## 1.0 INTRODUCTION

The Bonaparte Properties (East, Discovery and West), consisting of a total of 643 claim units, have been staked in stages since 1984. The initial staking covered ground defined as anomalous for gold, arsenic, and antimony in heavy mineral samples taken from stream sediments. Subsequent exploration led to the discovery of gold in quartz veins at the Discovery Zone, and to the recognition of the Discovery Belt, a north-west trending window of rocks with geologic similarities to the Discovery Zone (See Figure 1).

Since 1986, the immediate Discovery Zone area has been the focus of three drilling and trenching programs, while the Bonaparte East and West Properties have been the subject of a preliminary geological evaluation.

During the summer of 1988 a detailed exploration program consisting of grid soil sampling, ground VLF-EM and magnetometry surveys, and geological mapping covered the most prospective ground in the Discovery Belt, including the Discovery Zone. The following report presents the results of the 1988 Summer Field Program.

## 2.0 LOCATION, ACCESS AND TOPOGRAPHY

The Bonaparte Property is located in the Kamloops Mining Division some 35 kilometres north of Kamloops. The claims cover the portion of the Bonaparte plateau that includes the headwaters of Jamieson, Bob, Wentworth, Tsintsunko, and Criss Creeks, an area of forest cover with some open meadows. Topography is for the most part subdued, with elevations ranging from 1350m along Wentworth Creek to almost 1800m at the highest point on the claims. Access is afforded by numerous logging roads and trails branching off the main Jamieson Creek road, which leaves the paved road on the west side of the North Thompson River about 23 kilometres north of Kamloops. In November, 1986 a 2.5 kilometre access road was constructed from the end of the Bob Lake road to the Discovery Zone.

## 3.0 OWNERSHIP AND CLAIM STATUS

The Bonaparte Property has been divided into three blocks that are held under option by three separate companies of the Hughes-Lang Group. The property divisions and optionees are as follows (see Figure 3):

| Property | Optionee |
|---|---|
| Bonaparte West | Gallant Gold Mines Ltd. |
| Bonaparte Discovery | Hughes-Lang Corp. |
| Bonaparte East | Gabriel Resources Inc. |

### Bonaparte West

The Bonaparte West Property consists of 18 MGS claims totalling 259 units and is owned by Inter-Pacific Resources Ltd. Under terms of an option agreement, Gallant Gold Mines Ltd. has a right to earn a 50% interest in the claims.

The current status of the claims is as follows:

| Claim Name | Record Number | No. of Units | Due Date Before Summission of this Report |
|---|---|---|---|
| Bob 46 | 6436 | 10 | Nov. 13, 1990 |

Bonaparte Discovery

The Discovery mineral property, consists of nine claims and two fractional claims (totalling 57 units), is owned by Inter-Pacific Resource Corp. and is under option to the Hughes-Lang Corp. which can earn a 50% interest by spending $2.3 million and producing a positive feasibility study by December 31, 1992.

The current status of the claims is as follows:

| Claim Name | Record Number | No. of Units | Due Date Before Summission of this Report |

All claims within the Bonaparte Property are held by MineQuest Exploration Associates Ltd. on behalf of Inter-Pacific Resources Corp., Hughes-Lang Corp., Gabriel Resources Inc., Gallant Gold Mines Ltd. and GoldQuest Minerals Corp.

## 4.0 HISTORY AND PREVIOUS WORK

The Bonaparte Property has been acquired in stages over the last several years. Initial staking was designed to cover the source of highly anomalous gold values in heavy mineral concentrates of stream sediments. Subsequent silt and soil sampling, prospecting and rock chip sampling led to the staking of several claims near the southeast corner of the Bonaparte Study Area Mineral Reserve (O/C 925, 17.3.77 - No Staking).

The Bonaparte area had previously been explored for molybdenum mineralization in 1969 (GEM 1969, p. 234), 1973 (GEM 1973, p. 269), and 1979 (EXPLORATION IN B.C. 1980, p. 295). In 1973, Amoco Canada Petroleum Company Ltd. did geological mapping, soil sampling and magnetometer and IP surveys, and drilled two BQ diamond drill holes totalling 299 metres. Results were discouraging. No mention was made of gold exploration.

Prospecting by MineQuest on behalf of the GoldQuest I Limited Partnership late in 1984 led to the discovery of gold mineralization in quartz-vein stockworks exposed within the No-Staking Reserve. In July 1985 the Provincial Government released a limited amount of ground from the Reserve, most of which was acquired by MineQuest Exploration Associates Ltd. (as agents for GoldQuest I Limited Partnership).

An additional 12 claims totalling 137 units, lying south, east and north of the existing claims were acquired during November 1985.

Further ground released from the Reserve (O/C 599, 21.03.86), was staked by MineQuest on behalf of Inter-Pacific during March 1986.

In October 1986, Inter-Pacific optioned a 50% interest in this large claim block to three companies within the Hughes-Lang Group.

## 5.0 WORK CARRIED OUT IN 1988

### 5.1 Introduction

The 1988 summer field program began with the extension of existing grids. The extended grid was used as a base for geophysical surveys, soil geochemistry, rock chip sampling, and geological mapping.

### 5.2 Grid

Two baselines at 36+00 E and 53+00 E, and a line at 34+00 N were surveyed with a transit, and 94.5 line kilometres of grid were established by compass and chain. Stations were flagged at 10 metre intervals on east-west lines spaced 50 metres apart on Bonaparte East and on lines 100 metres apart on Bonaparte Discovery Property. Existing grid lines on Bonaparte West had a station interval of 20 metres on east-west grid lines with a 50 metre line spacing.

### 5.3 Soil Sampling

A total of 9,450 soil samples were collected from the B horizon at 10 metre intervals on grid lines covering Bonaparte East and Bonaparte Discovery Properties. On Bonaparte West a total of 1,250 soil samples were collected at 20 metre intervals on existing grid lines. All the soil samples from Bonaparte West, and every second sample from Bonaparte Discovery Property were analysed for gold. On Bonaparte East every second sample on alternate lines, and all samples on the intervening lines, covering the southern portion of the grid, were analysed for gold.

### 5.4 Rock Chip Sampling

Forty-one rock chip samples were collected from outcrop and float within the grid area, and analysed for gold and a thirty element suite.

### 5.5 Geophysical Surveys

89.5 line kilometres of VLF-EM survey were completed on the grid using a Geonics EM-16 electromagnetometer and Seattle, Washington as a signal source. Station spacing was 20 metres and all readings were taken

facing east. The VLF-EM survey was hampered by the transmitting station being inoperative for extended periods, resulting in only partial coverage of the grid on Bonaparte East.

The magnetometry survey employed a Scintrex IGS System with a base station. 62.3 line kilometres of survey, with a 20 metre station interval, were completed on the grid. Severe magnetic storms rendered data from the south portion of the grid, on Bonaparte East, worthless.

## 5.6 Personnel

Grid extension, soil sampling, and geophysical surveys were conducted by G.W. Vernon, C. O'Neill, S. Dribnecki, D. O'Brien, W. McLean, B. MacGuigan, D. O'Neill, P. Lloyd, J. Ryan, M. Jury, P. Haering, J. Parker, A. White, J. Walker, L. Walske and K. Miller. C. Stanford performed the geological mapping. The program was under the direction of A.W. Gourlay.

# 6.0 GEOLOGY

## 6.1 Regional Geology

The regional geology has been summarized by McClintock (1987) as follows:

"The vicinity of the Bonaparte Properties were mapped by Campbell and Tipper in 1965 and by Monger and McMillan (1983). The claim area covers Carboniferous to Permian Cache Creek Group rocks consisting of argillite, quartzite, hornfels, limestone, sheared conglomerate, breccia, greenstone and serpentinite. Intrusive into the Cache Creek rocks are quartz-diorite and granodiorite with minor diorite, monzonite, and gabbro of the early or mid-Mesozoic Thuya and Takomkane Batholiths. Capping the Paleozoic and Mesozoic are Miocene plateau basalts formed predominately of olivine basalt and andesite with minor ash and breccia."

For a complete description of the regional geology see McClintock (1987).

## 6.2 Property Geology

The Bonaparte West and East Properties were geologically mapped at a scale of 1:10,000 by McClintock during 1987, who subdivided the lithologies into three groups as follows:

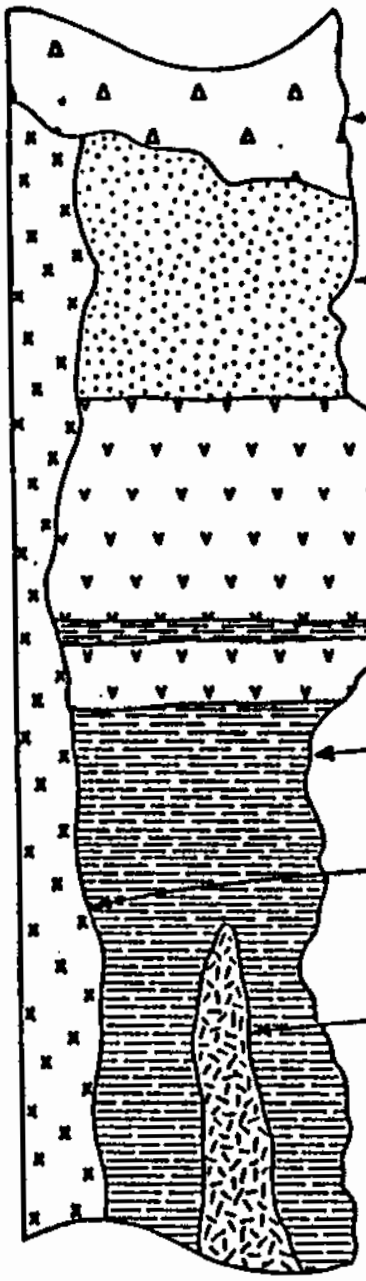
"From oldest to youngest these are: argillaceous metasedimentary rocks (Unit Ar); quartz monzonite and hornblende diorite (Units Gd, Di); and basaltic to andesitic lavas, breccias and minor tuffs (Unit Ba)."

McClintock provides thorough descriptions of the lithologies, structure, and mineralization in his 1987 reports.

## 6.3 Grid Geology

The grid geology is presented in Figure 5.

The grid area covers a window of older meta-sedimentary and intrusive rocks exposed beneath basalt cover. Outcrop is much less than 5%, with the majority of exposure found in Bonaparte East. Outcrop is rare on the Discovery Property and Bonaparte West.



**Ba** — Basaltic to Andesitic lavas, lesser breccia and tuff.

**Sd/SS** — Predominantly greywacke with lesser siltstone, minor argillite, limestone and conglomerate.

**$V_{F/T}$** — Andesitic to basaltic andesite flows, agglomerate breccia and tuff. Contains interculated argillite and shale beds.

**Ar** — Argillaceous siltstone and shale with lesser greywacke.

**Qm** — Medium to coarse grained biotite granodiorite.

**Di** — Diorite and Quartz Diorite generally porphyritic and weakly propylitically altered.

### 6.3.1 Litholgies

The lithologic subdivisions described by McClintock (1987) are retained in this report. Rock types, from oldest to youngest are: argillite, quartz diorite, hornfels, and basalt.

#### Argillite

Argillite is restricted to the southeast corner of the grid area, on Bonaparte East, and the northwest portion of the grid on Bonaparte West. The argillite is a medium to dark grey colour, and carries up to 5% disseminated, very fine grained pyrite. Colour change appears to reflect variation in composition from phyllitic shale to argillaceous siltstone. The phyllite units host white quartz veins that rarely exceed 20 centimetre thickness. The quartz veins very rarely carry pyrite. Argillite grades into hornfels near intrusive contacts.

#### Quartz Diorite

Quartz diorite has been exposed by trenching in the Discovery Zone and occurs as dikes and small stocks on Bonaparte East. A small stock of quartz diorite is inferred in Bonaparte West from the evidence the abundance of angular float and weak magnetic high feature. The quartz diorite is medium grained, with up to 50% 2 to 5 mm subhedral feldspar phenocrysts. Hornblende as euhedral phenocrysts may comprise up to 20% of the rock. The quartz diorite is weakly altered, with minor saussuritization of feldspar and chloritization of the mafic minerals. Locally, up to 3% pyrite and pyrrhotite are found disseminated through the diorite.

#### Hornfels

Hornfelsed argillaceous sedimentary rocks are found in contact with and adjacent to quartz diorite. Hornfels underlies the central portion of the grid area, near the Discovery Zone and the northwest part of the grid on Bonaparte East. The hornfels is brown to black coloured, with a well-indurated, with a fine-grained to sugary texture.

**Basalt**

Basalt caps the high ground and forms prominent cliffs bounding the exposures of older rock. The basalt is dark green, and massive columnar jointing is found on several cliff faces.

## 6.4 Mineralization

McClintock (1988) described the quartz veins as follows:

"Quartz veins are found within the argillite, hornfels, and quartz diorite. Veins within the argillite and hornfels appear to pinch and swell along strike. The quartz is milkly white with occasionally glassy patches, and rarely contains 1-2% pyrite along the vein margins. These veins trend north-northeast, parallel to the regional grain of the argillite. In the hornfels, quartz veins may trend from north to northeast."

Quartz veins hosted by the quartz diorite in the Discovery Zone are randomly oriented. Thickness varies from several centimetres to about 1.5 metres. The larger veins trend northerly, and are described by Gosse (1987, 1988). Peatfield (1986) reports "some of these veins carry pyrite, chalcopyrite, pyrrhotite, molybdenite and less commonly bismuth tellurides and free gold".

## 7.0 RESULTS

### 7.1 Soil Sampling

The results of the soil sampling program are presented in Figure 6, which incorporates the results of the 1987 soil surveys (McClintock, 1987). A 30 ppb cutoff is used to determine anomalous levels of gold.

Two areas standout as distinctly anomalous; the area to the immediate west and to the north of the Discovery Zone, and the north-east portion of the grid, in an area centered around 3150N, 4800E.

The immediate Discovery Zone area, where the trenching and diamond drill has been focussed, is not distinctly anomalous in gold from soil samples. A single sample at the northernmost edge of the trenched area returned 335 ppb, while the rest of the area returned less than 30 ppb. To the immediate west, at approximately 3500E, there are three samples in excess of 100 ppb between 3400 N and 3600N, all aligned north-south. On line 3700 N, due north of the trenched area, two adjacent samples returned 275 and 144 ppb. West of the Discovery Zone, between 2800E and 3500E, on lines 3400N to 3600N are numerous values in excess of 30 ppb, including four that exceed 100 ppb gold. West of 2800E the frequency of anomalous values drops significently although two values do exceed 100 ppb gold.

The southwest corner of the grid, south of L2200N, returned values in the same order of magnitude as those reported by McClintock (1987). Values in soil anomalies range up to 610 ppb in an area entirely overburden covered. The southeast portion of the grid produced only scattered anomalies. The area centered around 3150N, 4800E returned the most consistently anomalous values in soils, up to 3270 ppb gold. Several of these values are clustered together in consecutive samples and on adjacent lines.

North and west of the Discovery Zone, beyond line 3800N there are very few geochemically elvated values. Only seven samples exceed 100 ppb gold, and these are all single station anomalies found on Bonaparte West.

## 7.2 Rock Chip Sampling

Results of the rock chip sampling were disappointing. A single value of 7 ppb gold was the highest returned from a quartz vein sample west of the Discovery Zone. This sample (88214) also returned the highest copper value, 388 ppm, of the rock samples. The rest of the samples returned background values for gold and other elements.

## 7.3 Magnetometry

The magnetic survey (Figure 8) has defined two northwest trending fractures extending across the length of the grid. Distinct magnetic lows (less than 59750 gammas) define areas of basalt cover found on the very northwestern corner of the grid, the east side of the centre area, and a tongue of basalt extend into the eastern grid area from the north. Basalt is also found on the south-western corner of the gridded area. Weak magnetic highs (greater than 58000 gammas) outline areas of intrusive rock, mostly diorite and quartz diorite. The Discovery Zone area is not well defined by the magnetic survey. An area of intrusive rock found to the east, on Bonaparte East property is well defined, as is an intrusive in the northwest part of the grid, outlined by work completed during February 1988. Both of the intrusive bodies are adjacent to, or cut by, major fractures defined by both the magnetometry and VLF-EM surveys. A number of distinct high-low magnetic features found on the eastern portion of the grid occur in an area of abundant quartz float.

Hornfels and argillite do not have distinct magnetic features. The hornfels is interpreted to surround the intrusive rocks, while the unaltered argillite is found some distance from the intrusive rocks.

## 7.4 VLF-Electromagnetic Survey

The VLF-EM survey (Figure 9) has confirmed the presence of the northwest trending fractures that extend across the grid. A strong north-northeast trending features found on the southeast portion of the grid reflect the bedding and metamorphic textures of the older metasedimentary and metavolcanic basement rocks. In the northwest portion of the grid, the northwest trending fractures appear to be offset by north-northeast trending fractures,

parallel to the structural grain of the basement rocks.

Of particular interest are a number of distinct north-south fractures crossing the centre portion of the grid. The most pronounced of these fractures cuts the Discovery Zone, through the area trenched and drilled, and continues for several hundred metres to the north. Several shorter fractures are found to the west of the Discovery Zone, as far west as 3150E. Another distinct north-south feature is found at approximately 3950E between lines 3400N and 4700N.

## 8.0 DISCUSSION

The 1987 and 1988 grids cover a window of older rocks that contain a significant gold occurrence. Gold is found in quartz veins hosted by a diorite stock near the centre of the work area.

The geochemical and geophysical surveys have outlined two areas of geochemically anomalous gold values in soils. These are; Bonaparte East Target Area, centered at 3150N, 4800E and Discovery Target Area, immediately west and north of the Discovery Zone (See Figure 11).

The Bonaparte East Target Area covers the soil gold values of up to 3270 ppb returned from the 1987 soil sampling (McClintock, 1987). Prospecting uncovered quartz vein float assaying 2.13 opt gold and a north trending vein returned 0.022 opt over 15 centimetres. Outcrop is limited in this area but float mapping suggest this area is underlain by hornfels cut by diorite dikes. Magnetometry and VLF-EM confirm the presence of a major northwest trending structure but give no indication of the trend of individual dikes. Evaluation of the soil and rock anomalies will require trenching, geological mapping, and rock sampling.

The Discovery Target Area encompasses the known outcrop and subcrop of diorite surrounding the Discovery Zone. Anomalous gold values in soils immediately west of the Discovery Zone are coincident with a distinct north-south lineament defined by the VLF-EM survey. Further west, anomalous soil values are more scattered but appear to be related to north-south fractures. Two high values are located 100 metres due north of the Discovery Zone, coincident with a well defined north-south fracture.

At the Discovery Zone, the four quartz vein systems trenched and drilled to date all trend north-south. The coincidence of gold values in soil due north of the Crow Vein suggests that the vein may extend further than indicated by trenching and drilling. Similarly, the gold values found approximately 100 metres west of the Discovery Zone are associated with a distinct north-south VLF-EM feature. This suggests a previously unrecognized vein target similar to those within the Discovery Zone. Detailed prospecting and mapping, in conjunction with trenching are required to evaluate these targets.

## 9.0 CONCLUSIONS

The 1987 and 1988 grids cover the Discovery Belt, a window that is thought to extend the Discovery Zone.

Geophysical surveys have defined northwest trending fractures that are cut by and offset by northeast trending fractures. The VLF-EM survey has outlined several north trending fractures, one of which cuts through the Discovery Zone parallel to the known quartz veins. The survey also suggests a series of parallel north trending breaks in diorite west of the trenched area.

Soil geochemistry has outlined two areas of anomalous gold values. The area immediately west and north of the Discovery Zone returned values up to 335 ppb gold. These values, within the Discovery Target Area, are coincident with the north trending fractures defined by the VLF-EM survey.

On Bonaparte East, soil geochemistry has outlined an area of highly anomalous gold values in the vicinity of a narrow quartz vein carrying 0.022 opt gold, and angular quartz float returned 2.13 opt gold.

The Discovery Target Area requires detailed prospecting and mapping in conjunction with trenching to evaluate the soil anomalies and north trenching fractures. The Bonaparte East Target requires trenching to test gold-in-soil anomalies in an area of very limited outcrop.

## 10.0 RECOMMENDATIONS

The property continues to deserve a substantial program of trenching, drilling, re-sampling and other work, essentially the program recommended in March 1988, less the grid work carried out during the recent field season.

The program outlined below will provide a preliminary test of the two geochemical targets identified by the Summer Field Program. It is expected that this program will be followed by a recommendation to drill.

**Bonaparte Discovery Property** (Hughes-Lang Corp. Option)

The following is recommended for the Discovery Target Area:

1. Analysis of all remaining soil samples for gold, silver and copper.

2. Trenching of soil anomalies at:

   3500E from L3350N to L3700N
   3600 E on L3700N
   3000E on L3500N

3. Detailed mapping and sampling of trenches, and surrounding area.

4. Reclamation.

5. Abandoning and restaking all claims within the Bonaparte Discovery Property. Claims to be abandoned are listed below:

| Claim Name | Record Number | No. of Units |
|---|---|---|
| Nubob 1 | 6319 | 8 |
| Nubob 2 | 6320 | 2 |
| Rebob 1 | 6321 | 4 |
| Rebob 2 | 6330 | 4 |
| Rebob 3 | 6331 | 4 |
| Rebob Fr. | 6341 | 1 |
| Nubob Fr. | 6342 | 1 |
| Bob 44 | 6434 | 6 |
| Bob 101 | 6573 | 12 |
| Bob 118 | 6587 | 12 |
| Bob 120 | 6635 | 3 |

The program described above will cost approximately $155,000.

**Bonaparte East Property** (Gabriel Option)

The following is recommended for the Bonaparte East Target Area:

1. Trenching of soil anomalies at:

   4630E, 4800E on L3250N
   4850E on L3200N
   4760E, 4810E on L3150N
   4820E on L3100N

2. Detailed mapping and sampling trenches.

3. Reclamation.

   An additional 3 years assessment credit be applied to the following claims:

| Claim Name | Record Number | No. of Units |
|---|---|---|
| Bob 22 | 5767 | 15 |
| Bob 23 | 5768 | 15 |
| Bob 24 | 5735 | 20 |
| Bob 42 | 6432 | 15 |
| Bob 43 | 6433 | 6 |
| Bob 45 | 6435 | 15 |

These claims adjoin the Bonaparte Discovery Property.

The program recommended will cost approximately $85,000.

**Bonaparte West Property** (Gallant Option)

No further work is recommended.

# APPENDIX I

## LABORATORY METHODS

## SOIL GEOCHEMISTRY

Soil samples were collected at 20 metre intervals along lines spaced 50 metres apart on Bonaparte West ground. All of these samples were analysed for gold. On Bonaparte Discovery Zone, samples were collected at 10 metre intervals on lines spaced 100 metres apart, and every second sample was analysed. The Bonaparte East ground was soil sampled at 10 metre spacings along lines 50 metres apart. Every second sample on alternate lines, and all samples on the intervening lines, south of L2150N were analysed for gold. At each site, a sample of B horizon soil was collected and placed in a numbered kraft paper envelope. If B horizon soil was not available, no sample was collected. All samples were shipped to Acme Analytical's laboratory in Vancouver where they were oven dried and screened to -80 mesh. A 10 gram subsample of the -80 mesh material was digested with a hot aqua regia solution followed by a MIBK extraction. Gold analysis of the MIBK extract was carried out by atomic absorption.

## ROCK GEOCHEMISTRY

The rock chip samples were shipped to Acme Analtyical Laboratories Ltd., of Vancouver, B.C. The samples were crushed to less than 3/16 inch size, from which a 200 gram split was pulverized to 98% minus 100 mesh. A 0.50 gram sample was then subjected to a 30-element ICP (inductively coupled plasma) analtyical technique, after digestion for one hour at 95° in 3:1:2-HCL:$HNO_3$:$H_2O$. In addition, gold contents were determined by MIBK extraction followed by atomic absorption analysis. It is important to note that for the ICP technique the extraction process is only partial for several of the elements reported.

# GEOCHEMICAL ANALYSIS CERTIFICATE

Bot - file - Bonaparte

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER. THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM. - SAMPLE TYPE: ROCK AU* ANALYSIS BY ACID LEACH/AA FROM 10 GM SAMPLE.

## APPENDIX III

## GEOPHYSICAL TECHNIQUES

The VLF-EM survey was carried out with a Geonics EM-16 unit using Seattle, Washington as a signal source. Readings were taken at 20 metre intervals, facing east, along grid lines. Calculations and derivations used standard formulae.

The magnetometry survey employed a Scintrex IGS-2 integrated portable geophysical system. A base station measured the magnetic field at 60 second intervals while field surveys were taking place. Field measurements were recorded at 20 metre intervals along grid lines. Onboard computer programs calculated diurnal variation and provided corrected data for the total magnetic field.

# APPENDIX VI

## STATEMENT OF QUALIFICATIONS

## STATEMENT OF QUALIFICATIONS

I Andrew W. Gourlay, hereby certify that:

1) I am presently employed by MineQuest Exploration Associates Ltd. as Senior Geologist.

2) I am a graduate of the University of British Columbia, (B.Sc. Hons.) 1977, in geology.

3) I am a Professional Geologist in good standing with the Association of Professional Engineers, Geologists and Geophysicists of Alberta, and a Fellow of the Geological Association of Canada.

4) I have practised my profession as geologist for more than 10 years.

5) The information used in this report is based on reports, maps, and data lists on file at MineQuest Exploration Associates Ltd., and personal familiarity with the project area.

Signed 
Andrew W. Gourlay

Dated at Vancouver, British Columbia
this day of 1988
