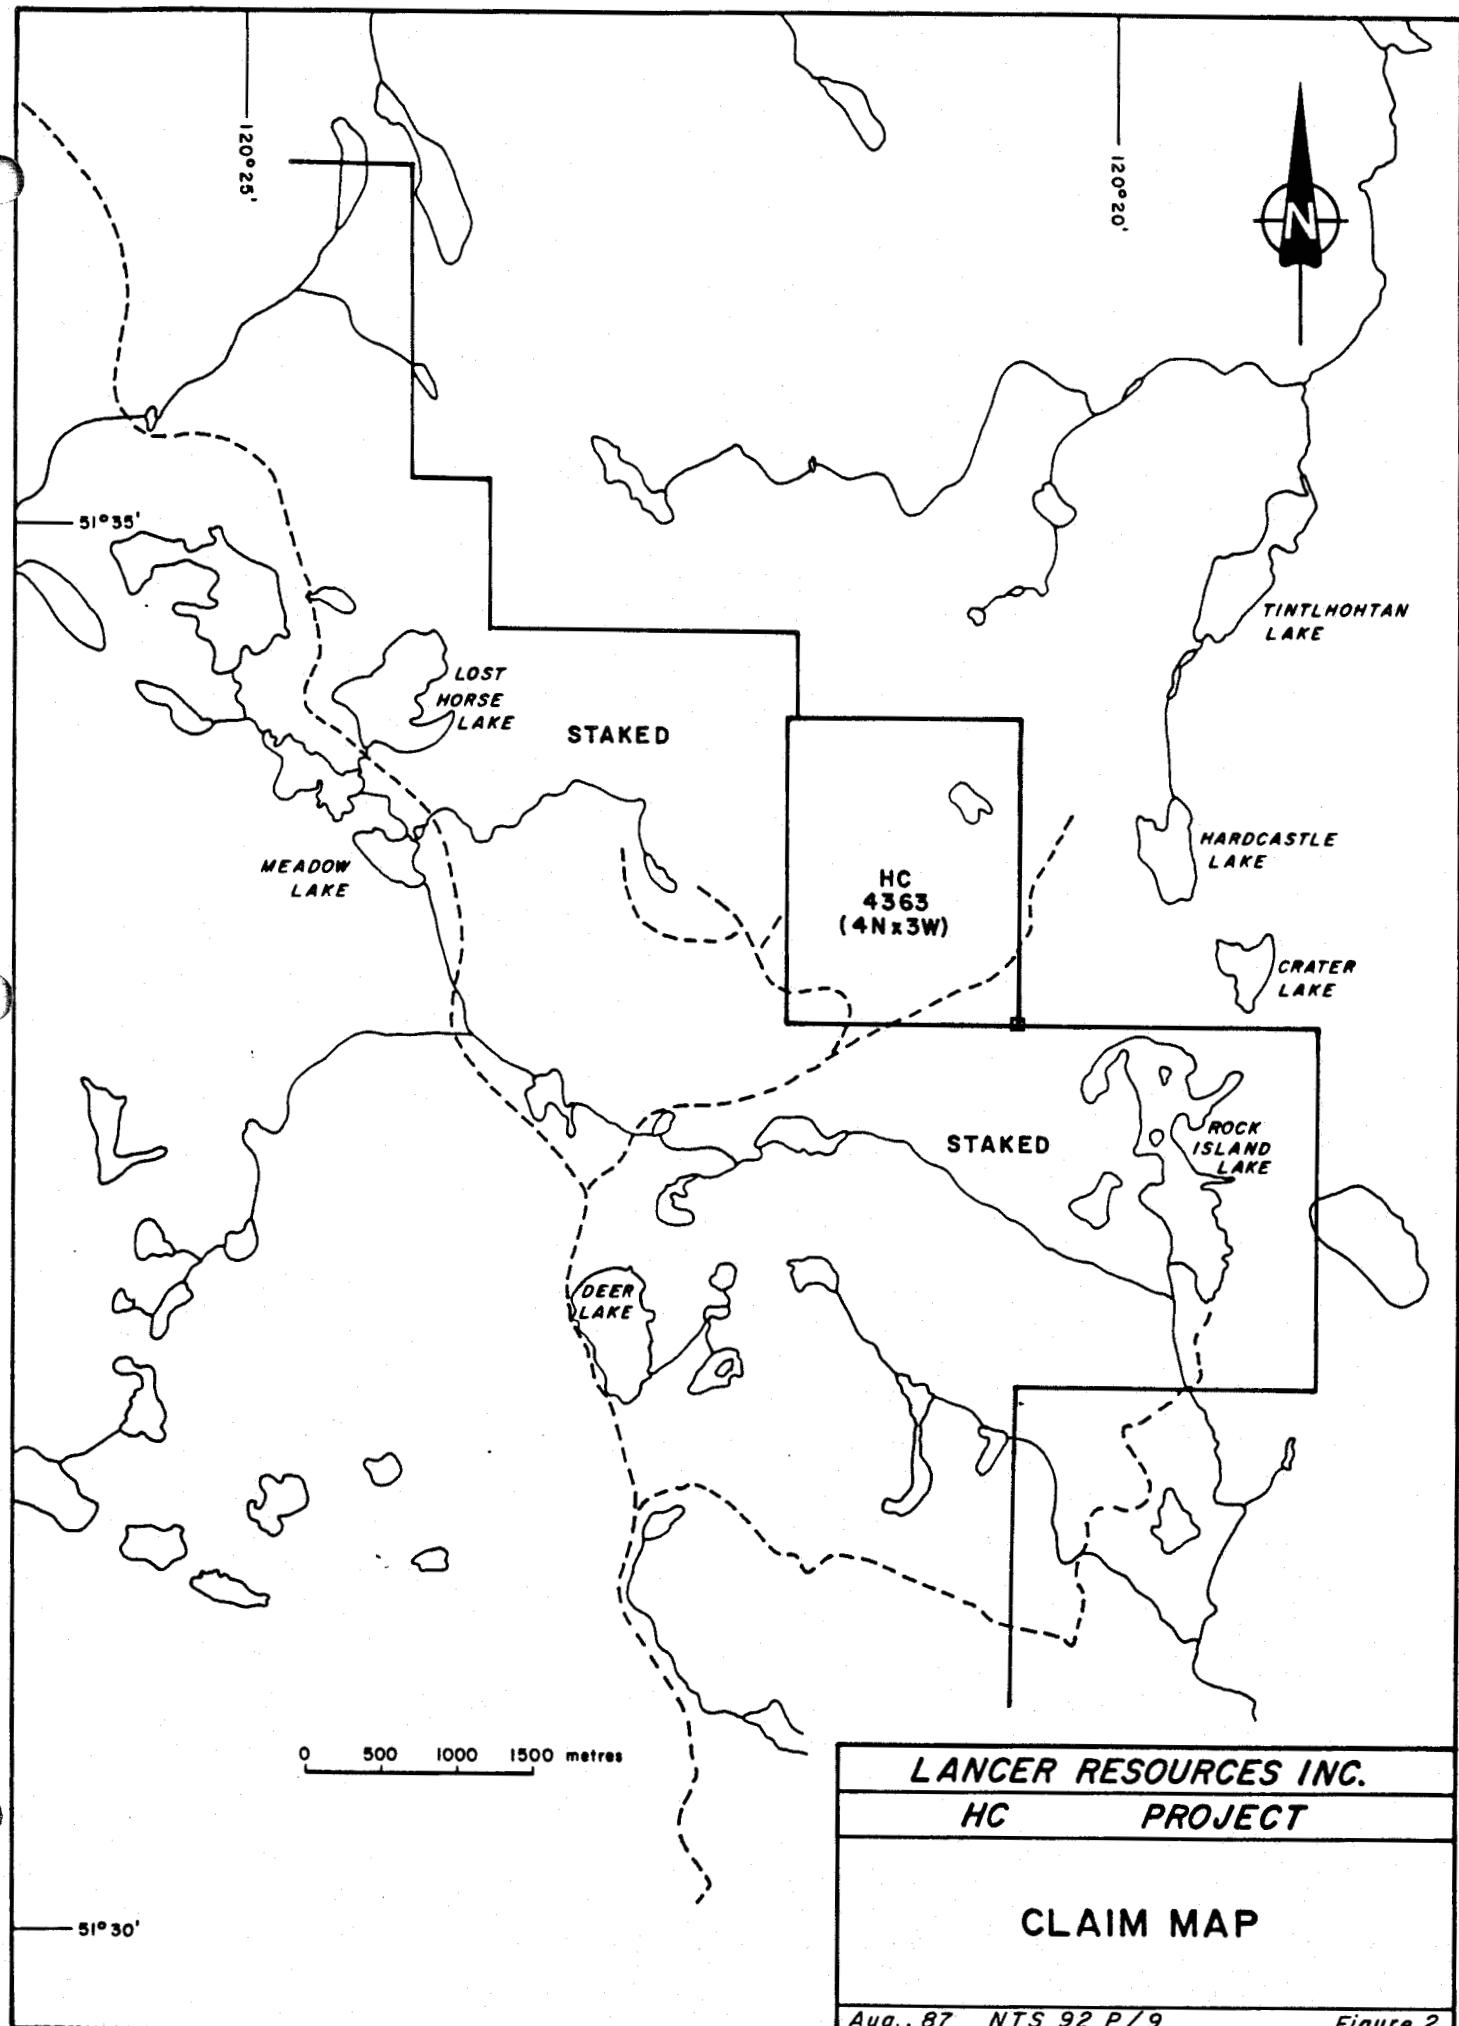

Figure 2

Rebagliati Geological Consulting Ltd.

Imperial's work in 1974 included geological, geophysical and soil geochemical surveys. A zinc anomaly was identified, however no further exploration was undertaken and the claims were allowed to expire.

In 1982, a regional reconnaissance program conducted by the Selco Division of BP Resources Canada Limited identified altered rocks in the project area carrying geochemically anomalous concentrations of mercury and arsenic. At that time, the ground was held by another party who were inactive. Subsequently the claims expired and Selco restaked the ground.

In 1982, the ground was prospected and lead-zinc mineralization associated with quartz-carbonate veins was found in old hand-dug trenches. Further prospecting led to the discovery of carbonate alteration zones. A reconnaissance multi-element soil geochemical survey utilizing a 200m by 200m sample spacing identified several single sample anomalies. The wide sample spacing proved ineffective in defining discrete zones of anomalous metal concentrations. In 1985 three carbonate alteration zones were backhoe trenched to determine their width, mineralogical and structural characteristics and to ascertain their potential to host mineralization. (The writer had the opportunity to examine the trenches in July 1986 prior to their being back-filled and landscaped.)

The property became inactive in late 1985. Lancer Resources Inc. optioned the HC claim from BP and in 1987 undertook a detailed soil geochemical survey to relocate and define zones indicated by previous surveys to be anomalous in metals.

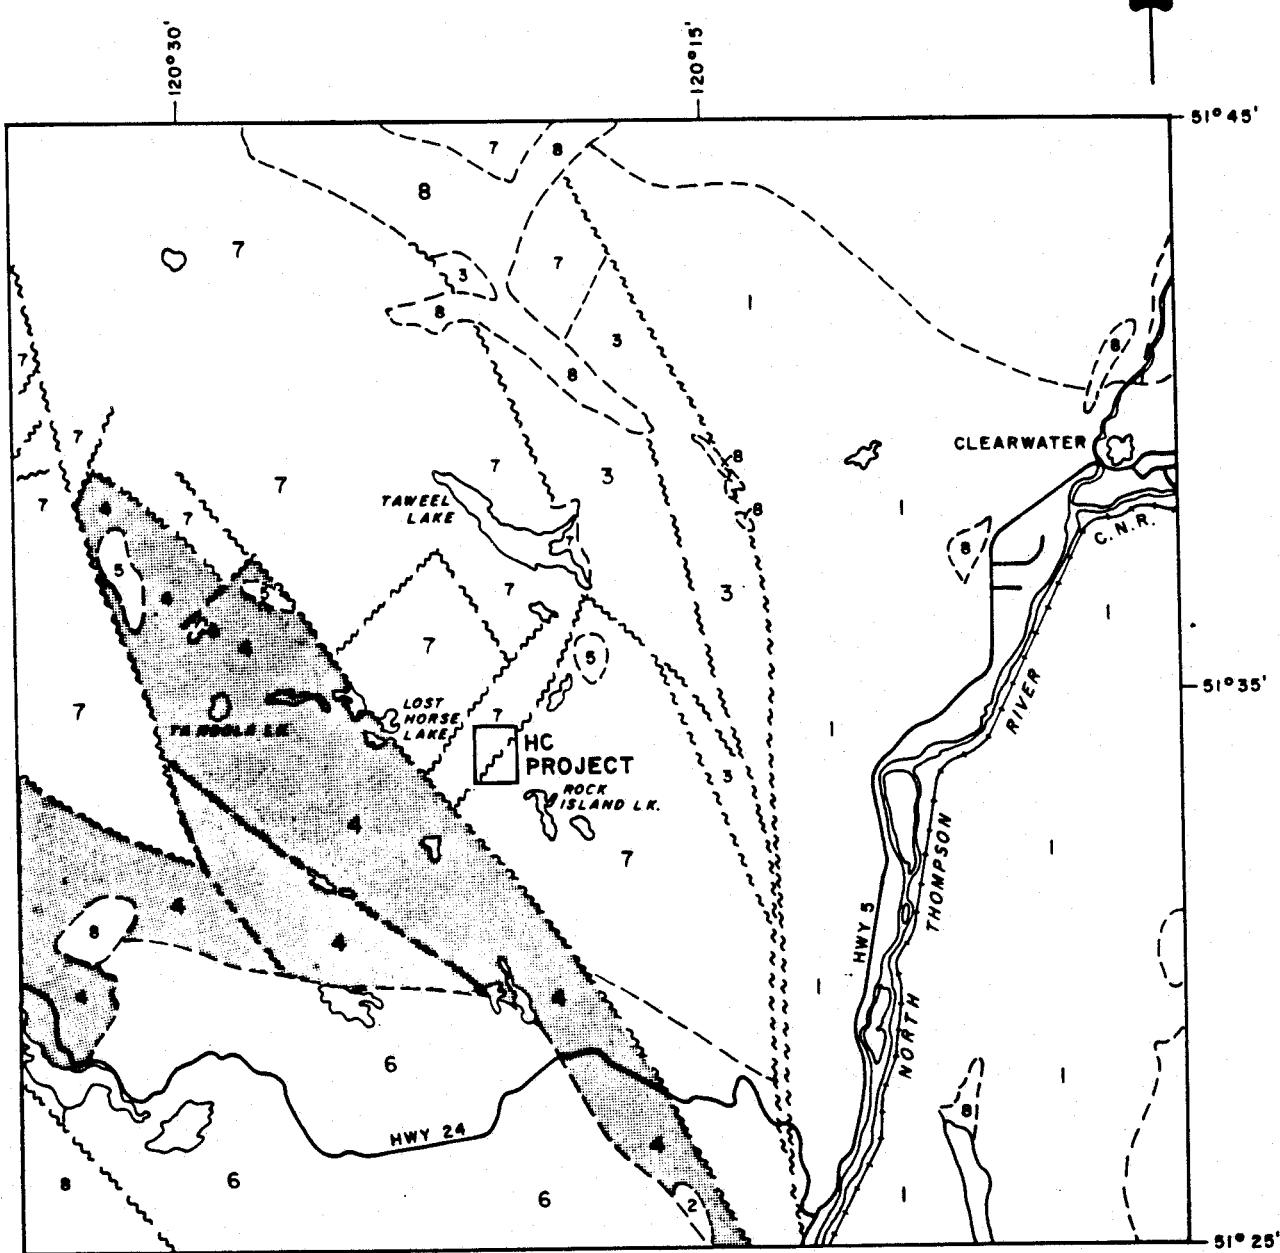

REGIONAL GEOLOGICAL SETTING

The HC property is situated within the Quesnel Trough, a 2,000 km long northwesterly trending belt consisting of Upper Triassic-Lower Jurassic volcanic rocks, derived sedimentary rocks and intrusives. The belt is characterized by a volcanic core of Triassic subaqueous andesite pyroxene porphyritic flows, tuffs and breccias. Interbedded with the volcanics are calcareous argillite, siltstone, silicious cherty sediments and thinly bedded limestone. On the eastern and western margins of the volcanic core is an overlying and flanking sequence of Lower Jurassic pyroxene porphyritic volcaniclastic breccias with proximal to distal epiclastic sediments consisting of conglomerate, greywacke and argillite (Figure 3). To the extreme east are fine clastic sediments, consisting of a siltstone, shale and argillite assemblage, which appear to form the base of the Triassic sequence.

Regional mapping indicates that the property area is underlain by Nicola Group alkaline volcanic and sedimentary rocks intruded by numerous comagmatic diorite to syenite stocks (Preto 1970, Campbell and Tipper 1971).

Late fumarolic or hydrothermal stages related to the plutons introduced volatiles and metals into the volcanics and extensively altered and mineralized large volumes of shattered volcanic rocks. The Copper Mountain, Afton, and Cariboo Bell copper porphyry deposits are directly associated with this late hydrothermal stage.

The HC claim lies within an area of intense block faulting, formed where the North Thompson Fault breaks into a multitude of

northwesterly-trending splays (Figure 4). At Little Fort, where the North Thompson Fault breaks into the splays, there are two ultramafic bodies aligned along the fault. These ultramafic bodies are evidence that the fault represents a zone of deep crustal weakness, a favourable host structure for mineralization associated with carbonate alteration.

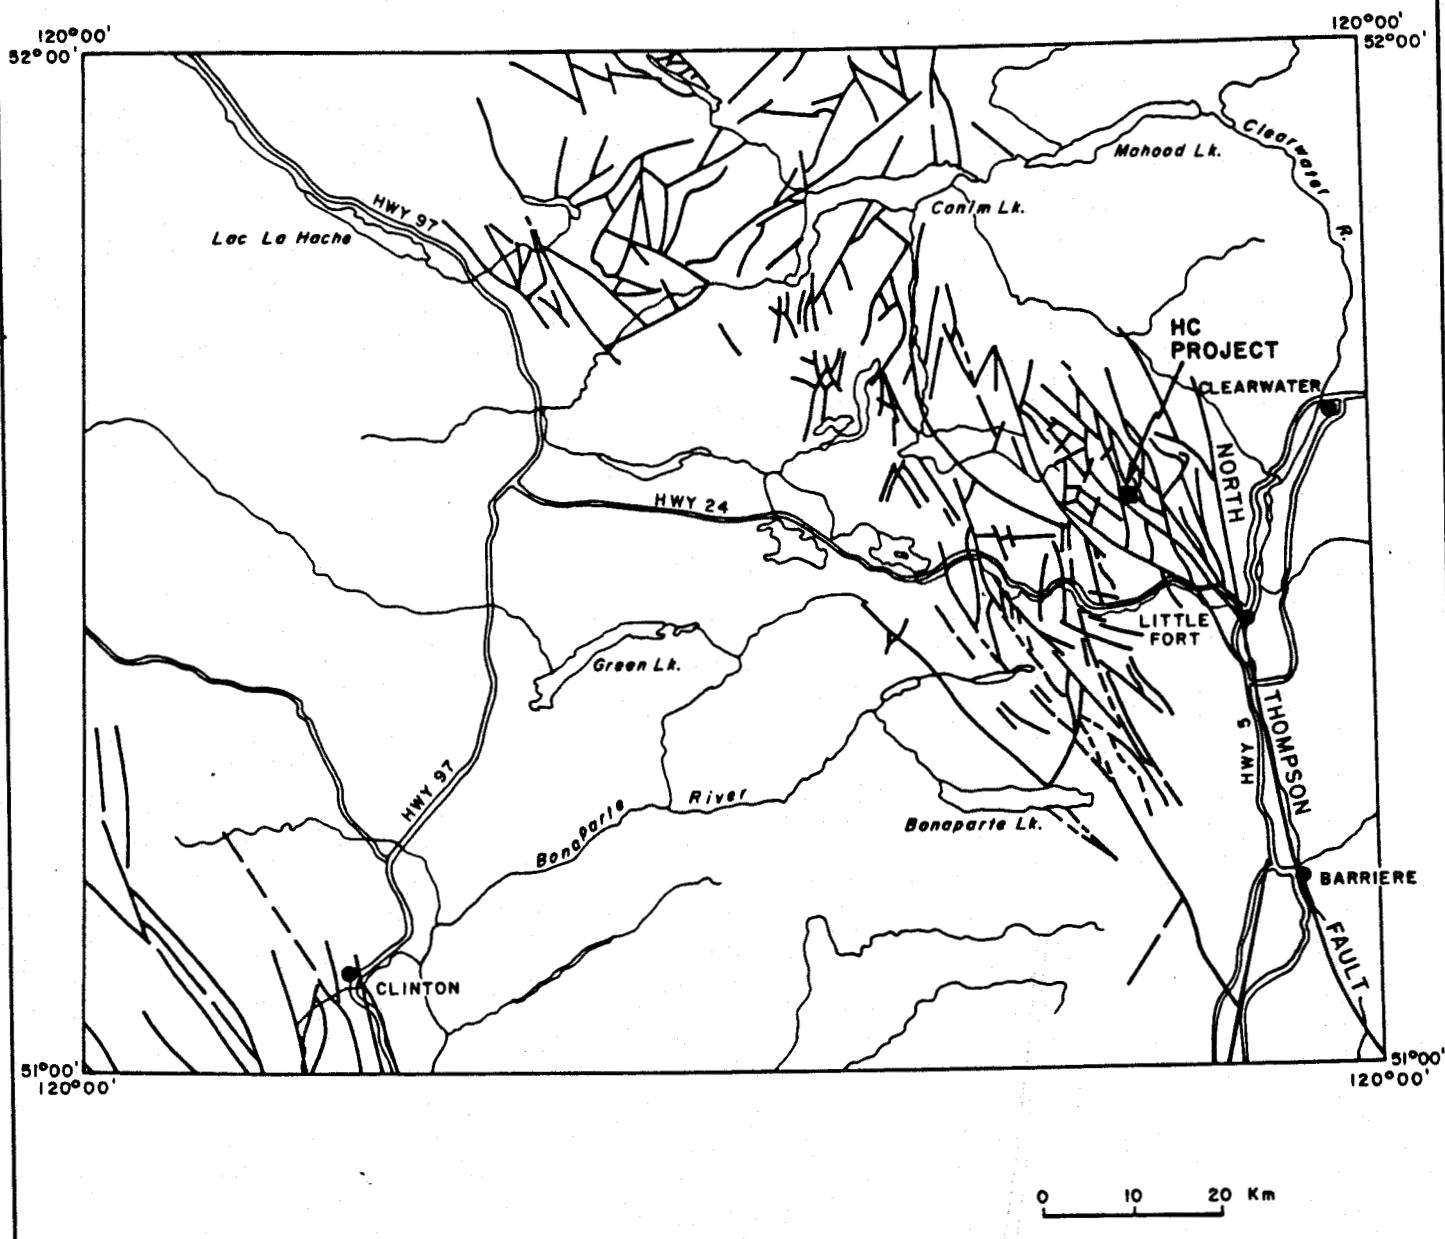

On the HC claim, wide, parallel, carbonate alteration zones conform to the dominant northwesterly fault trend.

PROPERTY GEOLOGY

The HC claim is situated to the east of the main Upper Triassic volcanic core and is underlain by the eastern flanking sequence of interbedded Lower Jurassic pyroxene porphyritic pyroclastics and distal epiclastic sediments (Figure 3). Block faulting has disrupted the stratigraphy, which has been rotated into a near vertical attitude. However, the regional north-northwest strike is maintained.

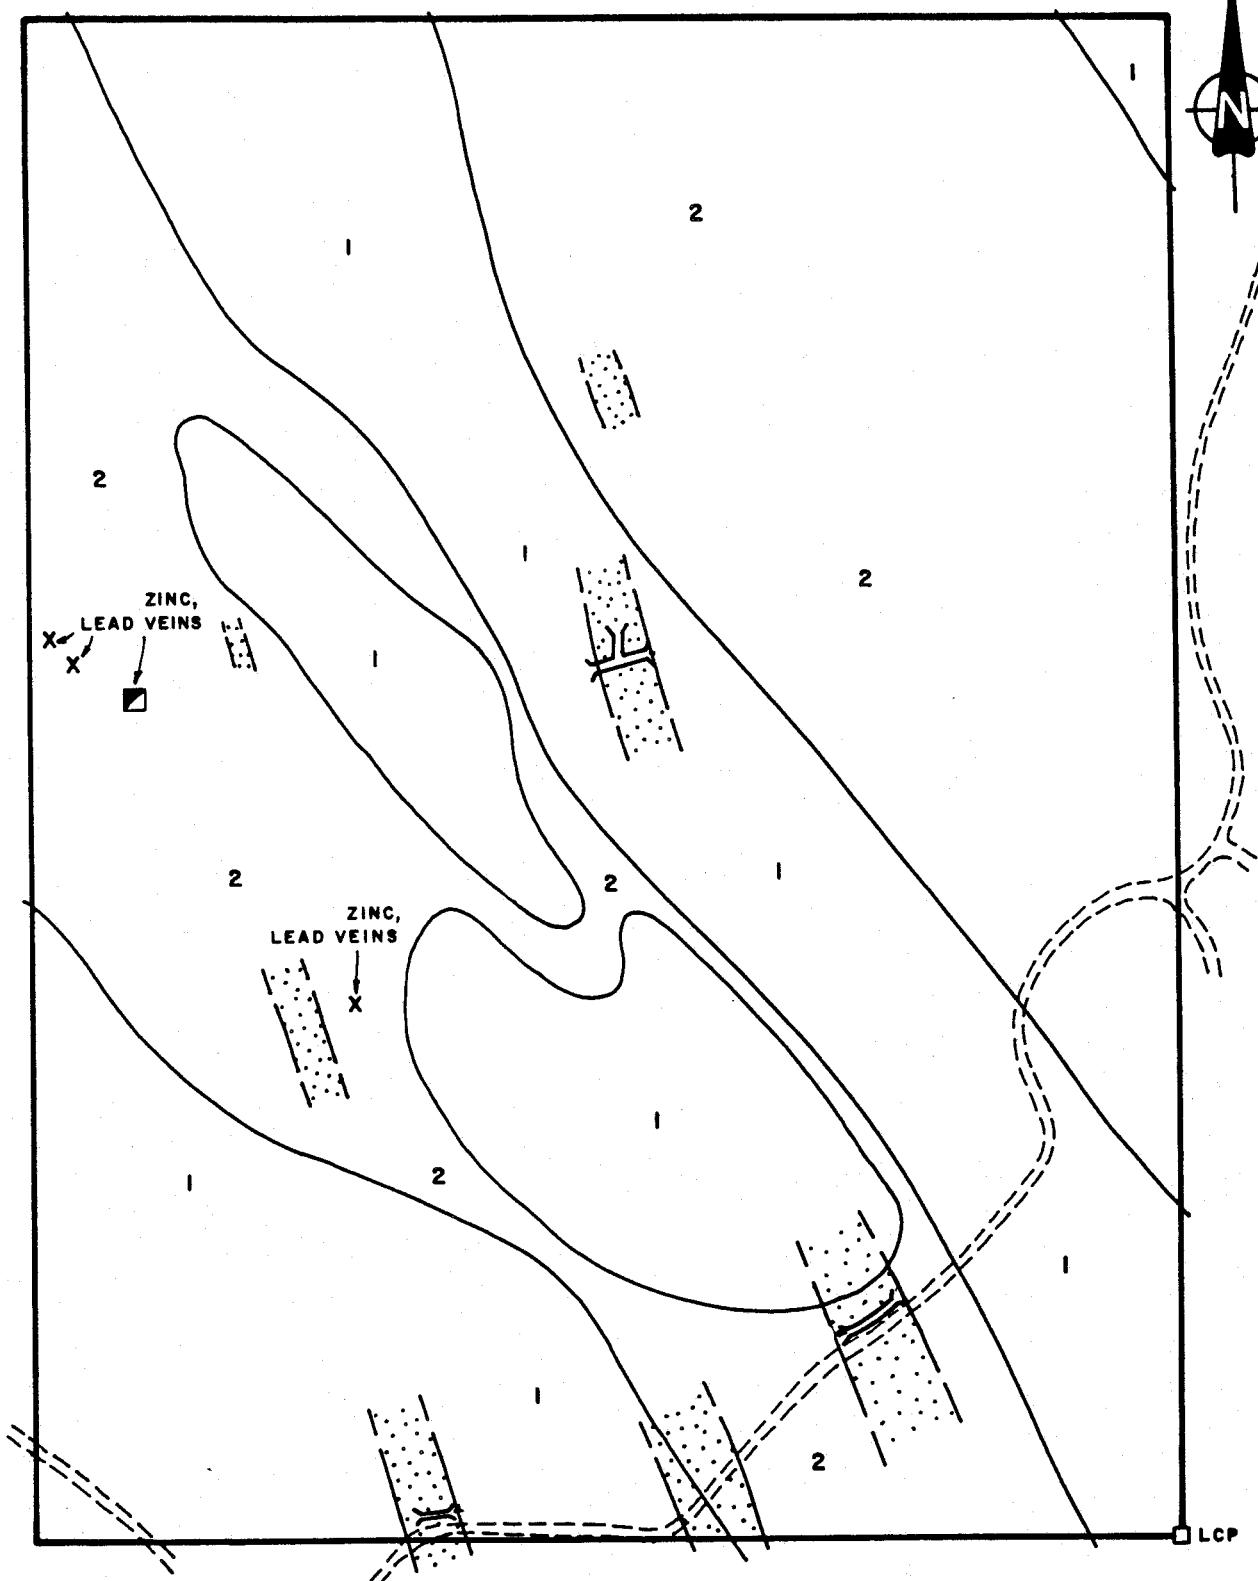

Three similar bands of pyroxene lapilli tuff-agglomerate trend northwesterly across the claim (Figure 5). These rocks are medium to dark green, massive and medium to coarse-grained pyroclastics. Fragment sizes vary from 1 cm to 20 cm and are comprised of subangular to subrounded porphyritic augite andesite. Clasts are supported by a matrix of fine-grained ash tuff. Pyrite occurs in minor concentrations as widely-spaced disseminated grains.

The epiclastic sediments comprise siltstone, argillite, chert, greywacke and conglomerate. Siltstone predominates. It is usually massive, laminated, fine to medium-grained and light

to dark grey coloured. Pyrite is sparse, occurring as disseminated grains, but reached 5% to 10% in light grey bands as heavy disseminations with interstitial carbonate. Subordinate very fine-grained, massive, black, carbonaceous argillite is occasionally interbedded with the siltstone. Disseminated pyrite is ubiquitous and commonly comprises up to 5% of the rock.

The only known intrusive rock on the claim is a northwesterly-striking feldspar porphyry dyke situated near the southwest corner of the claim.

ALTERATION AND MINERALIZATION

Carbonate alteration is widespread on the HC claim, occurring in three principal modes.

Narrow, randomly oriented calcite stringers and grain aggregates are commonly in all units. They are generally sulphide-free and barren.

Near the midpoint in the western claim boundary, several calcite-quartz veins, up to 80 cm thick, cut siltstone units. These veins, exposed in old hand-excavated shafts and trenches in a 500m long southeast-trending zone, carry an appreciable sulphide content comprised of sphalerite, chalcopyrite, galena, pyrite and tetrahedrite. A selected sample of sulphide-rich material, collected by BP personnel, ran 165 ppb gold, 0.99% copper, 0.65% zinc and 0.06% lead (Gamble 1986). A representative sample, cut by the writer, from a vein exposed in an old shaft at 61+25N, 51+30E graded 0.71 oz/ton silver, 0.022 oz/ton gold and 3.31% zinc across 0.70 m.

Rebagliati Geological Consulting Ltd.

Potentially of greater economic significance are three northwesterly-trending zones of pervasive carbonate alteration. These zones are moderately discordant to bedding, display crude banding, brecciation, crosscutting ferroan dolomite veining and are interpreted to be healed faults which have undergone multiple episodes of movement. These poorly-exposed alteration zones are geochemically enriched and have acted as important structural sites for mineralization. Late quartz stringers infilling fractures, breccias and dilation zones within the broad areas of carbonate alteration carry the highest values of copper and antimony.

BP's 1985 trench, located near the centre of the claim exposed a 24 m wide zone of pyritic pervasive carbonate alteration hosted by a fragmental andesite. A series of continuous 2.0 m long chip samples cut across the full width of the zone averaged 2.25 ppm silver and 997 ppm copper with a geochemically significant enrichment in antimony.

Near the southeast corner of the claim, a 59 m wide band of interbedded mafic volcanics and cherty, silty argillaceous sediments is extensively carbonate altered and carries 1% to 5% fine-grained disseminated pyrite.

The third carbonate alteration zone, located near the southwest corner of the claim, is well exposed in a trench along the southern claim boundary where a 27 m interval of altered interbedded andesite breccia and limey sediments is cut by a coarse-grained feldspar porphyry dyke. The altered sediments carry 5% to 10% disseminated pyrite; whereas, in the more intensely altered andesite breccias, pyrite concentrations up to 15% are attained. A 2.0 m interval cut by late quartz stringers

in the core of the intensely-altered zone ran 2,736 ppm lead (Gamble 1986).

Because of the intensity of the regional faulting (Figure 4), which is the probable structural control, the multiple carbonate alteration zones on the HC claim can be expected to have long strike lengths and to extend to considerable depths.

SOIL GEOCHEMISTRY

A detailed soil geochemical survey was carried out over the HC claim by Lancer Resources Inc. in July/August 1987, to relocate and define the anomalies indicated by the BP/Selco reconnaissance survey. A grid, comprising 61.5 km of blazed and flagged lines and 8.0 km of base lines, was established for survey control. A total of 2400 B-horizon soil samples were collected at 25 m intervals on grid lines spaced 50 m apart. Average sample depth was 25 cm except in moist organic-rich areas where the sampling depth was in the order of 50 cm. Samples (1,282) from alternate lines were geochemically analysed for gold by Atomic Absorption methods and for 30 elements by ICP. The remaining 1,118 samples from the intervening lines were dried, screened and placed in storage for possible later analyses for use to upgrade anomaly definition and to aid in their interpretation. Statistical analyses were made for each element and appropriate value ranges were determined for dot plot presentations. Two hundred and twenty of the stored samples were then analysed and statistical analyses were rerun to assist in anomaly interpretation. The 31 element plot maps are included in Appendix III.

Anomaly selection was based upon a combination of the

Rebagliati Geological Consulting Ltd.

clustering of anomalous values; their magnitude above background concentrations; and their correlation with the anomalous zones of the other elements.

The multi-element soil geochemical survey confirmed that base metals are present in anomalous concentrations. Plots for copper and lead show that specific, coherent anomalies can be identified from the general scatter of individually anomalous samples. A compilation of coincident anomalies outlines two significant trends. The 1,300 m long eastern anomalous trend coincides with the central band of augite porphyry volcanics. These volcanics host the structurally-controlled eastern-most carbonate alteration zone. The western anomalous trend is more closely associated with the interbedded sedimentary units and shows a much more complex pattern of metal associations.

A broad zone of high zinc values extends across the western half of the claim and encompasses both the eastern and western anomalous trends. Peak zinc values correlate well with the composite anomalies.

Core areas within the eastern and western anomalous trends have base metal values sufficiently high to directly reflect underlying mineralization and must be considered as prime exploration targets.

CONCLUSIONS

The HC claim is situated immediately to the east of the central volcanic core of the Quesnel Trough in a geologically prospective area of complex faulting. Wide bands of carbonate alteration geochemically enriched in base metals and indicator

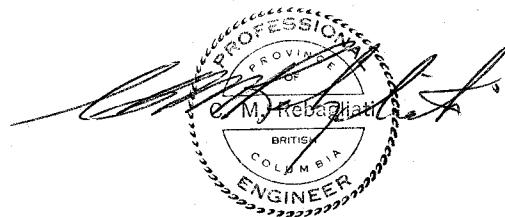

Rebagliati Geological Consulting Ltd.

elements are evidence that metal-generating hydrothermal events took place within the claim area. Multi-element soil geochemistry has outlined the trace of the altered zones and test trenching combined with rock chip sampling have substantiated that mineralization is present in at least two of the three carbonate alteration zones. The highest values occur where late stage quartz stringers cut carbonate altered fault planes.

The calcite-quartz base metal veins situated in the central western portion of the claim are interesting secondary exploration targets. A program of diamond drilling is justified to explore the extensive geochemically anomalies.

RECOMMENDATIONS

A program of diamond drilling is recommended to evaluate the multi-element anomalies associated with the carbonate alteration zones.

ACME ANALYTICAL LABORATORIES

852 E. HASTINGS ST. VANCOUVER B.C. V6A 1R6

PHONE 253-3158

DATA LINE 251-1011

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG.C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR MN FE CA P LA CR MG BA TI B W AND LIMITED FOR NA AND K. AU DETECTION LIMIT BY ICP IS 3 PPM.
 - SAMPLE TYPE: SOIL - AU ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: AUG 23 1987

DATE REPORT MAILED: Aug 26 1987

APPENDIX II

ANALYTICAL METHODS

ACME ANALYTICAL LABORATORIES LTD.
Assaying & Trace Analysis
852 E Hastings St., Vancouver, B.C. V6A 1R6
Telephone: 253-3156

Shipping of Samples

All shipments from outside Canada should be marked "GEOCHEMICAL SAMPLES FOR ANALYSIS - NO COMMERCIAL VALUE".

Free Custom Clearance on invoices of \$150.00 or more.

By Air Freight:

Acme Analytical
c/o Cole McCubbin
Vancouver, B.C.

By Surface - UPS

Acme Analytical
c/o Pac-Ex
140 - 14th Street, Blaine, Wa.

Discounts by Contract.

Turnaround time is generally around three days, and can be 24 hours by special contract.

Free pick up from downtown Vancouver and Bus Depot.

Field Services

Portable crushers and core splitters are available at reasonable rental rates.
Cut your shipping cost on large drilling programs.

All prices subject to change without notice.

Special Service

Modem data transfer: 5 cents/sample - minimum \$10.00

Statistical Analysis :

- SD
- Mean
- Median
- Frequency Plot
- Grid Coordinate Contour Plot

Data disks - \$6.00

Apple II - Require Acme's read programs

IBM-PC - ASCII or Lotus 1,2,3.

1987

Acme Analytical continues to update with mass spectrographic analysis which is now operational. In general, mass spec offers detection limits which are at least 100 fold lower than ICP or flame AA. These detection limits are comparable to graphite furnace AA, but the mass spec can analyze up to 60 elements simultaneously.

Acme has pioneered low cost multi-element ICP analysis which has better detection and precision than AA. Mass spec will further expand the range of elements and isotopes available to mineral exploration programs.

SPACE

Total laboratory, sample preparation and sample storage has been expanded to 12,000 square feet.

EQUIPMENT

1. Our ICP system has been expanded, and a fifth unit has been purchased which will allow us to determine up to 45 elements simultaneously.
2. AA spectrophotometers have been increased to 8.
3. Sample preparation, weighing and dissolution facilities have been increased.
4. A LECO Induction Furnace has been installed for determining Carbon and Sulfur simultaneously in geological and metallurgical samples.
5. An UAJ Laser Fluorometer from Scintrex is now used for determination of U in water to .01 ppb.
6. Two ICP mass spectographs.

TECHNOLOGY

1. Fire Assay for Ag, Au, Pt, Pd, Rh, Ru & Ir.; the precious metal bead can be analysed by gravimetric, AA, ICP or Mass spec.
2. ICP multi element packages for water, geochem and assay programs have been developed.
3. Lower detection limits for some elements have been achieved by graphite furnace AA.

TECHNICAL ACHIEVEMENTS

1. Background corrected Atomic Absorption analysis of Ag and Au since 1971.
2. Best proven precision, accuracy and price for MoS₂ assays in North America.
3. Pioneered geochemical analysis by ICP at or to better detection limits than AA, including Ag, As, U, Th and W.
4. First to offer Mass spectrographic scan analysis.

PROVEN PERFORMANCE

Our logistical and technical performance for our clients has been demonstrated on the Gambier, Capoose Lake, Trout Lake, Blackdome, Red Mountain, Carolin, Cirque, Minago River, Quesnel River, Terra Swede, Musto and other major projects. We are capable of handling up to 2500 samples per day.

ACME ANALYTICAL LABORATORIES LTD.

Assaying & Trace Analysis

Telephone: 253-3158

Suggestions for Effective use of Analytical Services

1. General Sampling

A. Rocks - In general 1/2 to 2 lb of sample is required. Large boulders should be broken down to chip size with a 20 lb sledge hammer. A representative sample is then taken from these chips. The lab will crush, split and pulverize.

B. Cores - Drill cores should be split into halves for assaying.

C. Soils - The organic "A" horizon gives good base metal responses. Supply about one cup of material in a soil or paper envelope. The soil is treated in one of three methods after drying :-
1) -80 mesh sieving (standard).
2) -80 mesh sieving + pulverizing.
3) pulverizing the whole sample.

Samplers must not wear any jewelry.

2. Shipping

A. Local and Within Canada - use Greyhound or Pacific Stage Lines. For large drill programs use a truck line.

B. U.S. Customers - for surface transport use UPS and address to :-

Acme Analytical Laboratories Ltd.,
c/o Pac Ex Services,
140 - 14th St.
Blaine, Wash. 98230

Air freight shipments are addressed to :-

Acme Analytical Laboratories Ltd.,
c/o Cole McCubbin
Vancouver, B.C.

Shipments from the U.S. should be labelled "Geological Samples for Analysis - No Commercial Value".

3. Suggested Geochemical Analysis

A. Rocks with No Visible Mineralization - 30 element ICP + geochemical Au.

B. Rocks with High Sulphides - 16 element ICP Assay.

C. Cores - assays for elements of mineralization and possible 30 element ICP.

D. Soils - 30 element ICP + geochemical Au.

4. Samples with Possible Native Gold

For rocks and cores with nugget or native gold, request that the total sample be pulverized and sieved on a 100 mesh screen. Two fire assays are then required for each sample; one on the entire +100 mesh fraction for any possible native gold and one on the -100 mesh. (1 A.T.)

Pan or sluice concentrates are best treated by cyclone concentration and fire assay for total Au.

GEOCHEMICAL LABORATORY METHODOLOGY & PRICES - 1987

Sample Preparation

S80	Soils or silts up to 2 lbs drying at 60 deg.C and sieving 30 gms -80 mesh (other size on request)	\$.75
SJ	Saving part or all reject	.35
S20R	Soils or silts - drying at 60 deg.C and sieving -20 mesh & pulverizing (other mesh size on request.)	2.00
SP	Soils or silts - drying at 60 deg.C pulverizing (approx. 100 gms)	1.50
RP100	Rocks or cores - crushing to -3/16" up to 10 lbs, then pulverizing 1/2 lb to -100 mesh (98%)	3.00
	Over 10 lbs	.25/lb
RPS100	Same as RP100 except <u>sieving</u> to -100 mesh and saving +100 mesh	3.75
RPS100 1/2	Same as above except pulverizing <u>1/2</u> the reject	2.50/lb
RPS100 A	Same as above except pulverizing <u>all</u> the reject	2.50/lb
COP	Compositing pulps - each pulp Mixing & pulverizing	.50 1.50
V1	Drying vegetation and pulverizing 50 gms to -80 mesh	3.00
V2	Ashing up to 1 lb wet vegetation at 475 deg.C	2.00
H1	Special Handling	16.00/hr

Sample Storage

Rejects - Approx. 2 lbs of rock or total core are stored for three months and discarded unless claimed.

P脉 are retained for one year and discarded unless claimed.

Supplies

Soil Envelopes	4" x 6"	\$110.00/thousand
Soil Envelopes	4" x 6" with gusset	\$130.00/thousand
Plastic Bags	7" x 12" 6 ml	10.00/hundred
Ties	12" x 20" 6 ml	20.00/hundred
Assay Tags		4.00/hundred
10% HCl	M/C	
Dropping bottles		5.00/liter
In test		1.00/each
A & B		10.00/each liter

Conversion Factors

$$\begin{aligned} \text{Troy oz} &= 31.10 \text{ g} \\ \text{oz/ton} &= 34.3 \text{ ppm} = 34.3 \text{ g/tonne} = 34,300 \text{ ppb} \\ &= 10,000 \text{ ppm} \end{aligned}$$

GEOCHEMICAL ANALYSES - Rocks and Soils

Group 1 Digestion

.50 gram sample is digested with 3 mls 3-1-2 HCl-HNO₃-H₂O at 95 deg.C for one hour and is diluted to 10 ml with water. This leach is near total for base metals, partial for rock forming elements and very slight for refractory elements. Solubility limits Ag, Pb, Sb, Bi, W for high grade samples.

Group 1A - Analysis by Atomic Absorption.

Element	Detection	Element	Detection	Element	Detection
Antimony	2 ppb	Copper	0.01 ppb	Holmium	1 ppb
Bismuth	2 ppb	Iron	0.01 ppb	Nickel	1 ppb
Cadmium	0.1 ppb	Lead	2 ppb	Silver	0.1 ppb
Chromium	1 ppb	Lithium	2 ppb	Vanadium	2 ppb
Cobalt	1 ppb	Manganese	5 ppb	Zinc	2 ppb

First Element \$2.25 Subsequent Element \$1.00

Group 1B - Hydride generation of volatile elements and analysis by ICP.
This technique is unsuitable for sample grading over 1% Ni or Cu.

Element	Detection	First Element	All Elements
Arsenic	0.1 ppb		
Antimony	0.1 ppb		
Bismuth	0.1 ppb		
Germanium	0.2 ppb		
Selenium	0.2 ppb		
Tellurium	0.3 ppb		

Group 1C - Hg Detection limit - 5 ppb Price \$2.25

Hg in the solutions are determined by cold vapour AA using a F & J scientific Hg assembly. The aliquots of the extract are added to a stannous chloride/hydrochloric acid solution. The reduced Hg is swept out of the solution and passed into the Hg cell where it is measured by AA.

Group 1D - ICP Analysis, same digestion

Element	Detection
Ag	0.1 ppb
Cd, Co, Cr, Cu, Mn, Mo, Ni, Sr, Zn	1 ppb
As, Au, B, Ba, Bi, La, Pb, Sb, Th, V, W	2 ppb
U	5 ppb
Al, Ca, Fe, K, Mg, Na, P, Ti	0.01 ppb

Any 2 elements \$3.25

5 elements \$4.25

10 elements \$5.25

All 30 elements 6.00

Group 1E - Analysis by ICP/MS

Element	Detection
Ga	1 ppb
Rh, In, Re, Os, Ir, Tl, Th, U	0.1 ppm

First Element \$ 4.00

Additional Element 2.00

All Elements 15.00

(Minimum 20 samples per batch)

Hydro Geochemical Analysis

Natural water for mineral exploration

26 element ICP - Mo, Cu, Pb, Zn, Ag, Co, Ni, Mn, Fe, As, Sr, Cd, V, Ca, P, Li, Cr, Mg, Ti, B, Al, Na, K, Ce, Be, Si \$8.00

F by Specific Ion Electrode - detection 20 ppb \$3.50
U by UA3 - detection .01 ppb 1.50

pH * Minimum 20 samples or \$5.00 surcharge for ICP or AA and \$15.00 surcharge for ICP/MS.
All prices are in Canadian Dollars

ACME ANALYTICAL LABORATORIES LTD.

Assaying & Trace Analysis

852 E. Hastings St., Vancouver, B.C. V6A 1R6

Telephone: 253-3158

Group 2 - Geochemistry by Specific Extraction and Instrumental Techniques

Element	Method	Detection	Price
Barium	0.100 gram samples are fused with .6 gm LiBO ₂ dissolved in 50 mls 5% HNO ₃ and analysed by ICP. (other whole rock elements are also determined)	10 ppm	\$3.50
Carbon	LECO (total as C or CO ₂)	.01 %	5.25
Carbon+Sulfur	Both by LECO	.01 %	6.25
Carbon (Graphite)	HCl leach before LECO	.01 %	7.25
Chromium	0.50 gram samples are fused with 3 gm Na ₂ O ₂ dissolved in 50 ml 20% HCl, analysed ICP.	5 ppm	3.75
Fluorine	0.25 gram samples are fused with NaOH; leached solution is adjusted for pH and analysed by specific ion electrode.	10 ppm	4.25
Sulphur	LECO (Total as S)	.01 %	5.25
Sulphur insoluble	LECO (After 5% HCl leach)	.01 %	7.25
Tin	1.00 gram samples are fused with NH ₄ I. The sublimed Iodine is leached with 5 ml 10% HCl, and analysed by Atomic Absorption.	1 ppm	3.25
Tungsten	.50 gram samples are fused with Na ₂ O ₂ dissolved in 20 ml H ₂ O ₂ , analysed by ICP.	1 ppm	3.25

Group 3 - Geochemical Noble Metals

Element	Method	Detection	Price
Au*	10.0 gram samples are ignited at 600 deg.C, digested with hot aqua regia, extracted by MIBK, analysed by graphite furnace AA.	1 ppb	\$ 4.25
Pd,Pt,Rh	10.0 gram samples are fused with a Ag inquart with fire assay fluxes. After cupulation, the core bead is dissolved and analysed by AA or ICP/MS.	1 ppb 2 ppb Larger samples - 20 gms add \$1.00 30 gms add \$2.00	5.75 -first element 2.50 -per additional 10.00 -for All

Group 4A - Geochemical Whole Rock Assay

0.100 gram samples are fused with LiBO₂ and are dissolved in 50 mls 5% HNO₃.

SiO₂, Al₂O₃, Fe₂O₃, CaO, MgO, Na₂O, K₂O, MnO, TiO₂, P₂O₅, Cr₂O₃, LOI + Ba by ICP.

Price: \$3.75 first metal \$1.00 each additional \$9.00 for All.

Group 4B - Trace elements

Element	Detection	Analysis	Price
Co,Cu,Ni,Zn,Sr	10 ppm	ICP	\$3.75 first element or
Ce,Nb,Ta,I,Tr	20 ppm	ICP	\$1.00 additional to 4A
Cs,Rb	10 ppm	AA	\$6.00 for All. \$1.50 each.

Group 4C - analysis by ICP/MS.

Be, Rb, Y, Ir, Nb, Sn, Cs, La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Hf, Ta, W, Th, U

Detection: 1 to 5 ppm
Price : \$7.00 for first element
\$20.00 for All.

* Minimum 20 samples or \$5.00 surcharge for ICP or AA and \$15.00 surcharge for ICP/MS.
All prices are in Canadian Dollars

ACME ANALYTICAL LABORATORIES LTD.

Assaying & Trace Analysis

852 E. Hastings St., Vancouver, B.C. V6A 1R6

Manganese	(Mn)	7.50	Zirconium*	(Zr)	10.00
Mercury*	(Hg)	7.50	Pb Isotope Ratio		20.00

* Minimum 5 samples per batch

Other elements by Mass Spec. on request.

Multi-Element Assay Price

Arsenic, Antimony, Bismuth, Cadmium, Cobalt, Copper, Gold, Iron, Lead, Manganese, Molybdenum, Nickel, Silver, Thorium, Uranium, Zinc.

Price : First element \$6.75 Each Additional \$3.00 All 16 elements \$20.00

Whole Rock Assay Prices

SiO₂, Al₂O₃, Fe₂O₃, CaO, MgO, Na₂O, K₂O, MnO, TiO₂, P₂O₅, Cr₂O₃, LOI.

Price : First oxide \$7.50 Each Additional \$3.50 All 12 \$20.00

Volume Discounts Available.

Special Fire Assay Prices

Gold, Silver, Platinum, Palladium, Rhodium
Placer conc. for total precious metal \$20.00
\$15.00
