INTRODUCTION

This report describes a geochemical follow-up survey completed on Wood 1-3 claims located 60 kilometres due east of Williams Lake, B.C. Work consisted of stream sampling, establishment of an extensive grid from which soil samples were collected and heavy mineral stream sediment sampling. Reconnaissance geological mapping was undertaken, however lack of outcrop precluded detailed geological evaluation.

The writer outlined and supervised the work program which was carried out by geologist B. Fraser.

WOODJAM PROPERTY

Location and Access

The Woodjam property is located 55 kilometers East of Williams Lake, B.C. (see Figure 1). The nearest settlement is the village of Horsefly, B.C., 15 kilometers to the NNW.

Access from Horsefly is South via good gravel road for 23 kilometers and thence East for 15 kilometers on the Moffat Lake logging main for 15 kilometers to the 2500R turnoff. The secondary logging road heads North for 6 kilometers to a logging show along the Southern boundary of Wood 3 claims. Travel time is about 1.25 hours from Horsefly.

B.H.Kahlert & Associates

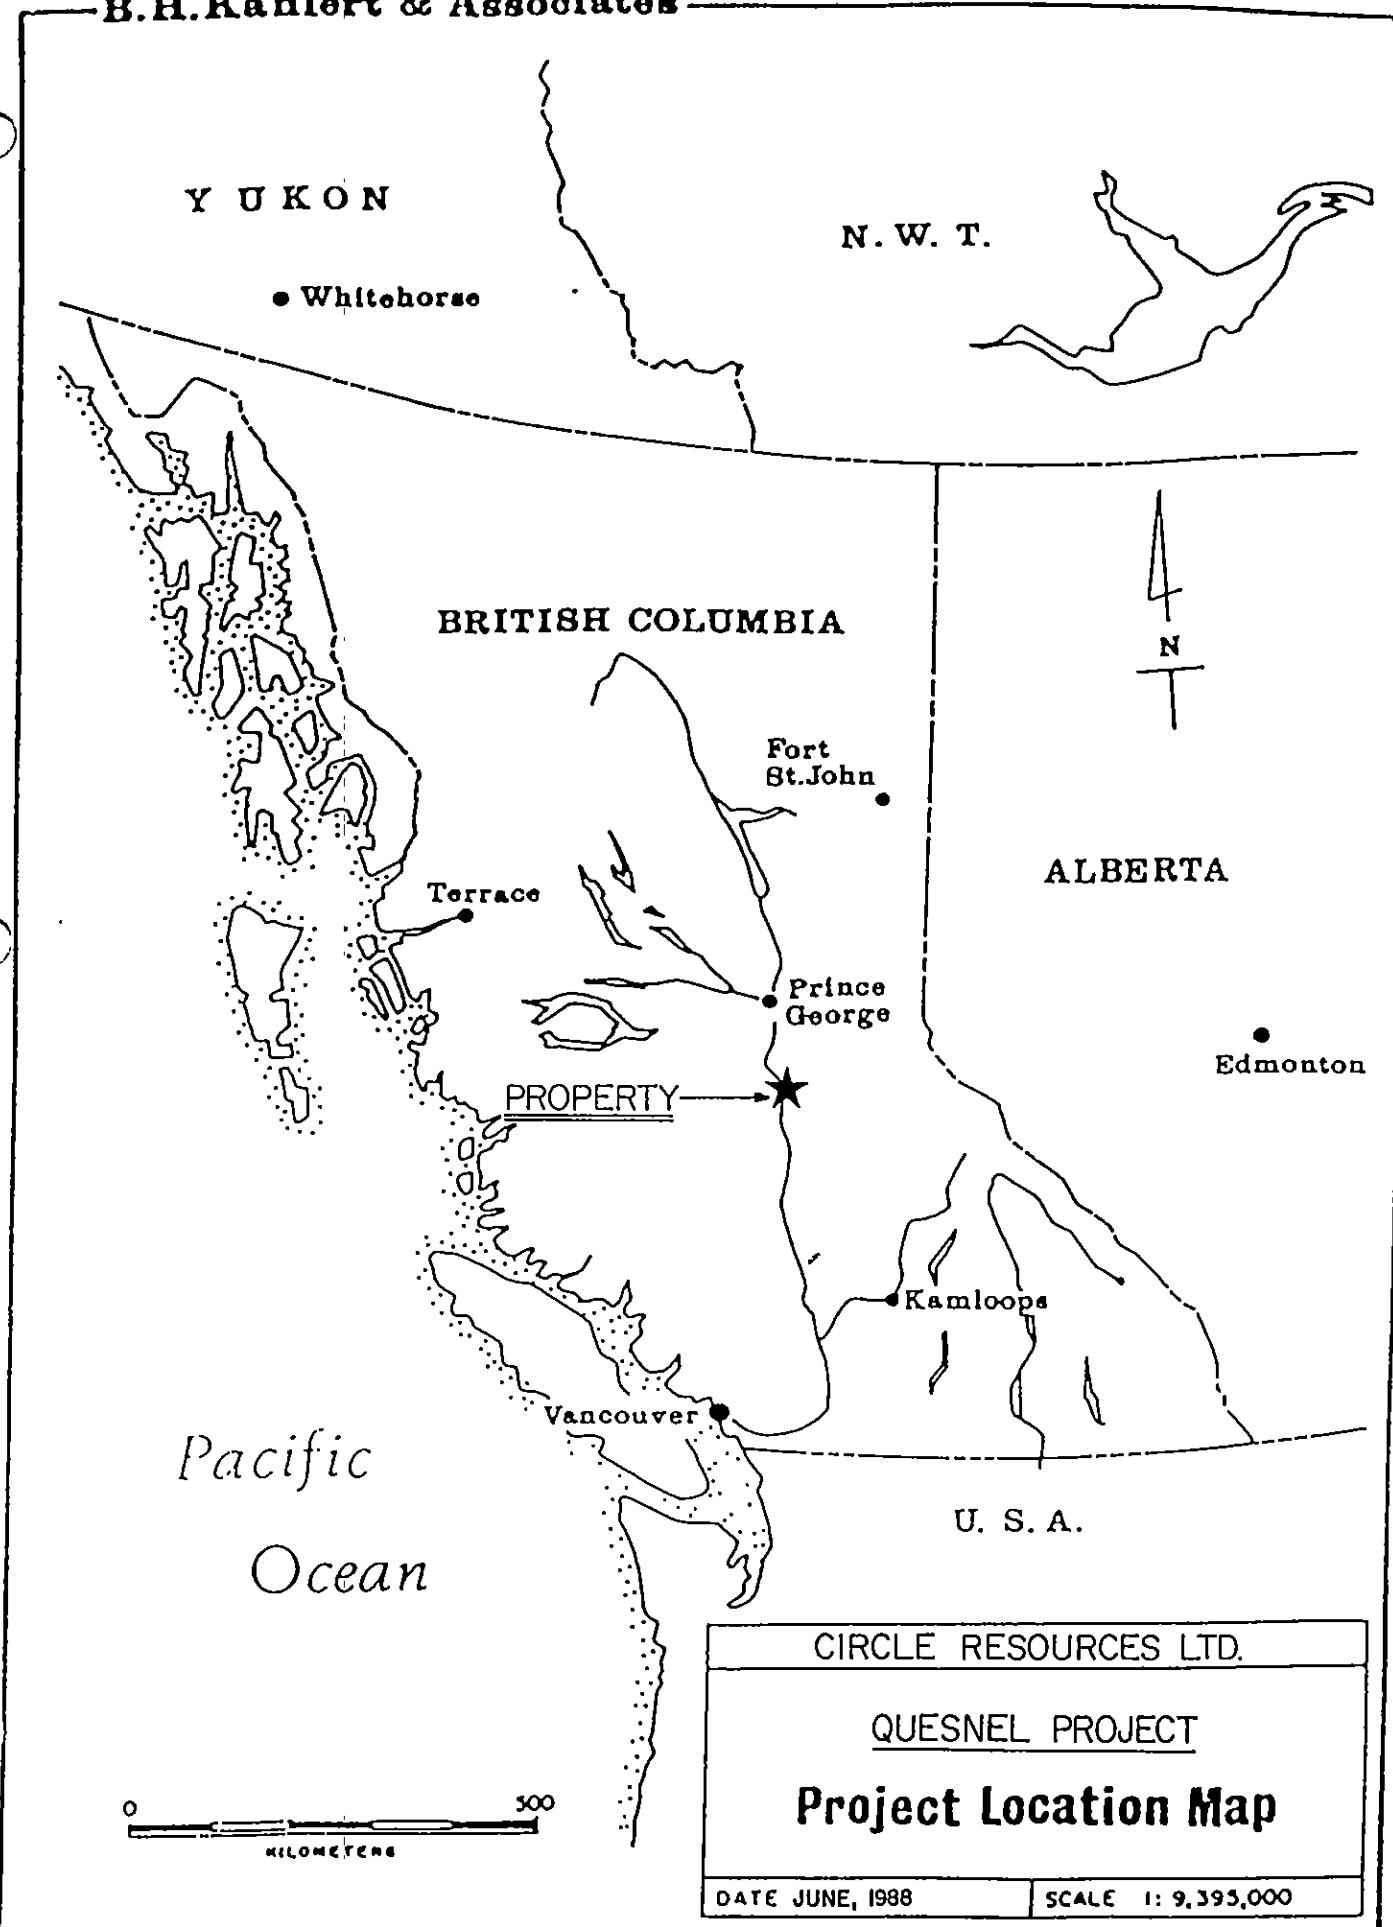

Figure 1

Alternate access is by following the Moffat Lake logging main for 55 kilometers from 150 Mile House (18 km. South of Williams Lake on Highway 97). Travel time is roughly 45 minutes from 150 Mile House.

Claim Description *previous exploration on the property
is not known.*

The Woodjam property consists of 3 mineral claims, in total 54 units (13.5 sq. km.) situated at Latitude 52 degrees 13 minutes, Longitude 121 degrees 18 minutes in the Caribou Mining District of British Columbia (see Figure E.1).

Table E.1 Woodjam Claim List (N.T.S. 93A/3W)

Claim Name	Record No.	Date of Record	Units
Wood 1	8283	March 5, 1987	18
Wood 2	8284	March 5, 1987	18
Wood 3	8629	September 25, 1987	18
total units			54

Soil Grids

The Woodjam property was staked in response to gold values of from 50 to 200 ppb returned by stream sediment samples on West flowing tributaries to Woodjam Creek. As well, heavy mineral

CIRCLE RESOURCES LTD.

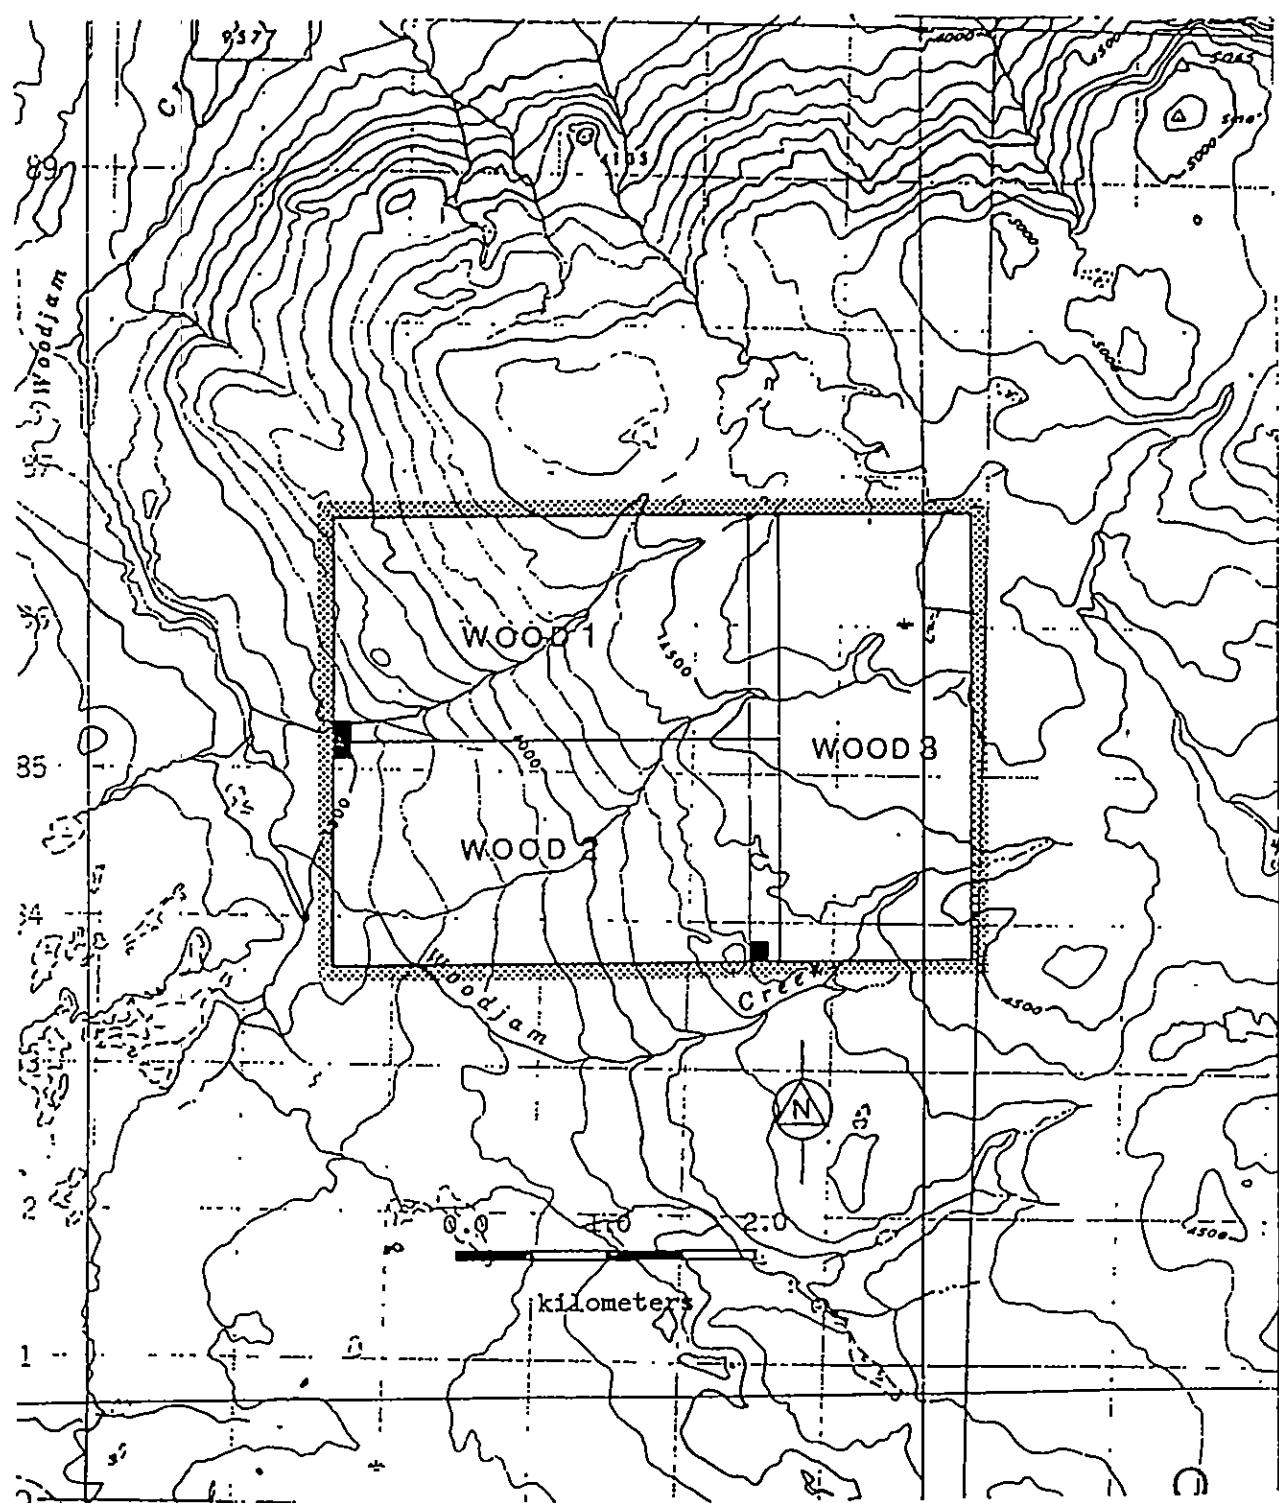

Figure E.1
Woodjam Property
Location Plan (1:50,000)

sampling of the Northern tributary was reported at 4,100 ppb gold in -60 +80 mesh non-magnetic fraction.

A reconnaissance grid was laid out with lines at 200 meter spacing trending 58 degrees azimuth, sub-parallel to the drainage. The grid was referenced from station 5000W-2600N which was fixed at Post 4N of Wood 3. In total, 9 lines of 3,000 meters length were sampled at 50 meter spacing.

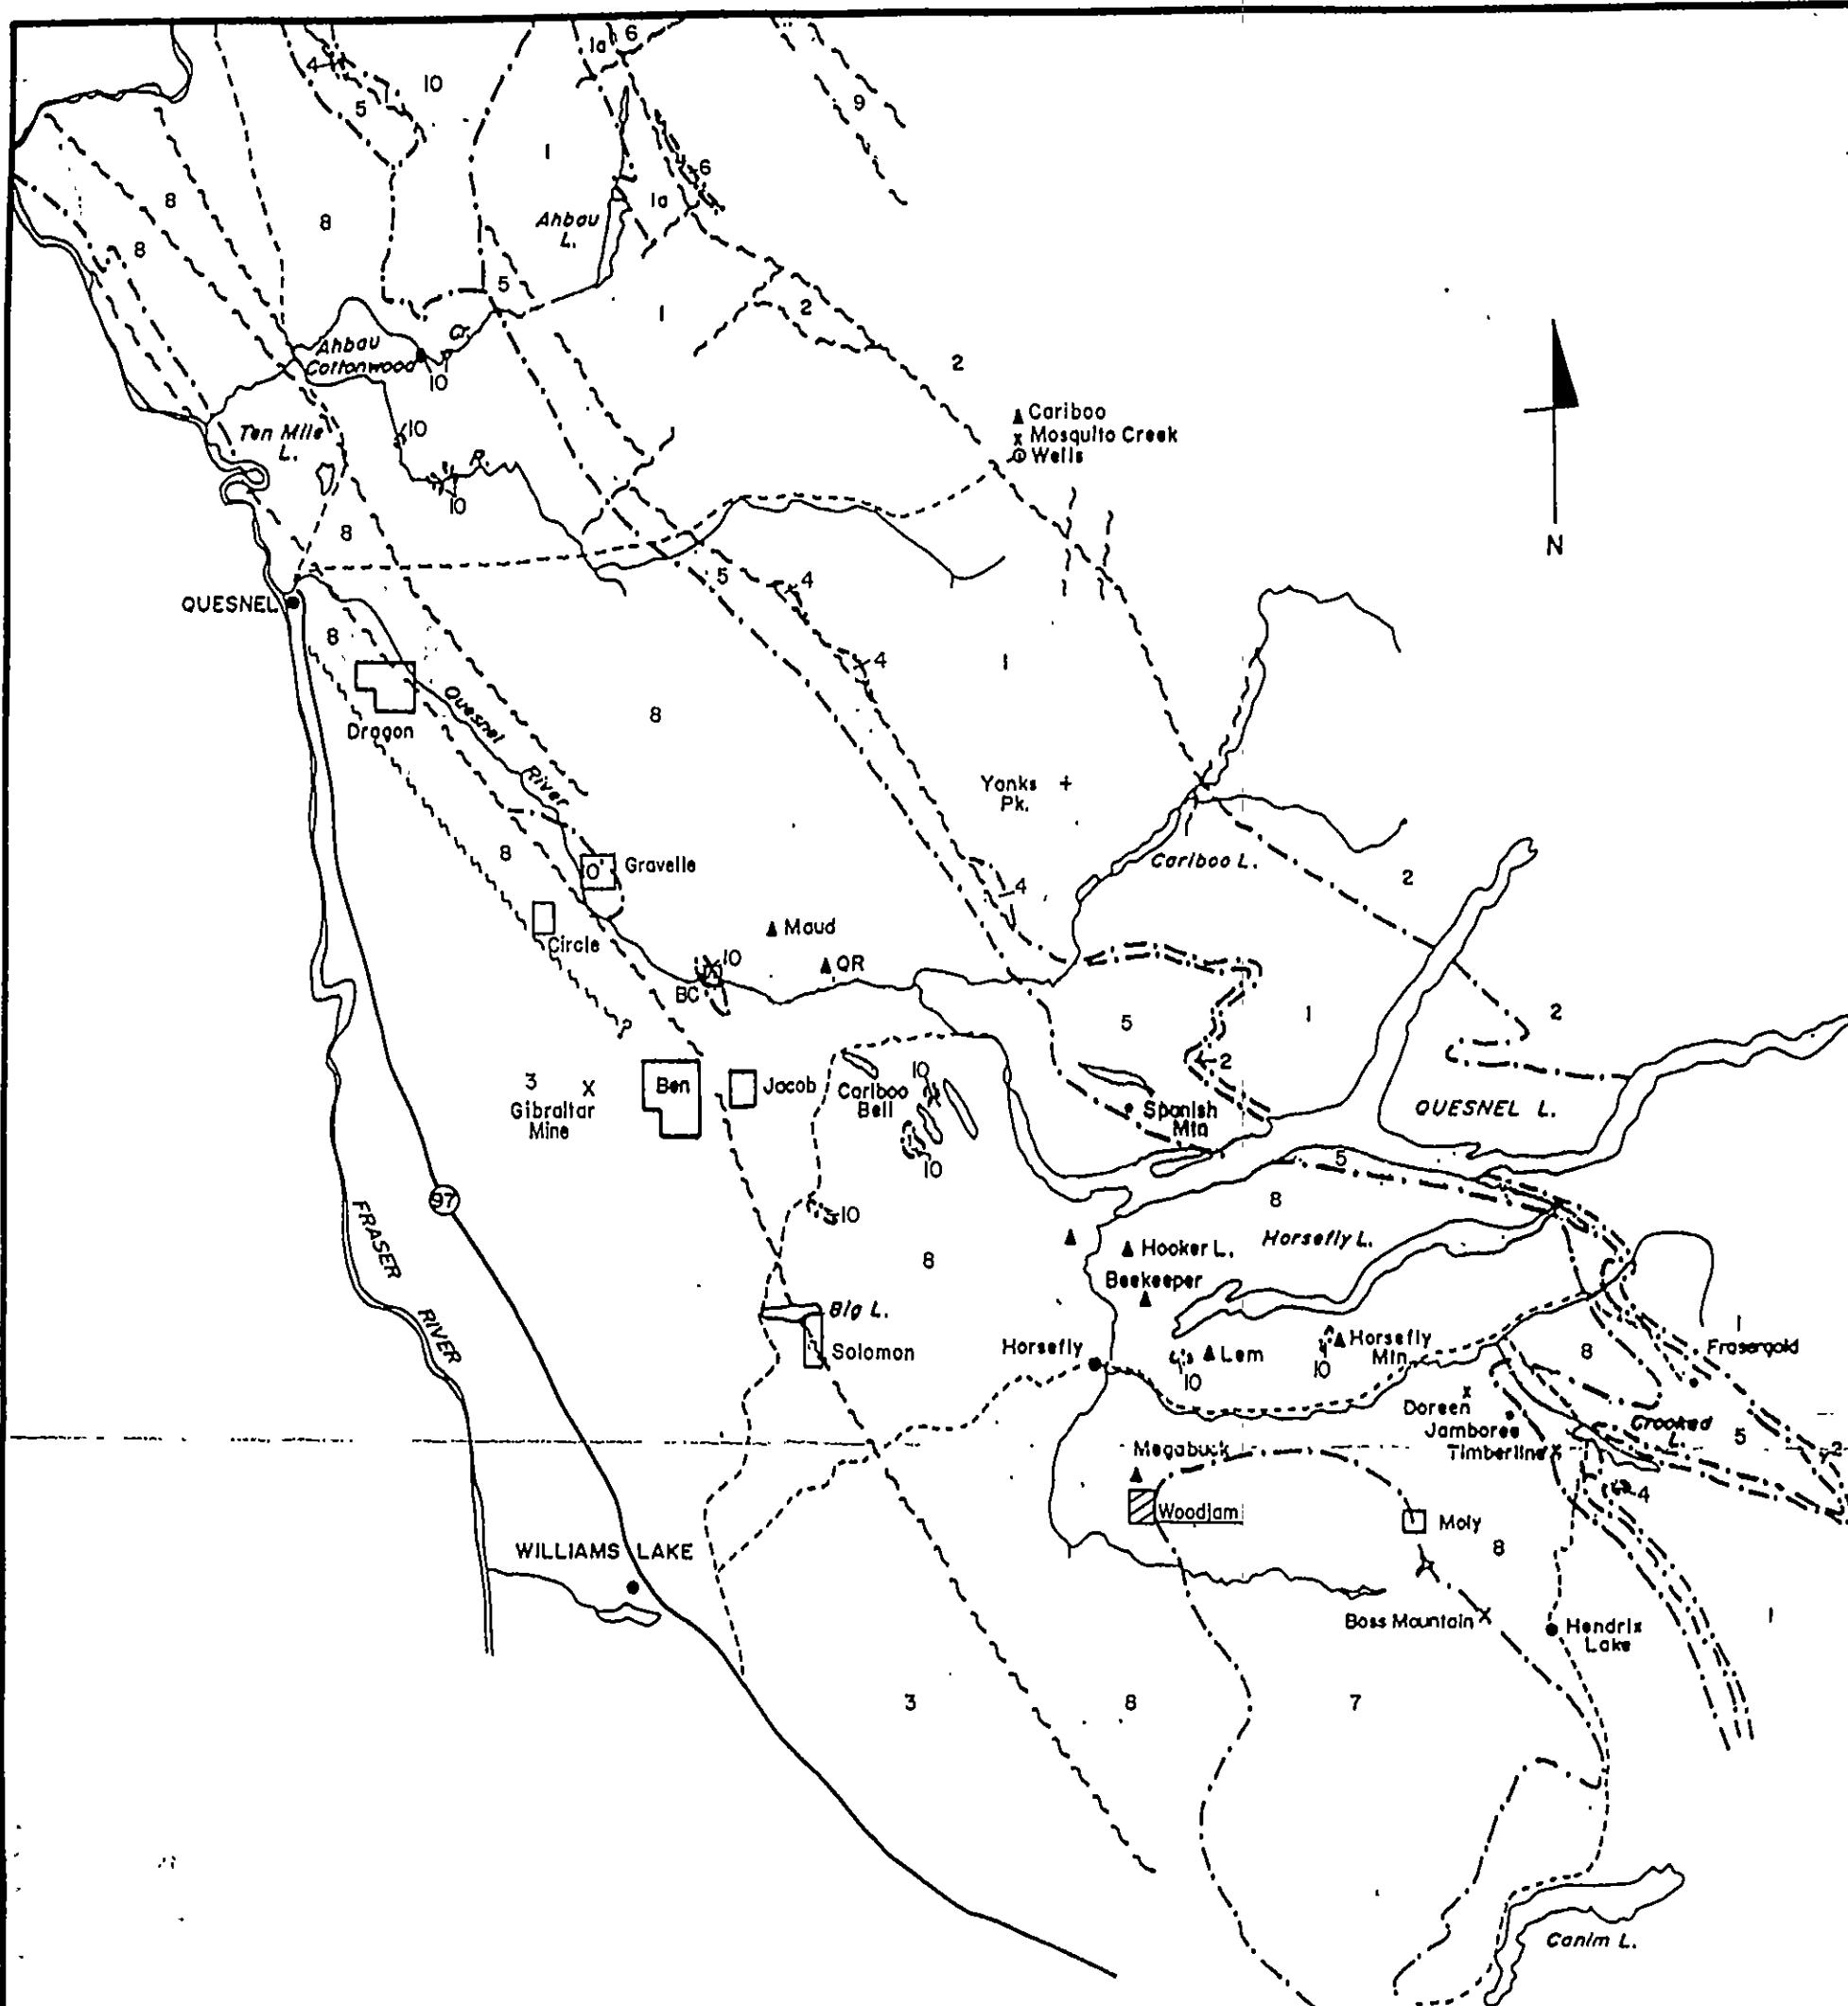

Work included:

- o 33 kilometers of flag lines
- o 531 soil samples *from the 'B' horizon, about 15 to 30cm deep, taken with a grubhoe.*

Geology

The property lies at the Northern margin of the Takomkane Batholith, a composite pluton variable in composition from quartz diorite to quartz monzonite. (Fig. 3, over)

Exposed outcrops were mainly rather fresh looking medium grained hornblende biotite quartz monzonite. Float of pale green tuff with trace chalcopyrite was found in the creeks but it is believed to have been transported from outcrop above 4,500 foot elevation on the plateau to the East of the property.

QUESNEL PROJECT

COMPILATION MAP

Drawn By	Igc	Scale	1:750,000
Date	SEPT. '87	Project No	001

FIG. E.3

On the Northern tributary, Takomkane quartz monzonite is overlain by in part by Tertiary vesicular basalt above 4,000 foot elevation.

Elsewhere much of the property is obscured by a veneer of Pleistocene glacial till.

Prospecting

Woodjam Creek and the two tributaries draining the property were traversed as well as known claim lines. Outcrop noted by soil samplers was also visited. Only five rock samples were collected of which four were of interesting float. Results are given under Rock Geochemistry.

Geochemistry

a. Soils (See Plans E-1, E-2)

A number of anomalous gold soil values are distributed over the property as single point highs, ranging from 20-2,800 ppb gold.

Silver forms a well defined zone of values ranging from 1.1 to 1.8 ppm Ag on the Northern creek between lines 3400N and 4000N and stations 5000W and 6800W. The NE corner of this zone is coincident with enriched arsenic ranging from 18-30 ppm As.

A small silver zone with values ranging from 1.1 to 1.7 ppm Ag occurs on lines 2000N and 2200N between stations 5400W and 5850W.

Antimony from 4-6 ppm forms a consistent zone between lines 2000N and 3000N and stations 5000W and 5300W.

Statistical analysis of soil sample results was carried out. This property was one of nine evaluated; a total of 4,234 soil samples were collected from Quesnellia Terrane properties. All samples were analyzed for Au, Ag, Cu, Pb, Zn, As, Sb. Basic statistical analysis of all samples was completed for comparative purposes and determining threshold and anomalous values. Results of all statistical results and distribution curves are shown in Appendix .

b. Rocks

Float samples indicate that the pyritic tuff package is weakly enriched in Ag (1.5 to 2.7 ppm).

Property Magnetics (See Figure E.2)

Regional 1"-1 mile air mag surveys show broad open contours over most of the property reflecting the uniform character of the underlying Takomkave batholith. The mag high on the Northern

CTRCL.E RESOURCES LTD.

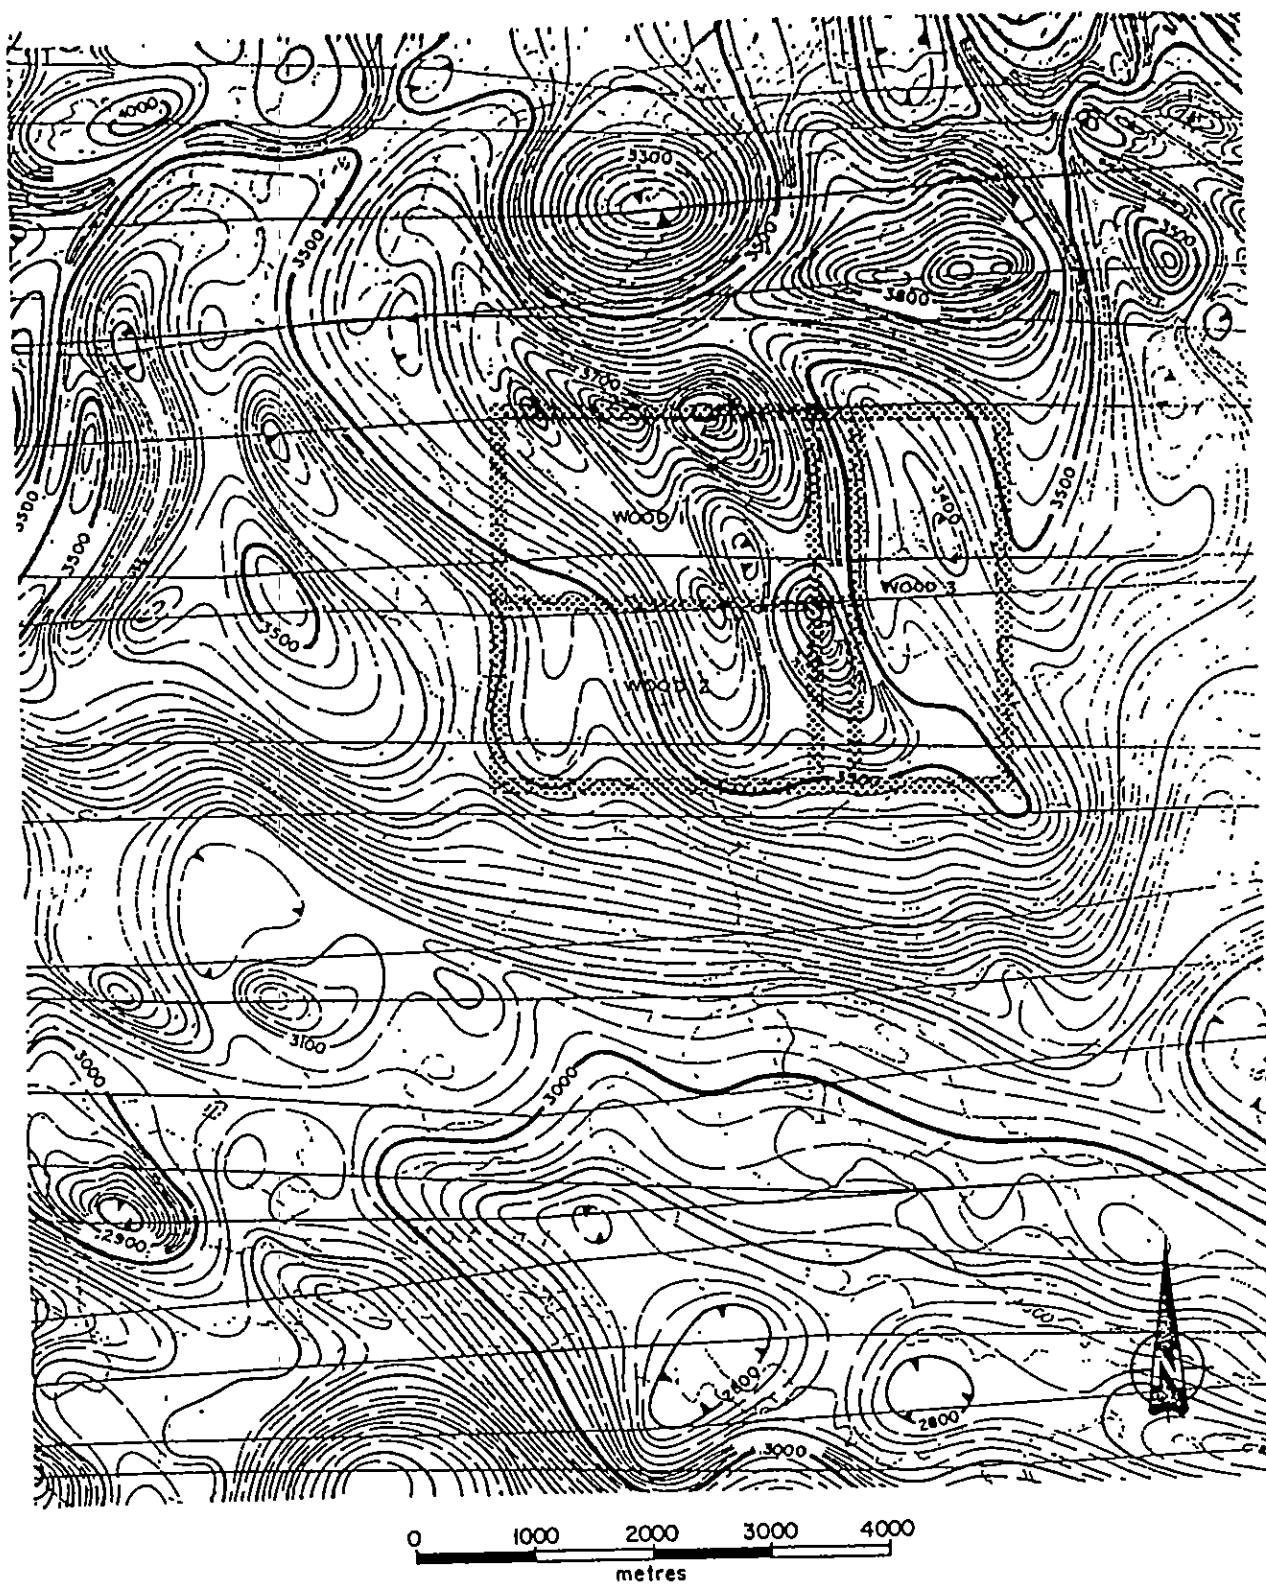

Figure E.2
Woodjam Property
Aeromagnetic Contour Map (1:62,500)

creek can be attributed to Miocene plateau basalt from field work. Active magnetic areas to the North have been mapped by the GSC as intermediate Tertiary volcanics.

Evaluation

Broadly spaced soil sampling at 100 metre intervals on lines separated by 200 metres has returned the following:

- o single point gold highs ranging from 20 to 2,800 ppb Au.
- o a 400 metre wide silver geochemical zones centered on the Northern Creek. The zone extends for roughly 1,000 metres and consists of moderately anomalous values ranging from 1.1 to 1.8 Ag. The NE corner of this zone coincides with enriched arsenic ranging from 18-30 ppm As.

The present survey has not clearly defined the source for 50 to 200 ppb Au silts and the 4,100 ppb Au heavy mineral sample. Isolated gold highs should be followed up with more detailed sampling at 25 metre intervals on lines separated by 50 metres. Fill in lines at 100 metre intervals should be run over the present grid. The grid should be extended to the East with 50 metre sample spacing and 200 metre line separation.

Work Recommended

a. Grid extension to East:

- o 200 metre line separation.
- o 50 metre samples.
- o 16 line kilometres of flag line.
- o 320 samples.

b. Fill-in lines on present grid:

- o 100 metre intervals between present lines.
- o 50 metre sample spacing.
- o 36 line-kilometres of flag line.
- o 720 samples.

c. Detailed sampling of Au highs:

- o 25 metre sample spacing.
- o 50 metre line separation.
- o 100 samples per anomalous Au location.
- o 8 line-kilometres of flag line.
- o 400 samples.

B. H. Kahlert

GOLD GEOCHEMICAL ANALYSIS BY MIN-EN LABORATORIES LTD.

Geochemical samples for Gold processed by Min-En Laboratories Ltd., at 705 W. 15th St., North Vancouver Laboratory employing the following procedures.

After drying the samples at 95°C soil and stream sediment samples are screened by 80 mesh sieve to obtain the minus 80 mesh fraction for analysis. The rock samples are crushed and pulverized by ceramic plated pulverizer.

A suitable sample weight 5.0 or 10.0 grams are pretreated with HNO₃ and HClO₄ mixture.

After pretreatments the samples are digested with Aqua Regia solution, and after digestion the samples are taken up with 25% HCl to suitable volume.

Further oxidation and treatment of at least 75% of the original sample solutions are made suitable for extraction of gold with Methyl Iso-Butyl Ketone.

With a set of suitable standard solution gold is analysed by Atomic Absorption instruments. The obtained detection limit is 0.005 ppm (5ppb).

ANALYTICAL PROCEDURE REPORT FOR ASSESSMENT WORK - FOR WHOLE ROCK ANALYSIS

Samples are processed by Min-En Laboratories Ltd, at 705 W. 15th St., North Vancouver Laboratory employing the following procedures.

After drying the samples at 95°C soil and stream sediment samples are screened by 80 mesh sieve to obtain the minus 80 mesh fraction for analysis. The rock samples are crushed by jaw crusher and pulverized by ceramic plated pulverizer.

1.0 gram of the samples are digested for 6 hours with HNO₃ and HCLO₄ HF mixture.

For those elements which do not yield complete dissolution, a Lithium tetraborate dissolution or potassium hydroxide dissolution is applied.

After cooling samples are diluted to standard volume. The solutions are analysed by computer operated Jarrell Ash 9000 ICP. Inductively coupled Plasma Analyser. Reports are formated by routing computer dotline print out.

Major Suppliers of Goods and Services for Quesnel Project

<u>Supplier</u>	<u>Service</u>
Aurum Geological Consultants 604 - 675 West Hastings Street Vancouver, B.C. V6B 1N2 (604) 683-9656	Geologist Field Assistant
C.J.L. Enterprises Ltd. Box 666 Smithers, B.C. V0J 2N0 (604) 847-3612	Prospector
Bill Chase and Associates Ltd. 1585 - 130th Street White Rock, B.C. V4A 3Z6 (604) 536-2936	Soil Crew
Pacific Northwest Geotech Ltd. 2246 Sifton Avenue Kamloops, B.C. (604) 374-3237 (Kamloops) (604) 689-3122 (Vancouver)	Proton Mag Operator
Valhalla Metal Box 4625 Quesnel, B.C. V2J 3J8 (604) 747-1111	Board
Campbell & Associates Ltd. #8 - 84 Lonsdale Avenue North Vancouver, B.C. V7M 2E6 (604) 985-4588	Petrology Engineering Reports
Rotortech Helicopters Ltd. 4189 - 104th Street Delta, B.C. V4K 3N3 (604) 992-3242 (Quesnel) (604) 591-7174 (Vancouver)	Helicopter (Quesnel)
Northern Mountain Helicopters P.O. Box 368 Prince George, B.C. V2L 4S2 (604) 992-3610 (Quesnel) (604) 398-6322 (Williams Lake)	Helicopter (Quesnel)
Min-En Laboratories 705 West 15th Street North Vancouver, B.C. V7M 1T2 (604) 980-5814	Geochemical Analyses, Supplies

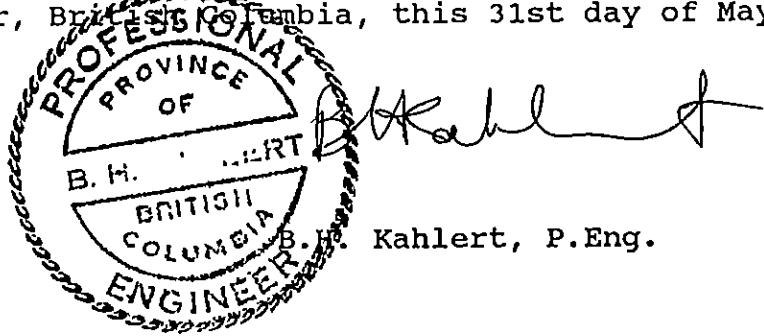

APPENDIX VII

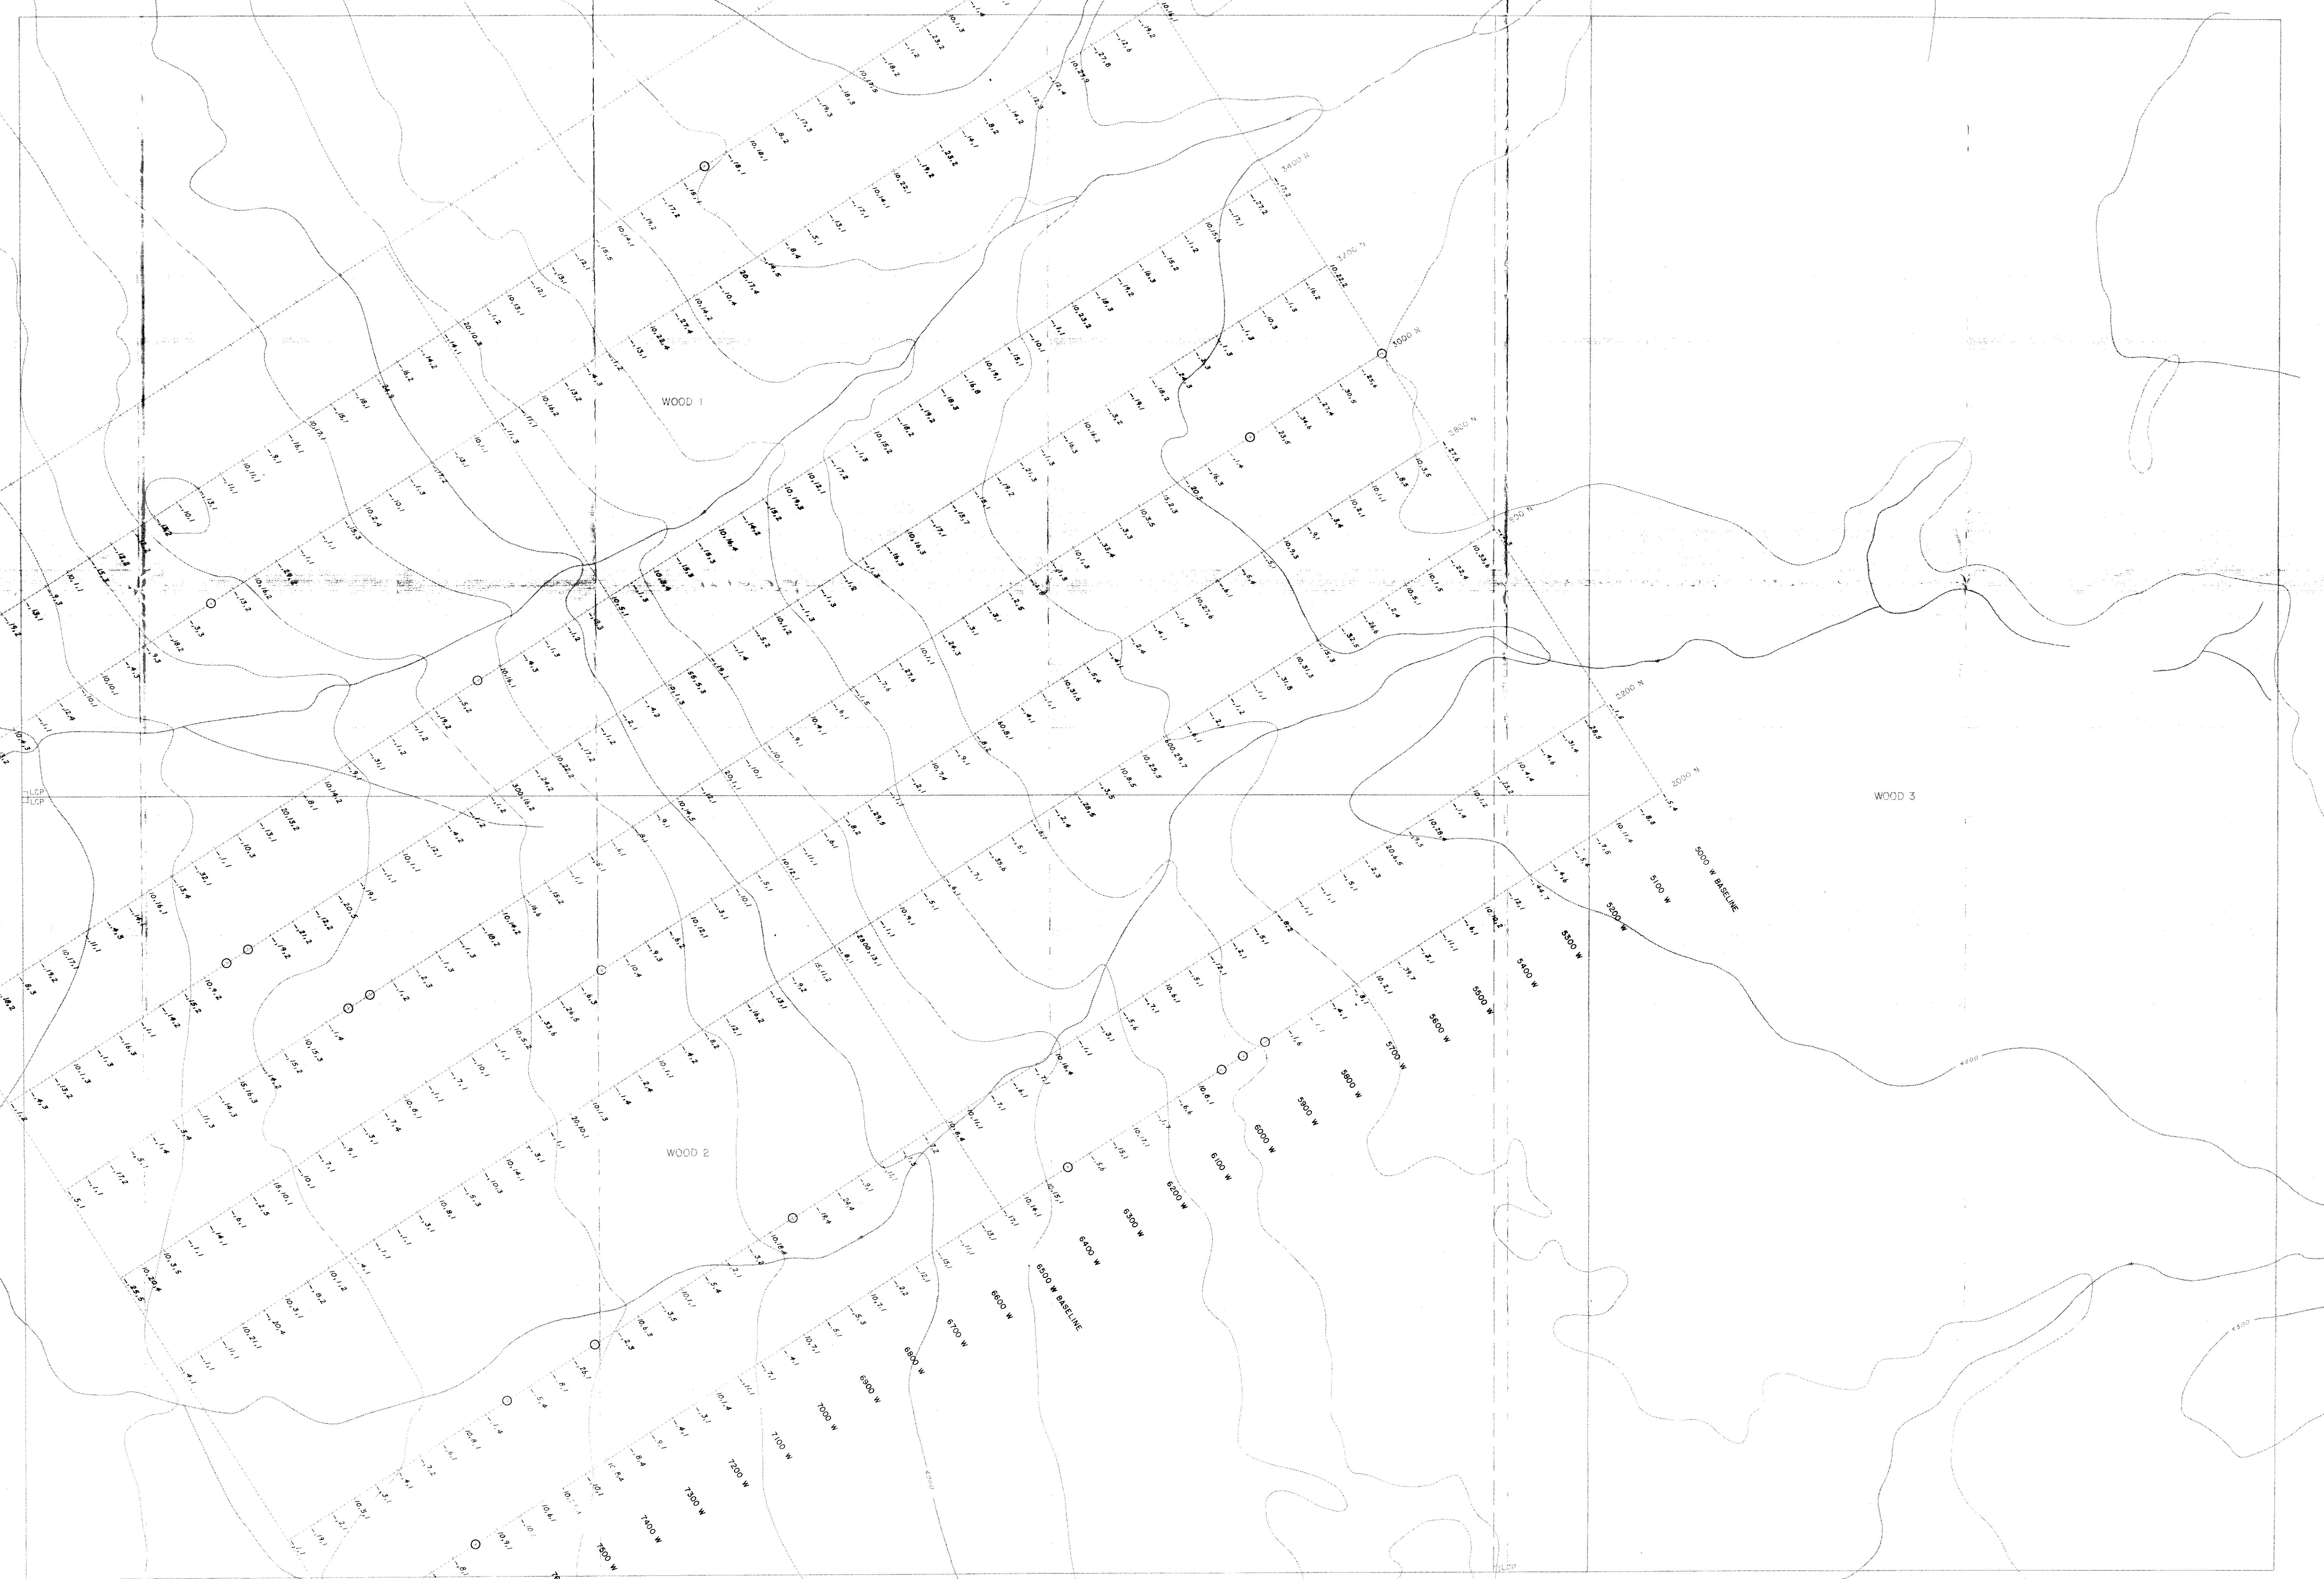

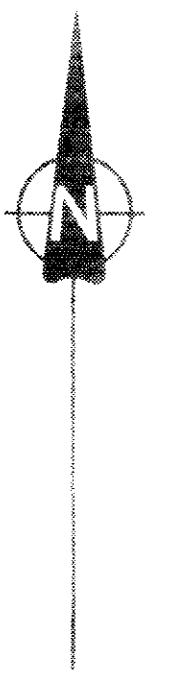

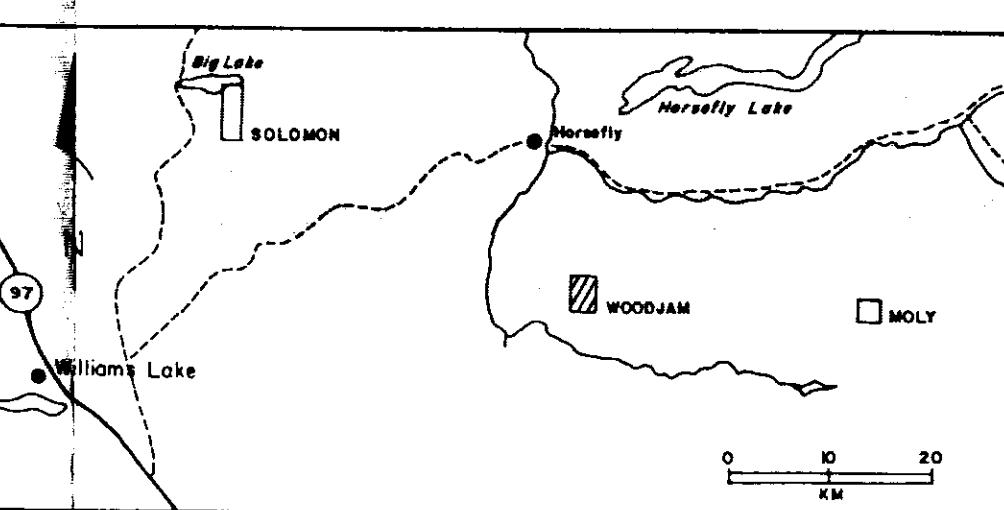

STATEMENT OF QUALIFICATIONS

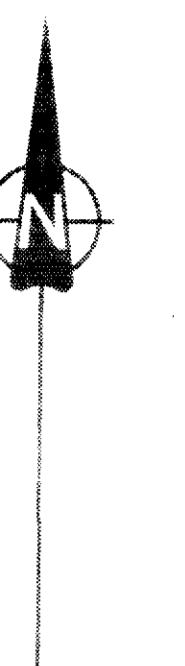

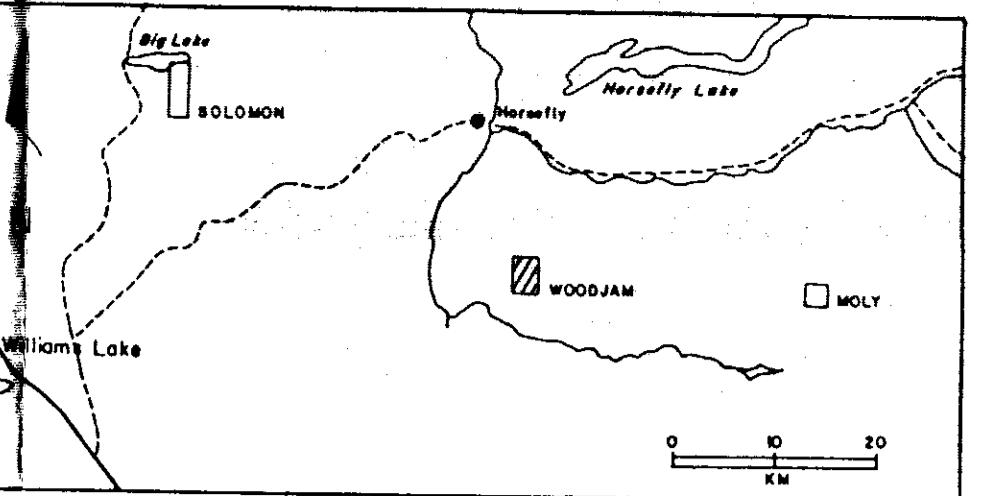

I, Bernard H. Kahlert, of the City of West Vancouver, in the Province of British Columbia do hereby certify that:

1. I am a Consulting Geologist and a principal in B.H. Kahlert and Associates Ltd. with offices at 1195 Sutton Place, West Vancouver, British Columbia;
2. I am a graduate of the University of British Columbia, 1966, with a Degree of B.Sc. in Geology;
3. I was registered with the Association of Professional Engineers of British Columbia in 1971;
4. I have practiced my profession as an exploration geologist continuously for over 22 years in Canada, the United States, Australia and China;
5. I have been employed by major mining, oil and consulting companies;
6. The information in this report was obtained from personal supervision of field operations, review of all results and compiling data for future planned work programs.

DATED at Vancouver, British Columbia, this 31st day of May, 1988.
