CLAIM(S): SC 3,Anna 2,Anna 8,Bar 5,Bar 11
OPERATOR(S): Minnova
AUTHOR(S): Gray, M.J.;Pirie, I.D.
REPORT YEAR: 1988, 77 Pages
COMMODITIES
SEARCHED FOR: Copper,Zinc,Lead,Gold,Silver
GEOLOGICAL
SUMMARY: The property is underlain by steeply dipping, northwest striking Devonian-Permian volcanic and sedimentary rocks of the Fennell Formation (SC and Anna Groups) and the Devono-Mississippian Eagle Bay Formation (Bar-B Group). Significant quartz-pyrite-sericite-albite alteration is associated with feldspar-quartz porphyry domes (Fennell Formation) and strong carbonate-sericite alteration in mafic volcanics (Eagle Bay Formation). Economic gold intersections have been intercepted in one feldspar-quartz porphyry dome.

I. SUMMARY AND CONCLUSIONS

The SC, Anna, and Bar B claim groups are part of Minnova's Bar property located 15 - 18 km NNE and E of Barriere, B.C. (NTS82M/5W). They were staked by Minnova Inc. in 1983 and 1984.

The 1987 exploration programme consisted of 41 line km of Max Min II and 8 NQ diamond drill holes totalling 829.34m.

The Max Min survey picked up 3 strong conductors. The drill programme was designed to explore Au mineralization hosted by albite-silica alteration within FQP domes, and to explore for volcanogenic massive sulphide mineralization on the flanks of FQP domes. Significant results include 7.51g/T Au over 0.4m within the FQP dome and 10.0m of 1700ppm Zn hosted by tuffaceous cherts flanking the Anna dome.

II. INTRODUCTION

The Bar B, SC and Anna claims were staked by Minnova Inc. in 1983 and 1984. A joint venture was entered into with Chevron Canada Resources in 1985, with Minnova maintaining the position of operator. Previous work on the SC, Anna and Bar B groups has consisted of detailed geological mapping, lithogeochemical sampling, Max Min II surveys and 7 diamond drill holes. This report presents the results of a Max Min II and diamond drilling programme carried out on the claim groups in 1987.

II.1 LOCATION AND ACCESS

The Bar Property is within the Kamloops Mining Division, B.C. (See Figure 1).

Access is by the East Barriere Lake road (8 km paved), then by logging roads North and South of the Barriere River. The property lies on moderate to gently sloping terrain, with good forest cover.

II.2 HISTORY

The Bar claims were staked in 1983 and 1984, based on reconnaisance work, to cover favourable stratigraphy between the Chu Chua massive sulphide deposit and the Rea Gold discovery. A number of prospecting programmes have been carried out on the Property over the years, but there is no evidence that any systematic exploration programme was attempted. In 1984, Minnova Inc. conducted reconnaisance mapping, and in 1985 and 1986 Max Min surveys, detailed mapping, lithogeochem and drilling.

II.3 TENURE

The Bar property consists of 6 claim groups, which total 515 units. Three of the groups are involved in this report. Pertinent claim data is listed in Table II.3. The claim configuration is shown in Figure 2.

III. WORK CONDUCTED

The 1987 exploration programme included a Max Min II survey over a new ANNA group grid (36.5 line km) cut during June of 1987. Diamond drilling was conducted from 04 October to 22 October 1987, and consisted of 8 NQ holes for a total of 829.34 metres.

III.1 MAX MIN II SURVEY PROCEDURE

The Max Min II survey was carried out by MWH Consulting Ltd. Coil spacing was 150m and stations read at 25m intervals. Line spacing was 100m. The two frequencies selected for the survey were 444Hz and 1777Hz.

At each station, secant measurements were taken to correct for nominal coil spacing irregularities induced by rough terrain. The in-phase and out-of-phase values, read as a percentage of the primary field strength, were recorded for each of the frequencies.

IV. PURPOSE OF PROGRAMME

The Max Min II survey was used to identify conductive bodies or contacts in the ANNA GROUP area. The diamond drill programme was designed to test the flanks and cores of feldspar-quartz porphyry domes. The holes Bar-8 through Bar-13 tested the core of the SC3 dome for Au mineralization associated with albite-silica alteration zones (SC Group). Bar-14 and 15 tested the north flank of the ANNA group dome and Bar-16 tested the east flank of the Little Dixon Lake dome (Bar B group) for Zn-Cu-Ag-Au volcanogenic massive sulphide mineralization.

V. RESULTS

V.1 MAX MIN II SURVEY

The Max Min II survey covered the ANNA grid (north and south sheets). The accompanying maps (Figures 3-6) at 1:2500 scale for 444 and 1777Hz are located in the back pockets.

The ANNA north grid area (Figures 3 and 4) is electromagnetically active in the SE corner. A weak out-of-phase anomaly was identified between 88 + 00N, 100 + 50E and 85 + 50N, 101 + 50E, and a weak in-phase anomaly between 84 + 00N, 100 + 75E and 82 + 00N and 100 + 50E (on 1777Hz). At the east end of the grid (SE corner) there is a buildup to a positive shoulder, suggesting the coverage is approaching a significant conductor.

The ANNA south area (Figures 5 and 6) shows a strong conductor in the NW corner and west side of the grid on both 444 and 1777Hz. The strong conductor extends from 81 + 00N, 92 + 50E to 77 + 00N, 93 + 00E on both channels, and is picked up on 1777Hz, with minor breaks, to 68 + 00N, 92 +50E. A second moderate-strong conductor was picked up on the east side of the grid between 72 + 00N, 103 + 00E and 68 + 00N, 101 + 50E (strong on 1777Hz, weak-moderate on 444Hz).

V.II DIAMOND DRILLING

Holes Bar-8 through Bar-13 tested albite silica alteration zones, within the SC3 FQP dome, for Au mineralization. The drill holes essentially follow-up a 1986 intersection of 4.45 g/T Au over 2.52 m (1986 Assessment Report). The 1987 programme returned a number of significant Au intersections, including 7.51 g/T Au over 0.4 m (see Appendix III for assay results).

Bar-14 tested the volcaniclastics and sediments on the Anna grid. The hole intersected a section of tuffaceous cherts and FQP dykes with disseminated sphalerite. An interval of 10.0 m returned an average of 1700 ppm Zn.

Bar-15 tested a pyritic stockwork within the Anna dome. The hole consists of Feldspar-quartz porphyritic rhyolite and minor sediments. No significant base or precious metal values were returned.

Bar-16 tested the east flank of a QFP dome in the Little Dixon Lake area. The hole collared in felsic tuffs, proceeded into a package of pyritic andesite tuffs/lapilli tuffs and finally ended in cherts. No significant base or precious metal values were returned.

VI. RECOMMENDATIONS

There exists good potential for Au mineralization in FQP domes and volcanogenic massive sulphide mineralization on their flanks on the SC, Anna and Bar B groups. It is therefore recommended that:

i) the SC3 dome Au mineralization be pursued N and S along strike by tightly spaced geochem sampling followed by drilling;

ii) the north flanking stratigraphy of the Anna dome, which includes the Zn-rich horizon, be followed-up by fill-in mapping and lithogeochem, then by trenching and drilling; and

iii) the Little Dixon Lake pyritic intermediate volcanic stratigraphy flanking a QFP dome be followed-up by fill-in mapping and lithogeochem, then by trenching and drilling.

STATEMENTS OF QUALIFICATIONS (2)

STATMENT OF QUALIFICATIONS

I, Michael J. Gray, of Vancouver, British Columbia hereby certify that:

1. I graduated from the University of British Columbia with a Bachelor of Science Degree in Geology (1985).
2. I am a geologist employed on a temporary basis by Minnova Inc. of 400-311 Water St., Vancouver, B.C.
3. I have been practising my profession for the past 3 years and have been actively involved in mineral exploration for the past 7 years.
4. I have no financial interest in the claims involved in this report, or in Minnova Inc.

Dated at Vancouver, B.C. this 1st day of February, 1988.

Michael J. Gray

Michael J. Gray
Exploration Geologist

STATEMENT OF QUALIFICATIONS

I, Ian D. Pirie certify that:

1. I am an Exploration Geologist residing at 4580 44B Ave., Delta, B.C.
2. I have a BSc (Hons) in Applied Geology from the University of Strathclyde, Glasgow, Scotland (1977) and a MSc (Geology/Geochemistry) from Queen's University at Kingston, Ontario (1980).
3. I have practised my profession since 1977.
4. I personally supervised the work reported herein.

Dated this 12th day of February, 1988.

Ian D. Pirie
Senior Geologist
