INTRODUCTION

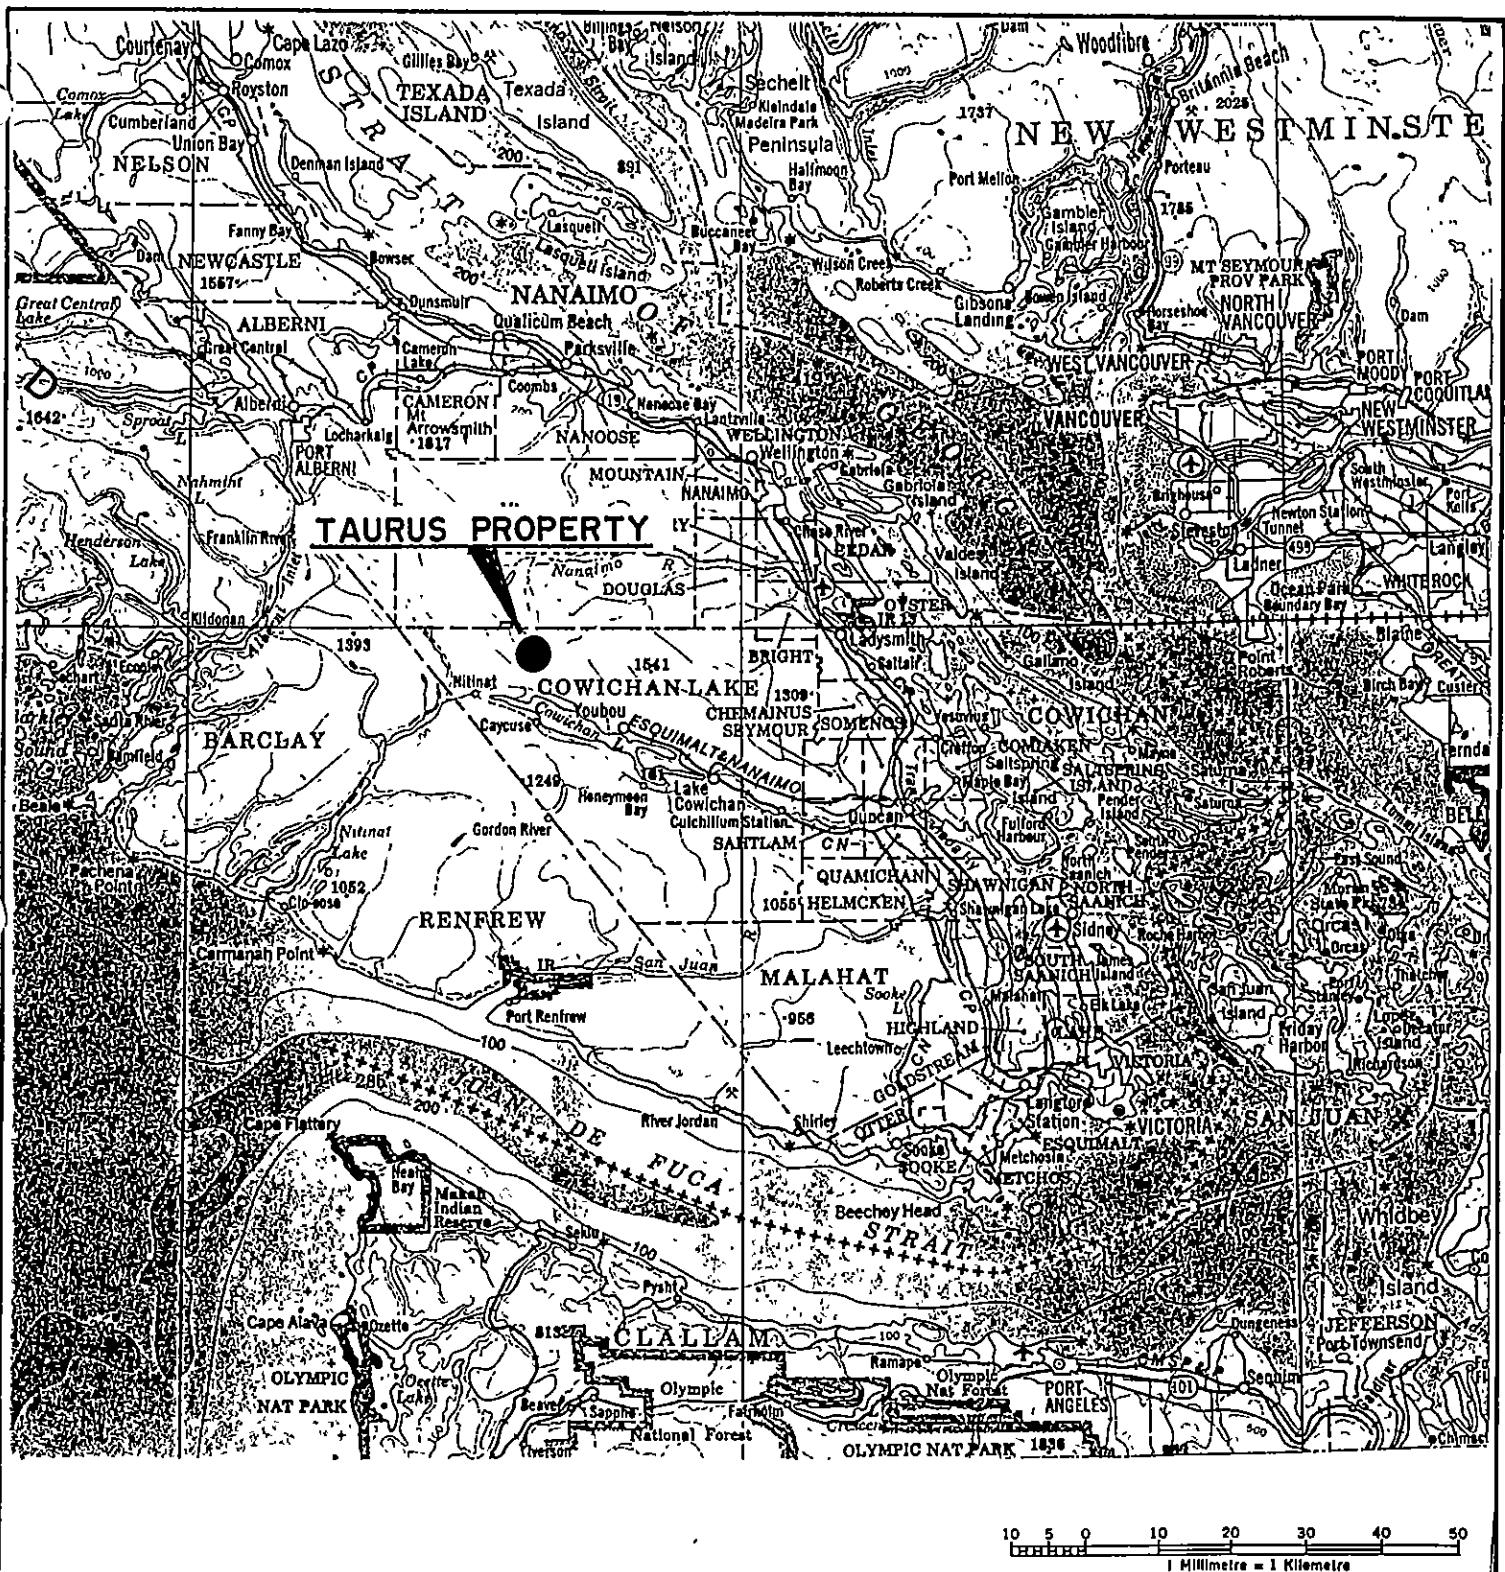

The Taurus Property comprising two non-contiguous claims is located northwest of the village of Cowichan Lake, Vancouver Island, B.C. The Property is wholly-owned by Black Gold Resources Inc., of Vancouver, B.C. During the periods December 2-12, 1987 and February 1-19, 1988, a program of line cutting, soil sampling and airborne magnetic and VLF-EM survey was carried on the property. Due to weather conditions most of the geochemical survey was restricted to the Taurus Claim.

Location and Access

The Taurus Property is located approximately 25 km northwest of the village of Lake Cowichan, Vancouver Island, B.C. (Figure 1). One of the claims, the Taurus which is the subject of this report, is approximately centered at latitude 48° 57.7' N and Longitude 123° 24.6' W, its eastern half being transected by Shaw Creek. The property is accessible from Lake Cowichan by paved and well-maintained gravel road along the north shore of Cowichan Lake, thence by a network of logging roads to the Taurus Claim.

Physiography

The topography is typically rugged with steep slopes and in places rock bluffs. At the Taurus claim elevations range from 300 m in the valleys to greater than 800 m. The immediate area abounds with merchantable stands of timber with active

FIGURE 1

logging providing a network of access roads. The climate in the area is typically mild although unseasonal snow precipitation can occur early in the fall.

Property Definition

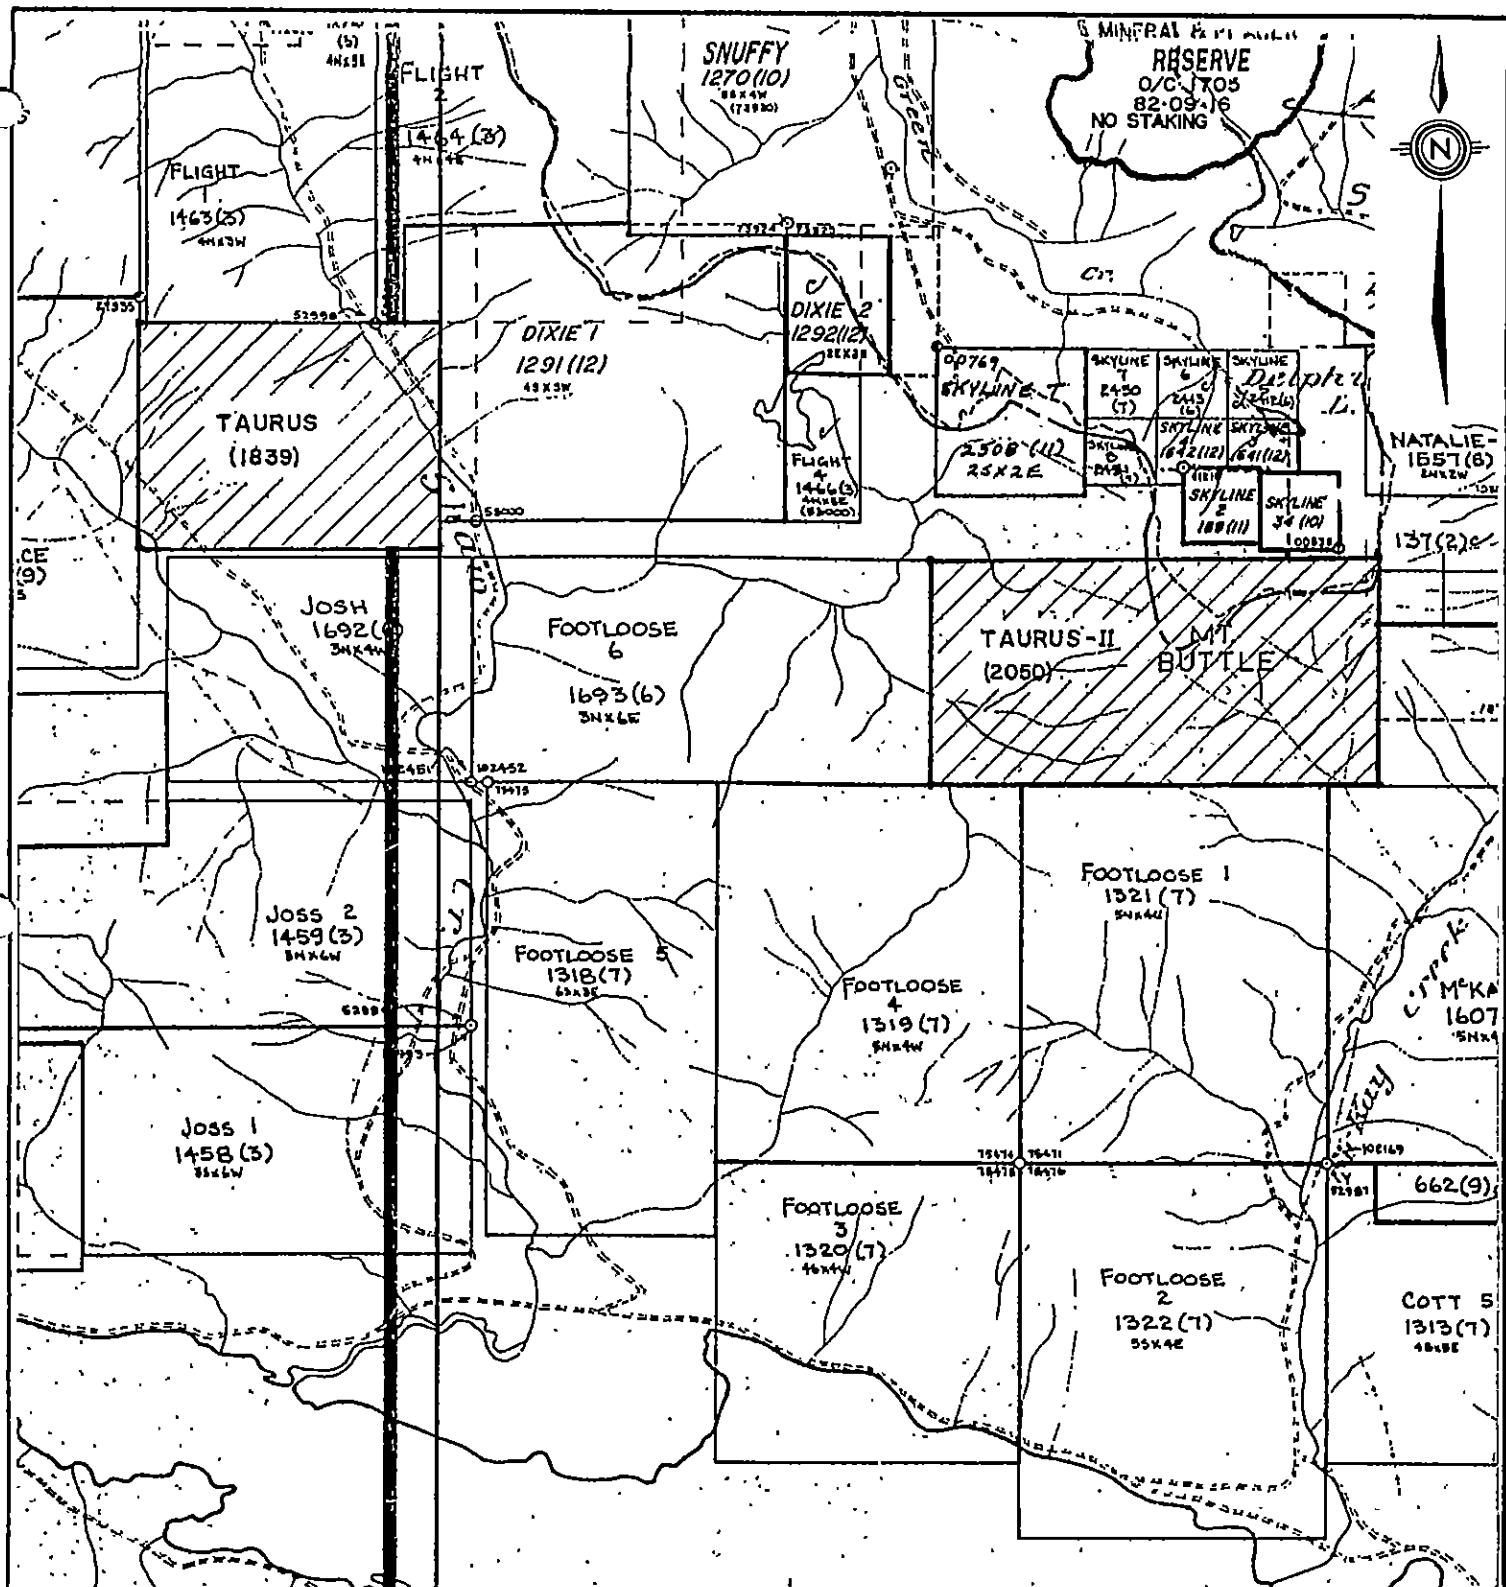

The property comprises two non-contiguous mineral claims, (Figure 2) as follows:

<u>Claim</u>	<u>Record No.</u>	<u>Units</u>	<u>Record Date</u>
Taurus	1839	12	March, 1987
Taurus II	2050	18	November, 1987

The claims are wholly-owned by Black Gold Resources Inc., 1012 - 409 Granville Street, Vancouver, B.C., V6C 1T2.

History

As early as the turn of the century, the area north of Mount Buttle has been the site of prospecting for gold, copper and molybdenum. The Delphi group some two kilometres north of Mount Buttle has been explored by shallow shafts and short adits. Other mineral showings in the immediate area are the Allies group having been explored for copper and molybdenum since the early 1900's and more recently the Close group having been explored for molybdenum as late as 1978 (Figure 3). No previous work has been recorded on the Taurus claims although their staking is connected to the resurgence of exploration in the general area prompted by the recent discovery of gold-bearing massive sulphide deposits in the so-called Sicker Group.

GEOLOGY

General Comment

The Taurus Property lies within the Sicker Group. In the Cowichan Lake area, the Sicker Group comprises a thick succession of Paleozoic volcanics and sediments including limestone and cherts, occurring in a wide northwesterly arcuate belt, extending northwards from Duncan in the south for nearly 160 km towards and past Port Alberni in the north. Within the Sicker Group lies a great number of precious metals showings which have been the subject of intensive investigation by different mining companies.

Local Geology

The most recent map of the Cowichan Lake area (J.E. Muller, 1982) shows the Taurus claim underlain by the Lower Devonian Myra and Nitinat Formations of the Sicker Group (Figure 3). The Nitinat Formation (PN) consists of commonly agglomeratic basalts containing pyroxene phenocrysts and amygdules. The Formation includes local interbeds of layered to massive dark-coloured tuff. The Myra Formation (PM) overlies the Nitinat and consists of well-bedded, mainly light-coloured silicic tuff and breccia interbedded with black argillite and some greywacke. Elsewhere outside the Taurus claim the Sicker Group is unconformably overlain by the Triassic Karmutsen Formation. The Karmutsen consists of pillow basalts, breccia, tuff and minor flows.

The dominant structural trend is northwesterly with generally

steep dips, consistent with the existence of numerous major faults in the immediate area.

The occurrence of numerous precious metals showings in the Sicker Group is well documented. The main effort by the various companies in the area appears directed towards the search for stratiform volcanogenic massive sulphide deposits such as the Lara deposit near Duncan currently being explored by Laramide Resources Ltd and Abermin Corporation. Drilling to date on the Lara deposit has outlined a massive sulphide type zone over a strike length of 1500 m with significant values in copper, lead, zinc, gold and silver. Closer to the Taurus claim, Fyles (1955) recognized three types of gold-bearing deposits, vis., copper-skarn, quartz-sulphide veins and shear zones. Noteworthy of the copper-skarn type is the old Comego Property 24 km southeast of the Taurus claim. For the quartz-sulphide vein type deposits the Allies, Close and Delphi groups north of Mount Buttle are given as examples. Only the Delphi is known to contain gold. The shear zones appear to be the most important for gold mineralization. The most noteworthy shear zone type of deposit was the Silver Leaf near El Capitan Mountain some 13 km southeast of the Taurus claim.

No mineral occurrence has previously been reported on the Taurus property. However, a number of gossan zones were observed along in the road cuts during the writer's initial examination of the claim. Fresh rock from the gossan zones

were found to contain fair amounts of pyrite and some chalcopyrite.

GEOCHEMISTRY AND GEOPHYSICS

Grid Establishment

Gridding was restricted, due to poor weather, to the western half and the southeastern corner of the claim. The location and configuration of the baselines were dictated by the topography. The cross lines spaced every 100 metres were corrected for slope.

Soil Sampling

Soil samples were collected every 25 metres from the "B" horizon at depths between 15 to 30 cm and place in wet-strength kraft envelopes. The samples were delivered to Acme Analytical Laboratory in Vancouver where they were analysed for Cu, Pb, Zn, Ag, As and Au. The analytical results are appended in the report and are plotted in Figures 4, 5, 6, 7, 8 and 9.

Magnetometer and VLF-EM Survey

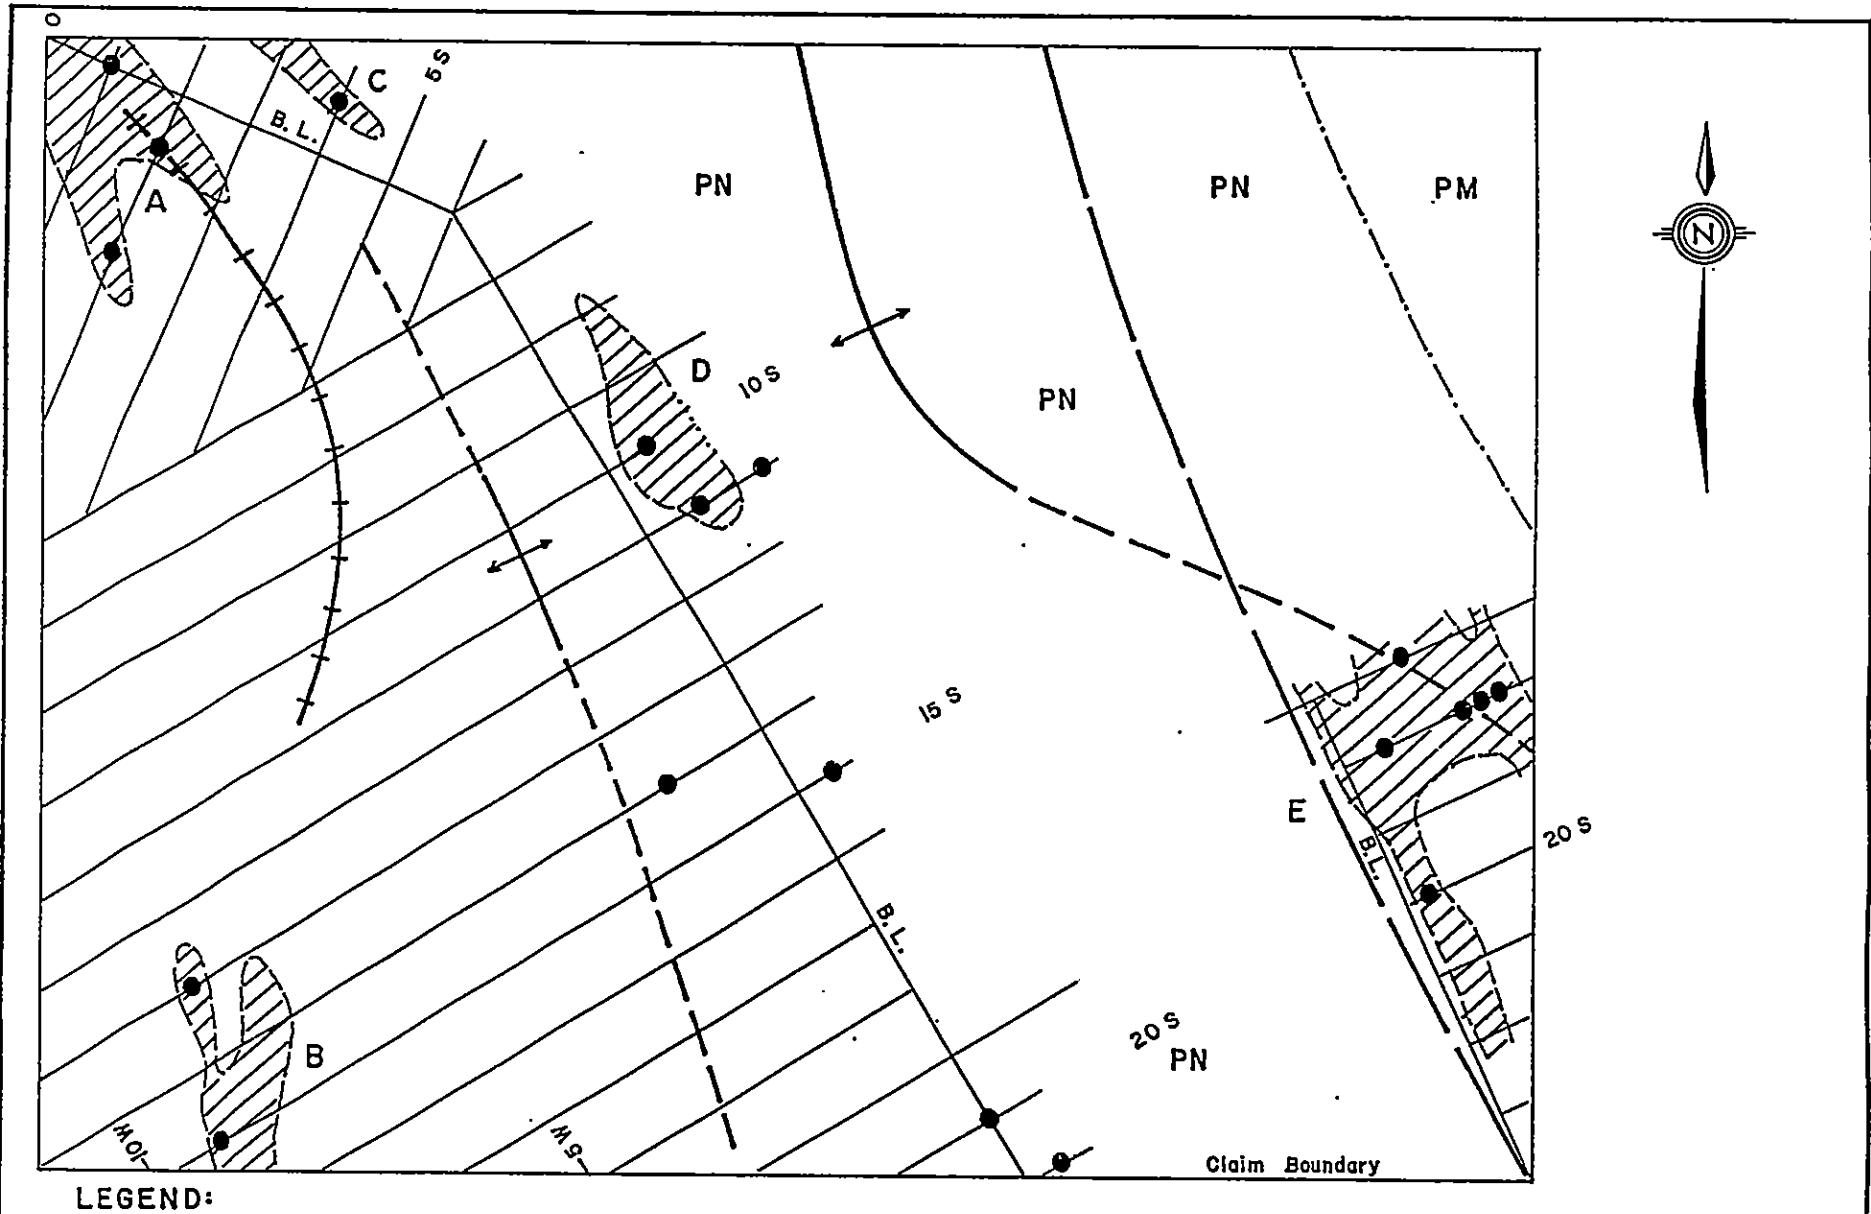

An airborne survey was carried out on the property which was farmed out to Western Geophysical Aero Data Ltd. of Richmond, B.C. The procedures and results of the survey are contained in a separate report by Western Geophysical and is a part of this submission.

DISCUSSION OF RESULTS

Five areas of elevated gold values are indicated within the

surveyed area (Figure 10). Although the amount of gold in soils are not spectacularly high, the anomalous areas have been defined on the basis of gradual increases in gold values from a background of 10 ppb to anomalous values of greater than 40 ppb. Anomaly A at the northwest corner of the claim is coincident with an intense VLF-EM anomaly. However, the EM anomaly may be due to topographic effects.

Anomalies C and D and including the single station anomalies at lines 15S, 20S and 21S appear to define a single major mineralized zone striking northwesterly and parallel to the dominant regional trend. Anomaly E, which at its widest section exceeds 200 metres has not been completely defined by soil geochemistry and could only be a part of a more extensive anomalous zone related to the major fault along Shaw Creek.

CERTIFICATE

I, Ruben S. Verzosa, of Langley, British Columbia, hereby certify that:

1. I am an independent Consulting Geologist with an office at 23064 - 50th Avenue, Langley, B.C., V3A 7N6.
2. I am a graduate of the University of the Philippines with the degree of Bachelor of Science in Geology (1957).
3. I have been a member of the Association of Professional Engineers of British Columbia since 1970.
4. I have been practicing my profession as a geologist for more than 25 years.
5. I do not have any interest nor do I expect to receive any interest in the property or securities of Black Gold Resources Inc.
6. This report is based upon a study of all available data on the property and upon personal observations while on the property.
