SUMMARY

The Mt. Evelyn claims consist of seven reverted crown grants and two located claims which are owned by More Resources Ltd. of Vancouver, B.C. The property is located approximately 12 km northwest of Smithers on the northern flank of Hudson Bay Mountain.

The geology underlying the property consists mainly of metavolcanic rocks (massive dacite, rhyodacite flows and tuffs) and intrusives (medium grained granodiorite and quartz monzonite). Occasionally small quartz porphyry dykes occur on the property.

The initial exploration program conducted on the property has delineated anomalous precious metal/base metal trends within the surveyed area. The Spondulix vein is the main anomalous zone with sampling indicating silver values from 0.06 oz Ag/ton across 15 cm to 25.81 oz Ag/ton across 30 cm.

In order to fully evaluate the mineral potential of the claims, an exploration program of trenching and diamond drilling is recommended.

1.0 INTRODUCTION

Hi-Tec Resource Management Ltd. conducted a program of grid soil geochemistry, magnetometer and VLF-EM geophysical surveys, rock sampling and geological mapping on the Last Hope and Spondulix claims on Hudson Bay Mt. from September 22 to October 12, 1987.

This report summarizes the results of the 1987 exploration program and provides recommendations for further exploration of the property.

1.1 Location and Access

The claims are located some 12 km northwest of Smithers on the northern flank of Hudson Bay Mountain (Figure 1). More specifically, the claims are located at the headwaters of Toboggan Creek around Schufer Creek. Approximate geographic coordinates are latitude $54^{o}52'$N and longitude $127^{o}19'$W.

The terrain is generally very steep and elevations range from 1000 meters to 2002 meters. The claims are situated above tree line and ground is covered by grass and shrubs.

Access is from Smithers by a 4-wheel drive road on the north side of Toboggan Creek, which branches north from the Glacier Gulch/Twin Falls road at the power line west of Kathlyn Lake or by helicopter from Smithers (Figure 1).

1.2 Property and Ownership

The property consists of seven reverted crown granted 2 post claims, totalling 100.73 hectares and two located mineral claims (see Figure 2).

Name of Claim	Record No.	Area in Hectares	Record Date
Last Hope	8426	19.04	June 5, 1987
Spondulix	8424	17.96	June 5, 1987
Fisher	8427	9.09	June 5, 1987
Rico Aspen	8425	20.90	June 5, 1987
Big Hope	8425	2.00	June 5, 1987
Little Joe	8429	13.12	June 5, 1987
Iron Dollar	8428	18.62	June 5, 1987
Eve	8961	500	Sept. 21, 1987
Lyn	8960	500	Sept. 21, 1987

The claims are owned 100% by More Resources Ltd. and are located in the Omineca Mining Division, B.C.

1.3 History and Previous Work

The Mt. Evelyn claims cover an area which has undergone considerable prospecting and exploration work over the past seventy years. The claims cover known surface showings and minor underground workings. Old assays from B.C. Bureau of Mines Annual Reports indicate significant silver and gold values were found in the sulphide veins explored in the past. Development work consisted mainly of open cuts, short tunnels and adits. In 1913 two tonnes of ore grading 0.50 oz/ton Au and 83.5 oz/ton Ag were shipped from the Spondulix claim.

1.4 The 1987 Exploration Program

Our exploration program has been based on recommendations by D. Kuran, B.Sc., who conducted

mapping, sampling and prospecting on Mt. Evelyn claims in 1983.

Fieldwork in 1987 was conducted by Hi-Tec Resource Management Ltd. between September 22 and October 12, 1987. Two grids were established on the property in order to provide control for detailed mapping, VLF-EM, magnetometer and geochemical surveys.

Rock and soil samples were shipped to and analyzed by Min-En Laboratories Ltd. in North Vancouver. Transportation to the property was by 4-wheel drive truck and daily set out by helicopter from Northern Mountain Helicopters Inc. based in Smithers.

2.0 GEOLOGY AND MINERALIZATION

2.1 Regional Geology

The claims are situated on the northern flank of Hudson Bay Mountain. This area is underlain mainly by metavolcanic and metasedimentary rocks of the Lower-Middle Jurassic Hazelton Group and metasedimentary rocks of the Upper Jurassic to Lower Creataceous Bowser Group. A few small bodies of the Creataceous Bulkley intrusive of granodiorite and quartz monzonite composition intrude the older stratigraphy. Minor quartz porphyry dykes in the area are possibly related to the Bulkley intrusive. Regional metamorphism has not exceeded lower greenschist faces.

2.2 Property Geology and Mineralization

The property is underlain by acid to intermediate volcanic rocks of the Hazelton Group. This complex has been intruded by the Bulkley intrusive and quartz feldspar porphyry dykes. Geological mapping on the grid was done at a scale of 1:2500 and 1:1000 presented on Figures 3 and 4 and property geology at scale 1:2500 (Figure 5).

The base of the stratigraphy on the property consists of acid to intermediate volcanic rocks which represent the Hazelton Group. This group can be divided into three units. Unit 1a consists of massive dacite, rhyodacite flows and tuffs which are locally autobrecciated. These rocks are pale green, blocky weathering and locally cliff forming. Unit 1a contains a 10-15 meter thick acid tuff horizon which has been bleached and shattered. This rock type locally contains siderite and quartz stringers and is referred to as Unit 1b. The top of the Hazelton group is a massive intermediate volcanic package of andesite flows and tuffs - Unit 1c.

Bulkley intrusives are represented by medium grained homogenous equigranular granodiorite (Unit 2) and quartz monzonite bodies (Unit 3).

On the Spondulix grid a quartz porphyry dyke was mapped, which weathers flesh white and has a very fine grained ground mass of quartz and feldspar. Numerous fractures or shear fillings with sulphide veins are exposed on the property. They range in thickness from 3 cm to 3 meters and contain variable amounts of base and precious metals. Sulphides found in the veins include pyrite, arsenopyrite, pyrrhotite, chalcopyrite, galena and sphalerite. Copper mineralization is very rarely

evident as secondary malachite or azurite. The gangue minerals are quartz, siderite and pyrolusite. The Spondulix vein trends 115° and dips 65° west and can be traced for 150 meters in length. It represents a multi-element anomaly containing 25.81 oz Ag/ton and only trace gold. The Spondulix vein contains mainly galena, sphalerite, pyrite, chalcopyrite, pyrolusite and arsenopyrite.

Mineralized structures on the property consist mainly of shearing and faulting. Shearing generally trends north from 115° azimuth to 10° azimuth, dipping from 10 to 65 degrees west.

3.0 GEOCHEMICAL SURVEYS

3.1 Sampling and Analytical Procedure

Two grids were established on the property in order to provide control for detailed mapping, VLF-EM, magnetometer and geochemical surveys.

The grid over the Spondulix claim consists of a 450 meter long baseline running 140° azimuth with crosslines at 50 meter intervals totalling 6.00 km of lines. Stations were chained and flagged and soil sampled at 25 meter intervals along the crosslines.

The Last Hope grid has a 650 meter baseline oriented at a 150° azimuth with crosslines 50 m apart with a total of 9.075 km of lines. Stations were chained, flagged and soil sampled with pickets at 25 meter intervals.

A total of 367 soil samples were collected with a mattock and a shovel from a depth of 10-25 cm.

Additional prospecting, geological mapping and rock chip sampling was performed over the surveyed area. A total of 190 rock chip samples were collected. Soil and rock samples were shipped to Min-En Laboratories Ltd. in North Vancouver, B.C. and analyzed for Ag, Cu, Pb, Zn, As and Ni by ICP with Au analyses by atomic absorption.

Soil samples were dried at approximately 90°C and then sieved to minus 80 mesh. A 0.5 gram portion of each sample was extracted by digestion with nitric acid and aqua regia followed by six element ICP analysis. Rock samples were crushed before extraction and ICP analysis. Gold in rock samples was extracted by aqua regia solution and measured by atomic absorption.

3.2 Discussion of Results

The analytical data for the rock chip and soil geochemical surveys is presentd in Appendix III. Rock chip samples are plotted on Figures 3 and 4. Figures 4a, 4b and 4c give the contoured soiil geochemical values and anomalous thresholds for silver/gold, lead/zinc and copper/arsenic for the Spondulix grid. Figure 3a, 3b and 3c show the contoured results from the same element groups on the Last Hope grid.

3.2.1 Rock Geochemical Results

Only one of the 190 rock samples contain anomalous amounts of gold. Sample 87038JA-102 taken from the Last Hope grid, contains 0.019 oz/ton Au.

A total of 34 samples contained greater than 2.0 ppm silver and are considered to be anomalous. Silver values range from 0.1 oz/ton Ag up to a high of 25.81

oz/ton Ag in sample 87038JA-189 taken from the Spondulix vein.

Copper values in rocks range from a low of 1 ppm to 2,894 ppm in sample 87038JA-055, which was taken from the east section of the Spondulix grid. Sample 87038JA-188 contains 18,327 ppm Cu taken from the Spondulix vein.

Lead values range from 5 ppm up to 9,015 ppm in sample 87038JA-055 taken from a trench on the southern portion of the Spondulix vein. In general, lead anomalies are coincident with silver and zinc and to a lesser extent copper.

Zinc values vary from 12 ppm up to 3,170 ppm in sample 87038JA-067 taken from the Spondulix vein. Anomalous values of 2,089 ppm, 1,664 ppm and 1,691 ppm in samples 87038JA-082, 084 and 085 respectively were taken from the northeast corner of the Last Hope grid.

Arsenic values are generally low on the grid areas. Values range from 1 ppm up to 1,148 ppm in sample 87038JA-133 from the Last Hope grid. This anomaly is coincident with lead and zinc anomalies of 2,956 ppm and 1,510 ppm respectively.

Antimony and nickel values are generally low on the grids. Antimony values ranged from 1 ppm up to an extremely anomalous value of 545 ppm in sample 87038JA-045. This anomalous antimony value is also coincident with anomalous As, Cu, Zn and Ag values.

3.2.2 Soil Geochemical Results

On the Spondulix grid, silver values in soil range up to 6.7 ppm. The longest silver anomaly as seen on Figure 4a is west of the baseline and correlates well with VLF-EM conductor A, seen on Figures 7a and 7b. Gold values do not reach the anomalous threshold of 20 ppb. Anomalous zinc values shown on Figure 4b are generally high and range up to 4,586 ppm. This site at 450S/175E forms an open anomaly and corresponds to the location of rock unit 1b on Figure 5. Zinc anomalies correlate well with conductors A and B on Figures 7a and 7b. Lead values range up to 225 ppm and anomalies also correlate with VLF-EM conductors A and B. Lead also correlates well with zinc and copper. Copper values are generally low and range up to 391 ppm.

The Spondulix soil geochemical results show a strong correlation between Cu, Pb, Zn and Ag. Several anomalies appear to be open and show good correlation with VLF-EM conductors.

On the Last Hope grid, silver values range up to 12.9 ppm and have a direct correlation with spotty anomalous gold values of up to 30 ppb. These silver anomalies show a good correlation with VLF-EM conductors A and D on Figures 6a and 6b. The northeastern portion of the grid and down the east side contains coincident anomalies in Cu, Pb and Zn with values ranging up to 541 ppm, 1,609 ppm and 4,767 ppm respectively. This area is coincident with the Last Hope vein zone and is open along strike both north and south. There is also a good correlation in this area with VLF-EM conductor A shown on Figures 6a and 6b.

The strong open ended multielemental anomalies with coincident geophysical signatures on the Spondulix vein, Last Hope vein and rock unit 1b provide strong support for further exploration on these target areas.

4.0 GEOPHYSICAL SURVEY

A VLF-EM/Magnetometer survey was performed over the two established grids using an EDA Omni Plus VLF-EM/Magnetomter (Serial No. 208035) as the field system and the EDA Omni IV Magnetometer as the recording base station. Both systems are microprocessor based. Using a Toshiba T1100 computer the data was stored, corrected, contoured and profiled.

Three VLF transmitting stations were recorded: Cutler-Maine, Jim Creek-Washington and Hawaii. For interpretive purposes only, Jim Creek was used as it is most closely aligned with the geological trends. Readings were taken at 12.5 meter intervals along lines separated by 50 meters. Magnetic total field and vertical gradient, VLF-EM total field, in-phase vertical component and quadrature component readings were stored automatically.

4.1 Discussion of Results - Last Hope Grid

The results of the VLF-EM in-phase vertical component (%) shows numerous anomalous zones of low magnitude alphabetically named on Figure 6a. The Fraser Filtered data clearly delineates an anomalous conductive zone labelled conductor A on the east side of the grid shown on Figure 6b. Trending roughly NW-SE, it extends 550 meters from LN 1+00N through LN 6+50N at a width of approximately 100 meters wide and is coincident with an observed shear zone. A weaker conductor labelled D lies

west of the baseline and has a weak geochemical signature.

The magnetic survey shows readings ranging from 56,000 to 58,500 gammas as shown on Figure 6c. There are numerous small zones of both high and low magnetics often typical of volcanic terrain. A series of low magnetic zones coincide with VLF-EM conductor A, however, the contrast is moderate, indicating that the rock composition is very similar. This correlates well with the geological mapping.

4.2 Discussion of Results - Spondulix Grid

The results of the VLF-EM survey are shown as profiles on figure 7a and contoured Fraser Filtered data on Figure 7b. The data shows an anomalously conductive zone, labelled A, which correlates well with the geochemcial anomalies but is tangential to the trend of the surface trace of the Spondulix vein. This may indicate a separate zone or the down dip expression of the vein. On the eastern portion of the grid, conductor B is of moderate strength and has good geochemical correlation.

The magnetics on this portion of the property varied greatly with readings ranging from 56,900 to 61,000 gammas. A particularly anomalous zone of high magnetics is centered at 2+00S/0+25W exhibiting nearly a 2,000 gamma contrast to the adjacent station. The anomalous conductive zone is coincident with the flanks of a series of magnetic highs.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Considerable prospecting and exploration work has been done over the past seventy years on the Mt. Evelyn area. Development work consisted mainly of open cuts, short tunnels and adits. Geological evaluation carried out on the property during the 1987 field program revealed that surveyed area is underlain by acid to intermediate volcanic rocks, medium grained granodiorite and a small outcrop of quartz porphyry dyke was recognized.

The soil and rock sampling generally confirmed former results. The 1987 work delineated base metal/precious metal trends within the surveyed area and anomalous silver, lead and zinc values were recorded. A VLF-EM survey has revealed a northwest trend with coincident anomalous silver, zinc and lead values (Spondulix vein). It is concluded that the Mt. Evelyn property has every indication that at least one high grade silver-zinc bearing vein structure is present on this ground.

In order to fully evaluate the mineral and economic potential of the property, further exploration work is recommended. Selection of drill sites for possible continuation of the Spondulix vein trending northwest should follow trenching of the zone. Zones with anomalous values on the Last Hope grid are lower priority targets, but warrant trenching. An exploration program is recommended for the Mt. Evelyn claims with mainly trenching and diamond drilling estimated to cost $85,000.00 (see cost estimate).

COST ESTIMATE FOR TRENCHING & DIAMOND DRILLING

Road access - approx. 4 km	$15,000.00
Trenching	10,000.00
Diamond Drilling - 300 m @ $120.00/m (all incl.)	36,000.00
Supervision/Core logging	5,000.00
Engineering and reporting	5,000.00
Mobilization and Domicile	6,000.00
Contingency	8,000.00
TOTAL:	**$85,000.00**

Respectfully submitted,

HI-TEC RESOURCE MANAGEMENT LTD.

APPENDIX I

Statements of Qualifications

STATEMENT OF QUALIFICATIONS

I, J. DURO ADAMEC of 4337 Capilano Road, North Vancouver, B.C. hereby certify that:

1. I graduated in geology from Commenius University of Bratislava, Czechoslovakia (1978) and I hold a Ph.D. in geology (1982) from the same University.

2. I have been practising my profession for over 8 years.

3. I am presently employed as a geologist with Hi-Tec Resource Management Ltd. of 1500 - 609 Granville St., Vancouver, B.C.

4. The information contained in this report was obtained from fieldwork conducted by myself and others in 1987.

J. Duro Adamec, Ph.D.

January , 1988

STATEMENT OF QUALIFICATIONS

I, DAVID L. KURAN of 25630 Bosonworth Avenue, in the Municipality of Maple Ridge, in the Province of British Columbia, hereby certify that:

1. I am a graduate of the Univeristy of Manitoba (1978) and hold a B.Sc. in Geology.

2. I am a Fellow of the Geological Association of Canada.

3. I have been employed in my profession as an Exploration Geologist by various mining companies and consulting firms for the past ten years in Canada, U.S.A. and Mexico.

4. I have actively supervised exploration work on the mineral occurrences now owned by More Resources Ltd. between September 29 and October 5, 1983.

5. I have participated in the evaluation and interpretation of field data obtained during the exploration program completed for More Resources Ltd. by Hi-Tec Resource Management Ltd. between September 22 and October 12, 1987.

Dated at Vancouver, British Columbia this 20th day of January, 1988.

Signed: Dave Kuran

APPENDIX III

Statement of Costs

STATEMENT OF COSTS

Mt. Evelyn Claims
1987 Exploration Program
Conducted from September 22 to October 12, 1987

Salaries		
Geologist	18.0 days @ $300.00/day	$ 5,400.00
Technician	18.0 days @ $200.00/day	3,600.00
Technician	18.0 days @ $200.00/day	3,600.00
Supervisor	2.0 days @ $375.00/day	750.00
Mobilization/Demobilization		4,000.00
Project Preparation		1,000.00
Office Costs and Communications		1,000.00
Geochemistry	190 rock samples @ $22.00/sample	4,180.00
	368 soil samples @ $ 9.90/sample	3,643.00
Truck Rental and Fuel		1,400.00
Geophysics - 18 km @ $400.00/km (Field magnetics, vertical gradient magnetics and VLF-EM with an EDA Omni Plus)		7,200.00
Domiciles - 54 man days @ $80.00/day		4,320.00
Helicopter Support		2,658.00
Field Supplies		1,637.00
Report Compilation and Drafting		6,000.00
Project Management - 20% @ $37,038.00		7,407.60
	TOTAL:	**$57,795.60**
