### Introduction

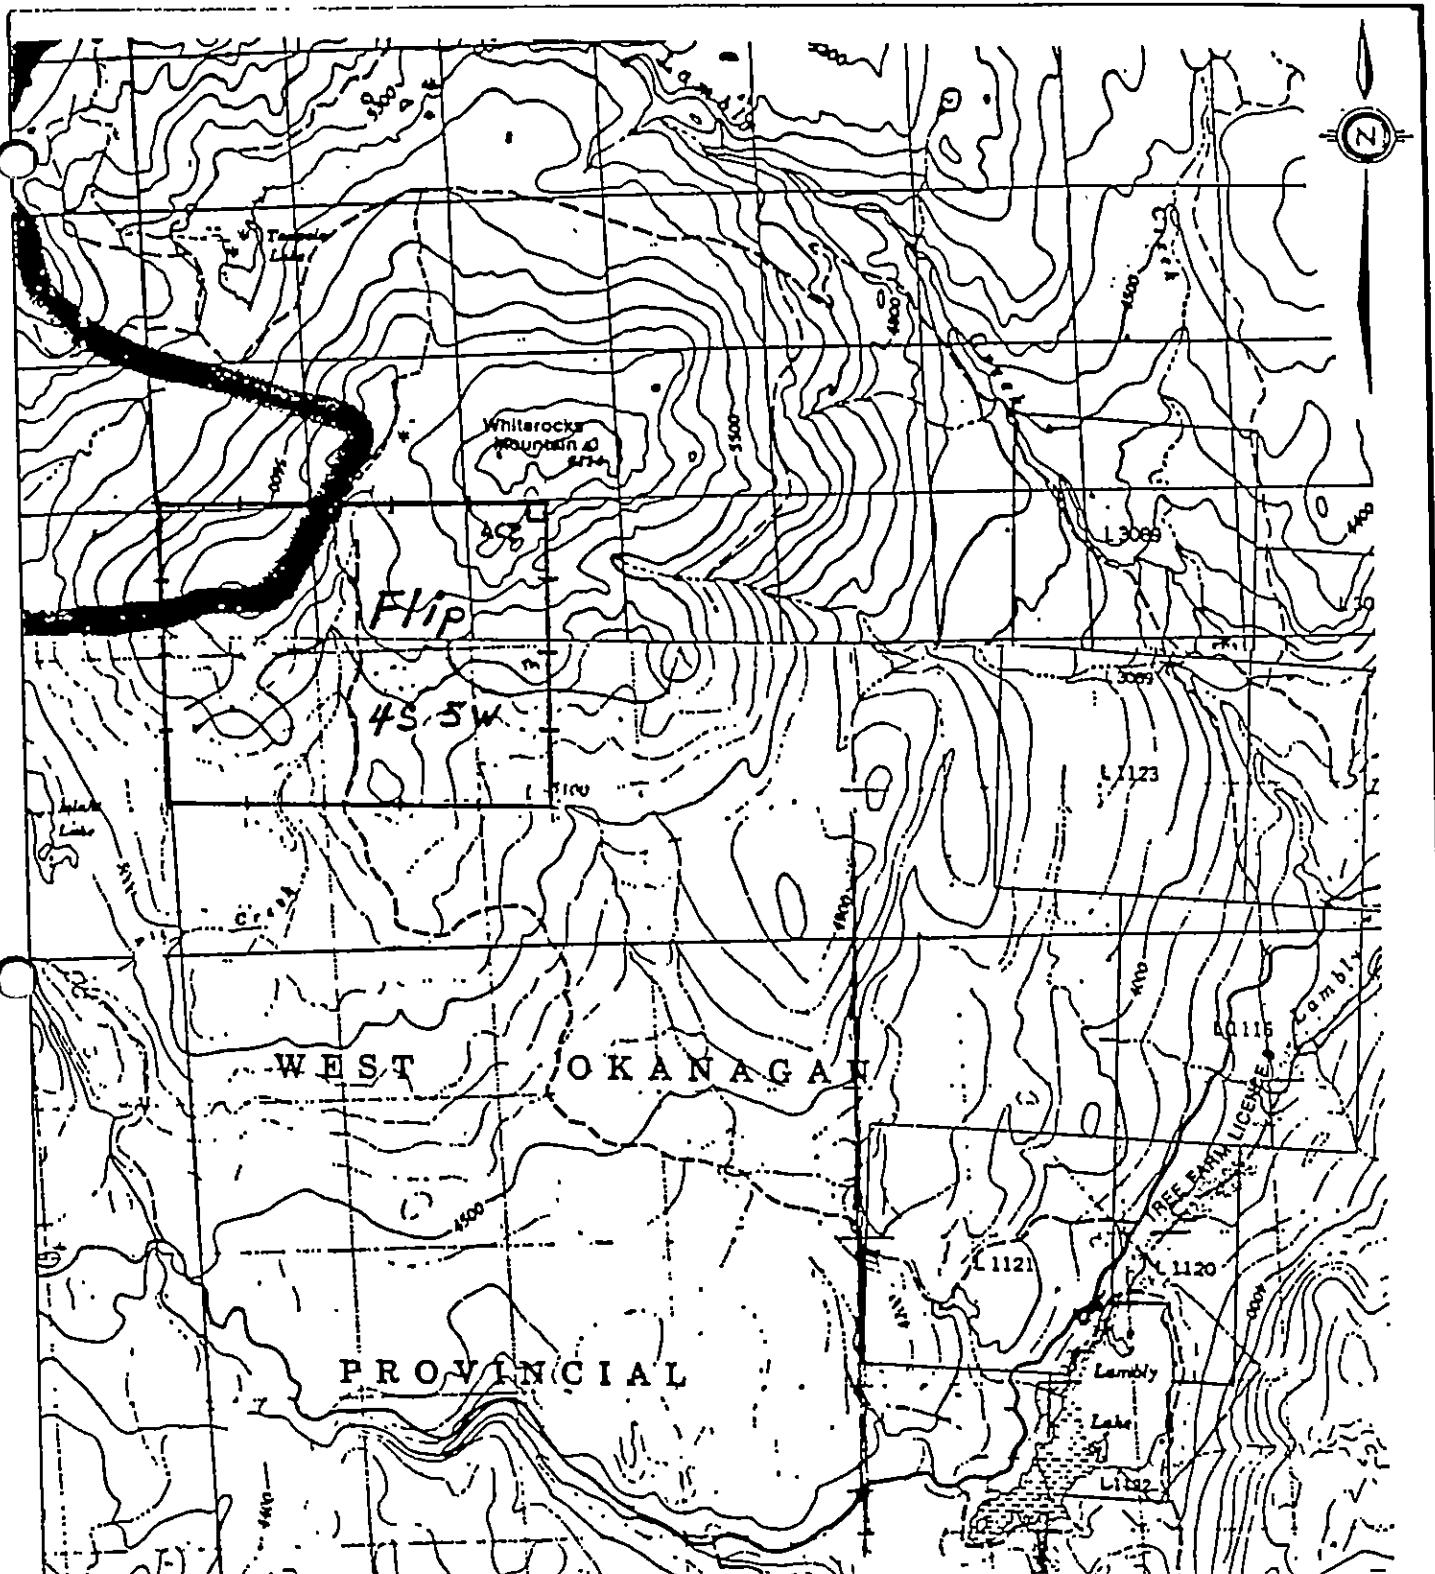

The Flip mineral claim is located on the southwest flank of White Rocks Mountain 24 km northwest of Kelowna, B.C. The author spent a total of 4 days prospecting the claims (July 24-25, 1987; June 25-26, 1988). Twenty rock and forty seven soil samples were collected and sent to Bondar Clegg & Company in Vancouver for geochemical analysis.

The property has had considerable exploration work done on it in the past, including percussion and diamond drilling, to assess its economic potential as a porphyry copper deposit.

The purpose of my work was to sample any mineralized and/or altered outcrops in hopes of discovering epithermal type gold mineralization. As the property is underlain, in part, by ultramafic intrusions, the 1988 samples were analysed for platinum and palladium as well as precious and base metals.

### Interpretation

The sampling failed to reveal any significant gold values except for sample Z-87-R-126 which is anomalous in gold & silver as well as copper. Sample R-126 was taken from an ultramafic outcrop which may explain its relatively high gold content. Nothing I observed in the field would suggest the presence of epithermal type gold mineralization. However, the presence of anomalous Pt. and Pd. values in a number of soil and rock samples warrant further work to determine their significance.

Technical Data

<u>Sample No.</u>	<u>Description</u>
Z-87-R-119	Percussion Hole 80-26. Sampled cuttings on ground near drill collar. Hole marked by 2"x 2" post with metal tag.
Z-87-R-120	Outcrop, grab sample. Mafic monzonite with 20% disseminated pyrite. Heavy epidote alteration.
Z-87-R-121	Outcrop, grab sample-ultramafic-gabbros with 5-10% disseminated pyrite. Epidote alteration.
Z-87-R-122	Outcrop, grab sample. Fine grained gabbro with 5-10% dissemination. pyrite, epidote alteration.
Z-87-R-123	Outcrop, grab sample. Dioritic rocks in contact with ultramafics. Diorite contains <3% pyrite. Minor magnetite. Epidote alteration.
Z-87-R-124	Outcrop, grab sample. Same as R-123. Ultramafic contains up to 10% pyrite, heavy magnetite. Some malchite, minor chalcopyrite.
Z-87-R-125	Outcrop. grab sample. Dark, rusty weathering gabbros with pyrite, magnetite epidote alteration.
Z-87-R-126	Outcrop, grab sample. Dark coloured, fine grained ultramafic with malchite, calcopyrite, pyrite magnetite. Epidote alteration.
Z-87-R-127	Outcrop, grab sample. Gabbro with weak pyrite malchite.
Z-87-R-128	Diamond drill core. (DDH-?, Box 1) Ultramafic to gabbroic rocks with disseminated pyrite, calcopyrite magnetite. Best copper with more ultramafic sections. Sampled best mineralized core.
Z-87-R-129	Diamond drill core. (DDH?, Box ?) Less mafic phase. disseminated pyrite, calcopyrite magnetite epidote alteration. Sampled best mineralized core.
Z-87-R-130	Diamond drill core. (DDH-2, Box 2) Mainly ultramafic, disseminated pyrite, magnetite. A few barren quartz veinlets. Narrow unmineralized aplite dykes.

- Z-87-R-131      Diamond drill core. (DDH-1A, Box 11-75)  
Footage 290'-320' - Mafic monzonite to  
Ultramafic. Disseminated pyrite, magnetite.  
Small aplite dyke. A few barren quartz  
veinlets. Sampled best mineralization.
- Z-87-R-132      Diamond drill core (DDH-?-Box ?) Ultramafic  
monzonite contact. Disseminated pyrite,  
magnetite. In 30' of core only a few barren  
quartz veinlets. Epidote alteration.
- Z-87-R-133      Outcrop- grab sample. Monzonite, reddish,  
brown iron stain. Disseminated magnetite heavy  
epidote-quartz veinlets. A few small  
ultramafic veinlets.
- Z-87-R-134      Outcrop, grab sample. Dark grey, aphanitic,  
siliceous sedimentary rock with fine grained  
disseminated pyrite. Contact zone.
- Z-87-R-135      Outcrop, composite sample. Monzonite in  
contact with fine grained sediments. Both  
units are highly siliceous with disseminated  
fine grained pyrite.
- Z-88-R-400      Old diamond drill core. Selected split  
pyroxenite with pyrite, magnetite, minor  
chalcopyrite. Hole number and footage not  
legible.
- Z-88-R-401      Outcrop, grab sample. Coarse grained  
ultramafic with heavy magnetite.
- Z-88-R-402      Local angular float, grab sample. Limestone  
conglomerate with limonite in fracture planes.  
White to tan coloured limestone clasts (often  
stretched) in a dark grey siliceous argillite  
matrix.
- Soil Line H      Ten soil samples taken from "B" horizon every  
30 metres from 0+00W to 3+60W.
- Soil Line F      21 soil samples taken from the "B" horizon at  
100 metre intervals from 0+00S to 20+00S.
- F-1 to F-3      Stream sediment samples

	Secretarial	30.00
	Computer Rental	<u>20.00</u>
		<u>50.00</u>
		\$3306.50

STATEMENT OF QUALIFICATIONS

I, Paul A. Ziebart, of the city of Kelowna, in the Province of British Columbia, do hereby state that:

1. I completed a two year course in Mining Technology at the Haileybury School of Mines in Haileybury, Ontario in 1969.
2. I have been employed as a prospector and/or technician in various phases of mining exploration for the last twenty years.
3. I have been involved in mineral exploration programs carried out in B.C., the Yukon, N.W.T. and Quebec in the last twenty years.
