ASSESSMENT REPORT 17324 MINING DIVISION: Similkameen

PROPERTY: White Gold-Red Gold
LOCATION: LAT 49 30 33 LONG 120 55 34
UTM 10 5485907 650136
NTS 092H10W 092H07W
CLAIM(S): White Gold,Red Gold
OPERATOR(S): West Coast Platinum
AUTHOR(S): Zastavnikovich, S.
REPORT YEAR: 1988, 73 Pages
GEOLOGICAL
SUMMARY: The property is underlain mainly by the Jurassic-Cretaceous Eagle granodiorite in contact with Upper Triassic Nicola Group metasediments and metavolcanics, which are in contact to the east with Tulameen Ultramafic Complex rocks. No known mineralization exists on the property.

TABLE OF CONTENTS

APPENDICES

MAPS

PROPERTY AND OWNERSHIP

The Blast Resources Ltd.'s Tulameen mineral property, which has been legaly surveyed by Morgan Stewart & Co. of Vancouver in September 1987, consists of two metric claims totalling 40 units, the White Gold claim Record No. 2520, recorded Jan. 23, 1986, 20 units, and the Red Gold claim Record No. 2523, recorded Jan. 27, 1986, 20 units. The 20 unit Blue Gold and the 9 unit Golden Dew claims, under same ownership, adjoin to north of the White and Red Gold claims. The eastern half of the Red Gold claim was staked over previously staked ground. All the L.C.P.'s for the above claims are located along the Tulameen River road and are clearly visible. Assessment on the claims has been recorded to 1992, and the claims status, pending acceptance of this report, is as listed below:

Claim Name	Record No.	Units	Expiry Date
WHITE GOLD	2520	20	January 23, 1992
RED GOLD	2523	20	January 27, 1992

LOCATION, ACCESS & PHYSIOGRAPHY

The property is located to the southwest of the Mt. Britton, straddling the Tulameen River where McGee Creek joins it, some 20km west of the town of Tulameen, along Tulameen River road, at 49 31' and 120 55'W in the Similkameen Mining Division on NTS map 92H/10W. Other logging roads traverse the northern and western perimeter of the property, leading to the Coquihalla Highway and the town of Hope, one and half hours driving time, while Princeton, a major mining community, is one hour by road easterly from the property.

Elevations range from 900m a.s.l. under precipitous slopes in the Tulameen River canyon, to 1,340m on top of the gently sloped Mt. Britton. The vegetation is sparse on the steep slopes, elsewhere it is thick with spruce, fir and

pine. Precipitation is moderate and the snow stays between October and May. Bedrock is abundant in the creek bottoms, the rest of the property is covered with glacial till of various thickness.

GEOLOGY

Regional Geology

From the latest summary of the Tulameen complex geology by Nixon & Rublee, in BCDM Geological Fieldwork 1987, Paper 1988-1, p. 281-282:

> The general geology of the Tulameen complex is shown in Fig. 2-2-2 (See Fig. 4). The principal ultramafic mafic units comprise dunite, olivine clinopyroxenite, hornblende clinopyroxenite and gabbro. . . . The intrusive suite was emplaced into metasedimentary and intermediate to felsic metavolcanic lithologies that belong mainly to the western facies of the Upper Triassic Nicola group. Volcanic assemblages in the Nicola Group contain clinopyroxenite-rich shoshonitic lavas that evolved during Late Triassic subduction. These rocks are possibly comagmatic with ultramafic and mafic alkalic rocks of the Tulameen suite. The Tulameen complex and its host rocks are unconformably overlain by terrigenous sedimentary and volcanic assemblages of the Early Tertiary (Eocene) Princeton Group and Miocene plateau basalts.
>
> Regional structures trend approximately northnorthwest and are characterized by a westward-dipping foliation that parallels the eastern margin of, and extends into, . . . the Eagle plutonic complex. The Tulameen complex forms an elongate body concordant with the structural grain.

Property Geology

The latest summary of the local geology in the claims area is described by G.T. Nixon and V.J. Kublee in BCDM's

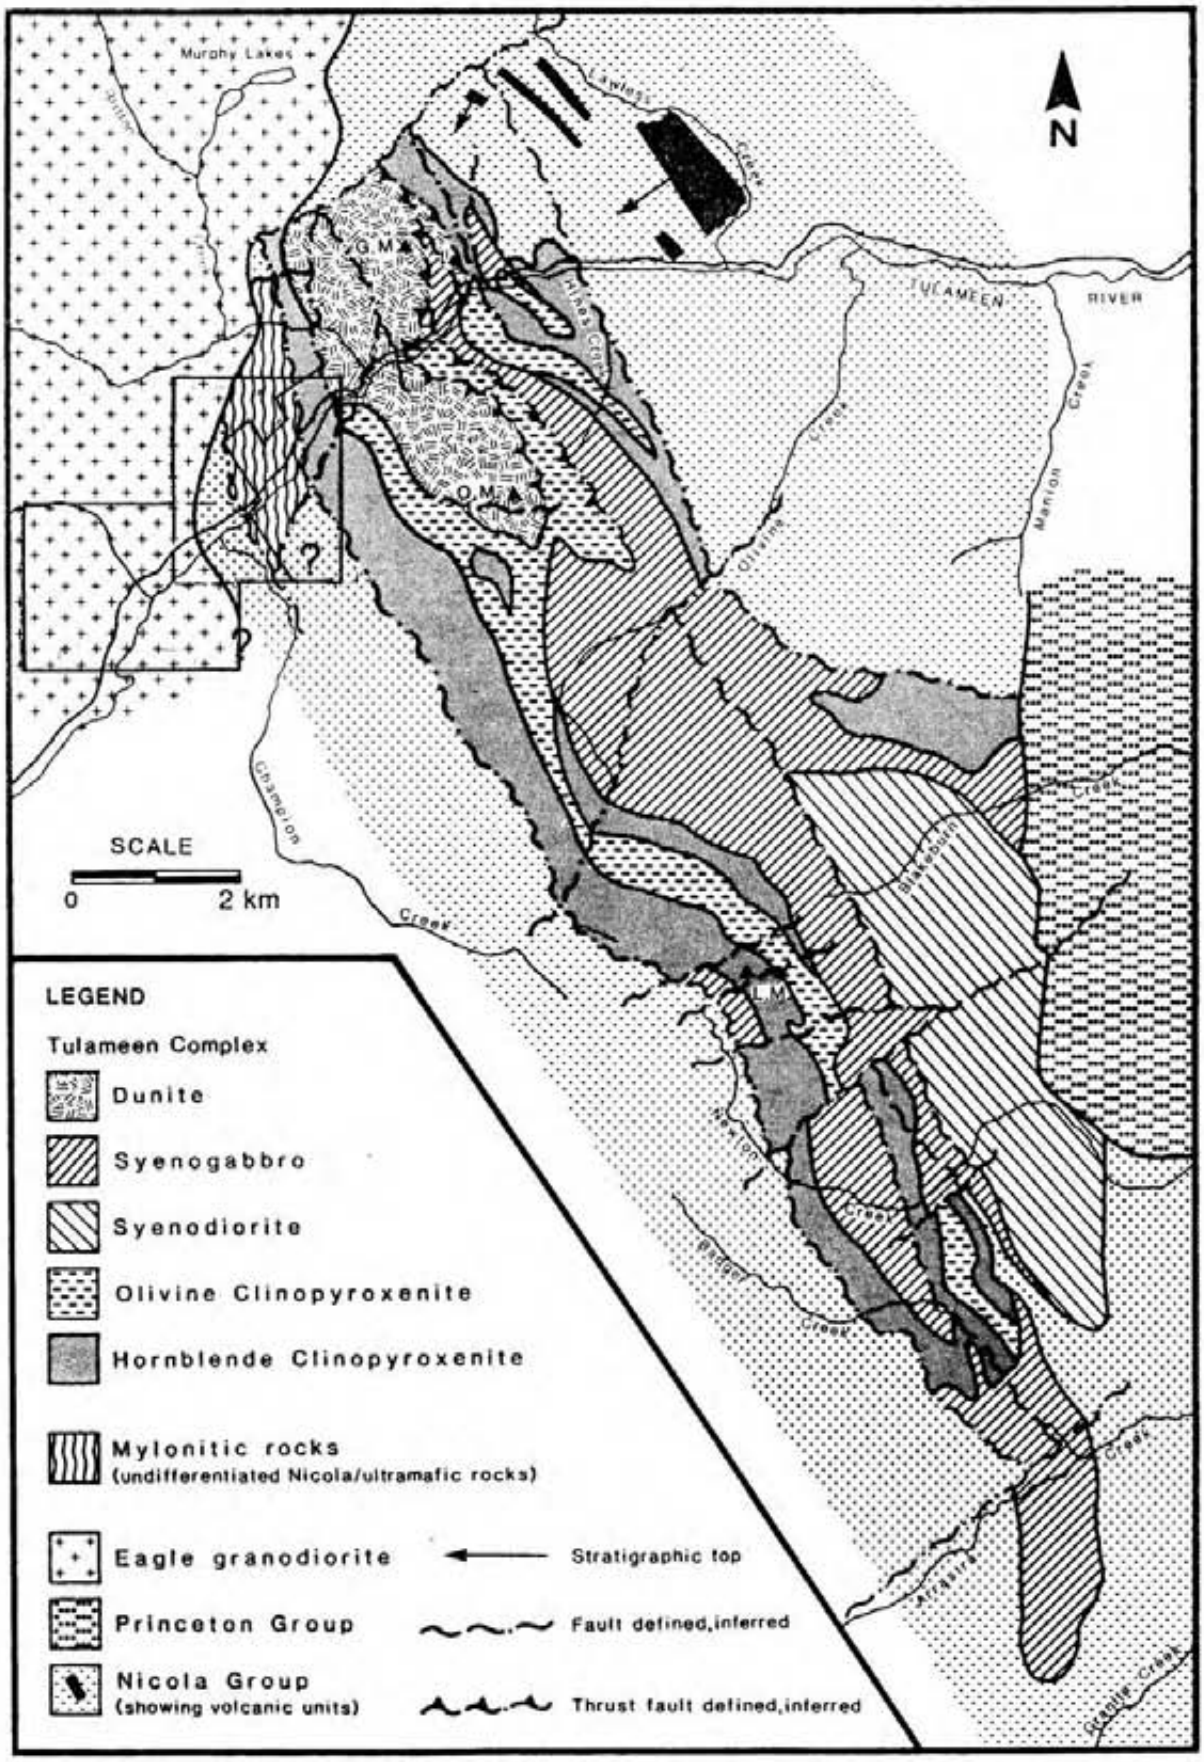

Figure 2-2-2. Generalized geologic map of the Tulameen ultramafic complex (modified after Findlay, 1963).

From Nixon & Rublee, 1987, in: BCDM Geological Fieldwork, Paper 1988-1

FIG. 4

Geological Fieldwork 1987, Paper 1988-1, pages 281-294, and on Open File 1988-25 1:25,000 scale geological map by G.T. Nixon, as copied on the large scale geochemical-geological map, Fig. 4, in pocket. The main feature of the claims geology is the northerly striking contact between the Jurassic to Cretaceous Eagle granodiorite to the west and the Upper Triassic Nicola Group metasedimentary and metavolcanic rocks to the east. The contact is well exposed on the Tulameen R. road at 750m west from the White Gold claim L.C.P. The two main lithologies on the property are described in Nixon & Rublee as follows:

> Representatives of the Nicola Group in the Tulameen region comprise black thinly laminated argillites, green and brown tuffaceous siltstones and lapilli tuffs, dark grey-green aphyric to plagioclase-phyric pyroxene andesite and hornblende dacite flows, rare aphanitic rhyolites, cherts, chert breccias, and dark grey limestones. All lithologies are regionally metamorphosed to greenschist grade. Chlorite-muscovite schists with minor biotite are common to the west of the ultramafic complex and marbles with weakly developed skarns commonly occur adjacent to the Eagle granodiorite contact. Skarn mineralization includes traces of molybdenite, chalcopyrite, pyrite, covellite, bornite and chalcocite (?).
>
> The Eagle pluton comprises a foliated to gneissic (syntectonic) granodiorite and variably deformed (syntectonic to post-tectonic) muscovite granite. Granodiorite at the western margin of the study area is a medium to coarse-grained rock containing quartz, plagioclase, potassium feldspar and biotite. The granodiorite is weakly to intensely foliated, cut by quartz veins and locally encloses amphibolitic schlieren. Near the contact with the Nicola on the Tulameen River road, numerous aplite sills (<1 metre) that are generally concordant with westward-dipping argillites and metasiltstones are probably rooted in the Eagle pluton. On Britton Creek, unfoliated biotite-hornblende granodiorite contains randomly oriented xenoliths of amphibole-biotite-chlorite schist derived from adjacent mylonitic rocks. Recent mapping has identified this granitoid stock as a post-tectonic intrusion of probable Tertiary (Eocene ?) age.

Rock Sampling & Mineralization

Initial outcrop sampling on reconnaissance prospecting traverses by geologist J. Wilson returned mildly anomalous precious metals values from four areas, the highest geochemical values being in rock sample W125 of 184 ppb Au, 177 ppb Pt and 342 ppb Pd, located near the White Gold claim L.C.P. on the Tulameen R. road, Figs. 3,3a, and Appendix III. The other three anomalous areas are Champion Ck., upper McGee Creek, Figs. 3b,c and the area east of Tulameen R., accross from the mouth of McGee Creek, Fig. 3.

Each of the four anomalies was investigated with selective rock sampling of siliceous and/or sulfide bearing outcrops. The strongest precious metals geochemical values in rocks in the -80 mesh fraction are as follows:

In the area east of the Eagle/Nicola contact, Fig. 2a, overleaf, the highest precious metals values in outcrop are found in samples W222, 11.2 ppm Ag, 103 ppb Au, [illegible] the contact, in W225 and W226, 86 and 73 ppb Au, 91 and 73 ppb Pt, and 140 and 138 ppb Pd. In Champion Creek, where an old inaccessable adit was found in an area of up to 5cm wide near vertical quartz-pyrite veining in shears, the best rock geochemistry values were obtined from sulfide bearing quartz veins, samples W216, with 7,806 ppm Zn, 60.7 ppb Cd, 7.9 ppm As, 44 ppb Au, 32 ppb Pt, and 23 ppb Pd, and from sample W561, with 9,425 ppm Zn, and 82.8 ppm Cd, Fig. 3b, overleaf.

Just west of McGee Creek in the NW corner of the White Gold claim, where a vertical-dipping, approximately 1x20m seam of crumbly pegmatite was located in highly weathered, crumbly granodiorite in a logging road cut, Figs. 3,3a, mild, though distinctly anomalous, precious metals values were obtained in mineral outcrop samples. The pegmatite consists of quartz and two feldspars, with crystals up to 2cm, and minor biolite and muscovite. Minor pyrite, disseminated

and on fractures, and red hematite on fractures, are present. No outcrops of the disintegrating rocks were located away from the road cut. The best precious metals values were obtained in rock samples W531 to W533 of 21-35 ppb Au, 14 to 42 ppb Pt and 25 to 43 ppb Pd, over a sampled width of 15 meters.

Quartz-pyrite veins to 4cm wide in near vertical shears in granodiorite were located in new logging road cuts east of Tulameen R., accross from the mouth of McGee Creek, yielding up to 27.3 ppm Ag, 24.9 ppm Cd, 453 ppm Bi, and 4,525 ppm Zn, but only 21 ppm Au, and 11 ppb Pt, in rock sample W28R, Fig. 3, in pocket.

GEOCHEMISTRY

At intervals from May to October 1987 the writer carried out a reconnaissance scale stream sediment sampling coverage of the property, followed by reconnaisance soil sampling in four anomalous areas on the claims, while geologist J. Wilson carried out reconnaisance scale prospecting coverage of the property, based on rock sampling of available outcrops, in search for platinum and gold precious metals mineralization. All the sample locations, together with geology, topography, and claim outlines, are presented on the large scale 1:11,400 geochemical and geological map Fig. 3, in pocket, and three 1:2,000 scale sample location maps Figs. 3a,b,c.

The geochemical sampling was concentrated in the four areas found to be mildly anomalous on the basis of initial reconnaissance sampling, namely in the vicinity of the Nicola Group/Eagle granodiorite contact, located 750m southeast of, from the White Gold L.C.P. on the Tulameen R. road; secondly, in lower Champion Creek, where an old adit was found; west of McGee Creek where pegmatite, mildly enriched in precious

metals, was located; and fourthly, accross Tulameen R. from the mouth of McGee Creek, where quartz-pyrite veins in shears carry mild base and precious metals geochemical values.

The high quality stream sediment survey, based on field sieved samples, yielded up to 1,220 ppb Au, 1,460 ppb Pt and 23 ppb Pd in McGee Creek, up to 2,620 ppb Au, 2,185 ppb Pt, and 142 ppb Pd in Tulameen River, and up to 630 ppb Au, 4,050 ppb Pt, and 49 ppb Pd in Champion Creek.

A total of 22 sediments, 343 soil, and 266 rock samples was collected on the property, as shown on the sample location map, Fig. 3, in pocket. The regular -80 mesh fraction for all the samples was processed and analyzed at Min-En Laboratories of N. Vancouver for 30 trace elements by ICP, and for gold, platinum and palladium by geochemical fire-assay, all standard analytical methods described in Appendix II. In addition, 48 rocks and soils samples were processed for heavy minerals and likewise analyzed. Complete precious metals analytical results are inscribed on the 1:5,000 scale geochemical sample location map, Fig. 3, and are also included with the trace element results as Appendix IV at the back of this report.

Stream Sediment Geochemistry

A specially constructed perforated pan and a 40-mesh sieve were used to field-sieve the stream sediments to enhance the uniformity od sampled material and provide reproducible analytical values.

As the precious metals analytical results presented on the Sample location Map, Fig. 3, indicate, highly anomalous gold and platinum values are present on the property ground in Tulameen, Champion and McGee Creeks. South of the property, samples SZ514 and SZ524 indicate that the streams are relatively poor in precious and trace element content. Based

on samples SZ501, 504, 507, 509 and SZ511, the Eagle granodiorite in the central portion of the White Gold claim is likewise barren. Upstream on McGee Creek, strong precious metals values of 1,220 ppb Au and 1,460 ppb Pt in sample SZ520, supported by anomalous 60 ppm Ni, is indicative of, at least in part, bedrock-related precious metals mineralization.

The reconnaissance scale stream sampling coverage must be supplemented with followup sediment sampling of greater density before the strong gold and platinum values obtained can be properly explained and related to source, particularly in the major streams, the Champion Creek and Tulameen River.

Soil Geochemistry

The 343 B horizon soils were sampled with grubhoes by the writer at depths of 10-30cm, mostly on 10m intervals along streams and road cuts in the four areas identified with reconnaissance rock geochemistry as being anomalous, as presented on sample location maps, Figs. 3,a,b,c.

In the Nicola Group rocks east of the Eagle granodiorite contact on the Tulameen R. road, Figs. 3,3a, the strongest precious metals soil anomalies exist in samples 0297, with 37 ppb Au, and 28 ppb Pt, and 0298 with 29 ppb Au, and 64 ppb Pt, with anomalous copper and zinc support of 132 ppm Cu, 217 ppm Zn in nearby sample 0299, and 219 ppm Cu, 839 ppm Zn in the next sample 0401, followed by 11 ppb Au, 33 ppb Pt, 12 ppb Pd in 0402 and 0403.

In Champion Creek, along the west bank, the strongest precious metals geochemical values in soils are present in samples 0459 to 0461 of 35 ppb Au, 37 and 61 ppb Pt, and 32 ppb Pd, near the adit, Fig. 3b, where strong copper-moly anomaly of up to 228 ppm Cu and 35 ppm Mo in samples 0461,62 is also

present. Palladium is anomalous from sample 0443 to 0448, as is gold, with up to 27 ppb Au, 44 ppb Pd, between 360m and 410m from the mouth of the creek. Along the east bank, 45 ppb Pt is present at CP290, and highly anomalous 118 ppb Pt, 93 ppb Pd at 73864, but no anomalous trace element geochemistry.

Along a logging road spur west of McGee Creek in the Eagle granodiorite, Figs. 3,3c, a crumbly pegmatite is mildly anomalous in precious metals. The strongest values in soils are present in samples 0273 and 0274 with 66 ppb Au, 55 ppb Pt, and 25 ppb Pd, with no trace element support, and at 0254 with 23 ppb Au and 56 ppb Pt.

Very strong barium values of 673 ppm and 859 ppm Ba in samples 0307 and 0322 are present in the small stream that drains the area, with strongly anomalous 259 ppb copper and supporting 158 ppm zinc present in the lower sample. This small stream should be sediment sampled at regular intervals from its mouth to the very end to detect the point of trace element enrichment.

On the new logging road east of Tulameen River, strong copper/nickel/zinc anomaly is present in soils in the vicinity of the Eagle/Nicola contact, Fig. 3, in samples 0369 to [illegible], up to 337 ppm Cu, 308 ppm Ni, and 1,495 ppm Zn, but only 24 ppb Pd of the precious metals. The best combined gold, platinum, palladium values are present in the last sample on the line, 0386, with 25 ppb Au, 51 ppb Pt, and 14 ppb Pd. Some 600m southeast soil sampling under rusty quartz veins in granodiorite produced similar base metals anomaly in samples 0392 to 0395, with up to 291 ppm Cu, 237 ppm Ba, 156 ppm Ni, 2,899 ppm Zn and 21 ppb Au, 32 ppb Pt and 12 ppb Pd in sample 0396. Such strong trace element anomalies may well be indicative of stronger precious metals mineralization at depth.

Heavy Minerals Geochemistry

As shown on the large geochemical sample location map, Fig. 3, a total of 19 rock and 12 soil sample sites were resampled in the four anomalous areas to collect sufficient material for heavy minerals fraction processing and analysis.

The initial analytical values for the precious metals in the H.M. fraction in soils were non-anomalous, as shown in the analytical results, Appendix IV. In the rocks, the three samples of McGee Creek pegmatite, C001, C002, and C003 returned by far the most anomalous trace element values of 463 ppm, 143 ppm, and 32 ppm silver, and 585 ppb, 255 ppb, and 380 ppb gold. Platinum and palladium are not anomalously concentrated in the same rock samples in the H.M. fraction. The high silver value, of some 11 oz/t Ag in the heavies, confirms the mineralized nature of the pegmatite.

A second set of six soils and two rock samples was collected in the pegmatite zone, Fig. 3c, and processed for the heavy mineral content, and the soils subdivided into three mesh sizes, the -20+40 Mesh; -40+80 Mesh; and -80 Mesh H.M. sizes; the regular -80 mesh size was analyzed as well for comparison. While no consistent trend of values accross the variety of mesh sizes exists in the limited number of samples taken, the presence of strongly anomalous platinum and palladium values in some of the soil samples was established in the H.M. fraction. Thus sample BL0-20+ has 645 ppb Pt in the 20+40 H.M. fraction, and sample BL35N has 438 ppb Pd in the same mesh size, while sample BL35S contained 500 ppb Pd in the 40+80 mesh H.M. fraction.

CONCLUSIONS

1. Stream sediment samples strongly anomalous in gold and platinum are present in the three main streams traversing the property. Mildly anomalous trace elements in some of those samples suggest that, at least in part, the precious metals anomalies may be related to bedrock, rather than strictly a placer source.

2. Outcrop samples [illegible] weakly anomalous in precious metals have been located on the property thus far. Additional rock, soil, and sediment sampling is necessary for detailed geochemical evaluation of the precious metals potential on the property.

3. Fresher samples of the gold and silver-enriched pegmatite horizon for analysis and petrological studies should be obtained by excavating, and geophysical surveys conducted to delineate its orientation and any crosscutting structures that may be mineralized.

ANALYTICAL PROCEDURES REPORT FOR ASSESSMENT WORK - PLATINUM, PALLADIUM, AND GOLD

Geochemical samples received for Platinum, Palladium, and Gold processed by Min-En Laboratories Ltd., at 705 W. 15th St., North Vancouver employing the following procedures.

After samples are prepared for analysis (grounded or sieved) a 30 gram subsample is weighed into crucibles and fluxed with Litharge and suitable flux material fire assayed down to the bead stage.

Then the bead is dissolved by Aqua Regia .

After cooling the sample solutions to room temperature they are made up to suitable volumes.

The solutions are analysed by computer operated Jarrell Ash 9000. Inductively Coupled Plasma Analyser.

Reports are given by the computer in parts per billion after the instrument is standardized with a suitable suite of standards.

APPENDIX II.

Analytical Procedure - The samples were analyzed by Min-En Laboratories Ltd. of 705 West 15th St., N.Vanc, as follows:

The stream sediments were oven-dried in their original water-resistant kraft paper bags at 95°C and screened to obtain the minus 80 mesh fraction for analysis. The rock samples were crushed and pulverized in a ceramic-plated pulverizer.

A suitable weight og 5.0 or 10.0 grams is pretreated with HNO_3 and $HClO_4$ mixture.

After pretreatment the samples are digested with Aqua Regia solution, then taken up with 25% HCl to suitable volume and aliquot used for the 26 element ICP trace element analysis.

From the major remaining portion of the sample, Gold is preconcentrated by standard fire assay methods, then extracted with Methyl Iso-Butyl Ketone and analyzed by Atomic Absorption.

For Mercury analysis, 1 gram of sieved material is sintered at 90°c for 4 hours, then digested in HNO_3 and HCl acids mixture, and analyzed by the Hatch and Ott flameless AA method.

ASSESSMENT REPORT FOR:

HEAVY MINERAL SAMPLING AND CONCENTRATIONS

A large sample is collected from stream sediments or soils big enough to yield a minimum of 0.5 kg of the desired minus fraction. After sieving through any of the sieve mesh sizes they are adapted for the survey. After seiving the samples, the minus fraction is grinded to -80 mesh.

Then 0.4 kg of sample is weighed into a suitable centrifuge containers. The prepared concentrations of liquids are added to obtain a 3.1 specific gravity flotation.

The heavy fractions are then washed cleaned and dried. After drying the samples they are separated . The sink float Heavy Minerals are separated into Magnetic and Non Magnetic fractions and both fractions are weighed. The percent of the Magnetic and non Magnetic fractions are calculated and reported with the analytical data.

The analysis are than carried out in the ususal analytical manner by I.C.P. or A.A. method.

APPENDIX III - Rock Sample Descriptions

W101 Rusty weathered. Crumbly seritic quartz vein with 2% fine pyrite. Strong sheared appearance. Sample taken over 5cm.

W102 Rusty weathered. Crumbly seritic quartz vein and sheared biotite schist country rock. Limonite in fractures. Trace pyrite. Sample taken over 45cm.

W104 Rusty weathered. Crumbly, seritic quartz vein and sheared biotite schist. Limonite in fractures. Sample taken over 50cm.

W105 Rusty weathered. Seritic quartz vein and sheared biotite schist. Limonite in fractures. Minor pyrite. Sample taken over 50cm.

W106 Rusty weathered. Seritic quartz vein with 5% pyrite in veinlets and disseminated pyrite cubes. Silicified biotite schist country rock. 20cm remnant of googe zone.

W107 Rusty weathered. Vuggy, granular quartz veining and clear quartz veinlets. Fine grained disseminated pyrite to 5%. Is quartz-pyrite rich rim around W106 remnant.

W108 Rusty weathered. Seritic biotite schist(?) and 5cm quartz vein with 15% pyrite cubes. Trace unknown black mineral.

W109 Rusty weathered. Vuggy 3cm quartz vein. Sericitized. 2% pyrite cubes, pyrite boxwork.

W110 Weakly rusty weathered. Coarse grained granodiorite-tonalite. Trace epidote. No visible mineralization.

W111 Weakly rusty weathered. Coarse grained granodiorite-tonalite. Strong hematite on slickenside surface. No visible mineralization. Sheared.

W112 Weakly rusty weathered. Medium grained granodiorite. 2cm quartz veining. Sericitized. No visible mineralization. Shea

W113 Weakly rusty weathered. 2 metre xenolith(?) of Nicola Group metasediment. Silicified, sericitized. Limonite veinlets. No visible mineralization.

W114 Rusty orange weathered. Rusty fractures in Eagle granodiorite. Fracture spacing of 1 per 50cm over 3 metres. No visible mineralization.

W115 Rusty yellow weathered. Rusty quartz veining in Eagle granodiorite. Veining to 10cm wide. Silicification. Minor pink vein silicate. No visible mineralization.

W116 Pale grey weathered. Coarse grained granodiorite. Minor epidote and iron staining hematite on occasional slickenside surface.

W117 Pale grey weathered. Coarse grained granodiorite-tonalite. No visible mineralization

W118 Pale grey weathered. Coarse grained granodiorite-tonalite. Minor epidote. No visible mineralization.

W119 Pale grey weathered. Coarse grained granodiorite-tonalite. Minor epidote. No visible mineralization.

W120 Rusty brownish weathered. Biotite-quartz schist with 15% disseminated pyrite and minor rusty quartz veinlets. Zone is 5cm wide. At Eagle-Nicola contact.

W121 Rusty weathered. Biotite schist with trace disseminated pyrite and quartz veining. At Eagle-Nicola contact.

W122 Rusty weathered. Sericitic biotite schist with quartz veinlets carrying traces of fine grained cube pyrite. At Eagle-Nicola contact.

W123 Rusty weathered. Quartz biotite schist with 5% disseminated limonite specks and minor quartz veinlets carrying traces of pyrite.

W124 Rusty weathered. Biotite schist with 5% disseminated pyrite grains and 1cm quartz veins carrying traces of pyrite.

W125 Rusty weathered. Biotite-quartz schist with minor disseminated pyrite over 3cm of bed thickness. Minor pyrite in quartz veinlets.

W126 Rusty weathered. Silicified biotite schist with 10% disseminated pyrite and 2cm quartz vein carrying 3% pyrite.

W127 Rusty weathered. Quartz biotite schist cut by 10cm quartz vein carrying trace disseminated pyrite.

W128 Pale grey weathered. Granodiorite with 2cm quartz vein carrying minor pyrite and galena. Float

W129 Rusty weathered. Nicola group quartz vein. 1cm wide. Very rusty, vuggy, limonite. Trace pyrite.

W130 Dark grey weathered. Hornfels. Calcite, chlorite alteration. Strong disseminated magnetite. No visible mineralization.

W131 Rusty weathered. Coarse grained granodiorite-tonalite. Trace epidote. No visible mineralization.

W132 Rusty weathered. Granodiorite containing 3cm quartz vein with trace of fine pyrite. Float.

W133 Pale grey weathered. Medium grained granodiorite. No visible mineralization.

W134 Dark grey weathered. Biotite-schist. Chloritic. Minor limonite stains on fractures. No visible mineralization.

W135 Pale rusty weathered. Biotite schist. Chloritic with vuggy 5mm quartz vein. No visible mineralization.

W136 Rusty weathered. Biotite-quartz schist. Minor pyrite and strong limonite on schistosity planes.

W137 Rusty weathered. Seritic, biotite quartz schist with 1cm quartz vein carrying 1% fine pyrite. Float.

W138 Rusty weathered. Quartz vein with 5% disseminated pyrite.

W139 Weakly rusty weathered. Quartz vein with minor disseminated pyrite.

W140 Rusty weathered. Quartz vein. Sericitic. Very strong limonite.

W141 Rusty weathered. Quartz vein with 5% pyrite cubes, some to 1cm in size. Minor tetrahedrite(?), minor malachite, bornite.

W142 Dark grey weathered. Coarse grained gabbro. No visible mineralization.

RE: WHITE GOLD & RED GOLD CLAIMS
RECORD NUMBERS 2520 & 2523
SIMILKAMEEN MINING DIVISION

The work credit requested on the Statement of Exploration and Development recorded on DECEMBER 31, 1987 (photocopy enclosed) is being applied to the above mentioned claims. A copy of the work sheet indicating application of the work credits is enclosed for your records.

If you have requested credits to the PAC account, this can only be granted if the work is substantiated by a technical report. Section 1(5) of Part C of the Regulations, required that the report be received within ninety days of the earliest anniversary date. The report is due on or before APRIL 23, 1988.

Both copies of the report should be forwarded directly to the Geological Branch, Ministry of Energy, Mines and Petroleum Resources, Parliament Buildings, Victoria, B.C., V8V 1X4. Kindly include the enclosed copy (or a photocopy thereof) of the statement with your report. All enquiries concerning submission of reports may be directed to the attention of Mr. Talis Kalnins of the Geological Branch in Victoria. The telephone number for Mr. Kalnins is 387-5975.

Yours truly,

Cheryll Heroux
Gold Commissioner
Similkameen Mining Division
