## INTRODUCTION

## Location, Access, and Physiography

The Cabin and Goats claim groups axe located approximately 320 kms . northwest of Prince George, B.C. at 56 12' 57" North latitude, 125 05' 55" West longitude, and 56 11' 13" North latitude, $12501^{\prime}$ 50" west longitude, respectively (Figure 1).

Although the Omineca road is only 5 kms . to the southwest, access at present is by helicopter only. On the Cabin claims, the cat road that parallels Jim May Creek and ends at the old cabins is not serviceable.

The Cabin group (Cabin, Cabin \#1, and Cabin \#2 claims) is situated on Jim May Creek, a tributary of Tenakihi Creek, which flows into the Osilinka River. The Goats group is located 7 kms to the southeast near the head of Jim May Creek (Figure 2).

The claims iie in the Tenakini Range of the Central plateau and Mountain area of the Canadian Cordillera. The area is rugged with elevations from 1260 to 2020 metres a.s.I.

Rock outcrop is good to excellent.

## Property Claim Status

The Cabin and Goats claim groups are owned by J. Mirko of 451 Hermosa Ave., North Vancouver, British Columbia, and Douglas Hopper of Vancouver, B.C. with details as follows:
GROUP CLAIM UNITS RECORDNO. RECORD DATE

## PROPERTY HISTORY

Prospecting has been active in the area since the turn of the century when placer gold deposits were worked on Jim May Creek and on the Ingenika River. Prospecting and drilling was carried out by Cominco in the 1930's and 1940's; a few other major and funior companies have been active in the area since then. No economic ore bodies have been developed to date.

## EXPLORATION PROCEDURE

Field work was carried out by Doug Hopper, prospector, and John Sveen, assistant, from July 17 to July 28, 1987, with two property examinations by C. McAtee during the work program.

Prospecting, rock chip sampling, mapping of veins and alteration zones, and soil-silt sampling were carried out on the claims. "B'horizon soil samples were taken at $15-30 \mathrm{~cm}$

## Cabin Claim Group

On the Cabin claim group, 4100 metres of line was flagged for geochemical soil sampling. The lines as well as the soil sample locations are shown on Figure 3a. Soil samples, and silt samples where applicable, were taken every 50 metres along the lines. The samples, 133 in all, were analyzed using the 30 element ICP package of Acme Analytical Laboratories ' (Appendix 1). Gold was determined by standard atomic absorption technique.

Twenty-seven rock chip samples were taken for assay and analyzed using the same methods as for soils. Several of the old showings were prospected and sampled, as were several new ones (Figure 3a and 3b).

## Goats Clatm Group

On the Goats claim group, 19 rock chip samples and 7 silt samples were taken on a reconnaissance program (Figure 4). These samples were analyzed as above.

## REGIONAL GEOLOGY

The Cabin and Goats claim groups occur within the 1:253,440 scale Aiken Lake map area (Roots, 1954).

Regionally, Tenakihi Group metamorphic rocks, Takla Group sedimentary and volcanic rocks, and unnamed interbedded volcanic and sedimentary rocks are intruded by Omineca intrusives of Mesozoic age. Northeast of Blackpine Lake, Wolverine Complex amphibolites, quartzites, and skarns are present.

Structurally, beds of the Tenakihi Group have been deformed into a series of compound folds that have overwhelmed earlier more north-trending folds. Northwesterly faulting plays a major role in localizing mineralization both regionally and locally.

## PROPERTY GEOLOGY, MINERALIZATION, AND RESULTS

## Cabin Claim Group

 GeneralThe Cabin claim group covers Tenakihi Group rocks near the head of Jim May Creek (Figure 2). On the claim group, Tenakihi rocks consist of highly contorted quartzites and quartz-

mica schists on a major regional anticlinal structure.
The mineral showings occur in a series of siliceous brecciated fault or shear zones, along which there has been repeated movement and deposition of vein quartz and sulphide minerals. At least four periods of mineral deposition are known (Roots, 1954).

Numerous quartz veins from 91 to 457 cms . wide, and from 30 to 91 metres long are exposed. The largest body of vein quartz found in the whole map area is on the claims and covers an area 183 by 55 metres. Most of the latter veins are not mineralized to any extent, although crosscutting veins such as the "Ruby" are.

Ruby Zone
The Ruby zone, which is exposed on Jim May Creek about 6.4 kms. from it's mouth and 550 metres east of the old cabins, was prospected and rock chip sampled (Figure 3a and 3b). The general axis of the Ruby zone strikes $N 20 \mathrm{E}$ over a distance of 150 metres.

The quartz veins, which are brecciated and faulted in argillite host rocks, display a herring-bone type of structure. Vein widths vary from 15 cms. to 8.2 metres and generally carry <1/2\% pyrite and other sulphides, as well as mica and graphite. According to Roots (Roots, 1954), minerals recognizable in hand specimen include pyrite, sphalerite, galena, tetrahedrite, pyrargyrite, arsenopyrite, and minor amounts of molybdenite and chalcopyrite.

Rock chip samples numbered 2105 to 2121 and 2127 were taken from the Ruby vein zone (Figure 3b). Figure 5 summarizes assay results, widths, and mineralization from the Ruby vein zone.

Gold values of 710 and 390 ppb over 165 and 132 cms., respectively, were obtained for brecciated quartz veins striking 240 (\#2108 and \#2127). Silver values of 44.4, 30.0, 19.0, and 17.9 ppm were obtained from brecciated and non-brecciated quartz vein material. Arsenic values of 2152, 2183, 4259, and 4516 ppm were returned. Mineralization observed in the vein quartz includes 1/2-1\% pyrite, galena, and up to $40 \%$ soft grey (sulphide?) material.

Cabin \#1 Showing
This zone is near a small creek at grid co-ordinates 12+00E, 2+00s, 200 metres north of Jim May Creek (Figure 3a). There are a series of quartz veins trending 140 to 160 with pyrite patches and some grey unidentifiable material. The quartz veins, which cut the bedding and fill fracture gaps, are 6 to 13 mms., and up to 30 cms. wide.

Assay samples numbered 2121 to 2125 were taken from the area (Appendix 2). Rock chip sample $\# 2123$, from a 5 to 10 cm wide pyrite stringer, assayed 11 ppb gold, 22.4 ppm silver, and 1335 ppm lead.

Geochemical soil Survey - CAB Grid
The reconnaissance geochemical soll survey program proved effective. Several low but anomalous values were found for $\mathrm{Pb}, \mathrm{Zn}, \mathrm{As}, \mathrm{Ag}$, and Au (Figures 6 and 7). A spot high value

0 Bx- quartz breccia

C $\because$
of 185 ppb gold at $4+50$ West on the baseline was returned.
Four anomalous silver values of 0.8 to 1.2 ppm suggest a quartz vein which carries silver trending 051 over 700 metres (Figure 6).

## Goats Claim Group

Rocks on the Goats claim group area similar to those observed on the Cabin group. Schists predominate.

Figure 4 shows the rock chip and silt sample locations. Figure 8 and Appendix 3 list assay results, vein widths, and mineralization.

On southwestern Goats claim, a 12 metre wide quartz breccia zone trends in a northerly direction (\#2141 to \#2146). Some cherty fragments were observed on the eastern contact, with pyrite and darker coloured fragments towards the centre of the zone. Assay values range to $245 \mathrm{ppb} A \mathrm{Au}^{2} 15.7 \mathrm{ppm} \mathrm{Ag}, 962 \mathrm{ppm} \mathrm{Pb}$, and 1424 ppm As for the zone.

Some 900 metres to the northwest, a quartz breccia zone identical in appearance to the one mentioned above was found. Here, a recemented quartz breccia and shear zone ran 58 ppb $A u$, $11.6 \mathrm{ppm} \mathrm{Ag}$,1355 ppm pb , and 156 ppm As over 61 cms . (\#2133).

Silver assay values of $6.7,8.6$, and 4.9 ppm were returned from a quartz vein in a shear (\#2138) and quartz breccia zone (\#2139 and \#2140). Anomalous lead and arsenic values were also found in the quartz breccia zone (Figure 11).

Silt samples taken in the Goats camp area returned fair zinc values of 161 to 462 ppm.

The 1987 program on the Cabin and Goats claim groups was successful.

Assays show a fair silver and anomalous gold content across relatively large widths. Soil and silt sampling provide a good tool in this terrain.

Recommendations for further work include:

1. Reconnaissance prospecting, rock chip sampling, and silt sampling on the Cabin \#1, Cabin $\# 2$, Cabin 38 , Cabin $\# 39$ and southern part of the Cabin claim.
2. Diamond drilling on the Ruby vein zone.

## QUALIFICATIONS

I, CHRISTOPHER L. MCATEE, certify that:

1. I am a minerals exploration geologist.
2. I am a graduate of Brock University, St Catharines, Ontario with a degree in geological Sciences (M.Sc., 1977), and a graduate of Wright State University, Dayton, Ohio, with a degree in Geology (B.Sc., 1972).
3. I have spent the past ten years in mineral exploration and development in Canada and the United States.
4. I personally examined the property and directed the geophysical program conducted by Skylark Resources Ltd. in 1987.

Vancouver, B.C.
April, 1988

Christopher L. McAtee Geologist

## QUALIFICATIONS

I, H. DOUGLAS HOPRER of 828 West Hastings street, Vancouver, B.C., did attend the provincial Institute of Mining, Haileybury, Ontario in the years 1962-1964, 1965 and 1966, for which I am a Mining Engineering Technologist.

Since 1966, I have worked with various mining companies as Field Geologist, Junior Engineer, looking after diamond drilling projets, underground mining exploration and surface wxploration.

DATED at Vancouver, British Columbia, this 23rd day of March, 1988.
