I

SUMMARY AND CONCLUSIONS

The Ranger claims are owned 50%-50% by Tanker Oil and Gas Ltd. and Levon Resources Ltd. and are located 7 km. East-Southeast of Gold Bridge, B.C. The claims are underlain by basaltic volcanics and cherty sediments of the Triassic Bridge River Group which hosts North-west South-east shears which contain gold and silver values.

The original discovery of a gold/silver vein was in 1944 and a short 12 m. adit was driven on the vein. In 1944 Bralorne mines attempted three drill holes on the structure but failed to reach bedrock.

During July-September 1988, two 100 m. spaced line grids were soil and talus sampled covering the 4 main areas of interest. These four areas are: The Saddle and Adit zones, and the North and East Ridge zones. The soil/talus sampling exploration method was used as it has proven to be an efficient method for finding vein deposits in the Bridge River district.

Sporadic anomalous gold values were found on the North and East Ridge zones. Anomalous zones of gold/arsenic were found on the Saddle and Adit zones.

A program of trenching is recommended with a follow-up program of drilling to fully explore the geochemical anomalies.

INTRODUCTION

Purpose

The purpose of this document is to report on assessment work carried out on the Ranger Property between July and September, 1988. Included in this report are the results of two detailed geochemical surveys, but not previous talus sampling and dynamite trenching which are covered in an earlier report (Cooke, 1986).

Location and Access

The Ranger Property is located approximately 7 km East-Southeast of Gold Bridge and 180 km. North-Northeast of Vancouver (figure 1). Access to the property is by automobile from Vancouver to Gold Bridge via Lillooet, or by truck via Pemberton over the Hurley Road. Access from Gold Bridge to the Ranger Property is possible by four wheel drive access road up Steep Creek to the Lucky Ranger claim. Helicopters are available from Tyax Lodge, 15 miles North of Gold Bridge.

Physiography and Climate

The claims lie North of Truax Mountain and East of McDonald Lake, at elevations of 1280 meters to 2680 meters. Vegetation cover is typical coniferous forest or alpine meadow, and the climate is characterized by hot, dry summers and cold, snowy winters.

Accommodation and Labour

Gold Bridge Hotel or Tyax Lodge are available for room and board. Levon Resources has a fully equipped camp at Gun Creek. Levon Resources supervised the program and local labour was used.

Claims Description

The Ranger Property consists of seventy units in a modified grid system of five claims covering 1,750 hectares in the Lillooet Mining Division (Figure 2). Total annual assessment on the Ranger claims is \$14,000.00

Mining History

Exploration and mining history is summarized from the reports from previous workers (see references).

First staked in 1944, the claims were optioned to Bralorne Mines Ltd., who drilled three shallow holes which failed to reach bedrock, therefore, no core was recovered. Bralorne Mines drove a 12 m. adit on the Ranger vein. Surface prospecting was carried out by the Ashmore Syndicate in 1945, after which the property fell dormant.

The claims were restaked in 1970 and magnetic surveying, trenching and sampling were completed. Rabbit Oil & Gas Ltd. bought the property in 1980 and trenched Arsenopyrite showings in Steep Creek, and completed VLF and PP magnetic surveys in 1981.

Newmont Explorations staked the property in 1983 and mapped the property with rock, soil and silt sampling. Tanker Oil & Gas Ltd. acquired the property in 1985 and brought in Levon Resources Ltd. to earn a 50% interest in performing exploration work. In 1986, Cooke Geological Consulting performed talus and dynamite trenching, sampling and mapping of the North Ridge zone (Cooke, 1986).

Claim List

GEOLOGY (COOKE, 1986)

Regional

Regional geology and tectonics are summarized from the reports of many workers in the Bridge River district, with emphasis on Geological Survey of Canada Reports and University of British Columbia Reports (see references).

The Bridge River district lies at the western margin of the Intermountain Belt of volcanic and sedimentary rocks where it abuts against the Coast Plutonic Complex of plutonic and metamorphic rocks (figure 3). Triassic arc volcanics and backarc sediments (Cadwallader and Bridge River Groups) are intruded by synvolcanic, intermediate plutons (Bralorne Intrusions) and faulted against ophiolitic, ultramafic intrusions (President Intrusions) (Table 2).

Jurassic and Cretaceous basinal sediments and rift volcanics (unnamed, Taylor Creek and Kingsvale Groups) are sequentially intruded by Cretaceous and Tertiary plutons of felsic composition (Coast, porphyry and Bendor Intrusions). Relatively flat-lying Tertiary intermediate and mafic volcanics (Rexmount porphyry and plateau basalt) cap the lithological sequence.

Triassic rocks probably formed a discrete plate, the Bridge River terrane, prior to collision with the North American plate to the northeast in Jurassic time. That collision thrusted arc volcanics, backarc sediments and oceanic crust onto the already assembled exotic terranes of the Intermountain Belt and prompted uplift and erosion that produced the Jurassic and Cretaceous sediments.

Bridge River terrane then got sandwiched by the arrival of eastward-drifting Insular belt rocks from the west in Cretaceous time. This collision probably remobilized old faults and sparked several periods of intrusive activity that resulted in Cretaceous and Tertiary plutons and volcanics.

Old breaks such as the Fergussion and Cadwallader faults were probably mobilized again as Tertiary dextral strike-slip faults, followed by extrusion of plateau basalts in response to extensional tectonics. Finally, Pleistocene glaciation and Recent uplift and erosion sculpted the existing mountainous terrain.

Bralorne and Pioneer mines comprise the largest and richest lode gold mining camp in British Columbia. Between 1899 and 1971, they produced 4.16 million ounces gold and 0.95 million ounces silver from 8.23 million tons ore grading 0.51 oz/ton gold and 0.12 oz/ton silver. Gold-bearing quartz veins follow two sets of narrow fissures in Pioneer andesite and Bralorne diorite near Bralorne granite and albrite dikes. Mining stopped in ore some 2,000 metres down because of the ventilation problem and high mining costs.

Many other gold prospects in the region, such as the Ranger vein on the Ranger property, are gold-bearing sulfide replacements along narrow shears in Bridge River basalts and cherts, often near Tertiary porphyry dikes. A significant new discovery on the Congress property of Levon Resources Ltd., some 7.5 kilometres north-north west of Levon's Ranger claims, assays up to 0.37 oz/ton AU, 0.32 oz/ton Ag and 1.7% Sb over 6.9 metres true width. Thus, the exploration and mining potential of old prospects such as the Ranger vein needs to be re-evaluated.

PROPERTY (COOKE, 1986)

The Ranger property is underlain by northwest striking, steeply dipping basaltic volcanics, cherty sediments, and minor rhyolite, serpentinite, argillite and limestone of the Triassic Bridge River Group (Figure 4). They are intruded by northwest trending, steeply dipping porphyry dikes, of Tertiary age and diorite and granodiorite plugs of the Bendor Intrusions.

Early tectonic deformation has shattered the cherts and sheared the argillites, and serpentinites, but the more competent basalts are only mildly deformed. Goldmineralized shear zones often follow the intrusive contacts of dikes and plugs or the stratigraphic contacts of sediments and volcanics and late, strike-slip faults offset the strata in intrusions and veins.

MINERALIZATION

Mineralization on the property occur in four areas; The Saddle and Adit zones, East Ridge zone, and the North Ridge zone. Mineralization consists of fine grained massive arsenopyrite, pyrite, phrrhotite, galena, stibnite, and sphalerite in fractured quartz/calcite veins.

The most important zones are the Adit and Saddle zones where anomalous Au, As, geochemical samples were taken. There is a 12 meter long Northwest trending adit following a quartz/calcite vein containing massive fine-grained arsenopyrite, pyrite, stibnite, sphalerite mineralization in fractured chert. Grab samples from the dump yielded values of up to 4.208 oz/ton Au and 18.427 oz/ton Ag.

The saddle zone consists of several pits in fractured chert with fine grained mineralization. Grab samples from these pits yielded values of .053 oz/ton Au.

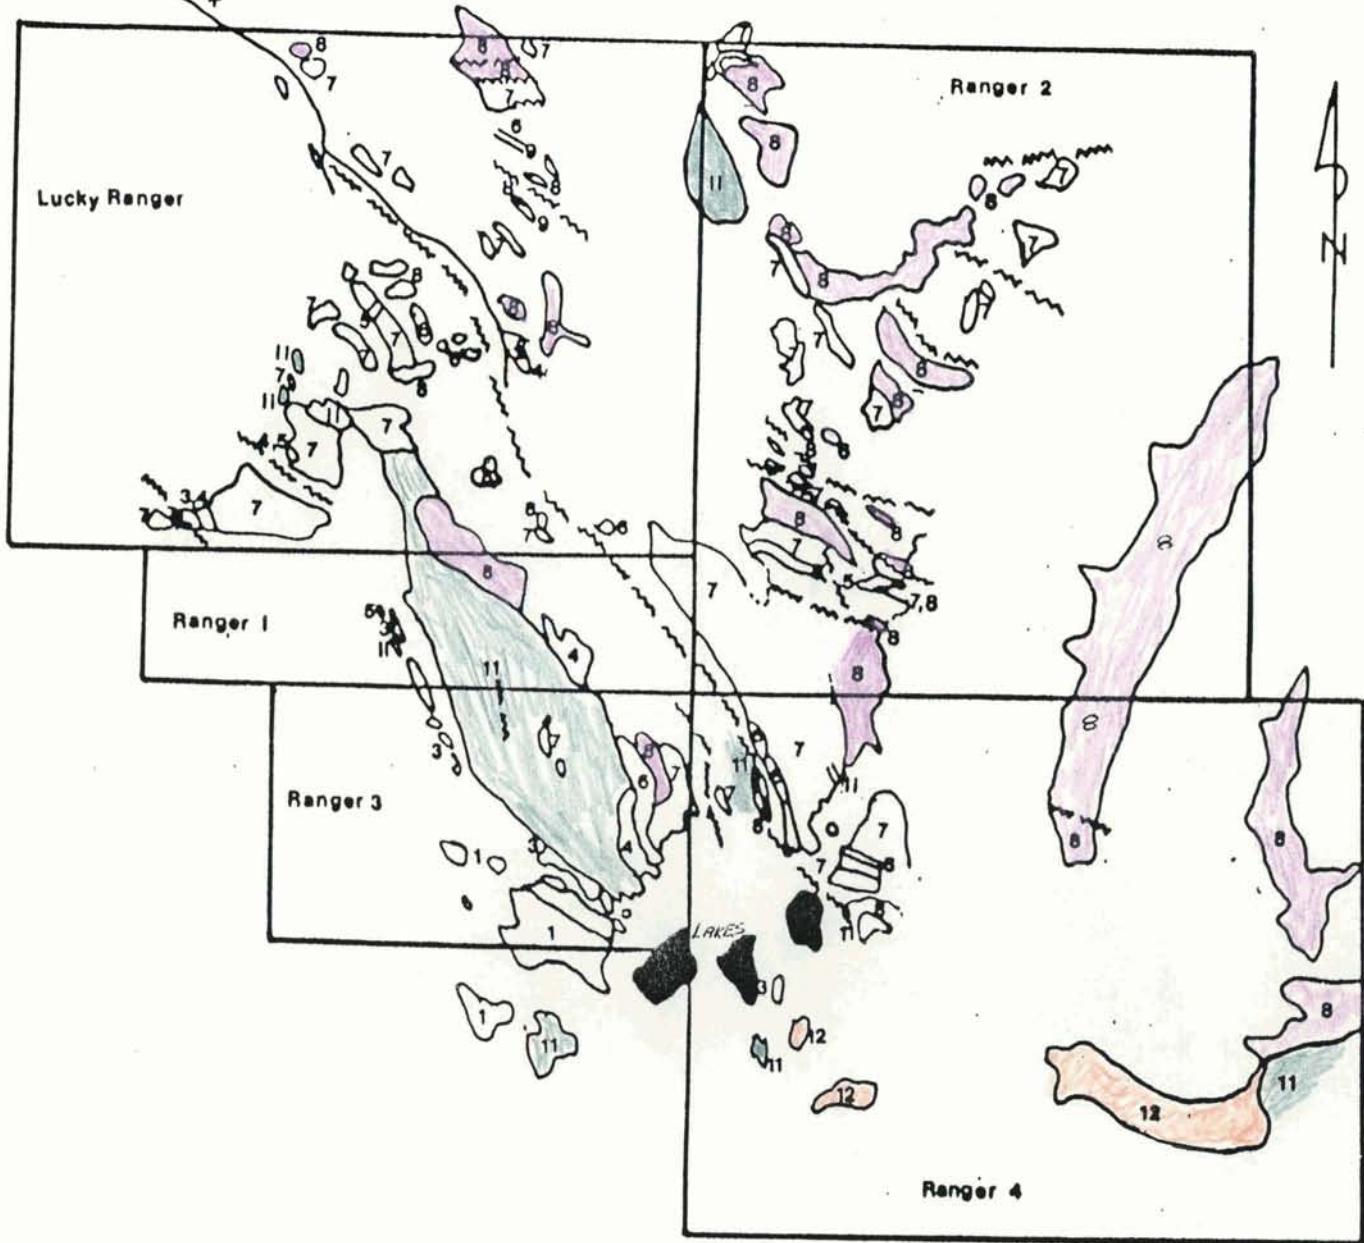

The East Ridge zone contains soil anomalies in gold up to 15,000 ppb with anomalous Arsenic values and Silver values up to 2.1 ppm. These values originate from quartz/calcite veins in chert and argillites.

The North Ridge zone contains soil anomalies up to 180 ppb Au with anomalous Arsenic values.

PERIOD	UNIT	LITHOLOGY
upper Tertiary	Plateau basalt	Basalt, rhyolite flows, breccias unconformable contact
lower Tertiary	Rexmount porphyry	rhyolite, dacite, andesite tuffs, breccias, flows, plugs unconformable contact
upper Cretaceous	Porphyry dikes	quartz, feldspar, hornblende porphyry dikes intrusive contact
	Coast Range intrusions	quartz diorite, diorite granodiorite intrusive contact
	Kingsvale group	arkose, greywacks, shale conglomerate unconformable contact
lower Cretaceous	Taylor Creek group	conglomerate, shale, tuff breccia unconformable contact
lower Jurassic	Unnamed sediments	argillite, shale, sandstone limestone, conglomerate unconformable contact
upper Triassic	Bralorne intrusions	augite diorite, soda granite, albitite dikes intrusive contact
	President intrusions	serpentinite, peridotite, pyroxenite, dunite, gabbro fault contact
	Cadwallader Hurley formation	group limy argillite, phyllite limestone, tuff, conglomerate, greenstone, chert
	Pioneer formation	greenstone, basalt, andesite flows, tuffs
	Noel formation	argillite, chert, conglomerate, greenstone conformable contact?

middle Triassic	Bridge River group	chert, argillite, phyllite, limestone, greenstone metamorphic equivalents

GEOCHEMISTRY

A total of 774 soil and talus samples were collected on two separate grids. Soil samples were taken by using a long-handled shovel to sample the well-developed red B-horizon. Talus samples were taken above tree-line where soil was sparse. All geochemical samples were analysed by Min-En Labs of Vancouver. The samples were collected every 25 meters with a line spacing of 100 meters. The two soil geochemistry grids covered the four zones: The Saddle and Adit zones, and the North and East Ridge zones.

The samples were analyzed for Au (wet), As, Ag, Sb, Cu, Zn, and Fe. Significant anomalous values were discovered in each of the four zones (figures: 1-6).

CONCLUSIONS

1. The Ranger property is located east of the main Bralorne volcanics and sediments. It is underlain by basaltic volcanics and cherty sediments of the Triassic Bridge River Group, intruded by porphyry dikes, Bendor granodiorite and Bralorne diorite. The mineralization zones occur along narrow shears near the intrusive and cherty sediment contacts.
2. Two sample grids were established with sample intervals at 25 meters and line intervals at 100 meters. A total of 22 km. were sampled with a total of 774 samples. The two grids covered the four zones; The Saddle and Adit zones, and The East and North Ridge zones.
3. A total of 15 rock samples were taken from the East, Saddle and Adit zones. The most significant assays were from the Adit zone dump which carried 4.208 oz/ton Au and 18.427 oz/ton Ag.
4. The Adit and Saddle zones need to be trenched and drilled. The North and East Ridge zones required trenching on the geochemical anomalies.

RECOMMENDATIONS:

The North and East Ridge zones required trenching on the Geo-chemical anomalies. The Saddle and Adit zones required trenching and drilling.

1. First Phase: Trenching on the anomalies would use a Cat 225 excavator as there is road access to all the zones except the Saddle and Adit zones. It would require 5 days with the excavator to build the road, trench and build drill sites on the Saddle and Adit zones.
2. Second Phase: Diamond drilling on the Saddle and Adit zone should be HQ core size. There will be road access to the zones, therefore, a Super 38 drill should be used.

BUDGET:

PHASE 1

Excavator trenching, 12 days at \$800./day	\$ 9,600.00
Geological mapping and sampling	2,500.00
Room and board	500.00
Truck and Fuel	600.00
Assays and Analysis	2,500.00
Equipment and supplies	200.00
Drafting and reproduction	500.00
Miscellaneous and contingencies (10%)	1,640.00
SUBTOTAL	\$18,040.00

PHASE 2

Diamond drilling	45,000.00
Geological supervision	3,000.00
Room	500.00
Truck and fuel	500.00
Assays and analysis	500.00
Drafting and reproduction	500.00
Miscellaneaous and contingencies	5,000.00
SUBTOTAL	\$55,000.00

TOTAL

\$73,040.00

STATEMENT OF COSTS

ITEM	COST
Labour	\$ 3,470.00
Geologist	5,230.00
Transportation and Fuel (Helicopter)	4,356.40
Equipment cost	450.00
Assay and Analysis	8,203.16
Drafting	864.30
Management Services (15%)	3,386.08
Overhead (10%)	2,596.00
TOTAL	\$28,555.94
TOTAL ASSESSMENT	\$28,000.00

QUALIFICATIONS:

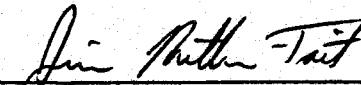

I, J. M. Miller-Tait, of Gold Bridge, B.C. do hereby certify that:

I am a graduate of the University of British Columbia with a Bachelor of Science degree in geology (1986).

I have been practising my profession as an exploration geologist, seasonally, since 1982, and full time since 1987.

I have been employed as an exploration geologist with Levon Resources Ltd. since July, 1987.

This report is based on personal examination of all relevant data and on supervision of field work during July and August, 1988.

GOLD GEOCHEMICAL ANALYSIS BY MIN-EN LABORATORIES LTD.

Geochemical samples for Gold processed by Min-En Laboratories Ltd., at 705 W. 15th St., North Vancouver Laboratory employing the following procedures.

After drying the samples at 95°C soil and stream sediment samples are screened by 80 mesh sieve to obtain the minus 80 mesh fraction for analysis. The rock samples are crushed and pulverized by ceramic plated pulverizer.

A suitable sample weight 5.0 or 10.0 grams are pretreated with HNO₃ and HClO₄ mixture.

After pretreatments the samples are digested with Aqua Regia solution, and after digestion the samples are taken up with 25% HCl to suitable volume.

Further oxidation and treatment of at least 75% of the original sample solutions are made suitable for extraction of gold with Methyl Iso-Butyl Ketone.

With a set of suitable standard solution gold is analysed by Atomic Absorption instruments. The obtained detection limit is 0.005 ppm (5ppb).

ONIVA INTERNATIONAL ASSAY LAB

A hard rock sample is placed in a drying oven at about 120°C. The sample is then crushed and split to get a representative sample. It is then pulverized for 35 to 45 seconds.

Each sample weighing 10 to 15 grams, is then prepared for firing, adding the following reagents: Litharge, Soda Ash, Flour, Silica, Borax and an Inquart.

The samples are then fused for 45 minutes at 1100°C, and cupelled for 30-40 minutes at approximately 900°C.

The samples are then parted in water and nitric acid (6 to 1) for approximately 15 minutes, until all action stops.

The samples is then weighed on a CAHN C-30 Microbalance, whereby a weight to the .001 mg. is derived from the sample.

After the above procedures are concluded, the sample is calculated to the #OZ/Assay Ton.
