WHITE CAP PROPERTY
Geology, Geochemistry, Geophysics
Lillooet Mining Division
NTS 92 J 9W/16W

SUMMARY

The White Cap Group of claims cover a gold prospect located along the southwest slope of Nosebag Mtn., thirty-two kilometres east of Bralorne, B.C.

The property was found to overlie Paleozoic Bridge River (Fergusson) Group metamorphics that are locally intruded by a small dioritic body. The diorite is closely related to the Upper Cretaceous Bendor Pluton, five kilometres to the west. A poorly exposed contact zone containing gossanous quartz veins has been tested in the past with a 196 metre long adit.

During the period from September 1987 to January 1988 several, brief investigations were carried out on the property. Results of this work show highly anomalous Au, Ag, Pb, Mo and W values associated with quartz veins exposed in the adit.

Additional work is recommended to test for mineralization along the extension of the contact zone in the adit area. Work is also recommended to test other zones outside of the adit area.

1.0 INTRODUCTION

The White Cap Property covers a gold prospect 32 km due east of Bralorne, B.C. From September 9, 1987 to January 27, 1988, reconnaissance geological, geochemical and geophysical surveys were carried out on the property. Results of these surveys are discussed in the following report.

1.1 Location and Access

The property is located in the Lillooet Mining District, B.C., approximately thirty-two kilometres due east of Bralorne, B.C. and two kilometres southwest of Nosebag Mountain. The claims cover approximately 15 km², centering on latitude 50°44'N and longitude 122°25'W.

The lower portions (Aspen Claim) of the White Cap Property can be accessed by the Whitecap Creek logging road from Seton Portage, B.C., eight kilometres to the southeast. Approximately sixty kilometres of good gravel road connect Seton Portage with Transprovincial Highway 12 at Lillooet, B.C.

Cariboo Chilcotin Helicopters Ltd. from Lillooet, B.C. was chartered to help facilitate work on the upper portions (Gold Cap 3 & 4 claims) of the property.

1.3 History and Previous Work

Armeno Resources Inc. purchased the Aspen and White Water Mineral Claims from M.G. Walker on July 31, 1987. Two additional claims, the Gold Cap 3 and Gold Cap 4 Claims, were subsequently located on September 9, 1987.

A 196-metre long adit is found approximately 520 metres at a bearing of 110° from the LCP for the Gold Cap 3 and 4 Claims. The adit is in excellent condition, of undetermined age with no apparent record of its history. It is believed that the adit was following quartz veins associated with the contact zone between intrusive and metamorphic rocks.

During 1969-70, the Lubra showing, a sulphide bearing skarn was explored by Union Carbide Canada Mining Ltd. The showing lies north of the summit of Nosebag Mountain near the eastern boundary of the Gold Cap 3 Claim. No other work is recorded in the claim area.

1.4 Work by Armeno Resources Inc. in 1987-1988

Reconnaissance field work on the White Cap Property commenced on September 9, 1987 and continued on an intermittent basis until January 27, 1988. During this period the following work was completed by Azimuth Geological and others for Armeno Resources Inc.

1. The location of the White Cap Adit was surveyed relative to the LCP for the Gold Cap 4 Claim. Survey data for the traverse is included as Appendix VIII.
2. Heavy mineral concentrates and silt samples were collected from Whitecap Creek and its tributaries.

1.4 Work by Armeno Resources Inc. in 1987-1988 (cont'd)

3. Two short (300m) grid lines were established over the White Cap Adit. Reconnaissance soil and VLF/EM-16 surveys were completed along the grid lines.
4. The White Cap Adit was mapped and sampled.
5. Reconnaissance mapping was carried out on the Gold Cap 3 & 4 Claims.

2.0 GEOLOGY AND MINERALIZATION

2.1 Regional Geology

The regional geology of this area is described by Roddick, J.A. & Hutchison, W.W. in GSC Paper 73-13 and by Woodsworth, G.T. & Roddick, J.A. in GSC Open File 482. Figure 3 and Table B below illustrate the regional geology in the immediate area of the White Cap Claims.

TABLE B

Legend - GSC O.F. 482, G.J. Woodsworth, 1977

PLUTONIC ROCKS (mostly of unknown age)

- gd Granodiorite
- gd Quartz diorite
- di Diorite; dioritic complexes containing diorite, quartz diorite, amphibolite, greenstone, and dyke swarms

STRATIFIED AND HIGH-LEVEL PLUTONIC ROCKS

MIOCENE OR YOUNGER(?)

- 20 Rhyolite and dacite breccia, tuff, and flows, minor sediments; 20a, andesitic volcanic breccia and conglomerate, lesser basalt; 20b, REXMOUNT PORPHYRY: dacitic porphyry (intrusive equivalent of 20?)

EOCENE(?)

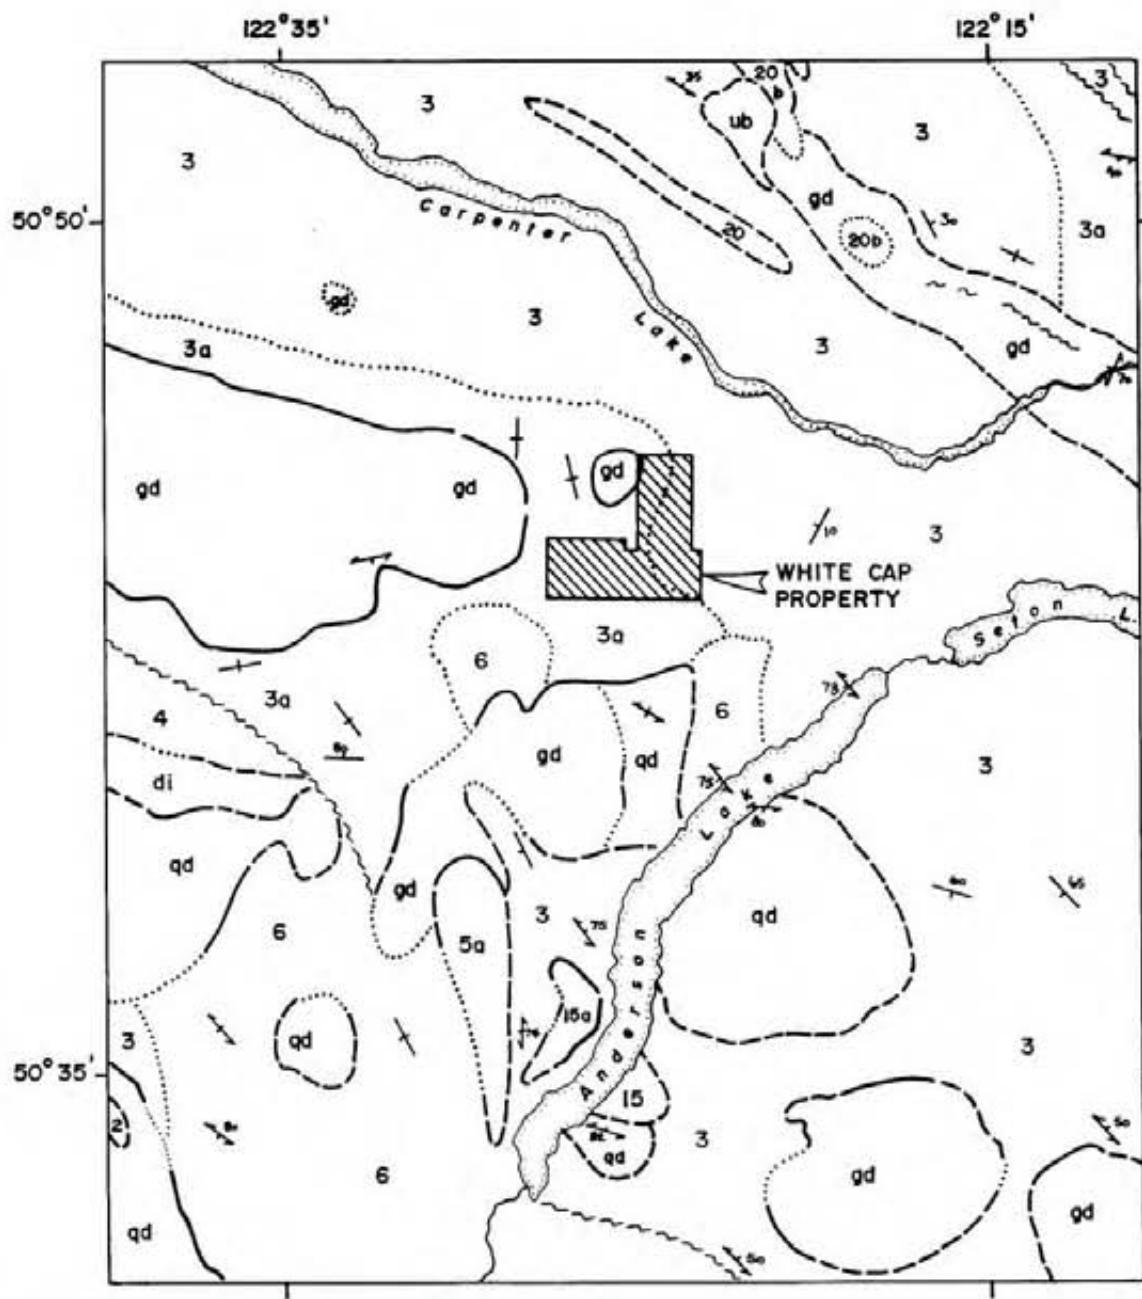

- 15 Miarolitic granite; 15a, dacitic volcanics and porphyries (possibly equivalent to 19a?)

UPPER TRIASSIC

- 6 HURLEY FORMATION: Thin-bedded argillite, phyllite, limestone, tuff, conglomerate, andesite, minor chert
- 5 PIONEER FORMATION: Greenstone, andesitic to basaltic flows and pyroclastics; 5a, BRALORNE INTRUSIONS (in part): augite diorite, gabbro, greenstone (intrusive and dioritized equivalents of 5)
- 4 NOEL FORMATION: Thin-bedded argillite, chert, conglomerate and greenstone

TRIASSIC AND JURASSIC AND OLDER(?)

- ub Ultramafic rocks: Serpentine, harzburgite, peridotite, diorite
- 3 BRIDGE RIVER (FERGUSSON) GROUP: Greenstone, basalt, chert, argillite, phyllite; minor limestone, serpentine, and serpentized peridotite; 3a, more metamorphosed equivalents of 3, mainly biotite schist

2.2 Local Geology

Local investigations of the geology were restricted to an orientation traverse on the Gold Cap 3 and 4 Claims, mapping along the survey traverse between the LCP for Gold Cap 4 and the White Cap Adit and underground mapping of the adit. Descriptions of rock samples collected during the mapping are given in Table C.

Reconnaissance mapping and efforts by earlier workers has identified a number of granitic rocks present on the White Cap Property. These units vary from diorite to granodiorite in composition and intrude phyllites, schist, metavolcanics and minor limestone. The intrusives are spatially related to the Bendor Pluton mapped to the west.

Surface mapping at a scale of 1:2,500 was carried out along a surveyed traverse between the White Cap Adit and the LCP for the Gold Cap 4 Claim. Results of the mapping are shown in Figure 4. The mapping shows a weakly mineralized contact zone between diorite and metavolcanics at Stn. 12, approximately 130 metres northwest of the White Cap Adit.

The 196 metre long White Cap Adit was mapped at a scale of 1:200. The adit begins in diorite and terminates in metavolcanics. The adit crosses the contact between the diorite and metavolcanics approximately 144 metres from the portal. Two small (0.5 m) beds of limestone are found in the metavolcanics at 172 and 180 metres. Results of the underground mapping are shown in Figure 5.

2.3 Mineralization

The White Cap Adit was apparently developed to investigate gossanous quartz veins that occur on surface near the contact between intrusive and metamorphic rocks.

The quartz veins are well defined in the adit and occur in shears, joints and as fracture fillings. The veins are typically narrow (<20cm) and contain occasional disseminated sulphides. Figure 5 shows the distribution of the veins seen during the underground mapping.

3.0 GEOCHEMISTRY

3.1 Sampling Procedures

3.1.1 Heavy Mineral Concentrate Sampling - A total of 4 heavy mineral samples were gathered from streams draining the White Cap Property.

To produce a heavy mineral sample approximately 10 kilograms of sediments were collected from the stream bed. This sample was sieved to remove oversize fragments and the remaining material was panned using a standard gold pan to produce a heavy mineral concentrate.

These samples were shipped to Acme Analytical Laboratories Ltd. in Vancouver, B.C. where special procedures were employed to determine gold content. (Appendix II)

3.1.2 Silt Sampling - Two silts samples were gathered from tributaries of White Cap Creek on the Aspen Claim. The samples were placed in Kraft paper envelopes and shipped to Acme Analytical Laboratories Ltd. in Vancouver, B.C. for Au (FA + AA) and ICP analysis. Sample preparation and analytical procedures are detailed in Appendix II.

3.1.3 Soil Sampling - A total of 19 soil samples were collected from two east-west lines (L0 + 00 and L1 + 00N) one hundred metres apart. The portal of the White Cap Adit was used as the origin (L0 + 00N, 0 + 00W).

Samples sites were generally selected at 25 metre intervals and were collected from the "B" horizon utilizing a steel "tree planters" shovel or cast iron mattock. Samples were collected from a depth of 10 to 50 cm varying with depth to the "B" horizon.

All samples were placed in kraft paper envelopes and shipped to Acme Analytical Laboratories Ltd. in Vancouver, B.C. for preparation and analysis.

3.1.4 Rock Sampling - Twelve rock samples (JW 001 - JW 008, TWC 001 - 002, WCA 001-002) were analyzed for Au (FA + AA) and ICP. Sample preparation and analytical procedures are detailed in Appendix II.

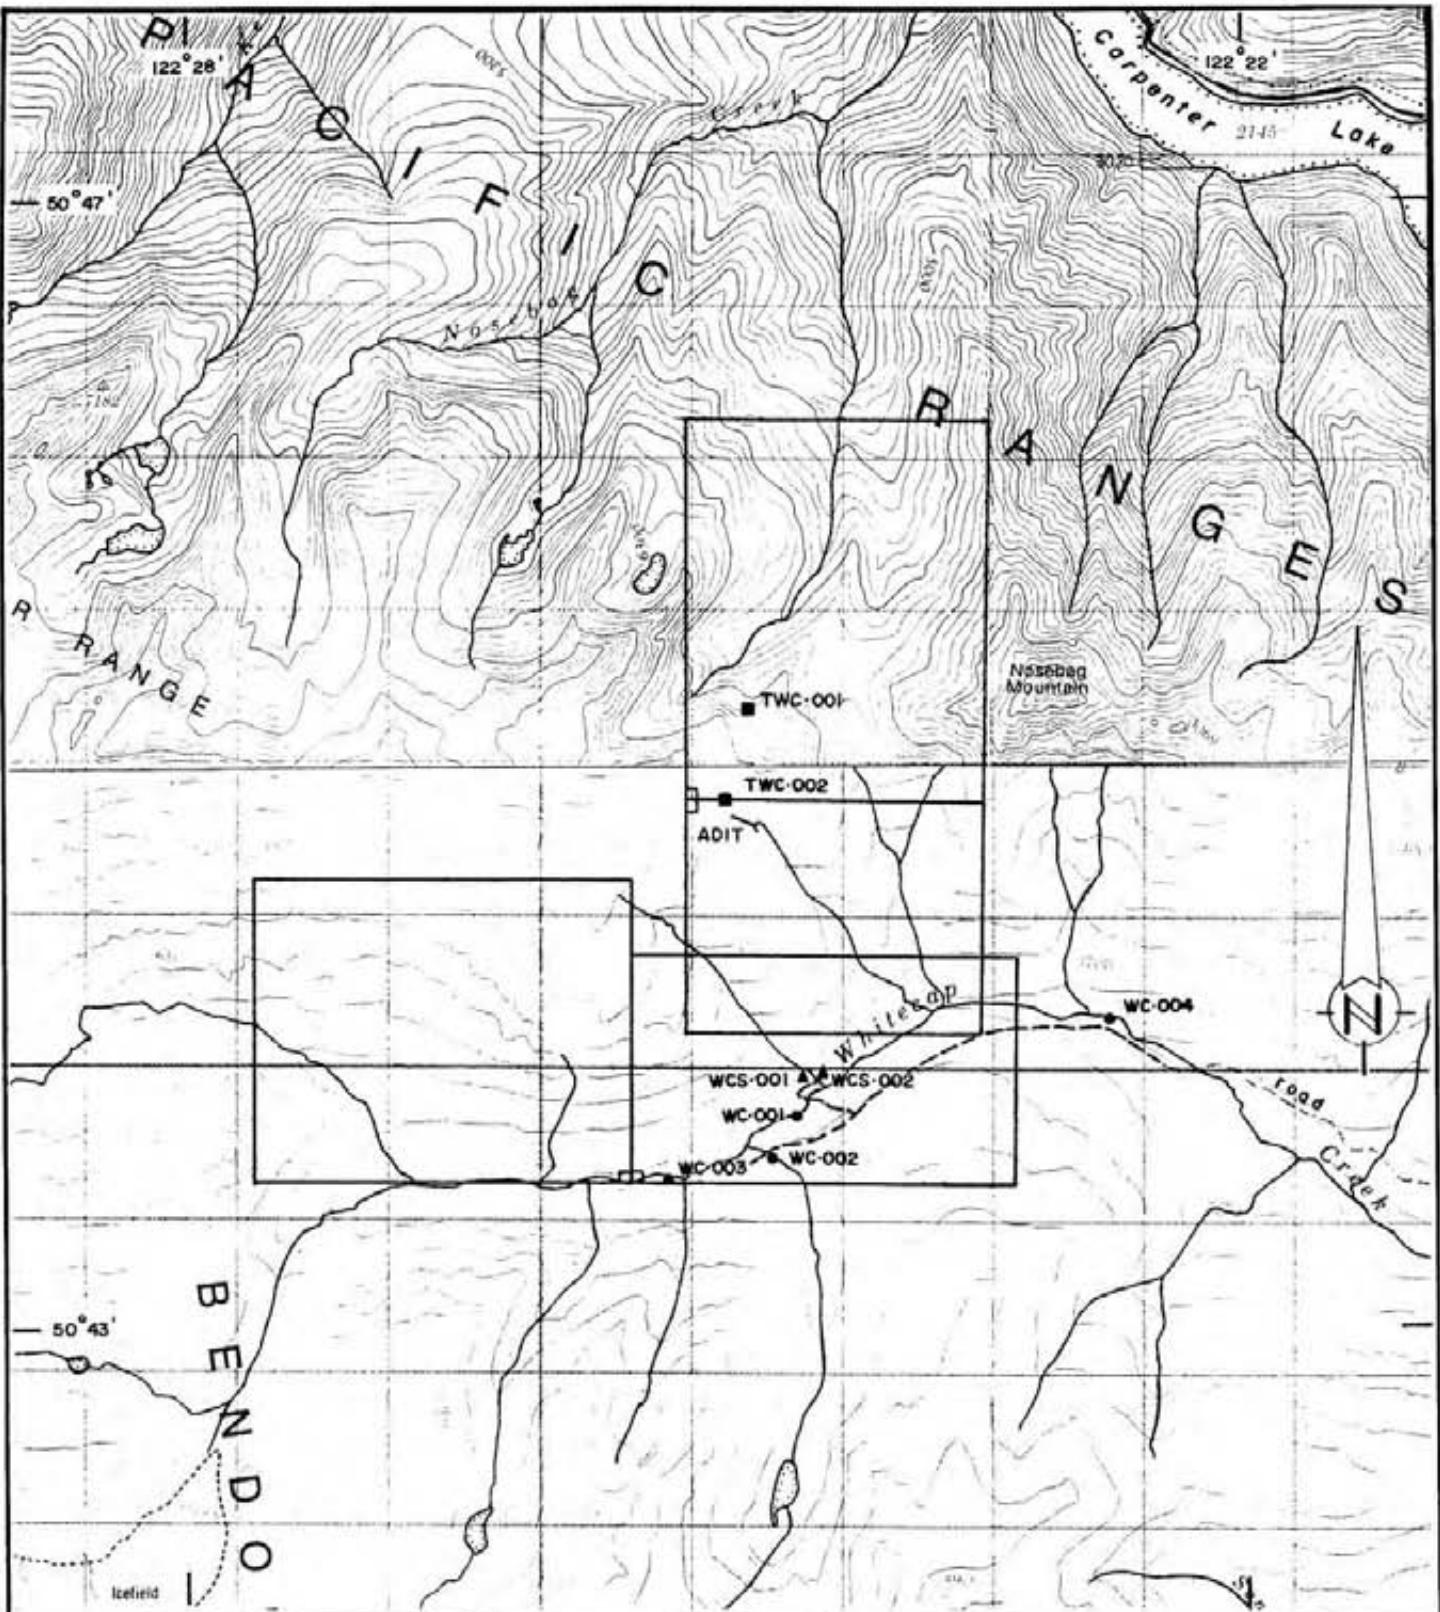

3.1.5 Underground Sampling - A total of thirty chip and channel samples were collected from quartz veins exposed in the White Cap Adit. Sample sites were chosen so only vein material was collected. Wherever possible samples were collected along one metre lengths. Samples were placed in plastic bags and shipped to Acme Analytical Labs for Au (FA + AA) and 30 element ICP analysis.

3.2 Presentation and Discussion of Results

Analytical results for samples collected from the White Cap Property are included in the Appendices. Gold determination include both ICP and FA + AA analysis. Gold results for heavy mineral concentrates, silt samples and rock samples are shown in Figure 6. Soil sample results (ppb Au) are shown in Figure 7.

Heavy mineral concentrates and silt samples were collected along the valley of White Cap Creek. Sample sites were chosen to test for possible indications of mineralization at higher elevations. One sample, WC 003, carried slightly anomalous Au values (73 ppb). Two rock samples (TWC 001, TWC 002) collected along a reconnaissance mapping traverse did not carry gold.

Soil sample results are highlighted by a sample collected from L0+00N, 2+40W. This sample carried extremely high Au values (2730 ppb Au). An assay of the sample reject returned 0.076 oz/ton Au. It is expected that the sample identifies a mineralized quartz vein.

Analytical results of different vein material sampled in the adit show anomalous values for Au, Ag, Pb, Mo, and W (see Appendix VII). Gold results are shown in Figure 5 on page 14 and listed in Table D below. The anomalous metal values in the quartz veins are of interest and may indicate potential mineralization on the property.

4.0 GEOPHYSICS

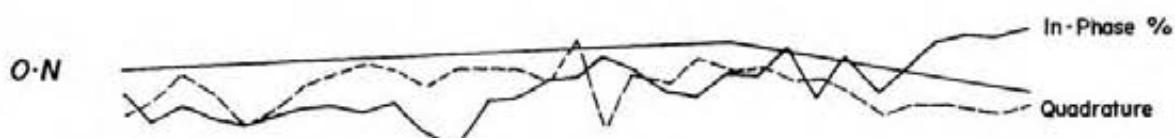

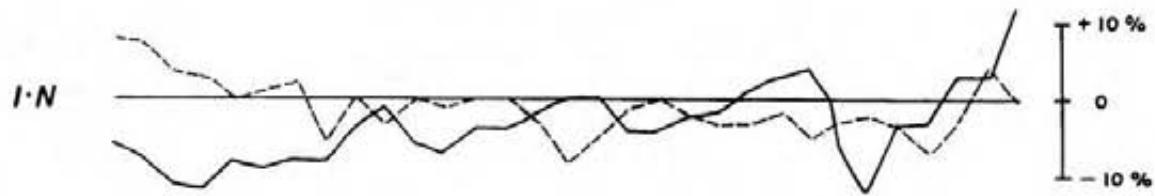

4.1 Method and Procedures

An orientation VLF/EM survey was carried out on lines 0 + 00N and 1+00N near the White Cap Adit. Data was collected from 10 metre stations using a Geonics EM 16 VLF electromagnetic receiver tuned to Cutler, Maine.

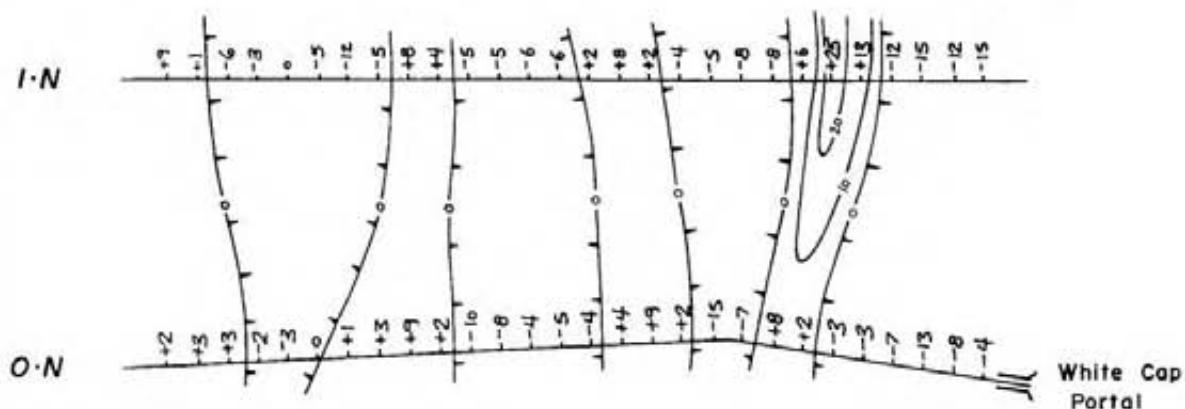

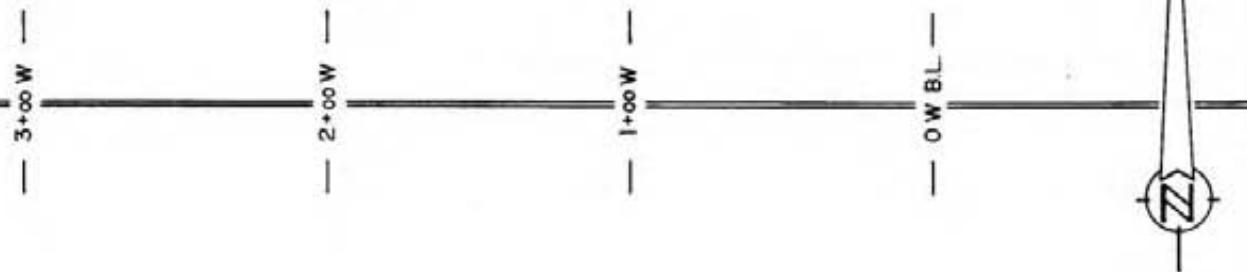

4.2 Presentation and Discussion of Results

The intent of the orientation survey was to test whether or not VLF/EM could be used to identify quartz bearing shear zones and/or identify the contact zone surrounding the intrusive. Figure 8 shows the results of the VLF/EM survey in both Fraser Filter and Profile (basic data) form.

The limited survey information shows two north-south trending linear features crossing the survey lines at approximately 0 + 70W and 1 + 40W. The linear at 1 + 40W corresponds with the general location of the contact zone seen in the adit. The linear at 0 + 70W is especially well defined on line 1 + 00N and is believed to be an extension of a weak shear mapped in the adit at 0 + 80W.

5.0 CONCLUSIONS AND RECOMMENDATIONS

The results of the reconnaissance programme on the White Cap Property has identified a weakly mineralized contact zone between granitic and metasedimentary and metavolcanic rocks. The zone is poorly exposed on the surface but is well defined in the White Cap Adit. Similar zones have been identified by others (Cook & Westervelt, 1969) due east of the Gold Cap 3 Claim.

The results of soil sampling and VLF/EM surveys along two orientation lines suggest these survey techniques can be used to identify possible mineralized structures associated with the contact zone. Chip and channel samples from quartz veins show highly anomalous Au, Ag, Pb, Mo and W values.

Additional work, including a combination of soil sampling, VLF/EM and mapping is recommended for the White Cap Property. Soil sample and VLF/EM surveys should be extended in the immediate area of the Adit. Soil sampling and mapping surveys should be used to test for other zones outside of the adit area.

Respectfully submitted,
AZIMUTH GEOLOGICAL LTD.

Larry R. Haynes

6.0 STATEMENT OF QUALIFICATIONS

I, Larry R. Haynes, residing at 127 East 18th Avenue, Vancouver, B.C., hereby certify that:

1. I graduated from the University of British Columbia in 1972 with a B.Sc. in Geology.
2. I have worked full time since 1972 as an exploration geologist in Canada and the Western United States.
3. I am a Fellow of the Geological Association of Canada, with membership number F4291.
4. I hold no interest either directly or indirectly in the White Cap Property or in the shares or securities of Armeno Resources Inc., nor do I expect to receive any interest.
5. This work is based on work carried out by myself and others under the supervision of Azimuth Geological Incorporated.

Dated this 15th day of March, 1988,

Larry R. Haynes, B.Sc., F.G.A.C.

1988

Acme Analytical continues to update with mass spectrographic analysis which is now operational. In general, mass spec offers detection limits which are at least 100 fold lower than ICP or flame AA. These detection limits are comparable to graphite furnace AA, but the mass spec can analyze up to 60 elements simultaneously.

Acme has pioneered low cost multi-element ICP analysis which has better detection and precision than AA. Mass spec will further expand the range of elements and isotopes available to mineral exploration programs.

SPACE

Total laboratory, sample preparation and sample storage has been expanded to 30,000 square feet, with purchase another building.

EQUIPMENT

- Our ICP system has been expanded, and a fifth unit has been purchased which will allow us to determine up to 45 elements simultaneously.
- AA spectrophotometers have been increased to 8.
- Sample preparation, weighing and dissolution facilities have been increased.
- A LECO induction Furnace has been installed for determining Carbon and Sulfur simultaneously in geological and metallurgical samples.
- An UAJ Laser Fluorometer from Scintrex is now used for determination of U in water to .01 ppb.
- Two ICP mass spectrographs.

TECHNOLOGY

- Fire Assay for Ag, Au, Pt, Pd, Rh, Ru & Ir.; the precious metal bead can be analysed by gravimetric, AA, ICP or Mass spec.
- ICP multi element packages for water, geochem and assay programs have been developed.
- Lower detection limits for some elements have been achieved by graphite furnace AA.

TECHNICAL ACHIEVEMENTS

- Background corrected Atomic Absorption analysis of Ag and Au since 1971.
- Best proven precision, accuracy and price for MoS2 assays in North America.
- Pioneered geochemical analysis by ICP at or to better detection limits than AA, including Ag, As, U, Th and V.
- First to offer Mass spectrographic scan analysis.

PROVEN PERFORMANCE

Our logistical and technical performance for our clients has been demonstrated on the Gamble, Capoose Lake, Trout Lake, Blackdome, Red Mountain, Carolin, Cirque, Minago River, Quenell River, Terra Swede, Hosto and other major projects. We are capable of handling up to 2500 samples per day.

GEOCHEMICAL LABORATORY METHODOLOGY & PRICES - 1988

Sample Preparation

280	Soils or silts up to 2 lbs drying at 60 deg.C and sieving 30 gms + .85 -80 mesh (other size on request)	.85
33	Saving part or all reject	.45
320R	Soils or silts - drying at 60 deg.C and sieving +20 mesh & pulverizing (other mesh size on request.)	2.00
3F	Soils or silts - drying at 60 deg.C pulverizing (approx. 100 gms)	1.50
RP100	Rocks or cores - crushing to -3/16" up to 10 lbs, then pulverizing 1/2 lb to -100 mesh (98%)	3.00
Cr	Surcharge crushing over 10 lbs	.25/lb
2PZ	Surcharge for pulverizing over 1/2 lb	1.75/lb
RPS100	Same as RP100 except sieving to -100 mesh and saving +100 mesh (200gms)	3.75
RPS100 1/2	Same as above except pulverizing 1/2 the reject - additional	2.50/lb
RPS100 A	Same as above except pulverizing <u>all</u> the reject - additional	2.50/lb
COP	Composite pulps - each pulp Mixing & pulverizing	.50 1.50
MN	Heavy mineral separation - S.G.2.95 + wash -20 mesh	12.00
V1	Drying vegetation and pulverizing 50 gms to -80 mesh	3.00
V2	Ashing up to 1 lb wet vegetation at 475 deg.C	2.00
HL	Special Handling	17.00/hr

Sample Storage

Rejects - Approx. 2 lbs of rock or total core are stored for three months and discarded unless claimed.

Pulps are retained for one year and discarded unless claimed.

Additional storage - for 3 years \$10.00/1.2 cu.ft. box
or 15 cents/sample pulp
or 5 cents/sample soil

Supplies

Soil Envelopes	1" x 6"	\$125.00/thousand
Soil Envelopes	1" x 6" with gusset	\$140.00/thousand
Plastic Bags	1" x 11" x 4" ml	\$10.00/hundred
Plastic Bags	12" x 20" x 6 ml	\$20.00/hundred
Ties		\$2.00/hundred
Alloy Tags		N/C
10% HCl		5.00/liter
Dropping bottles	A & B	1.00/each
In test		\$11.00/each liter

Conversion Factors

$$\begin{aligned} \text{Troy oz} &= 31.10 \text{ g} \\ \text{oz/ton} &= 34.3 \text{ ppm} = 34.3 \text{ g/tonne} = 34,300 \text{ ppb} \\ &= 34,300 \text{ ppm} \end{aligned}$$

GEOCHEMICAL ANALYSES - Rocks and Soils

Group I Digestion

.50 gram sample is digested with 3 ml's 3-1-2 HCl-HNO₃-H₂O at 55 deg.C for one hour and is diluted to 10 ml with water. This leach is near total for base metals, partial for rock forming elements and very slight for refractory elements. Solubility limits Ag, Pb, Sb, Bi, W for high grade samples.

Group IA - Analysis by Atomic Absorption.

Element	Detection	Element	Detection	Element	Detection
Antimony*	.2 ppm	Copper	1 ppm	Molybdenum	1 ppm
Bismuth	.2 ppm	Iron	0.01%	Nickel	1 ppm
Cadmium	0.1 ppm	Lead	2 ppm	Silver	0.1 ppm
Chromium	1 ppm	Lithium	2 ppm	Vanadium	2 ppm
Cobalt	1 ppm	Manganese	5 ppm	Tin	2 ppm

First Element \$2.25 Subsequent Element \$1.00

Group IB - Hydride generation of volatile elements and analysis by ICP. This technique is unsuitable for sample grading over 1% Ni or Cu.

Element	Detection	First Element	All Elements
Antimony	0.1 ppm		
Bismuth	0.1 ppm		
Germanium	0.2 ppm		
Selenium	0.2 ppm		
Tellurium	0.3 ppm		

Group IC - Hg Detection limit - 5 ppb Price \$2.50

Hg in the solutions are determined by cold vapour AA using a F & J scientific Hg assembly. The aliquots of the extract are added to a stannous chloride/hydrochloric acid solution. The reduced Hg is swept out of the solution and passed into the Hg cell where it is measured by AA.

Group ID - ICP Analysis, same digestion

Element	Detection
Ag	0.1 ppm
Cd,Co,Cr,Cu,Mn,Mo,Ni,Sr,Zn	1 ppm
As,Au,B,Be,Bi,La,Pb,Sb,Tl,V,W	2 ppm
U	5 ppm
Al,Ca,Fe,K,Mg,Mn,P,Tl	0.01%
Any 3 elements	\$3.25
5 elements	4.50
10 elements	5.50
All 30 elements	6.25

Group IE - Analysis by ICP/MS

Element	Detection
Ge,Os	0.1 ppm
Au,Bi,Cd,Hg,In,Ir,Os,Re,Rh,Sb,Te,Th,Tl,U	0.1 ppm
All Elements	15.00 (minimum 20 samples per batch or \$15.00 surcharge)

Hydro Geochemical Analysis

Natural water for mineral exploration

26 element ICP - Mo,Cu,Pb,In,Ag,Co,Mn,Fe,As,Sr,Cd,V,Ca,P,Li,Cr,Mg,Tl,B,Al,Mn,K,Ce,Be,Sn \$8.00

F by Specific Ion Electrode - detection 20 ppb \$3.75
U by UAS - detection .01 ppb 5.00
pH .1 pH 1.50

* Minimum 20 samples or \$5.00 surcharge for ICP or AA and \$15.00 surcharge for ICP/MS.
All prices are in Canadian Dollars

ACME ANALYTICAL LABORATORIES LTD.
Assaying & Trace Analysis
852 E. Hastings St., Vancouver, B.C. V6A 1R6
Telephone: 253-3158

Shipping of Samples

All shipments from outside Canada should be marked "GEOCHEMICAL SAMPLES FOR ANALYSIS - NO COMMERCIAL VALUE".

Free Custom Clearance on invoices of \$150.00 or more.

By Air Freight:

Acme Analytical
c/o Cole McCubbin
Vancouver, B.C.

By Surface - US Customers:
First Class Mail or UPS - under 30 lbs
- Bus (Canadian Customers)

Discounts by Contract

Turnaround time is generally around four days, and can be 24 hours by special contract.

Free pick up from downtown Vancouver and Bus Depot.

Field Services

Portable crushers and core splitters are available at reasonable rental rates.
Cut your shipping cost on large drilling programs.

All prices subject to change without notice.

Special Service

Modem data transfer: 5 cents/sample - minimum \$10.00

Statistical Analysis : At Cost.

- SD
- Mean
- Median
- Frequency Plot
- Grid Coordinate Contour Plot

Data disks - \$6.00

Apple II - Require Acme's read programs
IBM-PC - ASCII or Lotus 1,2,3.

Group 2 - Geochemical Analysis by Specific Extraction and Instrumental Techniques

Element	Method	Detection	Price
Barium	0.100 gram samples are fused with .6 gm LiBO ₂ dissolved in 50 ml 5% HNO ₃ and analysed by ICP. (other whole rock elements are also determined)	10 ppm	\$3.75
Carbon	LECO (total as C or CO ₂)	.01 %	5.75
Carbon+Sulfur	Both by LECO	.01 %	6.50
Carbon (Graphite)	HCl leach before LECO	.01 %	8.00
Chromium	0.50 gram samples are fused with 3 gm Na ₂ O ₂ dissolved in 50 ml 20% HCl, analysed ICP.	5 ppm	4.00
Fluorine	0.25 gram samples are fused with NaOH; leached solution is adjusted for pH and analysed by specific ion electrode.	10 ppm	4.50
Sulphur	LECO (Total as S)	.01 %	5.50
Sulphur Insoluble	LECO (After 5% HCl leach)	.01 %	8.00
Tin	1.00 gram samples are fused with Na ₂ O ₂ . The sublimed Iodine is leached with 5 ml 10% HCl, and analysed by Atomic Absorption.	1 ppm	3.50
Tungsten	.50 gram samples are fused with Na ₂ O ₂ dissolved in 20 ml H ₂ O, analysed by ICP.	1 ppm	3.50

Group 3 - Geochemical Noble Metals

Element	Method	Detection	Price
Au*	10.0 gram samples are ignited at 600 deg.C, digested with hot aqua regia, extracted by MIEK, analysed by graphite furnace AA.	1 ppb	\$ 4.50
Au**	10.0 gram samples are fused with a Ag Inquart with zinc assay fluxes. After cupellation, the doge bead is dissolved and analysed by AA or ICP/MS.	1 ppb	6.00 -first element 1.50 -per additional
Pd,Pt,Rh			10.00 -for All 4.

Larger samples - 20 gms add \$1.50
30 gms add \$2.50

Group 4A - Geochemical Whole Rock Assay

0.200 gram samples are fused with LiBO₂ and are dissolved in 100 ml 5% HNO₃.
 SiO₂, Al₂O₃, Fe₂O₃, CaO, MgO, Na₂O, K₂O, MnO, TiO₂, P₂O₅, Cr₂O₃, LOI + Ba by ICP.
 Price: \$3.75 First metal \$1.00 each additional \$9.00 for All.

Group 4B - Trace elements

Element	Detection	Analysis	Price
Co,Cu,Ni,Zn,Sc	10 ppm	ICP	\$3.75 First Element or
Cr,Mn,Ta,I,It	20 ppm	ICP	\$1.00 additional to 4A \$6.00 for All.

Group 4C - analysis by ICP/MS.

Be, Rb, T, Ir, Nb, Sn, Cs, La, Ce, Pt, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Hf, Ta, W, Th, U

Detection: 1 to 5 ppm Price : \$20.00 for All.

* Minimum 20 samples or \$5.00 surcharge for ICP or AA and \$15.00 surcharge for ICP/MS.
 All prices are in Canadian Dollars

Telephone: 253-3158

Suggestions for Effective use of Analytical Services1. General Sampling

A. Rocks - In general 1/2 to 2 lb of sample is required. Large boulders should be broken down to chip size with a 20 lb sledge hammer. A representative sample is then taken from these chips. The lab will crush, split and pulverize.

B. Cores - Drill cores should be split into halves for assaying.

C. Soils - The organic "A" horizon gives good base metal responses. Supply about one cup of material in a soil or paper envelope. The soil is treated in one of three methods after drying :
 1) -80 mesh sieving (standard),
 2) -80 mesh sieving + pulverizing,
 3) pulverizing the whole sample.

Samplers must not wear any jewelry.

2. Shipping

A. Local and Within Canada - use Greyhound or Pacific Stage Lines. For large drill programs use a truck line.

B. U.S. Customers - for surface transport use UPS or mail - under 30 lbs - Delta Airlines usually lowest rates.

All freight shipments are addressed to :

Acme Analytical Laboratories Ltd.,
c/o Cole McCubbin
Vancouver, B.C.

Shipments from the U.S. should be labelled "Geological Samples for Analysis - No Commercial Value".

3. Suggested Geochemical Analysis

A. Rocks with No Visible Mineralization - 30 element ICP + geochemical Au.

B. Rocks with High Sulphides - 16 element ICP Assay.

C. Cores - assays for elements of mineralization and possible 30 Element ICP.

D. Soils - 30 element ICP + geochemical Au.

4. Samples with Possible Native Gold

For rocks and cores with nugget or native gold, request that the total sample be pulverized and sieved on a 100 mesh screen. Two fire assays are then required for each sample; one on the entire +100 mesh fraction for any possible native gold and one on the -100 mesh. (1 A.T.)

Pan or sluice concentrates are best treated by cyclone concentration and fire assay for total Au.

GEOCHEMICAL ANALYSIS CERTIFICATE

ICP - .500 GRAM SAMPLE IS DIGESTED WITH JML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR MN FE CA P LA CR MG BA TI B W AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM.
 - SAMPLE TYPE: Rock Chips AU ANALYSIS BY FA+AA FROM 10 GM SAMPLE.

DISSENT REPORT

This block contains four separate, dark, and somewhat irregular fragments of what appears to be charred organic material, possibly bone or wood. The fragments are roughly rectangular or curved shapes, showing signs of heat damage.
