1.0 INTRODUCTION

The Stu 4 & 5 mineral claims (27 units) are situated in the Iskut River area of northwest British Columbia 10 kilometres east-northeast of Skyline Explorations Ltd.'s Stonehouse Gold deposit and 12 kilometres east of the Cominco/Delaware Resource Corp. Twin Zone gold deposit. Both deposits report reserves in excess of one million tons grading approximately 0.7 oz/ton gold.

A total of 50 man days were spent prospecting, mapping, rock chip and soil sampling the Stu 4 & 5 property between July 11, 1987 and July 28, 1987.

To date, the most successful exploration tool utilized on the Hector property has been soil geochemical sampling. Extremely dense underbrush comprised of devil's club and slide alder cover the lower elevations along the Iskut River and as a result very poor outcrop exposure is available. The upper reaches of the property consist of extremely steep and dangerous cliff outcrops.

At an elevation of approximately 200 metres above sea level, a soil anomaly measuring 100 metres x 100 metres was discovered with values ranging from 10 to 520 ppt gold. Numerous other spot high gold soil values were also obtained.

Introductory material for this report has been abridged from the March, 1987 Geological Report on the Stu 4 & 5 Mineral Claims written by Todoruk and Ikona.

2.0 LIST OF CLAIMS

Records of the British Columbia Ministry of Energy, Mines and Petroleum Resources indicate that the following claims (Figure 2) is owned by I. Hagemoen. Separate documents indicate the claims are under option to Hector Resources Inc.

3.0 LOCATION, ACCESS AND GEOGRAPHY

The Stu 4 & 5 mineral claims are located on the eastern edge of the Coast Range Mountains approximately 110 kilometres northwest of Stewart, British Columbia. The property is situated on the eastern flank of Snippaker Mountain. The claims lie within the Liard Mining Division centred at 56°39' north latitude and 130°46' west longitude.

Access to the property is by helicopter from the Bronson Creek gravel air strip, located approximately 11 kilometres to the west. Daily scheduled flights to the strip from Terrace and Stewart have been available during the field season using fixed wing aircraft. Alternate access may be possible from the airstrip constructed by Skyline Explorations Ltd. on Johnny Flats, about ten kilometres west-southwest of the property or from the Snippaker gravel air strip located approximately 11 kilometres to the southeast.

A proposal by C.K. Ikona of Pamicon Developments Ltd., on behalf of Skyline Explorations Ltd., addresses the construction of a road approximately 65 kilometres long, on the south side of the Iskut Valley to connect the Stewart-Cassiar Highway with a proposed BC Hydro dam site on the Iskut River and Skyline's Stonehouse Gold deposit on Bronson Creek.

Geographically, the area is typical of mountainous and glaciated terrain with the elevations ranging from a few hundred metres above sea level in the river valley bottoms to in excess of 1200 metres on the western claim boundary. Most of the property occurs below tree line although the upper reaches are covered with alpine vegetation.

The Snippaker Creek tributary below 580 metres falls within a precipitous, gossanous canyon. Lower slopes are covered with a dense growth of spruce with an undergrowth of devil's club. More open areas contain alder growth. Both summer and winter temperatures are moderate with over 200 centimetres of annual precipitation.

Rugged topography, climate and vegetation all inhibit traversing throughout the claim group. Therefore, operating with local helicopter support appears to be the most practical and cost effective means of exploring the GIM Claim during reconnaissance-style programs.

4.0 AREA HISTORY

The first recorded work done in the Iskut Region occurred in 1907 when a prospecting party from Wrangell, Alaska staked nine claims north of Johnny Mountain. Iskut Mining Company subsequently worked crown granted claims along Bronson Creek and on the north slope of Johnny Mountain. Up to 1920, a 9 metre adit revealed a number of veins and stringers hosting galena and gold-silver mineralization.

In 1954, Hudsons Bay Mining & Smelting located the Pick Axe showing and high grade gold-silver-lead-zinc float on the open upper slopes of Johnny Mountain, which today is part of Skyline Explorations Ltd.'s Reg deposit. The claims were worked and subsequently allowed to lapse.

During the 1960s, several major mining companies conducted helicopter borne reconnaissance exploration programs in a search for porphyry-copper-molybdenum deposits. Several claims were staked on Johnny Mountain and on Sulphurets Creek.

Between 1965 and 1971, Silver Standard Mines, and later Sumitomo, worked the E + L prospect on Nickel Mountain at the headwaters of Sulphurets Creek. Work

included trenching, drilling and 460 metres of underground development work. Reserves include 3.2 million tons of 0.80% nickel and 0.60% copper.

In 1969 Skyline staked the Inel property after discovering massive sulphide float originating from the head of the Bronson Creek glacier.

During 1972, Newmont Mining Corporation of Canada Limited carried out a field program west of Newmont Lake on the Dirk claim group. Skarn-type mineralization was the target of exploration. Work consisted of airborne and ground magnetic surveys, geological mapping and diamond drilling. One and one-half metres grading 0.220 ounces gold per ton and 15.2 metres of 1.5% copper was intersected on the Ken showing.

After restaking the Reg property in 1980, Skyline carried out trenching and drilling for veined high-grade gold and polymetallic massive sulphide mineralization on the Reg and Inel deposits between 1981 and 1985.

In 1986, drilling and 460 metres of underground cross-cutting and drifting on the Stonehouse Gold Zone confirmed the presence of high grade gold mineralization with additional values in silver and copper over mineable widths with good lateral and depth continuity. As of January 1988, reserves on the Stonehouse Gold Zone were reported as:

	Au (oz/ton)	Tons
Total Measured	1.246	121,000
Total Drill-Indicated	0.556	236,875
Total Inferred	<u>0.570</u>	<u>700,000</u>
Subtotal	0.644	1,057,875
McFadden	<u>2.800</u>	<u>30,000</u>
Ore Reserve Total	0.704	1,087,875

On the Delaware Resources Ltd. - Cominco Snip claims immediately north of the Stonehouse Gold deposit, approximately 10,000 metres of diamond drilling was

carried out, mainly delineating the Twin Zone. Drill hole S-71 intersected 10.2 metres of 2.59 oz/ton gold. An underground program is expected to begin in early 1988. As of December, 1987, reserves on the Twin Zone were reported as:

	<u>Au</u> (oz)	<u>Tons</u>
Total Inferred	0.700	1,100,000

Also, during 1987 Inel Resources Ltd. commenced an underground drifting and diamond drilling program along the main cross-cut intent on intersecting the Discovery Zone which hosts gold-bearing polymetallic massive sulphide mineralization.

Western Canadian Mining Corp. carried out an extensive diamond drilling program on their Gossen claims, concentrating on the Khyber Pass Gold Zone which is 45 metres thick. The best drill hole intersection in this zone to date is as follows:

<u>Hole</u>	<u>From</u> (m)	<u>To</u> (m)	<u>Length</u> (m)	<u>Length</u> (ft)	<u>Gold</u> (oz/t)	<u>Silver</u> (oz/t)	<u>Copper</u> (%)
85-3	11.2	16.8	5.6	18.4	0.12	6.48	1.74
	30.2	44.2	5.2	17.1	0.17	2.66	0.90
	54.5	60.1	5.6	18.4	0.15	1.77	--
	66.0	69.0	3.0	9.8	0.28	1.54	--

Tungco Resources Corporation drill tested three main gold/copper quartz vein targets; the Bluff, No. 7 and Swamp Zones. The Bluff Zone has been delineated 70 metres along strike and 60 metres downdip with better intersections grading up to 0.243 oz/ton gold across 2.45 metres. The No. 7 Vein returned 1.12 metres of 0.651 oz/ton gold.

5.0 REGIONAL GEOLOGY

Government mapping of the general geology in the Iskut River area (Kerr, 1929, GSC Maps 9-1957 and 1418-1979) has proved to be incomplete and unreliable. Subsequent mineral exploration studies have greatly enhanced the lithological and stratigraphic knowledge of this geo-entity known as the Stewart Complex (Grove, 1986).

Grove (1986) defines the Stewart Complex in the following manner:

"The Stewart Complex lies along the contact between the Coast Plutonic Complex on the west, the Bowser Basin on the east, Alice Arm on the south and the Iskut River on the north."

Within the Stewart Complex the oldest rock unit consists of Paleozoic crinoidal limestone overlying metamorphosed sedimentary and volcanic members. This oceanic assemblage has been correlated with the Cache Creek Group.

Unconformably overlying the Paleozoic limestone unit are Upper Triassic Hazelton Group island arc volcanics and sediments. These rocks have informally been referred to as the "Snippaker Volcanics." Grove (1981) correlates this assemblage to the Unuk River Formation of the Stewart Complex whereas other writers match this group with the time equivalent Stuhini Volcanics. Monotis fossils have been recognized on the north slope of Snippaker Peak and west of Newmont Lake, 20 km to the north, giving an age Late Triassic. It is within these rocks that Skyline's Stonehouse Gold and Inel deposits occur (Figure 3).

Grove reports an unconformable contact between Carboniferous and Middle Jurassic strata on both sides of Snippaker Ridge, north of Snippaker Peak. The same unconformable relationship between these major rock units appears to extend from Forrest Kerr Creek west, along the Iskut River, to the Stikine River junction. Present interpretation suggests an east-west trending thrust along the axis of the Iskut River which, like the King Salmon Thrust Fault, pushed up and over to the south.

Following the Iskut River thrust faulting, the entire region was overlain by Middle Jurassic Hazelton Group volcanic-sedimentary rocks named the Betty Creek Formation by Grove (1986).

The batholithic Coast Plutonic Complex intrusions in the Iskut region are of Cretaceous and Tertiary age. Composition varies from quartz monzonite and granodiorite to granite. Satellitic subvolcanic acidic porphyries may be important in the localization of mineralization.

Quaternary and Tertiary volcanics occur to the east along the Iskut River near Forrest Kerr Creek and north at Hoodoo Mountain.

6.0 LOCAL GEOLOGY

Outcrop exposure on the southern parts of the Stu 4 & 5 claims is less than 5% due to extremely dense undergrowth brush and devil's club in the river bottom level of the Iskut River. To the south on the claims, steep and rugged topography inhibits access. As a result, geological mapping of units was only able to be carried out in a general nature while prospecting by the author.

The oldest unit on the property appears to be Paleozoic massive white to grey limestone in fault contact with younger Mesozoic sedimentary and volcanic rocks. A thick sequence of greywacke/siltstone/argillite/quartzite appears to be overlain by younger andesite to andesite agglomerate. The youngest rocks found on the property occur along the Iskut River in the north of the claims area and are comprised of Cenozoic Tertiary basalt flows. Small intrusive plugs of dioritic composition are found within the andesite and locally in contact with limestone.

7.0 MINERALIZATION

During the 1987 field season, a total of 69 rock chip (Figure 4), 293 soil (Figure 5), 2 silt and 7 heavy mineral concentrate samples were collected from the Hector Stu 4 & 5 mineral claims.

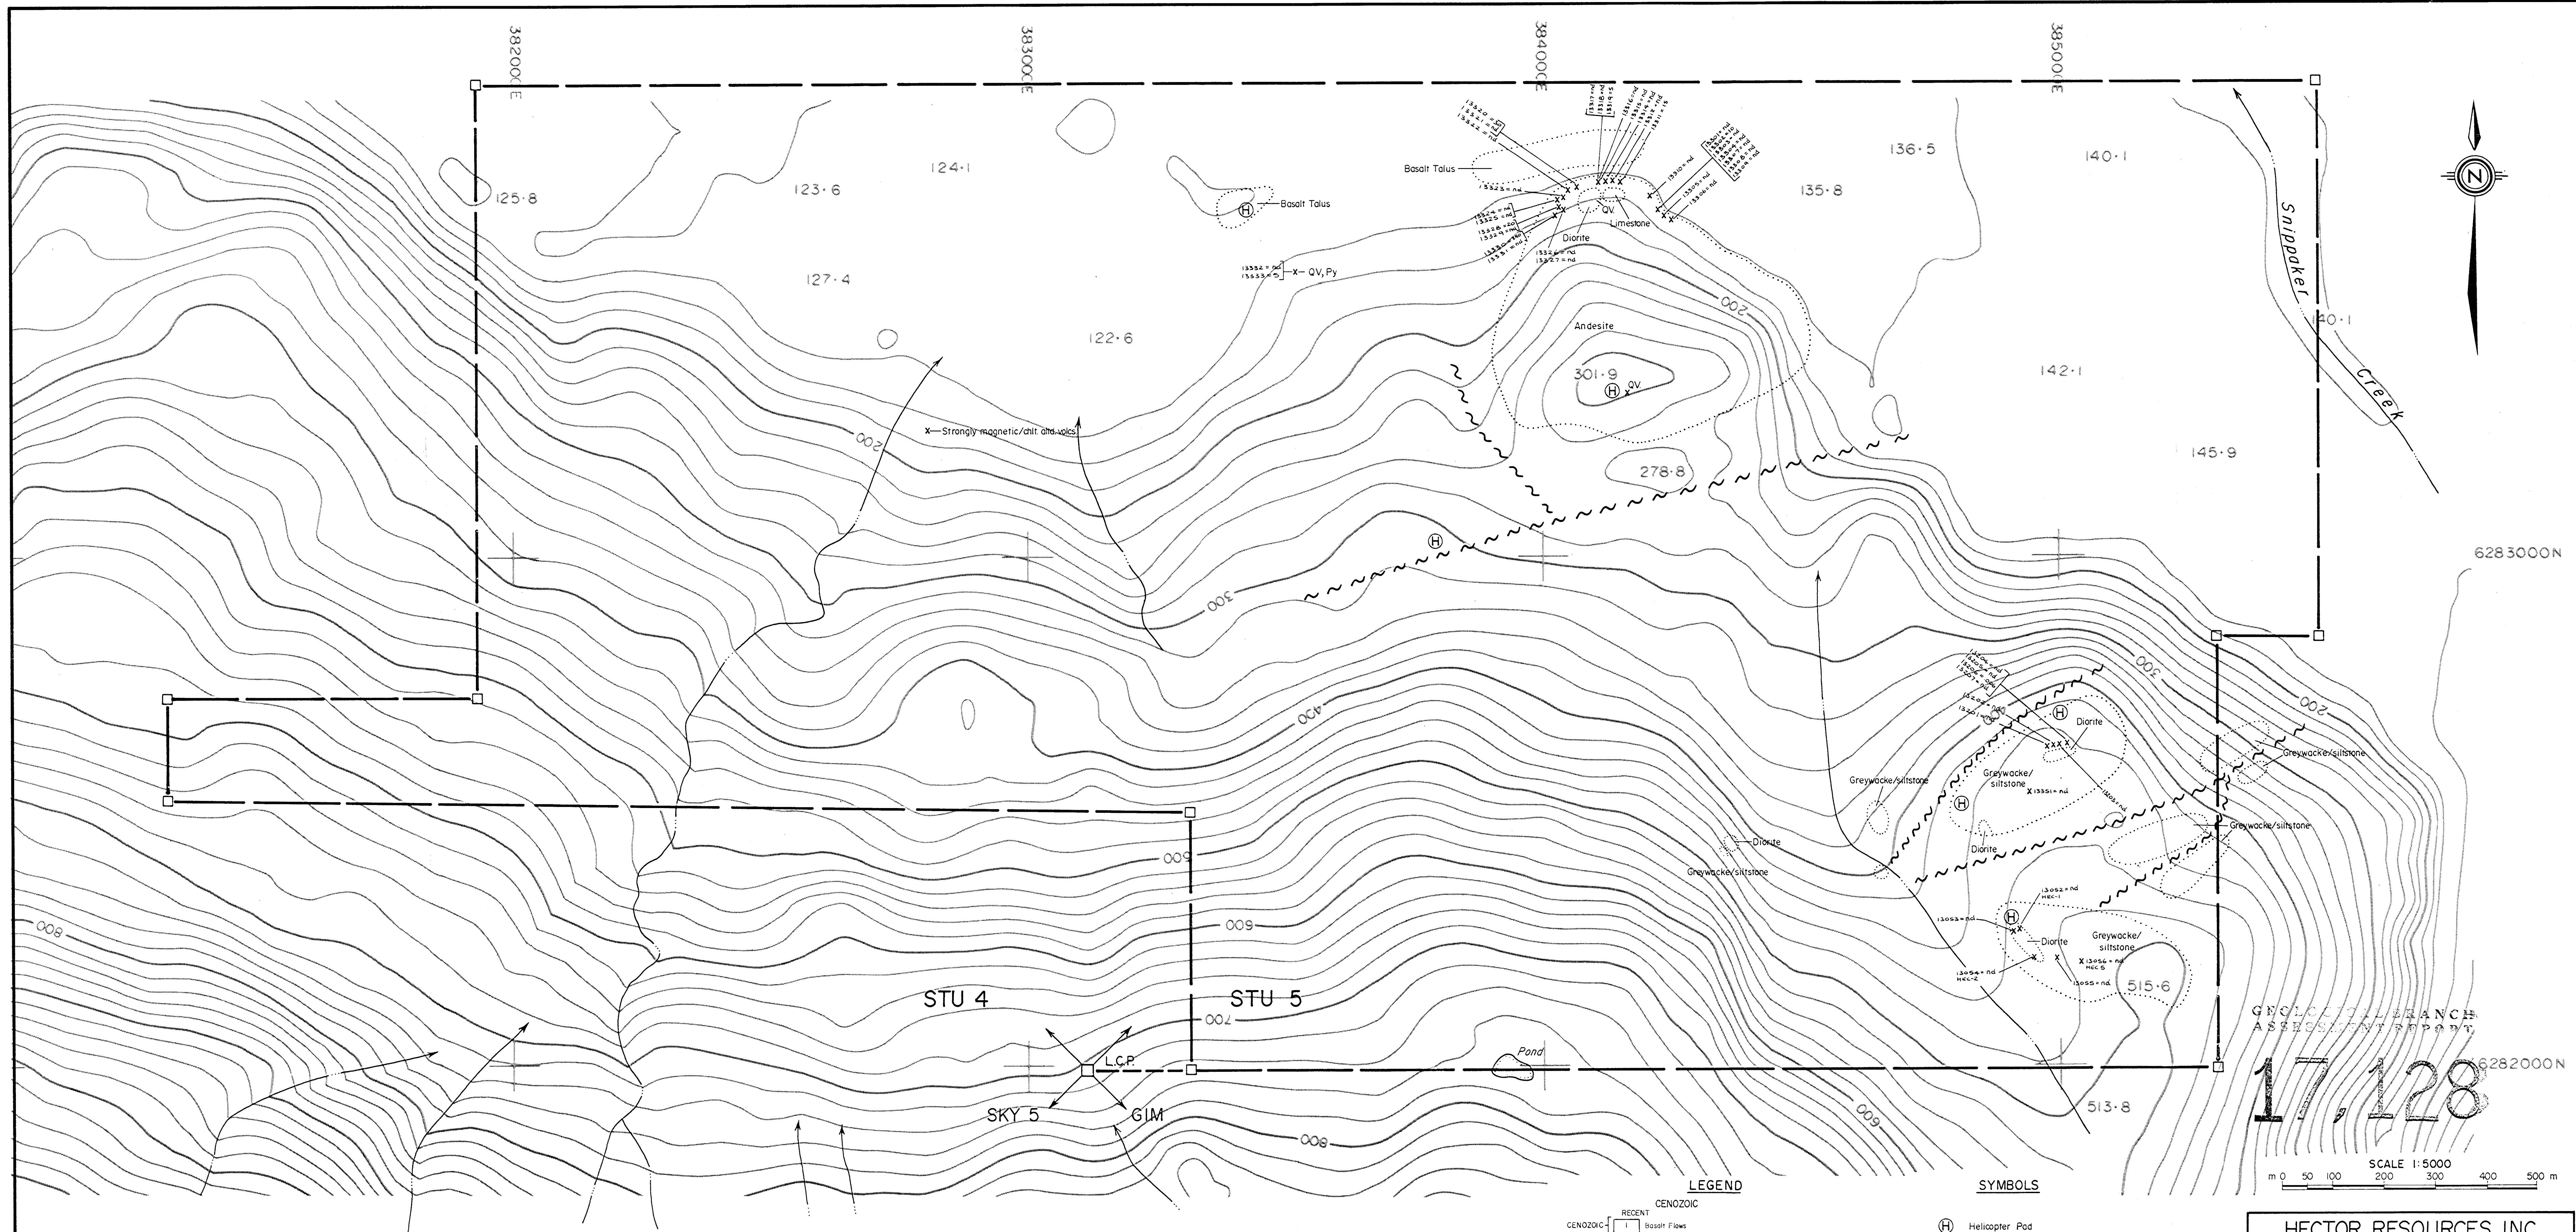

Near the 200 metre elevation level on the Stu 4 mineral claim a soil anomaly measuring approximately 100 metres by 100 metres was located on two separate contour soil geochemistry traverses. Geochem assay values are listed below:

<u>Sample Number</u>	<u>Gold (ppb)</u>
HS 88	520
HS 89	25
HS 91	45
HS 92	130
HS 93	190
HS 114	140
HS 115	165
HS 117	70
HS 118	70

In addition, several anomalous spot high gold soil values were identified along the various geochemical survey traverses.

These same Mesozoic rocks host auriferous quartz veining found on Kyle Resources Inc.'s GIM claim near the Hector-Kyle Legal Corner Post. Trenched rock chip samples obtained by the author from this vein assayed 3.707 oz/ton gold.

Significant gold/sulphide mineralization in quartz veining was also discovered in 1987 approximately 400 metres southwest of the Legal Corner Post on Hector's Sky 4 & 5, Spray 1 & 2 mineral claims. On this property, an auriferous zone extends for 300 metres and occurs within a prominent structure which possesses a strike length greater than 1000 metres.

Approximately 400 to 500 metres to the west of the Stu 4 & 5 property, Tungco Resources Corp. discovered high-grade gold on their Golden Arrow Zone. Rock chip samples assayed greater than 3.0 oz/ton gold and the zone presently has a strike length of 25 metres.

8.0 DISCUSSION AND CONCLUSIONS

The Hector Stu 4 & 5 mineral claims are underlain by Mesozoic Unuk River Formation volcanic andesite to andesite agglomerate and sedimentary grey-wacke/siltstone/argillite/quartzite which in places are in fault contact with Paleozoic limestone units. Small dioritic intrusive plugs have been mapped in the northern area of the claims.

In the Iskut River area, this formation hosts several important gold deposits (Skyline Explorations Ltd., Delaware/Cominco Resources, Inel Resources Ltd.) as well as numerous promising prospects. Three main types of mineralization have been discovered in the area:

1. Gold/silver/copper in quartz/carbonate veins (Skyline, Delaware/Cominco, Tungco, Hector).
2. Volcanogenic massive sulphide with gold/silver/zinc/copper (Inel, Western Canadian Mining Corp.).
3. Skarn type auriferous massive pyrite ± magnetite (Gulf International Minerals Ltd., Consolidated Sea-Gold Corp.).

On the Stu 4 & 5 property, a soil anomaly measuring approximately 100 metres by 100 metres with values ranging from 50 to 200 ppb gold was discovered on the Stu 4 claim block on two separate contour traverse lines. In addition, several other spot high gold soil values were obtained from other survey lines on the claims.

9.0 RECOMMENDATIONS

For the 1988 field season, it is recommended that continued prospecting, soil sampling and geological mapping be carried out on the Hector Stu 4 & 5 mineral claims. Because of the extremely dense bush it is strongly recommended that survey grid lines be established using linecutters in an attempt to accurately locate station coordinates. Several helicopter pads will also be required to be constructed to allow considerably better access to the more difficult and isolated areas on the claims.

The immediate focus of attention for the upcoming exploration program should be on investigating the 1987 100 metre by 100 metre soil anomaly on the Stu 4 claim block.

Prospecting and soil sampling should also be concentrated toward the northwest corner of the Stu 4 claim block in a search for similar high-grade gold mineralization to that which was found on the nearby Tungco Golden Arrow Zone.

A detailed airborne geophysical survey should be flown across the entire property with 250 metre spaced lines in a north-south direction to help define major controlling structures and additional mineralization.

A program of trenching should then be undertaken to test anomalies and exposed showings of interest.

A camp should be constructed in close proximity to the property and the project would be reliant upon a helicopter for support.

9.1 BUDGET

PHASE I

WAGES

Project Geologist		
14 days @ \$350/day		\$ 4,900
Prospector

SUBJECT: Analytical procedure used to determine Aqua Regia
soluble gold in geochemical samples.

1. Method of Sample Preparation

- (a) Geochemical soil, silt or rock samples were received at the laboratory in high wet-strength, 4" x 6", Kraft paper bags. Rock samples would be received in poly ore bags.
- (b) Dried soil and silt samples were sifted by hand using an 8" diameter, 80-mesh, stainless steel sieve. The plus 80-mesh fraction was rejected. The minus 80-mesh fraction was transferred into a new bag for subsequent analyses.
- (c) Dried rock samples were crushed using a jaw crusher and pulverized to 100-mesh or finer by using a disc mill. The pulverized samples were then put in a new bag for subsequent analyses.

2. Method of Digestion

- (a) 5.00 to 10.00 grams of the minus 80-mesh portion of the samples were used. Samples were weighed out using an electronic micro-balance and deposited into beakers.
- (b) Using a 20 ml solution of Aqua Regia (3:1 solution of HCl to HNO₃), each sample was vigorously digested over a hot plate.
- (c) The digested samples were filtered and the washed pulps were discarded. The filtrate was then reduced in volume to about 5 ml.

VANGEOCHEM LAB LIMITED

MAIN OFFICE

- (d) All complex ions were then extracted into a di-isobutyl ketone and thiourea medium (Anion exchange liquids "Aliquot 336").
- (e) Separatory funnels were used to separate the organic layer.

3. Method of Detection

The detection of Au was performed with a Techtron model AAS Atomic Absorption Spectrophotometer with a gold hollow cathode lamp. The results were read out onto a strip chart recorder. A hydrogen lamp was used to correct any background interferences. The gold values, in parts per billion, were calculated by comparing them with a set of gold standards.

4. Analysts

The analyses were supervised or determined by Mr. Conway Chun or Mr. Eddie Tang and his laboratory staff.

A handwritten signature in black ink, appearing to read "ET" or "Eddie Tang", is written over a horizontal line. To the right of the signature, the word "for" is handwritten in smaller print.

(d) The gold bead is retained for subsequent measurement.

3. Method of Detection

- (a) The gold bead is dissolved by boiling with aqua regia solution, then diluted with deionized water to 10 mls volume.
- (b) The detection of gold was performed with a Techtron model AA5 Atomic Absorption Spectrophotometer with a gold hollow cathode lamp. The results were read out on a strip chart recorder. The gold values, in parts per billion, were calculated by comparing them with a set of known gold standards.

4. Analysts

The analyses were supervised or determined by Mr. Conway Chun or Mr. David Chiu and his laboratory staff.

SUBJECT: Analytical procedure used to determine hot acid soluble for 28 element scan by Inductively Coupled Plasma Spectrophotometry in geochemical silt and soil samples.

1. Method of Sample Preparation

- (a) Geochemical soil, silt or rock samples were received at the laboratory in high wet-strength, 4" x 6", Kraft paper bags. Rock samples would be received in poly ore bags.
- (b) Dried soil and silt samples were sifted by hand using an 8" diameter, 80-mesh, stainless steel sieve. The plus 80-mesh fraction was rejected. The minus 80-mesh fraction was transferred into a new bag for subsequent analyses.
- (c) Dried rock samples were crushed using a jaw crusher and pulverized to 100-mesh or finer by using a disc mill. The pulverized samples were then put in a new bag for subsequent analyses.

2. Method of Digestion

- (a) 0.50 gram portions of the minus 80-mesh samples were used. Samples were weighed out using an electronic balance.
- (b) Samples were digested with a 5 ml solution of HCL:HNO₃:H₂O in the ratio of 3:1:2 in a 95 degree Celsius water bath for 90 minutes.
- (c) The digested samples are then removed from the bath and bulked up to 10 ml total volume with dimineralized water and thoroughly mixed.

3. Method of Analyses

The ICP analyses elements were determined by using a Jarrel-Ash ICAP model 9000 directly reading the spectrophotometric emissions. All major matrix and trace elements are interelement corrected. All data are subsequently stored onto disk.

4. Analysts

The analyses were supervised or determined by either Mr. Eddie Tang, and, the laboratory staff.

A handwritten signature in black ink, appearing to read "Eddie Tang". The signature is fluid and cursive, with a horizontal line extending from the end of the signature to the right.

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR SN, MN, FE, CA, P, CR, NG, BA, PD, AL, NA, K, W, PT AND SR. AU AND PD DETECTION IS 3 PPM.
 IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, - = NOT ANALYZED

COMPANY: PAMICON DEVELOPMENT

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR Si, Mn, Fe, Ca, P, Cr, Mg, Ba, Pb, Al, Na, K, W, Pt AND Sr. Au AND Pb DETECTION IS 3 PPM.
 IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, - = NOT ANALYZED

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCl TO HMDS TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR Mn,Fe,Ca,P,CR,Mg,Ba,PD,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.
 IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, - = NOT ANALYZED

REPRINTED
1116 17 1987
RESULTS

COMPANY: PAMICON DEVELOPMENT

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR SN, Mn, Fe, Ca, P, Cr, Mg, Ba, Pb, Al, Na, K, Ni, Pt AND Sr. Au AND PD DETECTION IS 3 PPM.
 IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -- NOT ANALYZED

APPENDIX V

STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, STEVE L. TODORUK, of Suite 102, 8675 Fremlin Street, Vancouver, in the Province of British Columbia, DO HEREBY CERTIFY:

1. THAT I am a Geologist in the employment of Pamicon Developments Limited, with offices at Suite 711, 675 West Hastings Street, Vancouver, British Columbia.
2. THAT I am a graduate of the University of British Columbia with a Bachelor of Science Degree in Geology.
3. THAT my primary employment since 1979 has been in the field of mineral exploration.
4. THAT my experience has encompassed a wide range of geologic environments and has allowed considerable familiarization with prospecting, geophysical, geochemical and exploration drilling techniques.
5. THAT this report is based on data generated by myself, under the direction of Charles K. Ikona, Professional Engineer.
6. THAT I have no interest in the property described herein, nor in securities of any company associated with the property, nor do I expect to receive any such interest.
7. THAT I hereby grant permission to Hector Resources Inc. for the use of this report in any prospectus or other documentation required by any regulatory authority.

DATED at Vancouver, B.C., this 17th day of February, 1988.

Steve L. Todoruk, Geologist

APPENDIX VI

ENGINEER'S CERTIFICATE

ENGINEER'S CERTIFICATE

I, CHARLES K. IKONA, of 5 Cowley Court, Port Moody, in the Province of British Columbia, DO HEREBY CERTIFY:

1. THAT I am a Consulting Mining Engineer with offices at Suite 711, 675 West Hastings Street, Vancouver, British Columbia.
2. THAT I am a graduate of the University of British Columbia with a degree in Mining Engineering.
3. THAT I am a member in good standing of the Association of Professional Engineers of the Province of British Columbia.
4. THAT this report is based on a research of all available information surrounding Hector Resources Inc.'s mineral claim compiled by Steve Todoruk, with whom I have worked for two years, and in whom I have every confidence.
5. THAT I have no interest in the property described herein, nor in securities of any company associated with the property, nor do I expect to acquire any such interest.
6. THAT I consent to the use by Hector Resources Inc. of this report in a Prospectus or Statement of Material Facts or any other such document as may be required by the Vancouver Stock Exchange or the Office of the Superintendent of Brokers.

DATED at Vancouver, B.C., this 17 day of Feb, 1988.
