December 5, 1988

SUMMARY

Ashworth Explorations Limited carried out a field program, consisting of geological mapping, rock sampling, stream sediment sampling and soil sampling on the Stryker Claim Group during September 1988.

The Stryker Claim Group consists of four contiguous mineral claims (80 units) located in the Clinton Mining Division. The claims are situated 45 kilometres northeast of Goldbridge, B.C.

The subject property is underlain by a sequence of Eocene volcanic rocks in thrust fault contact with Cretaceous sediments. The Eocene rocks are known for hosting an epithermal gold-silver quartz vein deposit at Blackdome Mountain, nine kilometres northeast of the Stryker claims.

Previous work on the Stryker Claim Group consisted of an airborne magnetometer and VLF-electromagnetometer survey in 1987. Survey results delineated a magnetic low along the Hungry Valley thrust fault which was interpreted as an area where mineralization could occur similar to Blackdome Mountain.

The 1988 exploration program has outlined one area of argillic alteration and silicification, with mercury anomalies in rocks and soils.

A second and third phase exploration program has been recommended. Phase II will consist of grid extension, soil sampling, geological mapping and rock sampling at an estimated cost of \$61,000. Phase III is contingent upon targets

being established from Phase II. It would consist of detailed soil sampling, geological mapping and backhoe trenching.

1. INTRODUCTION

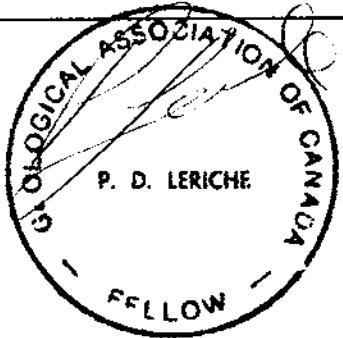

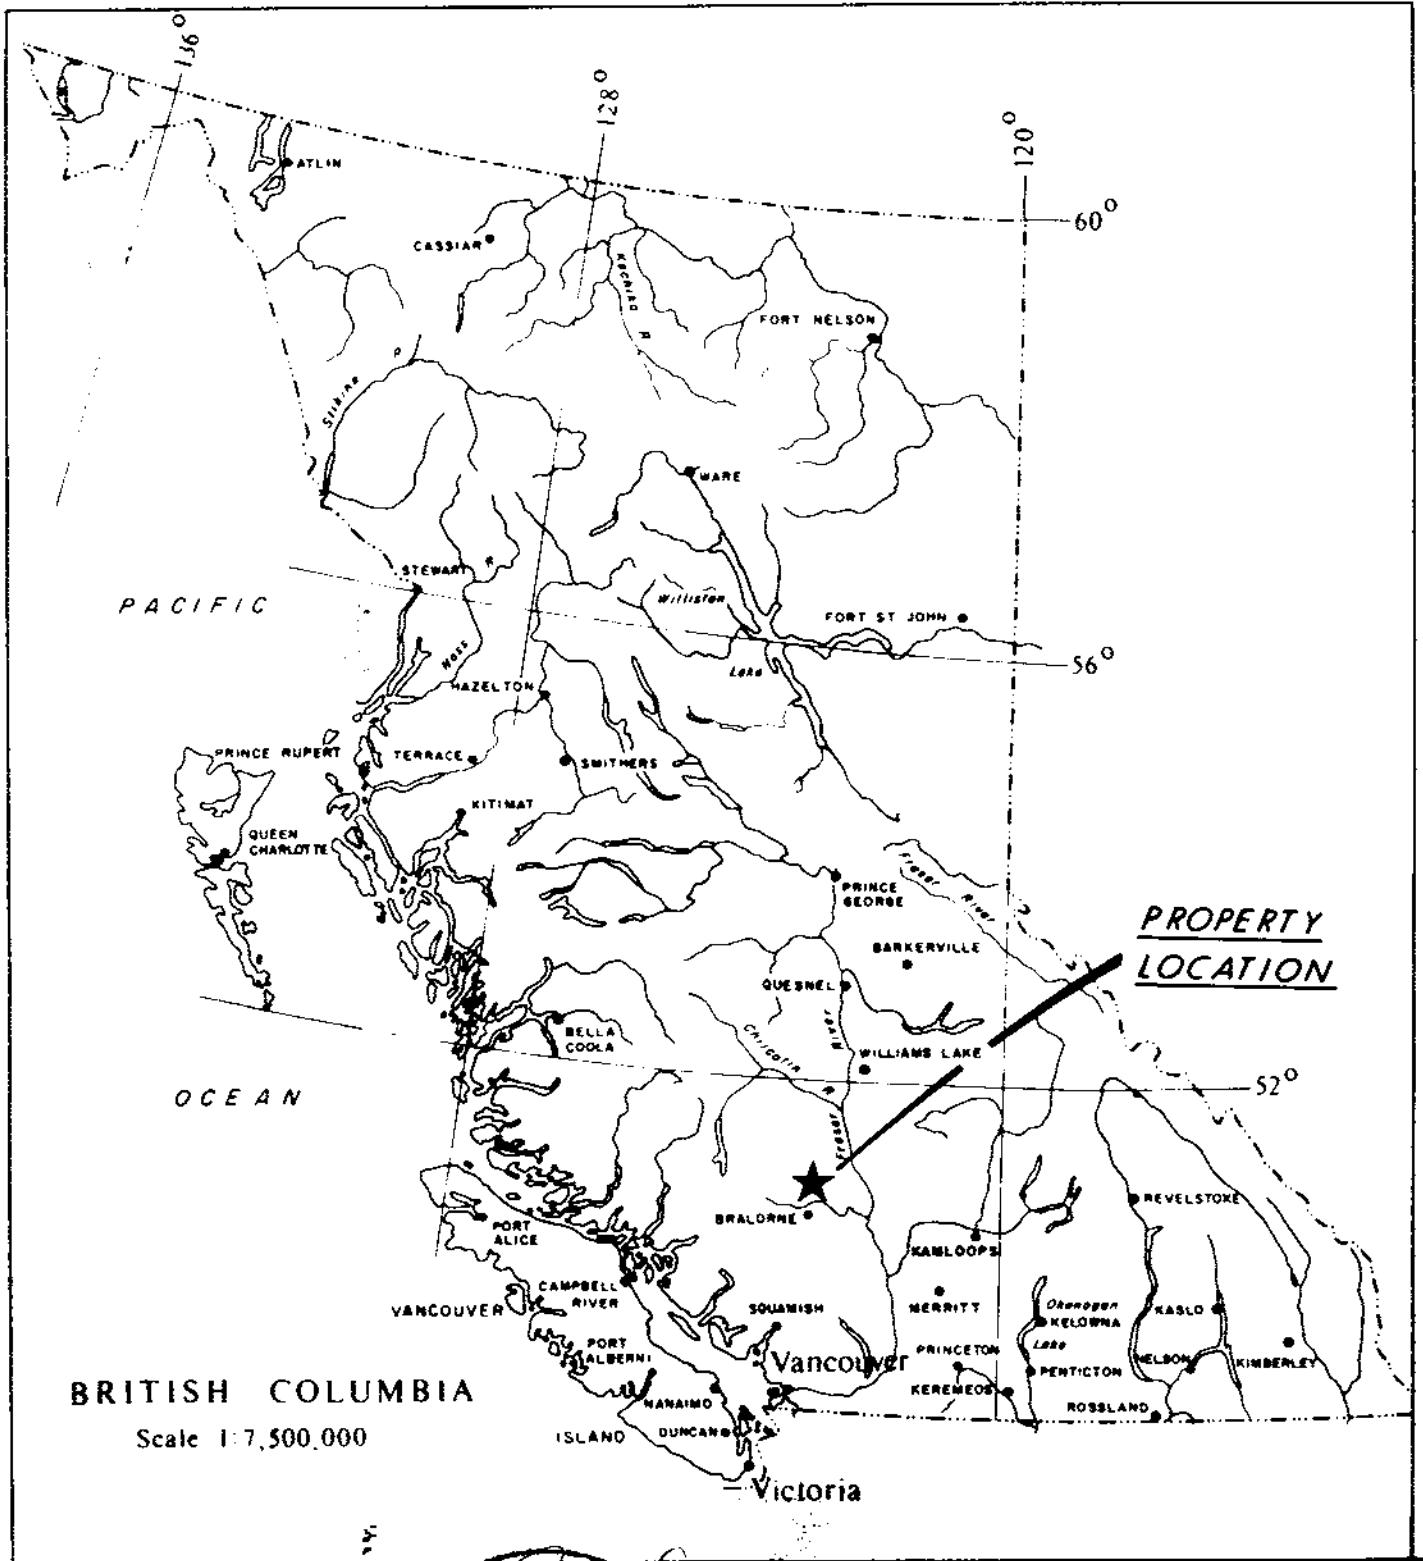

This report was prepared at the request of Lexington Resources Ltd. and Iskut Gold Corp. to describe and evaluate the results of a geological-geochemical survey carried out by Ashworth Explorations Limited from September 7 to 19, 1988 on the Stryker Claim Group, Red Mountain Area, B.C. The report also describes the regional geology and the past exploration activities in the area, and outlines a proposed exploration program.

One of the authors, Mr. Leriche, planned and supervised all fieldwork and examined the subject claims on August 24, 1988. Mr. Yacoub was the project geologist and party chief on the claims for the duration of the project.

2. LOCATION, ACCESS AND TOPOGRAPHY

The Stryker Claim Group is located in the Camelsfoot Range on the Fraser Plateau approximately 70 kilometres northwest of Clinton, B.C. and 45 kilometres northeast of the town of Goldbridge (Figure 1). The claims lie within NTS mapsheets 92O/2 and 92O/7, at latitude 51 14' north, longitude 122 35' west.

The property can be reached by road from Clinton, B.C. From Clinton, take Highway 97 North for approximately 16 kilometres then west on the Meadow Lake Road to the Gang Ranch Bridge. Turn south via the Empire Valley Road to the Blackdome Mine access road turnoff. After approximately nine kilometres, take the Red Mountain Forestry Road for approximately 25 kilometres to the property. Use of a four-wheel drive vehicle is recommended.

GENERAL LOCATION MAP

| | |
|-------------------|-------------------|
| Scale 1:7,500,000 | Date OCTOBER 1988 |
| Drawn by J.S. | Figure 1 |

Ashworth Explorations Limited

Alternative access is by helicopter from Goldbridge, B.C. where Cariboo-Chilcotin Helicopters maintains a base.

The terrain is characterized by gentle to moderate slopes descending into an east-west trending tributary of Lone Cabin Creek. Vegetation consists of scrub pine, spruce and minor fir. Elevation varies from 6300 feet (2067 metres) to 4800 feet (1575 metres) in the main creek valley, giving a total relief of 1500 feet (492 metres).

3. PROPERTY STATUS (Figure 2)

The Stryker Claim Group consists of four contiguous mineral claims totalling 80 units in the Clinton Mining Division. The claims are owned by Lexington Resources Ltd., Iskut Gold Corp., Mr. Hugh Harlington and Ms. Carolyn Beban. The operating address is 780 - 885 Dunsmuir Street, Vancouver, B.C., V6C 1N8.

Pertinent claim data is as follows:

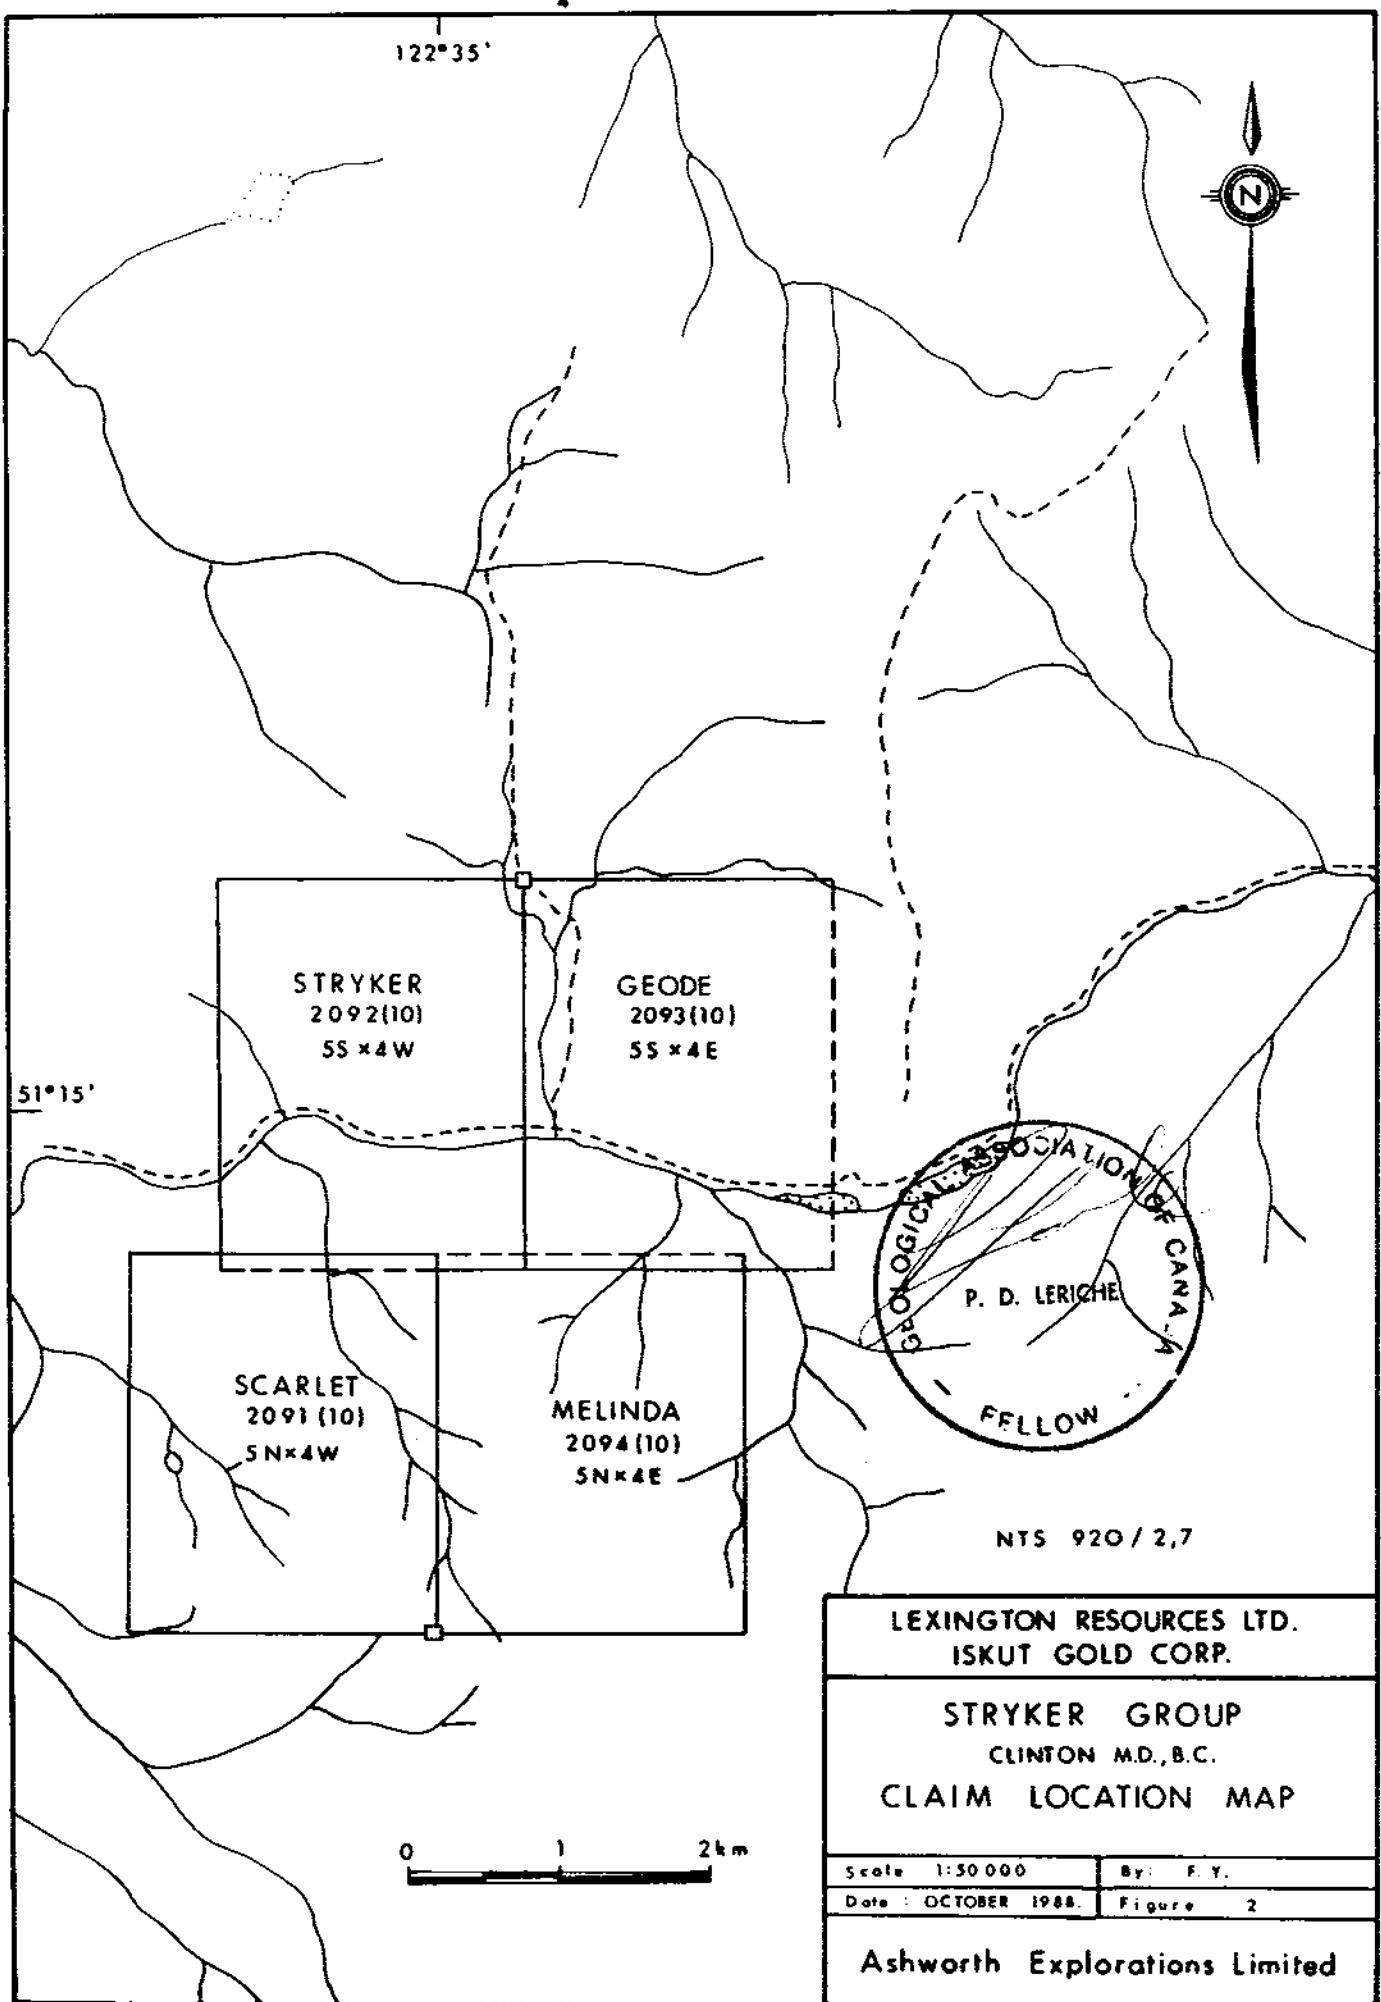

| <u>Claim Name</u> | <u>Record #</u> | <u>Units</u> | <u>Record Date</u> |
|-------------------|-----------------|--------------|--------------------|
| Scarlet | 2091 | 20 | October 14, 1986 |
| Stryker | 2092 | 20 | " " |
| Geode | 2093 | 20 | " " |
| Melinda | 2094 | 20 | " " |

The total area covered by the claim group is 2,000 hectares.

4. AREA HISTORY

BLACKDOME

The first major find in the general area of the subject claims occurred in the late 1940's with the discovery of gold-bearing quartz veins in the Black Dome Mountain area, approximately nine kilometres northeast of the north claim

boundary. The following ten year period saw work performed by Empire Valley Gold Mines Ltd. and Silver Standard Mines Ltd. which included sampling, stripping, packsack drilling, trenching and the driving of two adits into the vein structures.

By 1972 additional gold-bearing quartz veins had been located west of the original claims. In 1980, Blackdome Explorations Ltd. completed additional work including trenching, drilling and underground exploration. Mine construction began in 1985 with underground development of the Number 1 and 2 veins on two levels and a 200 ton-per-day mill. This led to the commencement of production on May 16, 1986. Reserves at December 31, 1987 were estimated at 245,615 tons with an average grade of 0.74 ounces of gold and 2.15 ounces of silver per ton (Blackdome Mining Corporation Annual Report, 1987).

The gold-bearing quartz veins at the Blackdome Mine are hosted by Eocene rhyolitic to andesitic volcanics which exhibit argillic wallrock alteration adjacent to the veins. A northeasterly trend is dominant in the structure, veins and host rocks. Northeasterly-trending normal faults cut the area and are believed to be related to movement along the Fraser Fault System during the Eocene epoch (Harrop & Scroggins, 1987).

BOBCAT

Immediately southwest of the Blackdome property, and approximately three kilometres north of the Stryker Group, lies the Bobcat Claim Group owned by Lexington Resources Ltd. The Bobcat claims were originally staked in 1980 as the Pony claims and occupy the southwest extension of the same mineralized

zone present on the Blackdome Mine property. Highly anomalous gold results were obtained from soil samples collected in 1982 near the northwest corner of the Pony claims.

In 1986 the Pony claims lapsed and were restaked as Bobcat I, II and III claims and were subsequently sold to Lexington Resources Ltd. Between 1986 and the present, geological mapping, prospecting, geochemical soil sampling, geophysical surveys, trenching and diamond drilling have been performed on the claims with results showing good potential for finding epithermal Au-Ag mineralization similar to that at the Blackdome Mine. (Harrop and Scroggins, 1987)

BALLATAR

Ballatar Explorations Ltd. has optioned the EH1, EH3, EH5, EH6 and EH7 claims, located adjacent to the eastern boundary of the Geode claim. An airborne VLF-EM survey and reconnaissance geological mapping followed by mapping, soil and rock sampling and geophysical surveys have been performed on this property from 1984 to 1987. In 1988 a detailed soil sampling program was completed to be followed by trenching of soil anomalies and vein occurrences in October 1988. The soil sampling program returned values up to 790 ppb gold with additional results pending (Vancouver Stockwatch, November 7, 1988). Trenching and road building has uncovered additional altered shear zones in rocks believed to be stratigraphically equivalent to the host rocks at Blackdome Mine (Vancouver Stockwatch, November 7, 1988).

EDGE

Brenwest Mining Ltd.'s Edge Claim Group, located approximately 30 kilometres eastsoutheast of the Scarlet and Melinda L.C.P., has undergone exploration since 1980 when Kerr Addison Mines Ltd. staked the original Big Bar claims. Percussion drilling completed in 1980 obtained a high Au value of 2600 ppb, As 1000 ppm and Ag 25.2 ppm, over drill intersections of 3, 3.1 and 3 metres respectively (Neelands, 1980). Recent work by Brenwest has consisted of surface sampling, trenching, geophysical work and limited drilling. Results have outlined drill targets including an area highlighted by a northwest-trending I.P. anomaly, 950 metres long and open in both strike directions. Previously obtained values include a surface sample high of 3480 ppb Au and a drill intersection over 3 metres of 0.13 oz/ton Au (Brenwest Mining Ltd. News Release, 1988).

OTHER PROPERTIES

Twenty-six kilometres southeast of the Stryker Claim Group, Chevron Standard Limited controls several crown grants and mineral claims covering the headwaters of Stirrup and Ward Creeks.

This property has seen a long history of exploration and prospecting for gold since the location of the original Astonisher and Chisholm claims around 1926. Development work has included several crosscuts, open cuts and trenching to 1933, geochemical soil surveys and percussion drilling by Rio Tinto in 1971, and mapping, trenching and sampling by Canex Placer Limited in 1973.

Chevron Standard Limited took control of the crown grants in addition to 19 mineral claims in 1975 and completed two diamond drill holes with no documented assay results. Since 1982 Chevron has restaked ground formerly covered by the Eagle claim. A 1982 reconnaissance rock and soil sampling survey plus detailed soil sampling obtained anomalous values of greater than 1000 ppm antimony, 100 ppm arsenic and 374 ppm gold (Livingstone, 1982).

The Poison Mountain copper-molybdenum-gold porphyry deposit is located on the southwest slopes of Poison Mountain, approximately eight kilometres southwest of the Scarlet and Melinda claims. Initial staking occurred in 1935 following the discovery of placer gold along Poisontown Creek in 1932.

Mineralization is associated with granodiorite to quartz diorite stocks intruding Jackass Mountain Group sedimentary rocks. Two porphyritic zones are present: an inner relatively unaltered hornblende plagioclase porphyry which grades outward into a biotite plagioclase porphyry. The highest grade mineralization occurs within the biotite-altered border phases and consists of pyrite, chalcopyrite, molybdenite and bornite, both disseminated, fracture fillings and in veins associated with quartz. Diamond drilling and trenching outlined reserves of 175 million tonnes averaging 0.33% copper, 0.015% molybdenum and 0.3 gram per tonnes gold (Glover et al, 1987). Long Lac Mineral Explorations completed additional diamond drilling in 1979 and 1980 but no published figures are available.

Exploration for porphyry copper-molybdenum mineralization began in 1970 in the upper Relay Creek area, located approximately 21 kilometres southwest of the

Scarlet claim. At this location mineralization is associated with a swarm of sills, dykes and small plugs which intrude volcanic and sedimentary rocks. Disseminated pyrite and/or pyrrhotite occur within and adjacent to the porphyries along with local chalcopyrite, molybdenite, arsenopyrite and sphalerite. Esso Minerals Canada is currently exploring the northwestern end of the altered belt, obtaining gold values of one to ten grams per tonne from narrow quartz-carbonate and chalcedony veins in association with broader zones of elevated gold values in the range of 50 to 300 parts per billion and anomalously high values of arsenic (Glover et al, 1987).

Low grade epithermal gold mineralization occurs at Big Sheep Mountain which is located 21 kilometres southwest of the Stryker Claim Group. The mineralization is associated with carbonate and argillic-altered granitic intrusions, probably Tertiary in age.

5. PREVIOUS WORK

In 1979 a regional geochemical survey was performed by the B.C. Ministry of Energy, Mines and Petroleum Resources (RGS-3-1979). Two samples were taken that are now covered by the Stryker Claim Group. One sample (5571) taken along the Hungry Valley Thrust Fault was anomalous in mercury (270 ppb). Gold was not analyzed.

In 1987 an airborne magnetic and VLF-EM survey was conducted for Ms. Carolyn Beban and Mr. Hugh Harlington by Western Geophysical Aero Data Ltd. The survey delineated the east-west trending Hungry Valley Thrust Fault as a pronounced magnetic low separating two distinct magnetic and lithological

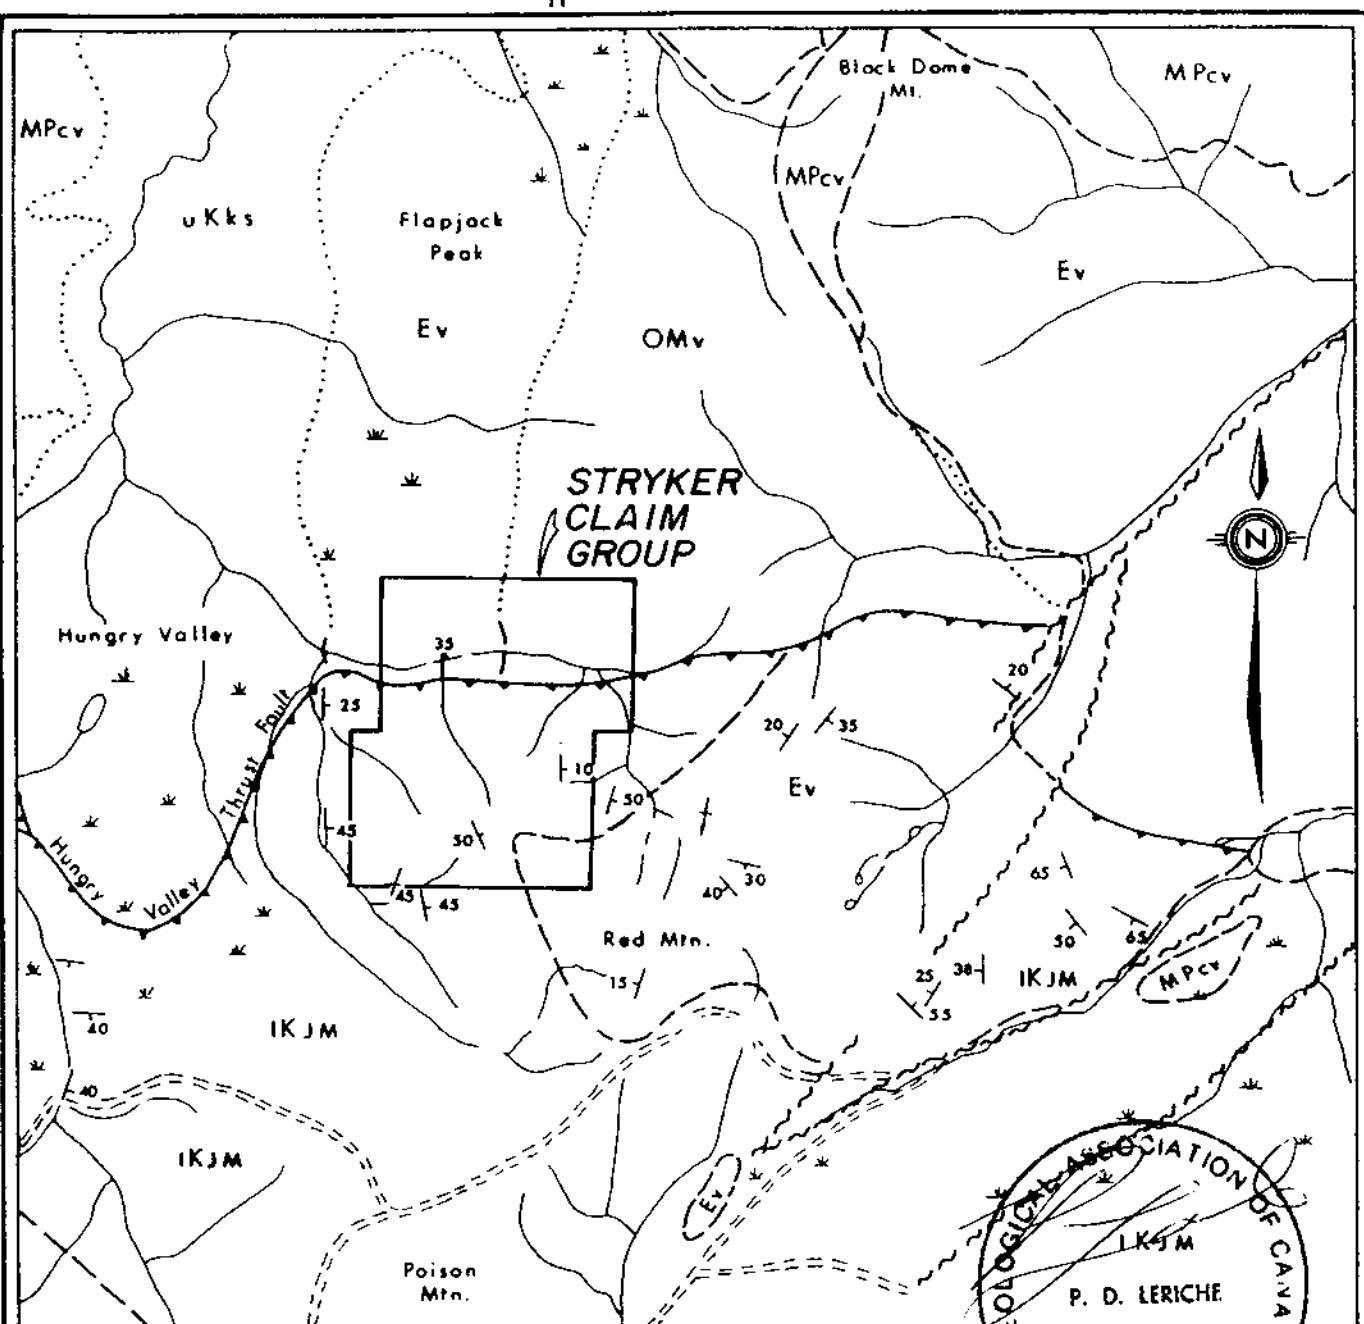

environments. This magnetic low was interpreted as an area where mineralization could occur similar to Blackdome Mountain (White and Hermary, 1988).

6. REGIONAL GEOLOGY (Figure 3)

The Stryker Claim Group is located in a region underlain by Mesozoic sedimentary and volcanic rocks which lie within a northwest-trending, structurally complex zone along the western margin of the Intermontane Belt, east of the Coast plutonic complex. The Tyaughton Trough is a feature of the area and is characterized by marine sedimentary rocks of the Middle Jurassic to Lower Cretaceous Relay Mountain Group and the mid-Cretaceous Taylor Creek and Jackass Mountain groups. An Upper Cretaceous succession of laterally discontinuous, nonmarine basinal deposits grading up into continental volcanic arc-related rocks, overlies the Tyaughton rocks with local angular unconformity (Glover et al, 1987).

The Jackass Mountain Group (Lower Cretaceous) is composed of clastic sedimentary rocks which outcrop over a large area northeast of the Yalakom Fault. It outcrops in the south-central, and western portion of the Scarlet and Melinda China claims. The boulder to cobble conglomerate of the Jackass Mountain Group is the most distinctive and occurs as beds up to several metres thick.

The Jackass Mountain Group is unconformably overlain by Eocene volcanics comprised of andesitic to rhyolitic composition. The volcanics are similar lithologically to Eocene-dated volcanics to the north and northeast which are

host to the Blackdome epithermal gold deposit. They are made up of andesitic to dacitic flows (locally vesicular and/or amygdaloidal), discontinuous units of flow-banded rhyolite, and unsorted andesitic to dacitic volcanic conglomerates.

Eocene (Glover et al, 1987) or Oligocene (Tipper, 1978) porphyritic rocks appear to intrude the Eocene volcanics at Red Mountain and Big Sheep Mountain and a large area to the north of the Red and China Claim Groups (Glover et al, 1987). These are commonly carbonate altered and contain variable proportions of feldspar, hornblende, biotite and quartz phenocrysts.

Flat-lying Miocene plateau basalts unconformably overlie the older rocks in the area. They occur as medium to dark gray flows intercalated with minor amounts of volcanic breccia and volcanic conglomerate. They cap several ridges in the region including Black Dome Mountain.

The Yalakom fault and the Fraser fault system are dominant features on the regional scale. The Yalakom fault divides the general area into two parts. The Red Mountain region lies northeast of the fault zone and is characterized by relatively widely spaced northwest and northeast-trending faults and by east-trending folds probably related to dextral movement along the Yalakom fault system.

The Jackass Mountain Group and the Eocene volcanics are bounded to the west by the north-northwest-trending Red Mountain fault which truncates several northeast-trending faults. North-northeast-trending extensional faults and

fractures (Eocene?) appear to have developed in the Eocene volcanics in relation with the dextral wrench fault along the Fraser fault system (Glover et al, 1987).

An easterly-trending fault on the subject claims is believed to be part of the Hungry Valley thrust fault (Tipper, 1978). It is inferred, separating Jackass Mountain sandstones from the Eocene volcanics, and possibly extends to the west.

7. 1988 PROGRAM

7.1 SCOPE AND PURPOSE

During September 1988 a field crew consisting of one geologist and three geotechnicians completed a program of geological mapping, rock sampling, stream sediment and soil sampling.

The purpose of this program was to cover the property using geochemical methods to define follow-up exploration targets. The expected target is an epithermal gold-silver deposit similar to that found at Blackdome Mountain.

7.2 METHODS AND PROCEDURES

Geological mapping was performed at a scale of 1:10,000 (Figure 4) over the property. Control for mapping was established using an altimeter, compass, hipchain and the survey grid on the Stryker, Geode and Melinda claims.

A total of 36 rock samples were collected and analyzed for gold, mercury and multi-element ICP by Chemex Labs Limited. See Appendix B for analytical reports and Appendix C for analytical techniques.

Ten rock samples from various rock units were sent to Vancouver Petrographics Ltd. for thin section analysis. Appendix E is a complete report on each section and Figure 4 shows their locations.

Stream sediment samples were taken from all drainages. Samples were collected at 200 to 300 metre intervals from the active part of the streams. Grain size varied from silt to sand size. Altogether 48 stream sediment samples were taken, placed into marked sand sample bags and sent to Chemex Labs Ltd. for gold, mercury and multi-element ICP analysis (see Appendix B and C).

A survey grid (Figure 5) was laid out on the Stryker, Geode and Melinda claims to use as control for soil sampling and geological mapping. A baseline was compassed, brushed out, slope corrected and hipchained at an azimuth of 40 degrees for 2.2 kilometres. Cross-lines were surveyed using compass, hipchain and flagging at 200 metre line spacings and 50 metre station spacings. Total line surveyed, including baseline and cross-lines, was 31.5 kilometres.

A total of 545 soil samples were collected at 50 metre station spacings. All soil samples were taken with a grub hoe from the B horizon (approximate depth of 25 cm), placed into marked Kraft-paper bags, field dried, then sent to Chemex Labs Ltd. and analyzed for gold, mercury and multi-element ICP (Appendix B and C).

The lab results for two elements (Au and Hg) were computer-plotted on 1:10,000 scale maps (Figures 6 and 7). To evaluate any existing geochemical anomalies, frequency distribution histograms based on lab data were prepared for each of

the aforementioned elements (Appendix D). Anomalous values were chosen using natural breaks in each histogram. For interpretation purposes, correlation coefficients were calculated (Appendix D) and anomalous values for gold and mercury were plotted as symbols on Figures 6 and 7. Anomalous ranges for arsenic and zinc have been plotted on 1:20,000 scale symbol maps (Figures 8 and 9). All statistical and plotting work was performed by Tony Clark Consulting Services.

7.3 PROPERTY GEOLOGY (Figure 4)

The property is underlain by a package of Eocene volcanic rocks that have been overthrust by Cretaceous conglomerate, siltstone and one outcrop of volcanic greenstone, along the Hungry Valley Thrust fault.

The following description of lithologic units is based on geological mapping by Mr. Fayz Yacoub and from petrographic analysis by Vancouver Petrographics Ltd. (See Figure 4 for thin section locations).

CRETACEOUS - JACKASS MOUNTAIN GROUP

Unit 1 - Greenstone

Probably the oldest unit on the property, this unit outcrops in the western portion of the property, south of the Hungry Valley thrust fault. It is a light gray to green chloritic andesite with numerous veinlets of gypsum or zeolite up to 2 mm wide. Thin section analysis (TS-8) interpreted unit 1 as being a fine-grained andesite-basalt volcanic wacke.

Unit 2 - Siltstone

Unit 2 outcrops at the boundary of the Scarlet and Melinda claims, south of the Hungry Valley thrust fault. In the field this rock type is buff-light brown fine-grained siltstone with light green angular clasts up to 3 mm in diameter. Thin section 4 is described as a lithic arenite composed of 77% subangular felsitic lithic clasts in a fine-grained quartz-plagioclase-biotite-hornblende matrix (23%).

Unit 3 - Polymictic Conglomerate

Unit 3 outcrops in the central part of the Scarlet and Melinda claims. It consists of poorly sorted, well rounded cobbles and boulders of granitic, volcanic, clastic sedimentary and metamorphic composition, in a light brown sandy matrix.

EOCENE VOLCANIC ROCKS

Unit 4 - Latite

This unit represents the oldest rock within the Eocene package and underlies the northwest part of the property. It is a light gray-brown sparsely porphyritic latite. Phenocrysts of sanidine (8%) lie in a groundmass composed of potassic minerals (84%) and quartz (8%). Minor amygdules up to 2 mm in size are infilled with calcite plus minor quartz and sericite.

Unit 5 - Andesite

Unit 5 outcrops along the Hungry Valley fault in the west part of the property. It is a light gray to dark gray porphyritic amygdaloidal andesite. It is composed of phenocrysts of euhedral plagioclase (22%) and pyroxene (4%), amygdules (7%) infilled with quartz and a groundmass of feldspar (58%), biotite, opaques and rutile (9%).

Unit 6 - Pyroxene Basalt

Rocks of this unit occupy the northwest and south areas of the property. It is a medium gray to black porphyritic pyroxene basalt. Compositional minerals include plagioclase, volcanic glass, minor carbonates and opaques.

Unit 7 - Volcanic Glass

This occurs as one elongated light gray to green-coloured outcrop on the Geode claim.

Thin section 6 is described as a glassy volcanic (tuff?) composed of glass (73%), feldspars (15%) and chlorite.

INTRUSIVE ROCKS

A swarm of aphanitic pyroxene basalt dykes was located in the central part of the Melinda claim, cross-cutting unit 6. Thin section evidence (thin section 7) revealed a composition of plagioclase and pyroxene.

Glover et al (1987) mapped three Eocene intrusive stocks approximately 1.5 to 2 kilometres north of Red Mountain (two kilometres south of subject claims). These consist of an equigranular to porphyritic quartz diorite to quartz monzonite.

STRUCTURE

The main structural feature on the property is the Hungry Valley Thrust Fault which strikes east-west across the centre of the claim group.

Two other north-south trending faults were mapped on the claims on the north and south sides of the main thrust fault. They are interpreted as being compressional fractures, with minimal displacement, that probably are related to the Fraser River fault system.

ALTERATION

Two types of alteration occur on the subject claims: 1) argillic and 2) rusty limonitic.

Moderate argillic alteration was observed mainly in the latite unit (Unit 4) and it is characterized by kaolinite alteration of feldspars. The source of this alteration could be from a hydrothermal magmatic origin, possibly from the intrusive stocks south of the property.

Limonitic alteration occurs within the pyroxene basalt (Unit 6), northeast of the claim group.

7.4 MINERALIZATION AND ROCK GEOCHEMISTRY

7.4.1 Geological Model

The target deposit expected on the Stryker group is an epithermal gold-silver deposit similar to that found at Black Dome Mountain.

According to the British Columbia Epithermal Model (Panteleyev, 1986), the Blackdome deposit fits in as gold-silver-bearing quartz-carbonate veins relatively high up in the epithermal system. Elements typically associated with these deposits include mercury, arsenic and antimony. A regional geochemical survey

jointly conducted by the British Columbia Ministry of Energy, Mines and Petroleum Resources (B.C.RGS-3) and the Geological Survey of Canada (Open File 774, 1983) shows that creeks surrounding the Blackdome deposit are highly enriched in mercury.

Another example of enriched mercury is on the Bobcat II claim, owned by Lexington Resources Ltd. Mercury anomalies in soils and rocks (argillic alteration zones) have been used to define trenching and drilling targets. Follow-up trenching and drilling has located gold and base metal mineralization in quartz veins. Gold geochemistry is generally low on surface.

Hence, mercury is considered to be the best pathfinder element in the area of the subject claims.

7.4.2 Rock Geochemistry

The following rock sample results are considered significant:

| SAMPLE | VALUE | DESCRIPTION AND LOCATION |
|-----------|------------|---|
| SM88-R457 | 80 ppb Au | Float; Light gray latite (?) with 40-50% quartz-calcite veinlets. Grid coordinates 5+40N 4+70W. |
| SM88-R484 | 55 ppb Au | Chip sample across 1 metre of argillic alteration zone. Grid coordinates 5+00N 8+00E. |
| SM88-R468 | 115 ppb Au | Float; Angular to subangular hematitic quartz vein material, 2 - 3% white mica. West-central part of Melinda claim. |
| SM88-R462 | 350 ppb Hg | Float; Angular volcanic rock exhibiting weak argillic alteration and silicification. Southeast corner of Geode claim. |
| SM88-R463 | 770 ppb Hg | Channel sample across 30 cm of volcanic rock exhibiting moderate argillic alteration with minor limonite and hematite. Southeast corner of Geode claim. |

| | | |
|-----------|-------------|---|
| SM88-R464 | 410 ppb Hg | Chip sample across 3 metres of silicified, argillic altered zone, 20-30% quartz, minor hematite. Southeast corner of Geode claim. |
| SM88-R465 | 1500 ppb Hg | Chip sample across 2 metres of moderate argillic alteration zone grading into clay; 20-30% quartz fragments. Southeast corner of Geode claim. |

The four mercury anomalies are clustered in the southeast corner of the Geode claim.

7.5 STREAM SEDIMENT GEOCHEMISTRY (Figure 5)

The following samples are considered anomalous:

| SAMPLE | VALUE | LOCATION |
|----------|------------|--|
| SM88-T02 | 120 ppb Hg | Lone Cabin Creek tributary, southeast part of Geode claim. |
| SM88-T17 | 80 ppb Hg | Central part of Scarlet claim. |
| SM88-T18 | 80 ppb Hg | Central part of Scarlet claim. |
| SM88-T48 | 80 ppb Hg | Northeast corner of Melinda claim. |

7.6 SOIL GEOCHEMISTRY

The soil sampling grid was laid out in the northeast part of the property. This location was chosen to cover the Hungry Valley Thrust Fault which has mercury associated with it in the area, and which could be a conduit for ascending mineralizing solutions. The grid was oriented at 40 degrees to parallel the strike of the gold-silver quartz veins at Blackdome Mountain.

7.6.1 Gold in Soil (Figure 6)

| | |
|---------------------|------------------------|
| Range: | Not detected to 65 ppb |
| Mean: | .8716 |
| Standard Deviation: | 4.974 |
| Background: | 0-20 ppm |
| Anomalous: | 20+ ppb |

A total of nine single point anomalies exist in gold. The two highest results (60 and 65 ppb) are located at L6+00S 7+00W and L0 10+00E.

7.6.2 Mercury in Soil (Figure 7)

| | |
|---------------------|-------------------------|
| Range: | Not detected to 160 ppb |
| Mean: | 26.972 |
| Standard Deviation: | 16.54 |
| Background: | 0-100 ppb |
| Anomalous: | 100+ ppb |

Ten spot mercury anomalies are scattered over the grid. The highest value (160 ppb) occurs at L4+00S 8+50W.

A two point anomaly (130 and 100 ppb) at L4+00N 17+50E and 18+00E is coincident with four anomalous values in rocks.

7.6.3 Arsenic and Zinc in Soil (Figures 8 and 9)

Four spot arsenic anomalies above 50 ppm and eight spot zinc anomalies above 150 ppm are scattered throughout the grid.

The purpose of Figures 8 and 9 is to illustrate the two distinct background populations corresponding to the two main rock types. South of the Hungry Valley Thrust Fault a higher background threshold exists in the Cretaceous sedimentary terrain as indicated by the high density of anomalies. North of the thrust fault in the Eocene volcanics the background threshold is lower.

7.7 DISCUSSION OF RESULTS

The 1988 geological and geochemical surveys have delineated several areas which will require follow-up exploration work.

The main area of interest is in the southeast corner of the Geode claim. Four rock samples exhibiting strong argillic alteration and silicification were anomalous in mercury (350 to 1500 ppb Hg) and correspond with two mercury soil anomalies. Mercury is known to be the best pathfinder for epithermal gold mineralization in the Blackdome area.

Three rock samples were collected which were anomalous in gold (55, 80 and 115 ppb). The sample locations will require checking by geological mapping and rock sampling.

The 1988 surveys have covered approximately 30% of the claim group by soil geochemistry and 60% by geological mapping. Taking into consideration the favourable host rocks and close proximity to the Blackdome deposit, the remainder of the property should be covered by geological mapping and geochemical soil sampling to evaluate its potential.

8. CONCLUSIONS

Both writers conclude that the Stryker Claim Group has the potential to host an epithermal gold-silver vein deposit for the following reasons:

- The main host rock (Eocene volcanics) is favourable for hosting economic gold-silver quartz veins as seen at the Blackdome deposit.
- Anomalous values in gold and mercury from soils and rocks point towards the presence of an auriferous epithermal system on the subject claims.

For these reasons further exploration work is warranted and recommended.

9. RECOMMENDATIONS

Phase II

- 1) Lay out approximately 35 kilometres of grid to extend the present grid. Line spacings should be at 200 metres to maximize coverage over the property. In addition, layout approximately five kilometres of detailed grid to cover the anomalous area in the southeast corner of the Geode claim.
- 2) Soil sample the extended grid at 50 metre station spacings. Soil sample the detailed grid at 25 metre station spacings. Samples taken north and south of the Hungry Valley Thrust Fault should be treated statistically separately.
- 3) Geologically map and rock sample the unmapped areas of the property.

Phase III

Phase III is contingent upon targets being established from Phase II. It would consist of detailed soil sampling, mapping and backhoe trenching to establish drill targets.

10. PROPOSED BUDGET - PHASE II

(Project Geologist, 3 Geotechnicians - 13 field days)

| | | |
|--|------|--------------------|
| Project Preparation | \$ | 1,200 |
| Mob/Demob (includes transportation, freight and wages) | | 4,035 |
| Field Crew | | 12,415 |
| Field Costs | | 13,525 |
| Lab Analysis | | 16,300 |
| Supervision and Report | | <u>5,725</u> |
| Sub-total | \$ | 53,200 |
| Administration 15% | | <u>7,980</u> |
| Total | | <u>61,180</u> |
| | (Say | \$ <u>61,000</u>) |

Respectfully submitted

Peter D. Leriche, B.Sc., F.G.A. FELLOW

CERTIFICATE

I, PETER D. LERICHE, of 3126 West 12th Avenue, Vancouver, B.C., V6K 2R7, do hereby state that:

1. I am a graduate of McMaster University, Hamilton, Ontario, with a Bachelor of Science Degree in Geology, 1980.
2. I am a Fellow in good standing with the Geological Association of Canada.
3. I have actively pursued my career as a geologist for nine years in British Columbia, Ontario, Yukon and Northwest Territories, Arizona, Nevada and California.
4. The information, opinions, and recommendations in this report are based on fieldwork carried out under my direction, and on published and unpublished literature. I was present on the subject property on August 24, 1988.
5. I have no interest, direct or indirect, in the subject claims or the securities of Lexington Resources Ltd. or Iskut Gold Corp.
6. I consent to the use of this report in a Prospectus or Statement of Material Facts for the purpose of private or public financing.

Peter D. Leriche, B.Sc. F.G.A.C.

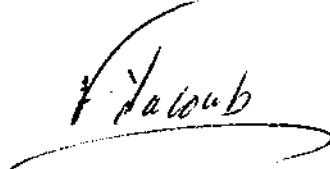

Dated at Vancouver, December 5, 1988

CERTIFICATE

I, FAYZ F. YACOUB, of 13031 - 64th Avenue, Surrey, British Columbia, V3W 1X8, do hereby declare:

1. That I am a graduate in geology and chemistry from Assuit University, Egypt (B.Sc. 1967), and Mining Exploration Geology of the International Institute for Aerial Survey and Earth Sciences (I.T.C.), Holland (Diploma 1978).
2. I have actively pursued my career as a geologist for the past fifteen years.
3. The information, opinions, and recommendations in this report are based on fieldwork carried out by myself, and on published and unpublished literature. I was present on the subject property on September 7 to 19, 1988.
4. I have no interest, direct or indirect, in the subject claims or the securities of Lexington Resources Ltd. or Iskut Gold Corp.
5. I consent to the use of this report in a Prospectus or Statement of Material Facts for the purpose of private or public financing.

Fayz F. Yacoub, B.Sc.

Dated at Vancouver, December 5, 1988

APPENDIX A
ROCK SAMPLE DESCRIPTIONS

**STRYKER CLAIM GROUP
ROCK SAMPLE DESCRIPTIONS**

| SAMPLE NO. | DESCRIPTION | WIDTH (cm) |
|------------|--|------------|
| SM88-R451 | Float; Light brown to gray rusty volcanic, 10-15% iron oxides, mainly hematite. | |
| SM88-R452 | Chip; Light brown oxidized zone of volcanic rocks, limonite staining, remnant of volcanic fragments. | 200 |
| SM88-R453 | Channel; Dark brown rusty altered zone of volcanic rock with 3-4mm wide calcite veinlets. | 100 |
| SM88-R454 | Channel; Volcanic rocks with 3-4 mm wide calcite veinlets. | 30 |
| SM88-R455 | Chip; Light to dark brown rusty volcanic rock with numerous calcite veinlets 1-3mm wide, no mineralization. | 200 |
| SM88-R456 | Float; Subangular quartz vein material, one square foot in size. White sugary quartz with light brown weathered surface. No obvious sulphides. | |
| SM88-R457 | Float; Subangular volcanic rock, 40-50% quartz-calcite veinlets in light gray volcanic matrix. | |
| SM88-R458 | Float; Angular quartz vein material, white sugary quartz with dark green to black biotite. | |
| SM88-R459 | Float; Angular local green volcanic rock with 50-60% green volcanic glass, 1-2% calcite. | |
| SM88-R460 | Channel; Rusty volcanic zone, dark brown weathered limonite, excess of iron oxides, minor calcite. | 30 |
| SM88-R461 | Float; Subangular, light brown, hematitic sugary quartz vein material with minor muscovite. | |
| SM88-R462 | Float; Angular local volcanic rock, minor argillic alteration, 50% quartz fragments, limonite and minor hematite. | |

| | | |
|-----------|---|-----|
| SM88-R463 | Channel; Light brown to reddish volcanic subcrop with 20-30% quartz fragments, moderate argillic alteration, minor limonite and hematite. | 30 |
| SM88-R464 | Chip; Silicified argillic alteration zone with 20-30% secondary quartz, minor hematite. | 300 |
| SM88-R465 | Chip; Moderate argillic alteration zone, 40% clay minerals, 20-30% quartz fragments, minor hematite. | 200 |
| SM88-R466 | Float; Subangular altered volcanic, over 60% combined white and light brown hematitic quartz, minor iron staining, remnants of light gray volcanic fragments. | |
| SM88-R467 | Float; Angular quartz vein material, no mineralization. | |
| SM88-R468 | Float; Angular to subangular 2'X2' size quartz material, light brown hematitic quartz with 2-3% white mica. | |
| SM88-R469 | Chip; Light green to dark green glassy volcanic with occasional veinlets and patches of chalcedony. | 400 |
| SM88-R470 | Chip; Light green to dark brown altered volcanic tuff with 5% limonite. | 100 |
| SM88-R471 | Chip; Brown weathered volcanic outcrop, minor silicification, no mineralization. | 100 |
| SM88-R472 | Chip; Small argillic alteration zone, buff to light brown altered rock going into clay with occasional calcite veinlets. | 100 |
| SM88-R473 | Float; Sugary quartz coated with quartz chalcedony. No obvious mineralization. | |
| SM88-R474 | Float; Angular quartz vein material, reddish to dark brown hematitic quartz with minor muscovite. | |
| SM88-R475 | Float; Light brown to reddish quartz vein material, 5-10% white to light brown biotite. Subangular, 1'X2'. | |

| | | |
|-----------|--|------|
| SM88-R476 | Float; Angular sugary quartz vein material with 5% white mica. Vugs filled with rusty Fe oxides. | |
| SM88-R477 | Chip; Olive green altered serpentized outcrop, dark weathered surface and calcite veinlets. | 200 |
| SM88-R478 | Chip; Small argillic alteration zone of light to dark brown amygdaloidal volcanic subcrop, moderately altered. | 300 |
| SM88-R479 | Chip; Altered green volcanics, brecciated with numerous quartz stringers, light brown weathering surfaces. | 200 |
| SM88-R480 | Chip; Light green silicified volcanics, 10-15% injected quartz, brecciated with rusty light brown weathering surfaces. No mineralization. | 1000 |
| SM88-R481 | Chip; Buff, reddish to olive green volcanics, minor silicification and argillic alteration. | 500 |
| SM88-R482 | Float; Chalcedony quartz, amygdaloidal texture on surface, massive white barren quartz. No sulphides. | |
| SM88-R483 | Chip; Dark brown, hematitic altered volcanics with 10-20% limonite in cavities and on fracture surfaces, white calcite veinlets 1-2mm wide. | 300 |
| SM88-R484 | Chip; Small argillic alteration zone, light gray, soft volcanics going into clay. No sulphides. | 100 |
| SM88-R485 | Chip; Light gray volcanics, amygdaloidal texture, weak to moderate argillic alteration with 15-20% clay. | 300 |
| SM88-R486 | Chip; Rusty, light to dark brown volcanics with strong oxidation, excess of limonite and hematite on fracture surfaces. No obvious mineralization. | 200 |

P.O. # : NONE

Samples submitted to our lab in Vancouver, BC.
This report was printed on 5-OCT-88.

SAMPLE PREPARATION

| CHEMEX CODE | NUMBER SAMPLES | DESCRIPTION |
|-------------|----------------|--------------------------------|
| 205 | 36 | Rock Geochem: Crush,split,ring |
| 238 | 36 | ICP: Aqua regia digestion |

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

| CHEMEX CODE | NUMBER SAMPLES | DESCRIPTION | METHOD | DETECTION LIMIT | UPPER LIMIT |

CERTIFICATE A8824341

ASHWORTH EXPLORATIONS LTD.

PROJECT : 232

P.O. #: NONE

Samples submitted to our lab in Vancouver, BC.
This report was printed on 4-OCT-88.

SAMPLE PREPARATION

| CHEMEX NUMBER | | CODE | SAMPLES | DESCRIPTION |
|---------------|-----|------|---------|----------------------------------|
| 201 | 183 | | | Dry, sieve -80 mesh; soil, sed. |
| 203 | 13 | | | Dry, sieve -35 mesh and ring |
| 217 | 13 | | | Geochem:Ring only,no crush/split |
| 238 | 200 | | | ICP: Aqua regia digestion |

• NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

| CHEMEX NUMBER | | CODE | SAMPLES | DESCRIPTION | METHOD | DETECTION LIMIT | UPPER LIMIT |
|---------------|-----|------|---------|---|---------------|-----------------|-------------|
| 100 | 200 | | | Au ppb: Fuse 10 g sample | FA-AAS | 5 | 10000 |
| 20 | 200 | | | Hg ppb: HNO ₃ -HCl digestion | AAS-FLAMELESS | 10 | 100000 |
| 921 | 200 | | | Al %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 922 | 200 | | | Ag ppm: 32 element, soil & rock | ICP-AES | 0.2 | 200 |
| 923 | 200 | | | As ppm: 32 element, soil & rock | ICP-AES | 5 | 10000 |
| 924 | 200 | | | Ba ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 925 | 200 | | | Be ppm: 32 element, soil & rock | ICP-AES | 0.5 | 100.0 |
| 926 | 200 | | | Bi ppm: 32 element, soil & rock | ICP-AES | 2 | 10000 |
| 927 | 200 | | | Ca %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 928 | 200 | | | Cd ppm: 32 element, soil & rock | ICP-AES | 0.5 | 100.0 |
| 929 | 200 | | | Co ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 930 | 200 | | | Cr ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 931 | 200 | | | Cu ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 932 | 200 | | | Fe %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 933 | 200 | | | Ga ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 934 | 200 | | | Hg ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 935 | 200 | | | K %: 32 element, soil & rock | ICP-AES | 0.01 | 10.00 |

PROJECT : 232

P.O. # : NONE

Samples submitted to our lab in Vancouver, BC.
 This report was printed on 6-OCT-88.

SAMPLE PREPARATION

| CHEMEX CODE | NUMBER SAMPLES | DESCRIPTION |
|----------------|-------------------|---------------------------------|
| 201 | 220 | Dry, sieve -80 mesh; soil, sed. |
| 203 | 3 | Dry, sieve -35 mesh and ring |
| 238 | 223 | ICP: Aqua regia digestion |

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

| CHEMEX CODE | NUMBER SAMPLES | DESCRIPTION | METHOD | DETECTION LIMIT | UPPER LIMIT |
|----------------|-------------------|---|---------------|--------------------|----------------|
| 100 | 223 | Au ppb: Fuse 10 g sample | FA-AAS | 5 | 10000 |
| 20 | 223 | Hg ppb: HNO ₃ -HCl digestion | AAS-FLAMELESS | 10 | 100000 |
| 921 | 223 | Al %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 922 | 223 | Ag ppm: 32 element, soil & rock | ICP-AES | 0.2 | 200 |
| 923 | 223 | As ppm: 32 element, soil & rock | ICP-AES | 5 | 10000 |
| 924 | 223 | Ba ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 925 | 223 | Be ppm: 32 element, soil & rock | ICP-AES | 0.5 | 100.0 |
| 926 | 223 | Bi ppm: 32 element, soil & rock | ICP-AES | 2 | 10000 |
| 927 | 223 | Ca %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 928 | 223 | Cd ppm: 32 element, soil & rock | ICP-AES | 0.5 | 100.0 |
| 929 | 223 | Co ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 930 | 223 | Cr ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 931 | 223 | Cu ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 932 | 223 | Fe %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 933 | 223 | Ga ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 951 | 223 | Hg ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 934 | 223 | K %: 32 element, soil & rock | ICP-AES | 0.01 | 10.00 |
| 935 | 223 | La ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 936 | 223 | Mg %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 937 | 223 | Mn ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 938 | 223 | Mo ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 939 | 223 | Na %: 32 element, soil & rock | ICP-AES | 0.01 | \$.00 |
| 940 | 223 | Ni ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 941 | 223 | P ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 942 | 223 | Pb ppm: 32 element, soil & rock | ICP-AES | 2 | 10000 |
| 943 | 223 | Sb ppm: 32 element, soil & rock | ICP-AES | 5 | 10000 |
| 958 | 223 | Sc ppm: 32 elements, soil & rock | ICP-AES | 1 | 100000 |
| 944 | 223 | Sr ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 945 | 223 | Ti %: 32 element, soil & rock | ICP-AES | 0.01 | 5.00 |

ASHWORTH EXPLORATIONS LTD.

PROJECT : 232

P.O.# : NONE

Samples submitted to our lab in Vancouver, BC.
This report was printed on 5-OCT-88.

SAMPLE PREPARATION

| CHEMEX CODE | NUMBER | DESCRIPTION |
|-------------|--------|----------------------------------|
| CHEMEX CODE | NUMBER | SAMPLES |
| 201 | 132 | Dry, sieve -80 mesh; soil, sed. |
| 203 | 24 | Dry, sieve -35 mesh and ring |
| 217 | 13 | Geochem:Ring only,no crush/split |
| 238 | 169 | ICP: Aqua regia digestion |

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

| CHEMEX CODE | NUMBER | DESCRIPTION | METHOD | DETECTION LIMIT | UPPER LIMIT |
|-------------|--------|---|---------------|-----------------|-------------|
| 100 | 169 | Au ppb: Fuse 10 g sample | FA-AAS | 5 | 10000 |
| 20 | 169 | Hg ppb: HNO ₃ -HCl digestion | AAS-FLAMELESS | 10 | 100000 |
| 921 | 169 | Al %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 922 | 169 | Ag ppm: 32 element, soil & rock | ICP-AES | 0.2 | 200 |
| 923 | 169 | As ppm: 32 element, soil & rock | ICP-AES | 5 | 10000 |
| 924 | 169 | Ba ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 925 | 169 | Be ppm: 32 element, soil & rock | ICP-AES | 0.5 | 100.0 |
| 926 | 169 | Bi ppm: 32 element, soil & rock | ICP-AES | 2 | 10000 |
| 927 | 169 | Ca %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 928 | 169 | Cd ppm: 32 element, soil & rock | ICP-AES | 0.5 | 100.0 |
| 929 | 169 | Co ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 930 | 169 | Cr ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 931 | 169 | Cu ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 932 | 169 | Fe %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 933 | 169 | Ga ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 951 | 169 | Hg ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 934 | 169 | K %: 32 element, soil & rock | ICP-AES | 0.01 | 10.00 |
| 935 | 169 | La ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 936 | 169 | Mg %: 32 element, soil & rock | ICP-AES | 0.01 | 15.00 |
| 937 | 169 | Mn ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 938 | 169 | Mo ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 939 | 169 | Na %: 32 element, soil & rock | ICP-AES | 0.01 | 5.00 |
| 940 | 169 | Ni ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 941 | 169 | P ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 942 | 169 | Pb ppm: 32 element, soil & rock | ICP-AES | 2 | 10000 |
| 943 | 169 | Sb ppm: 32 element, soil & rock | ICP-AES | 5 | 10000 |
| 958 | 169 | Sc ppm: 32 elements, soil & rock | ICP-AES | 1 | 100000 |
| 944 | 169 | Sr ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 945 | 169 | Ti %: 32 element, soil & rock | ICP-AES | 0.01 | 5.00 |
| 946 | 169 | Tl ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 947 | 169 | U ppm: 32 element, soil & rock | ICP-AES | 10 | 10000 |
| 948 | 169 | V ppm: 32 element, soil & rock | ICP-AES | 1 | 10000 |
| 949 | 169 | W ppm: 32 element, soil & rock | ICP-AES | 5 | 10000 |
| 950 | 169 | Zn ppm: 32 element, soil & rock | ICP-AES | 5 | 10000 |

CERTIFICATION

APPENDIX C
ANALYTICAL TECHNIQUES

Gold FA-AA ppb:

A 10 gram sample is fused with a basic litharge flux inquarted with 10 mg of Au-free silver and then cupelled.

Beads for AA finish are digested for 1/2 hour in 1 ml HNO₃, then 3 ml HCl are added and digested for 1 hour. The samples are cooled and made to a volume of 10 ml, homogenized and run on the AAS with background correction.

32 ELEMENT GEOCHEMISTRY PACKAGE - ICP-AES

Prepared sample (0.5g) is digested with concentrated nitric-aqua regia acid at medium heat for approximately 2 hours. The acid solution is diluted to 25 ml with demineralized water, mixed and analyzed on a Jarrell-Ash 1100 Plasma unit after calibration with proper standards.

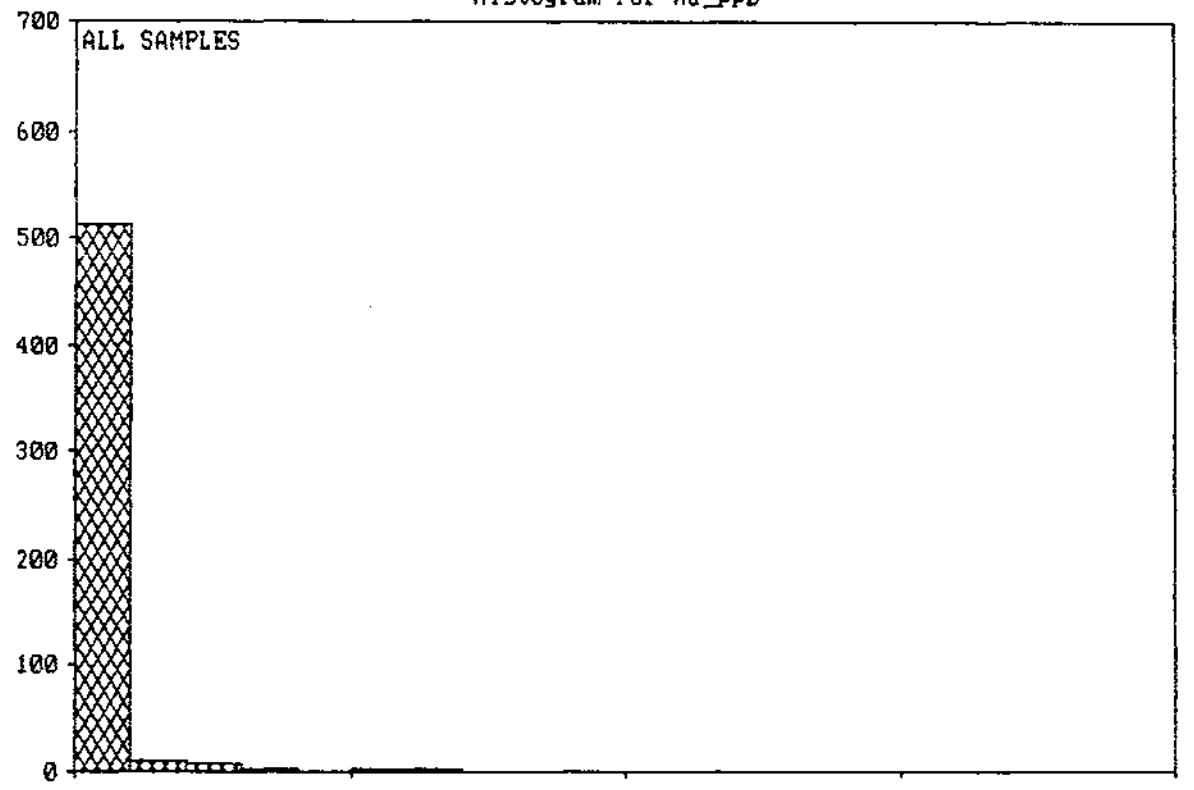

Results are corrected for spectral interelement interferences.

Vancouver, B.C.
V6C 1A5

Invoice 7687

October 20th, 1988

Samples:

10 rock samples, numbered 1 - 10, for thin sectioning and petrographic examination.

Summary:

a) **Basalts:** This is the commonest rock type in the suite. Samples 3, 7 and 10 are holocrystalline, though #7 is minutely fine-grained. #10 has a meshwork texture and is the coarsest grained of the basaltic rocks (though only slightly more so than #3); it may be a diabase.

Samples 2 and 5 are very fine-grained, and include a considerable proportion of residual glass in the groundmass.

These rocks (except for #5) are sparsely microporphyritic. #5 is non-porphyritic and has some tiny amygdalules.

The basalts are generally fresh throughout. Samples 2, 3 and 5 may be of somewhat potassic composition.

b) Other volcanics:

Sample 1 is a weakly porphyritic felsic rock of latite-rhyolite composition. It is fresh.

Sample 9 is a distinctly porphyritic, amygdaloidal andesite with a somewhat potassic groundmass. It is fresh.

Sample 6 is largely glassy and of uncertain, patchily potassic composition. It may be a vitric tuff.

c) Volcaniclastics:

Sample 4 is a lithic arenite of angular felsitic clasts and lesser quartz, feldspar and mafic mineral grains.

Sample 8 is a fine-grained, quartz-free volcaniclastic or tuff, composed of plagioclase and minor mafic crystals, with a matrix of brownish altered glass fragments.

Individual petrographic descriptions are attached.

A handwritten signature in black ink, appearing to read "J.F. Harris".

J.F. Harris Ph.D.

Sample 1**LATITE**

Estimated mode

| | |
|----------------------|-------|
| Quartz | 8 |
| Sanidine phenocrysts | 8 |
| Potassic groundmass | 84 |
| Opaques | trace |

This is a homogenous, fine-grained, leucocratic felsic volcanic of simple mineralogy.

It consists predominantly of a feathery/felsitic aggregate composed largely of feldspar. This exhibits a texture typical of rapid crystallization and/or devitrification of a near-glassy matrix. A diffuse, equigranular fabric, on the scale 50 - 100 microns, is overlain by minutely microlitic crystallization, yielding an overall sub-trachytic texture.

Scattered, small grains and grain clumps within the predominantly feldspathic groundmass are clearly of quartz.

The rock is sparsely porphyritic and contains small, randomly oriented, subhedral-euhedral phenocrysts of sanidine, 0.2 - 1.5mm in size.

The only other constituents are sparsely disseminated, minute granules and euhedra of opaques (pyrite?) 10 - 100 microns in size.

This rock has a relatively low content of free quartz (and no quartz phenocrysts). Judging from the moderately strong overall cobaltinitrite stain developed on the cut-off block, the groundmass is composed of an intimate mixture of K-feldspar and lesser plagioclase. The rock is therefore best classified as a latite though close to the compositional boundary with rhyolite.

Sample 2**BASALT**

Estimated mode

| | |
|--------------------|----|
| Plagioclase | 30 |
| Pyroxene | 21 |
| Interstitial glass | 40 |
| Opacites | 5 |
| Carbonate | 4 |

This is a sparsely porphyritic volcanic of basaltic aspect

It is composed predominantly of a sub-trachytic groundmass of plagioclase laths and tiny blocky grains of pyroxene, 20 - 100 microns in size, with interstitial brownish feldspathic glass. Equant euhedral opacites (probably mostly oxides) 10 - 50 microns in size, are a notably abundant, evenly disseminated component.

The rock contains occasional small blocky euhedral phenocrysts of feldspar, 0.2mm - 1.5mm in size. This is probably plagioclase, though has more the form of sanidine - of which it could be a sodic variety. Its actual identity is obscured by the prevalence of mottled, sub-opaque inclusions - possibly of altered groundmass glass. Rare tiny phenocrysts of pyroxene are also seen.

Diffuse, irregular patches of carbonate are sporadically developed in the groundmass, and marginal to the feldspar phenocrysts

Both phenocrysts and groundmass are essentially fresh.

The rock takes a faint positive cobaltinitrite stain, and appears to be a somewhat potassic basalt flow.

Sample 3**BASALT**

Estimated mode

| | |
|-------------|-------|
| Plagioclase | 76 |
| Pyroxene | 20 |
| Opaques | 4 |
| Carbonate | trace |

This is a rock of very similar type to Sample 2, except for being holocrystalline and slightly coarser.

It consists predominantly of a sub-trachytic aggregate of fresh plagioclase laths, 0.05 - 0.2mm in length, with interstitial granules of pyroxene and opaques, 20 - 50 microns in size

This groundmass shows streaky, local orientation of the constituent plagioclase laths and slight variations in grain size. These probably represent incipient flow features.

The rock contains rare, blocky, euhedral phenocrysts of plagioclase, 0.3 - 1.2mm in size. These are identical in appearance to those in Sample 2, being poorly twinned and having abundant, emulsion-textured, sub-opaque inclusions.

Carbonate occurs as rare, tiny pockets, sometimes of amygdaloidal aspect.

Like the majority of basaltic rocks of the suite, the cut-off block exhibits a weak overall positive cobaltinitrite stain, indicating a slightly potassic feldspar composition.

Sample 4**LITHIC ARENITE**

Estimated mode

| | |
|------------------------|-------|
| Quartz | 7 |
| Plagioclase | 13 |
| Biotite | 2 |
| Hornblende | 1 |
| Chlorite | trace |
| Epidote | trace |
| Opaques | trace |
| Felsitic lithic clasts | 77 |

This rock is composed of a close-packed aggregate of angular to sub-angular clasts, 0.1 - 3.0mm in size.

The majority of these are lithic fragments, of various minutely fine-grained, glassy, feathery-textured microlitic or felsitic rocks of andesitic aspect. As can be seen from the stained cut-off chip, a proportion of these are of quite strongly potassic (trachy-andesite) composition.

Other lithic types, represented in much lesser abundance, are granular quartz aggregates of uncertain origin (quartzite? chert? vein quartz?), and coarse-grained plagioclase and quartz-plagioclase aggregates of dioritic aspect.

Disaggregated mineral grains - mainly plagioclase, but including some quartz, biotite, hornblende and epidote - make up a fine sandy component which fills the interstices between the coarser clasts.

There is no clay-sized chloritic or sericitic matrix (as would be present in a wacke), and the rock is most properly classified as an arenite.

Sample 5**BASALT**

Estimated mode

| | |
|-------------|----|
| Plagioclase | 30 |
| Glass | 38 |
| Pyroxene | 18 |
| Mineral X | 8 |
| Carbonate | 2 |
| Epidote(?) | 1 |
| Opacates | 3 |

This is another variant of the somewhat potassic basaltic rocks of the suite. It is a particularly fine-grained form, with a high content of glass.

A homogenous meshwork fabric of plagioclase microlites, 20 - 100 microns in size, is developed in an interstitial matrix of turbid, brownish dusty glass. Tiny, prismatic pyroxenes and equant granules of opaques are the other constituents.

An additional component is a pale brown high relief, low R.I., isotropic material which occurs as diffuse wisps and patches in the groundmass. This may be opal or a form of segregated, altered glass.

The rock is essentially non-porphyritic, but contains relatively numerous tiny amygdules (0.1 - 0.5mm) filled with carbonate or a high-relief, yellowish radiate mineral (epidote?). The latter type of amygdule is strikingly spheroidal/radiate in form, and sometimes has cores of chalcedony.

The slide includes one small xenolith of slightly coarser-grained basalt.

Sample 6**GLASSY VOLCANIC (TUFF?)**

Estimated mode

| | |
|---------------|-------|
| Glass | 73 |
| Feldspars | 15 |
| Chlorite | 10 |
| Rutile) | 2 |
| Leucoxene) | |
| Chalcedony(?) | trace |

This is a non-porphyritic volcanic of largely glassy composition.

It is made up of a pellet/aggregate of compact, greenish-brown non-vesicular glass

Some of the pellet forms show the development of tiny, lath-like feldspars in a greenish chloritic matrix (i.e. incipient crystallization of the glass). Flecks, granules and skeletal grains of rutile/leucoxene are a common dispersed minor component.

The glass show subtly varying degrees of incipient devitrification throughout. This may correlate with the diffuse pattern of more K-rich segregations recognizable in the stained cut-off block.

Occasional discontinuous veinlets and diffuse patches of microgranular material are thought to be chalcedony.

The composition of this rock can only be determined by chemical analysis. It lacks the content of fine-grained opaques seen in those members of the suite classified as basalts, and is texturally distinctive. The pellet fabric may, in fact represent an agglomeration of small vitric particles i.e. it may have tuffaceous affinities.

Sample 7**BASALT**

Estimated mode

| | |
|-------------|----|
| Plagioclase | 64 |
| Pyroxene | 28 |
| Rutile) | 8 |
| Opacques) | |

This is another aphanitic volcanic, of similar general type to most of the rest of the suite.

Though minutely fine-grained, it is found, under the microscope, to be holocrystalline, and to consist of a tight, meshwork aggregate, of grain size 5 -20 microns, composed of plagioclase microlites and pyroxene granules. Tiny equant grains of rutile and/or opaques are densely and evenly disseminated through this aggregate.

Slightly coarser plagioclase laths (to 0.2mm in length) occur, sparsely disseminated, in random orientation. Very rare, euhedral micro-phenocrysts of fresh clino-pyroxene and labradorite, to 1.0mm in size, are seen.

The rock is texturally homogenous and notably fresh. Judging from the almost non-existent cobaltinitrite stain on the cut-off block, it is somewhat less potassic in overall composition than other similar rocks of the suite.

Sample 8**VOLCANIC WACKE****Estimated mode**

| | |
|------------------------|----|
| Plagioclase | 45 |
| Brown matrix) | 42 |
| Altered glassy clasts) | |
| Pyroxene | 5 |
| Hornblende | 2 |
| Biotite | 1 |
| Rutile) | 4 |
| Leucoxene) | |
| Zeolite) | 1 |
| Gypsum) | |

This sample has the characteristic texture of a fine-grained volcaniclastic.

It is made up of a rather even-grained aggregate of angular particles, of grain size 30 - 100 microns. These consist of crystal clasts of somewhat turbid plagioclase and minor pyroxene, hornblende and biotite, and apparent lithic clasts of a brown, biotitic/chloritic material - possibly altered glass. The latter material also forms a diffuse interstitial matrix or cement to the crystal clasts. Wisps and granules of sub-opaque rutile and leucoxene are abundant throughout

The rock shows perceptible layered character. There is an incipient preferred elongation of some of the constituent clasts and crudely banded intercalations of coarser grain size - incorporating crystals and lithic clasts up to 0.5mm. Rare, elongate, fine-grained lithic clasts of brownish, altered tuff(?) are also seen.

It appears to be quartz-free and is probably of andesitic or basaltic composition.

The rock is cut by a few ramifying, sub-parallel veinlets composed of a cloudy low-birefringent material thought to be gypsum or a zeolite.

Sample 9**PORPHYRITIC ANDESITE**

Estimated mode

Phenocrysts

| | |
|----------------------|----|
| Plagioclase | 22 |
| Pyroxene | 4 |
| Amygdules | |
| Quartz | 7 |
| Groundmass | |
| Feldspar | 58 |
| Secondary biotite(?) | 6 |
| Opaques) | 3 |
| Rutile) | |

This is a volcanic of distinctive textural type compared to the rest of the suite.

It is distinctly porphyritic, coarser-grained and of somewhat less mafic composition than most of the other volcanics.

About 25% of the rock consists of phenocrysts. These are mainly of euhedral-subhedral plagioclase (fresh andesine-labradorite), ranging in size from 0.2 - 1.5mm. A minor proportion of generally smaller (0.2 - 0.5mm) phenocrysts of fresh clino-pyroxene are also present - sometimes clumped with plagioclase.

The groundmass is a sub-trachytic aggregate of locally oriented laths of fresh plagioclase, to 0.1mm in size. The weak cobaltinitrite stain suggests a slightly potassic groundmass composition.

Accessory groundmass constituents are interstitial flecks and wisps of a brownish mineral - probably secondary biotite or amphibole, after original mafics; and tiny equant granules of evenly disseminated rutile and opaques, 5 - 20 microns in size.

Irregular elongate and branching amygdules, 0.1 - 2.0mm in size, are prominent. They are filled by coarse mosaics of feathery radiate/textured quartz.

The rock is notably fresh throughout.

Sample 10**DIABASE**

Estimated mode

Phenocrysts

| | |
|---------------|---|
| Plagioclase | 2 |
| Pyroxene | 2 |
| Altered mafic | 4 |

Groundmass

| | |
|----------------|----|
| Plagioclase | 69 |
| Pyroxene | 20 |
| Rutile) | 2 |
| Opaques) | |
| Limonite) | 1 |
| Altered glass) | |

This is a typical, holocrystalline, weakly porphyritic diabase.

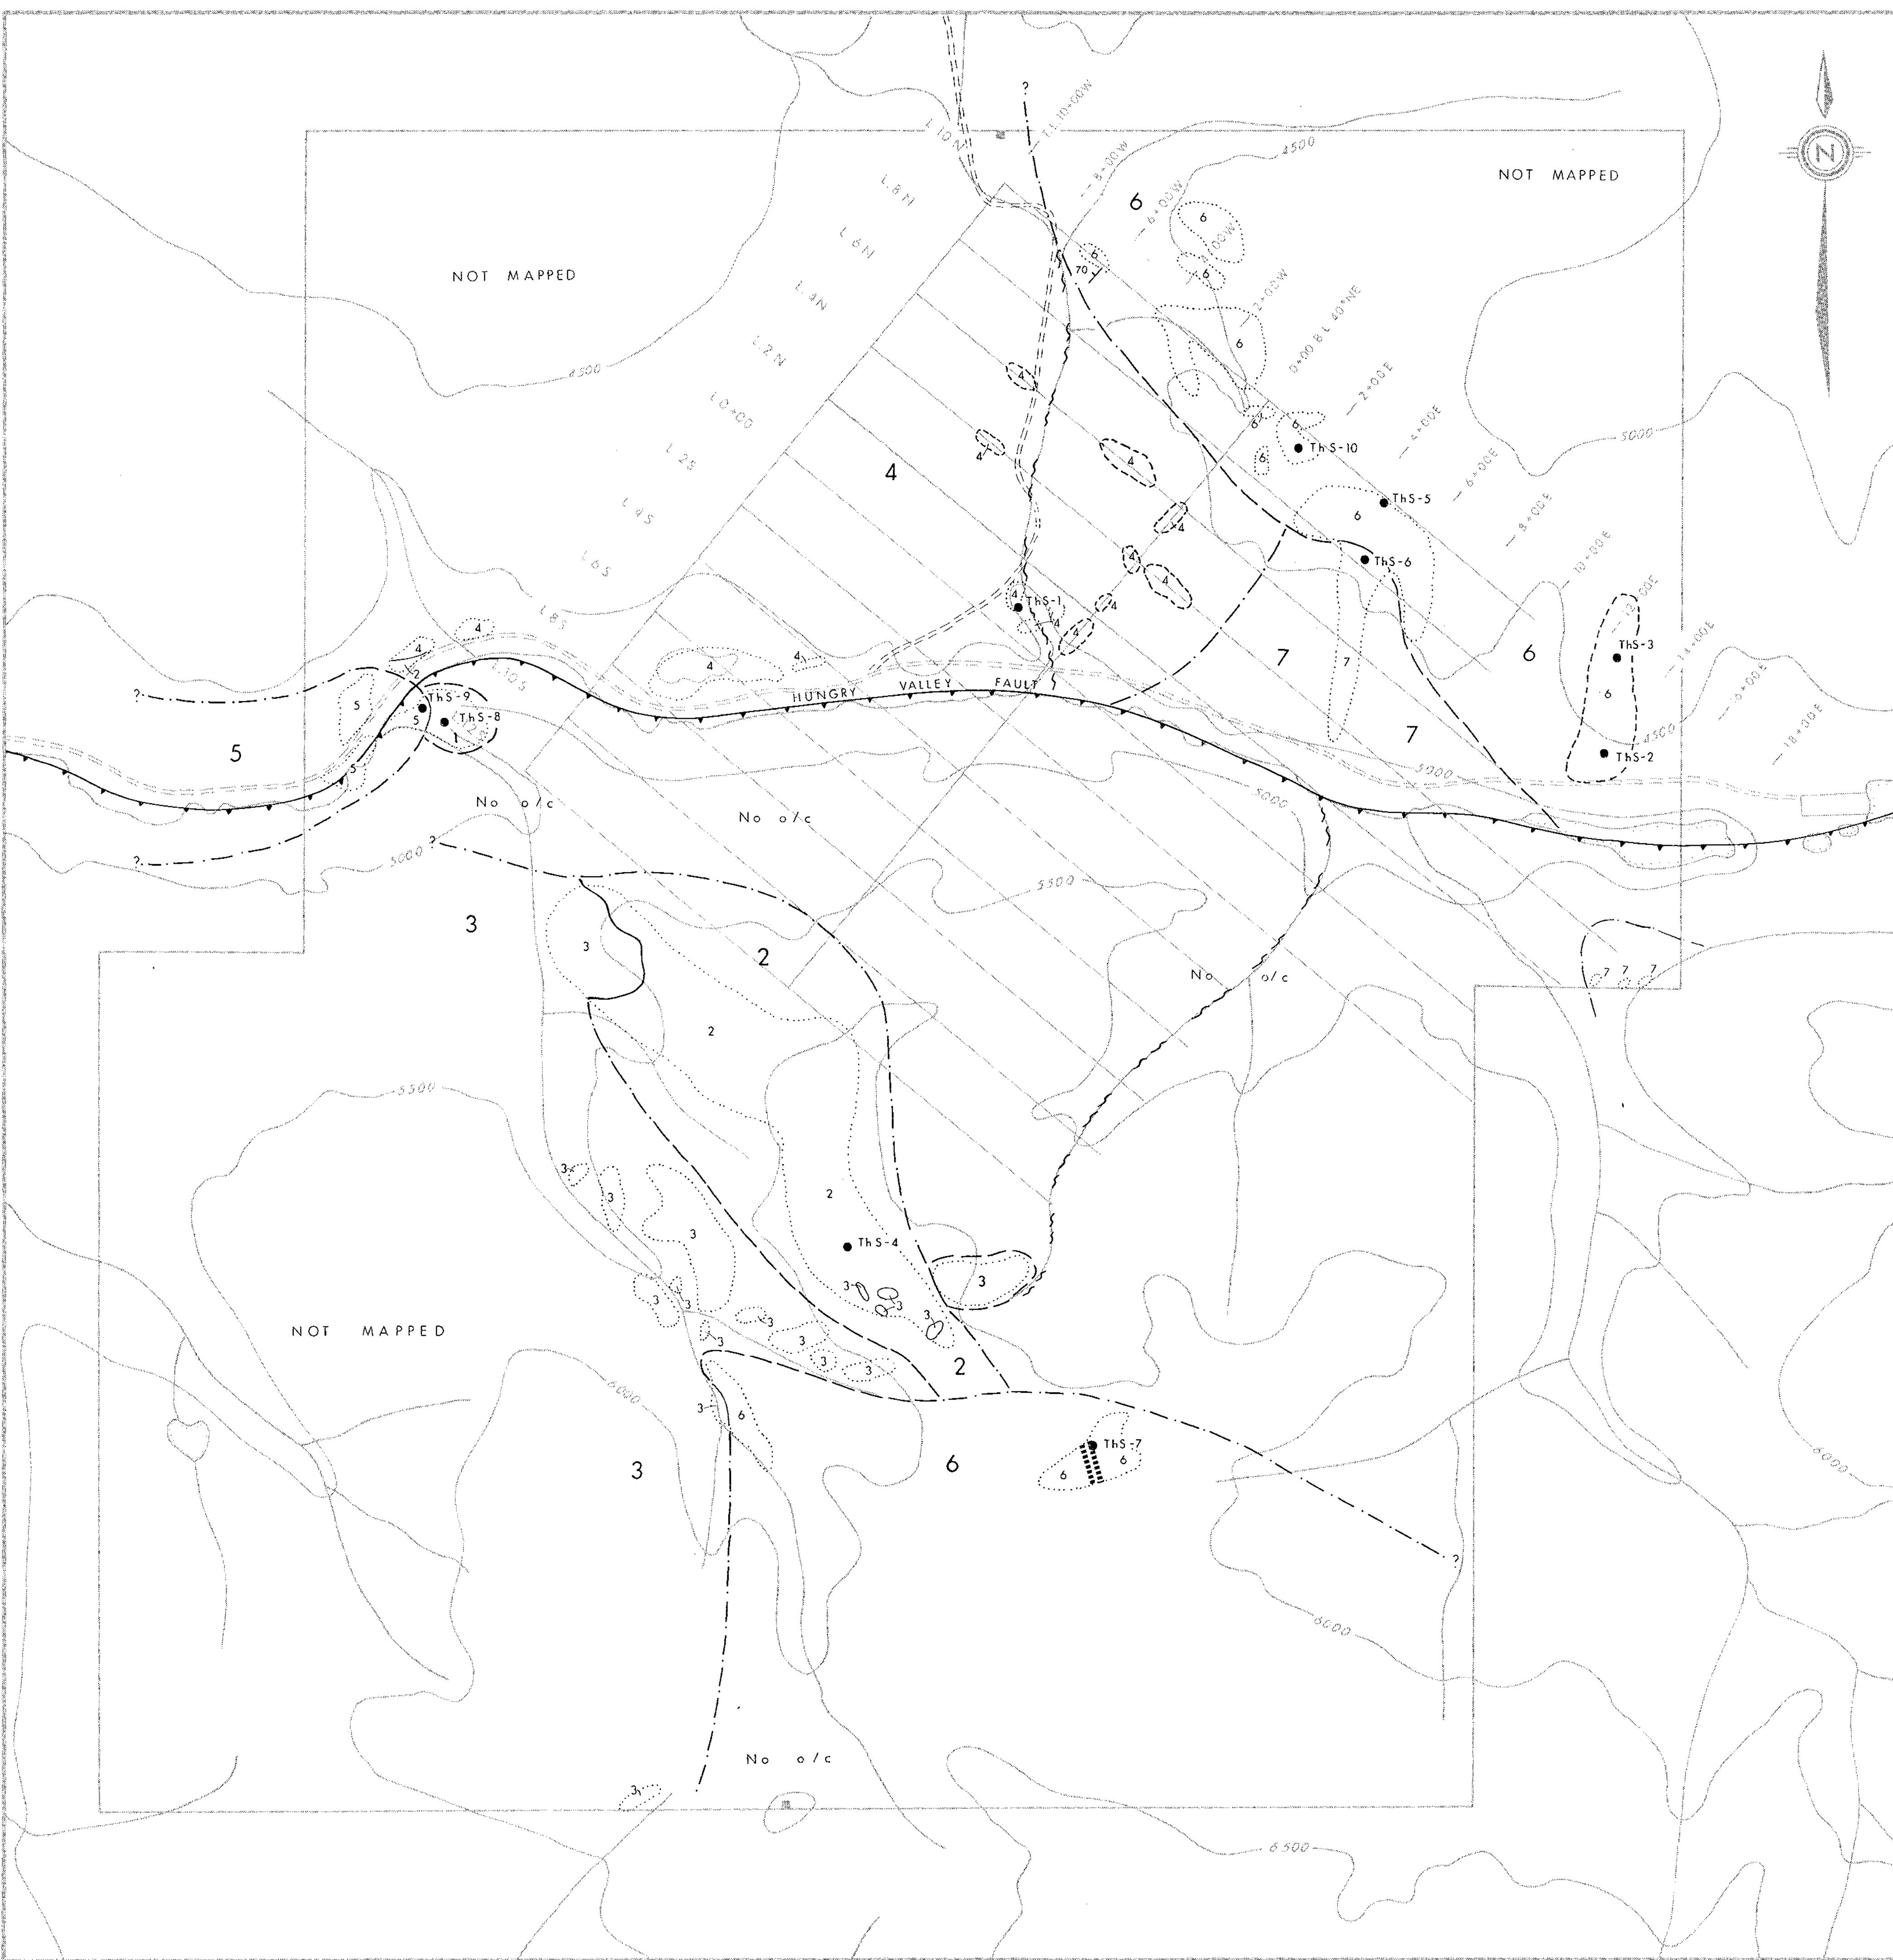

The phenocrysts are of two kinds. One consists of fresh, euhedral clinopyroxene, 0.2 - 0.7mm in size. The other consists of brownish-green secondary material (limonite/chlorite?), sometimes intergrown with carbonate and cherty quartz in various proportions. These totally altered phenocrysts range up to 2.0mm in size and show sub-prismatic form, sometimes with a relict cleavage and/or a cellular texture. They may represent original olivine or amphibole.

The groundmass is a homogenous, meshwork-textured aggregate of strikingly fresh plagioclase laths, mostly in the size range 0.05 - 0.3mm, with interstitial granules and small prisms of pyroxene and minor, tiny, equant opaques. A minor proportion of diffuse, brown, interstitial material is also present; this may be limonite or altered residual glass.

A few gradationally coarser plagioclase prisms, up to 0.5 or 0.6mm in size, occur scattered through the groundmass; these possibly qualify as phenocrysts.

Very rare, small, irregular amygdules are seen, filled by red-brown, translucent material (sideromelane?) or probable zeolites.

This rock has a significantly coarser groundmass than the basalts of the suite, and has more the aspect of a diabase. Field relationships may indicate whether it is a dyke or a flow.
