SUMMARY

The Gaspard Lake gold property, consisting of 420 units in 22 claims, is located in Chilcotin District of central British Columbia, 85 kilometres southwest of Williams Lake and 30 kilometres northeast of the Blackdome Mine.

The property was optioned from B. Bowen and A. Gordon in February, 1988.

During May and October, the property was mapped at 1:20,000 scale with selective areas mapped at 1:5,000. A total of 2,873 soil samples were collected on three detailed grids and reconnaissance traverses. 702 metres of diamond drilling in nine holes tested the Discovery and Kelsch Showings. Hand and backhoe trenching were conducted on the Discovery, Kelsch and Double Diamond showings.

The claims are underlain by Jurassic andesite and by younger plutons of granodiorite and granite. These rock types are overlain by small patches of Tertiary mafic and felsic volcanics. Extensive drift covers 99% of the property.

Mineralization has been located in three areas which are related to three separate lineaments. At the Discovery Showing, drusy quartz veins, 0.5 to 20 centimetres wide, and associated kaolinized volcanics strike northwest, dip southwest and are exposed over a strike length of 35 metres and a width of 37 metres. Thirty rock chip samples average 1,584 ppb Au and 216 ppm As. Three diamond drill holes aligned behind the showing encountered much lower gold values in drusy quartz veins, jasper veins and a clay breccia zone.

The Kelsch Showing consists of a northeasterly striking, steeply dipping drusy quartz breccia vein up to 3 metres wide and exposed over a strike length of 15 metres. Eleven samples average 847 ppb Au and 33 ppm As. The Kelsch Showing and the nearby Double Diamond Showing are both located on the northeasterly striking Kelsch Lineament. A single drill hole under the Kelsch Showing failed to reach its target depth because of drilling difficulties.

The Gas 1 Showing consists of a 170- by 50-metre area of strongly kaolinized granodiorite with a trace amount of disseminated pyrite that averages 333 ppb gold. The showing is close to a northeasterly striking lineament.

Detailed soil sampling (1,518 samples) was carried out over the three showings. Anomalous gold and arsenic values exist in soil over the Discovery Showing. Gold, arsenic and copper are anomalous in soil northeast of, but not over, the Gas 1 Showing. The Kelsch Showing has no related soil anomaly. 1,355 soil samples collected on 135 line kilometres of reconnaissance traverses failed to locate any multiple sample anomalies, except for a three-sample gold anomaly near the Gas 1 Showing.

Fifteen pits, measuring 2 to 3 metres deep, were dug with a backhoe near gold-bearing float. Bedrock was only reached in two trenches near the Discovery Showing.

Exploration expenditures in 1988 totalled \$184,000.

CONCLUSIONS

Two showings of low sulphide gold-bearing drusy quartz breccia and related kaolin alteration (Discovery and Kelsch Showings) have been located on the Gaspard Lake property. The two showings are 900 metres apart, hosted in Middle Jurassic volcanics and are located along northwesterly and northeasterly striking lineaments respectively. A third showing of gold-bearing kaolinized granodiorite, two kilometres north of the Vein Showing, is associated with a northeasterly striking lineament. Diamond drilling at the Discovery Showing failed to locate any values as high as the surface samples. A nearby Jasper Zone and a Clay Breccia Zone are both weakly anomalous in gold and may be related to the Discovery Showing. One diamond drill hole on the Kelsch Showing did not adequately test this mineralization.

A soil anomaly northeast of the Gas 1 Showing is thought to indicate underlying gold mineralization of a higher tenor than the exposed Gas 1 Showing.

Many portions of the claim block are unexplorable due to extensive drift cover over 20 metres deep.

Mineralization at the Discovery and Kelsch Showings is similar in type to that at the Blackdome Mine, 25 kilometres to the southeast, which had start-up reserves of 200,000 tons grading 0.79 oz gold/ton and 3.76 oz silver (Northern Miner, November 1986).

RECOMMENDATIONS

Discovery Showing and Grid

1. No further work is recommended.

Kelsch Showing and Grid

1. Collar a diamond drill hole under the Kelsch Showing at the northeastern side of the swamp. A drill access road from the existing road could be used to better expose the Kelsch Showing.
2. A complete section of drill holes (2-3 holes) across the Kelsch Lineament, one of which could test the Double Diamond Quartz Breccia Zone.
3. Hand trench the two anomalous soil samples in the northeastern corner of the Kelsch Grid.

Gas 1 Showing and Grid

1. Stake one or two 20-unit claims north of Gas 1 and 2.
2. Excavator trench the gold soil anomaly northeast of the Gas 1 Showing.
3. If warranted, diamond drill the trenched area.

Other

1. Carry out prospecting and soil sampling along the Little Gaspard Lineament.

INTRODUCTION

Location, Access and Physiography

The Gaspard Lake Property is located near Gaspard Lake in south-central B.C., 85 kilometres southwest of Williams Lake. The property is 25 kilometres northwest of the Blackdome Mine.

Access is from Williams Lake via Highway 20 and a system of logging roads south from Riske Creek. The total road distance from Williams Lake is 130 kilometres (Figure 1).

The terrain is relatively flat, heavily drift covered and vegetated with open stands of pine. Elevations range from 1,400 to 1,600 metres. Except for Gaspard Creek, drainages are small, slow moving and intermittent.

Claims

The property consists of the following claims (Fig.1a):

<u>Claim Name</u>	<u>No. of Units</u>	<u>Record Number</u>	<u>Record Date</u>	<u>Expiry Date*</u>

FIG. 1

Previous Work

A gold-bearing alteration zone in a logging road cut and nearby gold-bearing float were discovered by B. Bowen and A. Gordon in 1987. This led to staking the Fame and Fortune claims.

In February 1988, Canamax optioned the property. In the same month, Canamax staked Gas 1 to Gas 17 claims.

In August, Bowen and Gordon staked Gas 18 to 20 claims.

1988 Work

Field work in 1988 was carried out during the months of May and October. In May, F. Harris, assisted by D. Kelsch, B. Gilmore and L. Flint, carried out geological mapping, established and soil sampled the Discovery Grid (423 samples), carried out hand trenching and chip sampling on the Discovery and Kelsch Showings and backhoe trenching near the Discovery Showing. In October, F. Harris, assisted by D. Fleming, B. Mann, R. Cranswick, T. Robinson and L. Flint, conducted geological mapping and soil sampling (1,095 soil samples) on two new grids, the Gas 1 and Kelsch Grids, and collected 1,355 soil samples on 135 kilometres of reconnaissance soil lines on claims Gas 2, 3, 9, 10, 14, 15 and 16. Finally, 702 metres of NQ diamond drilling in 9 holes was carried out by Connors Drilling Ltd. of Kamloops. A total of \$219,000.00 was spent to the end of October including a \$35,000.00 cash payment.

In the area of the Discovery, Kelsch and Gas 1 Grids, geological data are plotted on a 1:5,000 base map enlarged from a 1:50,000 topographic map. Geological and geochemical data outside of the grid areas are plotted on a 1:20,000 base map also enlarged from a 1:50,000 topographic map.

Trenching and sampling of the Discovery, Kelsch and Double Diamond Showings are plotted at 1:200 scale. 1:1,000 scale cross sections of the Discovery and Kelsch Showing are also included in the report.

GEOLOGY

Regional Geology

As shown on Open File 534 by H.W. Tipper (1978), the area lies between the Fraser River transcurrent fault and the complexly faulted and folded rocks of the Coast Range Mountains. The area is mainly underlain by flat-lying Tertiary volcanic rocks and an extensive cover of drift. Older rocks, including Jurassic granodiorite, Jurassic volcanics and Cretaceous quartz monzonite, are exposed in uplifted areas. Major transcurrent and thrust faults strike northwest, whereas secondary faults commonly strike north-easterly.

Property Geology (Figure 2)

Summary

The property is underlain mainly by Middle Jurassic andesite and pyroclastic volcanics which, in the northern portion of the claims, have been intruded by a batholith of granodiorite and by smaller bodies of granodiorite and granite throughout the rest of the claim group. These two rock types are cut by Tertiary mafic and felsic dykes and are overlain by a small area of Eocene felsic tuff on the Fame 1 Claim and a small area of Miocene-Pliocene vesicular basalt on the Gas 4 claim.

A northeasterly striking fault through Gas 18, 19 and 20 separates Jurassic volcanics to the northwest from a variety of felsic to intermediate Tertiary volcanics to the southeast.

An extensive cover of till, sand and gravel limits bedrock exposure to less than 1%. Outcrops are mainly confined to ridge tops and the sides of gullies formed by Pleistocene and present-day streams.

Middle Jurassic Volcanics

Middle Jurassic volcanics are the oldest and most abundant rock type in the claim group. Fresh rock consists of dark green, red or purple andesite with an aphanitic or porphyritic texture and volcanic breccia comprised of andesite fragments. These rocks are frequently cut by veins of calcite-epidote-quartz up to 0.5 metres wide which have not yielded any significant gold values to date.

Granodiorite and Granite

The southeastern contact of a granodiorite batholith extends through the northern portion of the claim group. Smaller stocks of granodiorite and granite intrude the Middle Jurassic volcanics throughout the rest of the claim group. These small stocks and the widespread calcite-epidote-quartz veins suggest that the granodiorite-volcanic contact is at a shallow depth. The granodiorite commonly contains epidote as disseminations and veins. In places, most notably on the Gas 1 claim, granodiorite and granite are kaolinized to a light brown soft rock in which only the quartz grains remain unaltered.

Mafic and Felsic Dykes

Aphanitic mafic and felsic dykes cut granodiorite and Jurassic volcanics in several areas. The mafic dykes are up to 4 metres wide, whereas the porphyry or flow-banded felsic dykes are up to 40 metres wide. These dykes are probably of Tertiary age.

Tertiary Volcanics

Light grey banded felsic volcanic tuff is exposed in the northwestern portion of the Discovery Grid on the Fame claim. The rocks are correlated with Eocene volcanics on Tipper's geological map.

Vesicular olivine basalt is the most abundant type of float in the area, but no solid outcrops of this rock type were located. An area containing large angular boulders of vesicular basalt on the Gas 4 claim indicates a nearby bedrock source. West of the Gas 12 claim and near the Gaspard airstrip, core holes drilled in 1979 by Lac Minerals intersected olivine basalt below 30 metres of overburden.

Rhyolite, dacite, red cherty rhyolite and a very coarse polymictic volcanic breccia occur along an eastwest-trending ridge crest on claims Gas 19 and Gas 20. These are believed to be part of a Tertiary volcanic package which has been downdropped by a northeasterly striking normal fault through Gas 18, 19 and 20 claims. Location of this fault was inferred from an air photo topographic lineament (Little Gaspard Lineament). The coarse volcanic breccia is close to the fault suggesting that it may have been a locus for one or more Tertiary volcanic vents.

MINERALIZATION

Discovery Showing (Figures 6 and 7)

The original Discovery showing on the Fame claim consists of limonite-stained westerly dipping zones in a road outcrop of Jurassic volcanics and nearby float of drusy quartz vein breccia. The float was traced to quartz veins in outcrop by hand trenching.

Figure 6 shows the quartz veins and alteration zones exposed by trenching. Individual veins are from 3 millimetres to 20 centimetres wide and have an average attitude of $160^{\circ}/-55^{\circ}$ west. Smaller veins consist of acicular quartz crystals oriented perpendicular to vein walls with a drusy open central core. Wider veins display a drusy brecciated texture with acicular quartz veins encrusting completely kaolinized volcanic fragments. The veins are limonite-stained and trace amounts of pyrite have been recognized.

The volcanic host rock is usually moderately to strongly kaolinized near the quartz veins. The volcanics were considered to be strongly kaolinized when they had the appearance of soft clay. When moderately kaolinized, the volcanics are not as friable and some volcanic textures are preserved. The width and strength of kaolinization is not directly related to the amount of quartz veining. Some 1-to 2-metre zones of kaolinization contained only several small veins. In places, the kaolinized rock has been silicified suggesting that quartz veining and silicification were the last hydrothermal event.

Trench D1 (Figure 6) exposes a northerly striking zone of crushed volcanic rock up to 0.5 metres wide which is weakly to moderately kaolinized and cut by several narrow drusy quartz veins. This suggests that fault zones have been the locus for mineralization and alteration.

In the Discovery Showing area, trenched quartz veins and kaolinized zones are exposed over a width of 37 metres and a length of 35 metres. This zone contains 12 quartz veins, 2-3 centimetres wide and 3 metres of kaolinized volcanics.

The most intense zone of quartz and kaolinization within the larger zone strikes 156° , dips -60° west and is exposed over a strike length of 30 metres from trenches D10 to D3. This zone ranges from 1.7 to 0.2 metres wide and is cut off to the north by trench D10 but is still open south of trench D3. Drusy quartz veins within this zone are from 0.5 to 20 centimetres wide.

Following is a table of chip samples taken at the Discovery Showing:

<u>Sample Number</u>	<u>French Number</u>	<u>% Quartz</u>	<u>% Kaolinization</u>	<u>Length cm.</u>	<u>ppb Au</u>	<u>ppm As</u>
88GHT32	D11	16	84	25	5,250	570

88GHT39	D6	8	92	100	4,600	150
88GHT40	D6	15	85	70	2,950	250
88GHT57	D5	100	--	8	14,800	120
88GHT58	D5	2	98	100	3,800	180
88GHT59	D5	2	98	100	3,000	190
88GHT64	D4	20	80	70	1,000	90
88GHT65	D4	10	90	30	240	180
88GHT66	D4	--	100	20	1,420	1,000
88GHT67	D3	80	20	25	4,490	60
88GHT60	D2	5	95	100	2,300	140
88GHT62	D2	10	90	20	2,000	50
88GHT63	D2	80	20	25	620	45
88GHT61	D1	50	50	15	2,270	100

The average sample has a length of 89 centimetres and length weighted grade of 1,584 ppb Au and 216 ppm As.

Significant composite sample intervals from the Discovery trenches are listed below:

<u>Trench Number</u>	<u>Interval (metres)</u>	<u>ppb Au</u>
D5	2.0	3,400
D6	1.7	3,920
D10	6.0	1,327
D11	10.0	826

A fence of three diamond drill holes (88-1, 6 and 8) were collared 30, 90 and 185 metres west of the Discovery Showing at azimuths of -85 and dip of -45° (Figure 7).

Drill hole 88-1 encountered a 21.3-metre zone containing 20, 1- to 30-millimetre-wide, drusy quartz veins, 28 metres downdip from the surface showing. Weak to moderate kaolinized zones up to 1.8 metres wide make up 23% of the zone. Thirteen continuous samples from this zone contain gold values ranging from 5 to 590 ppb with an average of 121 ppb. Hole 88 Gas 6 intersected two 5-millimetre-wide drusy quartz veins whereas Hole 88 Gas 8 intersected no drusy quartz veins.

Jasper and chalcedonic quartz veins in the bottom 65 metres of Hole 88-6 and in the bottom 5 metres of Hole 88-8 form a westerly dipping "Jasper Zone" (Figure 7). The Jasper Zone contains 1 to 10% jasper and/or chalcedonic quartz as discontinuous 5- to 40-millimetre-wide veins or patches. The Jasper Zone is weakly anomalous in gold with values from 5-860 ppb.

Hole 88-8 encountered a kaolinized-brecciated fault zone between 26.8 and 80.7 metres with low gold values (5 to 180 ppb). This is thought to represent a fault between Eocene felsic tuff to the west and Jurassic volcanics to the east.

Vancouver —

N. T. S. Ref. 92 0 7 and 10

FIG. 6

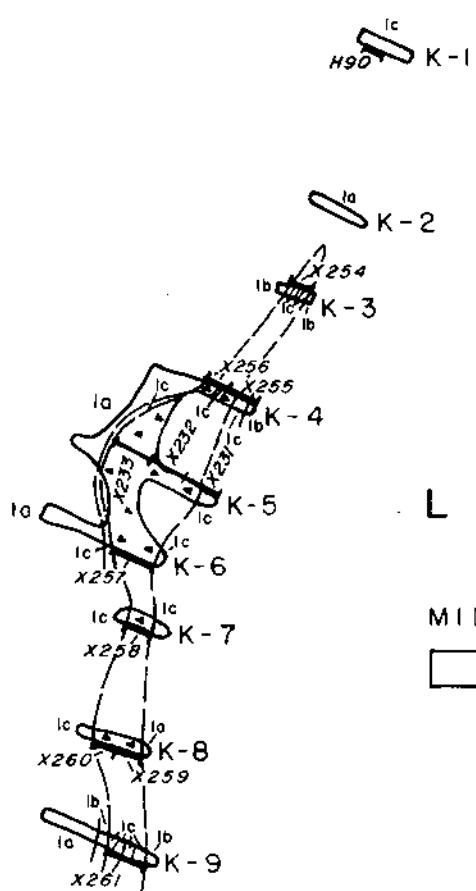

Trace elements in seven surface samples from the Discovery Showing are anomalous in Au, Ag, As and Mo. Three samples from the Jasper Vein Zone are enriched in Au and three samples from clay breccia in Hole 88-8 are enriched in Au and Mo.

Kelsch Showing (Figures 8 and 9)

While carrying out detailed prospecting along a north-easterly striking lineament which extends through the Fame 1, Gas 2 and Gas 3 claims, assistant David Kelsch found float of drusy quartz breccia halfway up a northwesterly facing slope. Hand trenching led to the discovery of a quartz breccia vein up to 3 metres wide which strikes 015°, dips steeply southeast and is hosted in Jurassic volcanics. Except for weaker limonite staining, the vein and associated kaolinization are similar to the Discovery Showing. North-easterly striking shear planes, parallel to the lineament, cut both the quartz veins and volcanic rocks. The zone has an exposed length of 15 metres and is open to the southwest. The Kelsch Showing is covered by 1.0 metre of hard compact clay which makes hand trenching difficult.

Following is a table of samples taken at the Kelsch Showing:

| Sample Number | Trench Number | % Quartz | % of Kaolinization | Length cm. | ppb Au | ppm As |
|---------------|---------------|----------|--------------------|------------|--------|--------|
| 88GXT231      | K5            | 80       | 20                 | 100        | 360    | 18     |

Vancouver —

N. T. S. Ref. 92 0 7 and 10

FIG. 9

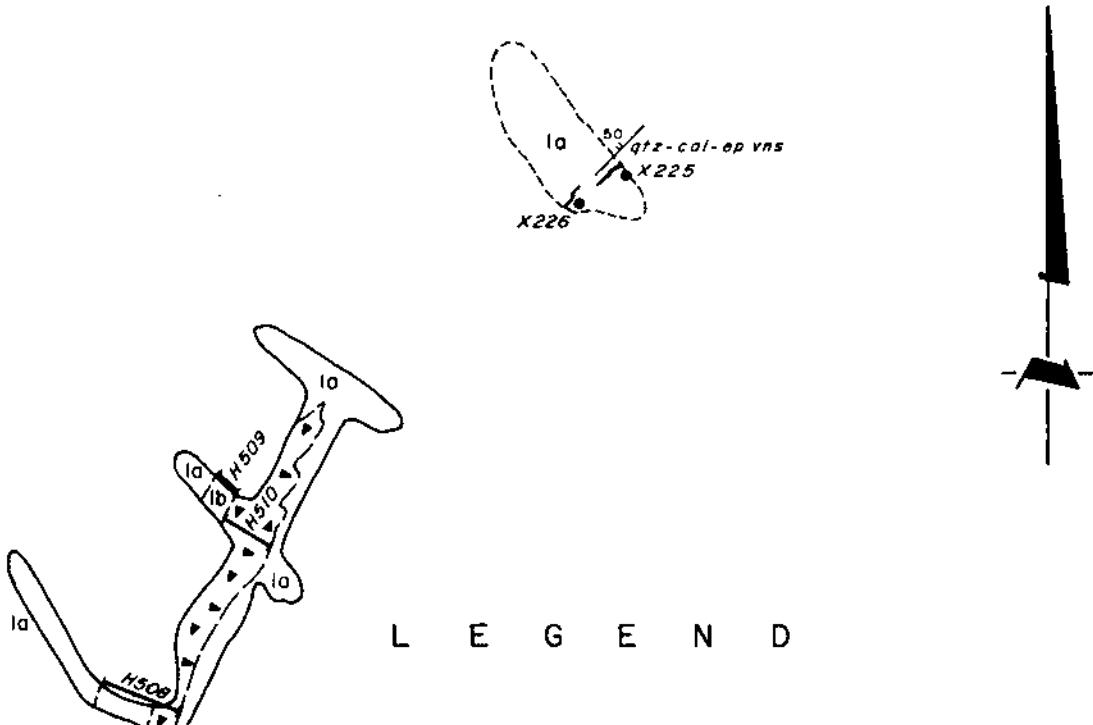

The average sample in the Kelsch Showing has a length of 80 centimetres and a grade of 847 ppb Au and 33 ppm As.

Drill Hole 88-7, collared 56 metres southeast of the Kelsch Showing, was drilled at a dip of  $-45^{\circ}$  with a target depth of 110 metres. The hole was shut down at 52.7 metres because of broken kaolinized rock. Twenty-five centimetres of quartz breccia was intersected at 44.7 metres which assayed 360 ppb gold. It is not known if this is the down dip extension of the Kelsch Zone (implied dip of  $-33^{\circ}$ ) or a more steeply dipping parallel zone in the hangingwall of the surface showing. The 31 metres of casing in this hole indicates that kaolinization is extensive in this area since bedrock is exposed 130 metres southwest, at the same elevation as the drill hole collar.

Except for anomalous gold, there is no trace element enrichment in eight surface Kelsch Showing samples analyzed by I.C.P.

#### Double Diamond Showing (Figure 10)

During a visit to the property in the summer of 1988, Bowen and Gordon discovered the Double Diamond Quartz Breccia Zone (DDQB) on the northwestern side of the Kelsch Lineament, 130 metres southwest of the Kelsch Showing. In October, the showing was hand trenched and sampled. Drusy quartz breccia are hosted in Jurassic volcanics. The vein, which is similar to that at the Kelsch Zone, is exposed in a zone 9.5 metres long and 2 metres wide that strikes  $26^{\circ}$  azimuth and dips  $-60^{\circ}$  northwest. It is open to the southwest. The hangingwall of the quartz breccia is comprised of 1 to 2 metres of moderately kaolinized volcanics. Three representative samples assayed 30, 50 and 80 ppb gold.

Vancouver —

N. T. S. Ref. 92 07 and 10

FIG. 10

A second showing 45 metres southwest of DDQB is referred to as the Double Diamond Quartz Stringer Zone. This is composed of fragments of granodiorite cut by 1- to 8-millimetre-wide drusy veins which assayed 140 ppb gold in a representative sample. A hand trench failed to locate bedrock.

#### Gas 1 Showing (Figure 3)

At the northern boundary of the claim block, near the border between Gas 1 and Gas 2, occur patches of limonite-stained, kaolinized granodiorite, some of which are anomalous in gold. The gold-bearing kaolinized granodiorite is close to a contact with Jurassic volcanics. Rock samples anomalous in gold taken in May led to the establishment of the 19.6-kilometre Gas 1 Grid in October which was mapped and soil sampled.

The Gas 1 Grid is mainly underlain by medium-grained granodiorite that contains 15% Jurassic volcanics as large inclusions. The granodiorite is cut by two rhyolite dykes and five basalt dykes.

A northeasterly trending area, 800 metres long and 250 metres wide, contains 10-15% moderate to strongly kaolinized and limonite-stained granodiorite with a trace amount of disseminated pyrite in patches 5 to 50 metres across. The five most anomalous rock samples which average 333 ppb gold (100-875 ppb gold) are located at the southwestern end of the zone. This 170- by 50-metre area is referred to as the Gas 1 Showing. This gold-bearing kaolinized zone is approximately on line with the Gas 1 Lineament (Figures 2 and 3). Of six altered granodiorite samples analyzed by I.C.P., the two samples anomalous in gold are also anomalous in arsenic and molybdenum.

Clay Breccia Zone

Pyritic clay breccia was intersected throughout Holes 88-2, 3 and 9. A similar but non-pyritic clay breccia was also intersected at the top of Hole 88-8. These four holes define a northwesterly trending "Clay Breccia" Zone, 450 metres long and 150 metres wide (Figure 3).

Pyritic clay breccia contains 5 to 70% clay which cements fragments of altered volcanic rock. Both the clay and fragments contain from 2 to 6% fine-grained disseminated pyrite.

The intensity of brecciation is not homogenous. Any given three-metre interval may show intense brecciation and abundant clay whereas other intervals are comprised of broken core with only minor clay. It was noted that some fragments are surrounded and their rims are enriched in pyrite and that adjacent fragments may contain different amounts of pyrite.

Friable calcite occurs along numerous slip planes but no quartz was observed.

Of 37 assay samples from Holes 88-2, 3 and 9, only four contained greater than 20 ppb gold (30, 30, 40 and 50 ppb). Of 16 samples from the clay breccia in Hole 88-8, 13 contained greater than 20 ppb gold ranging from 30 to 180 ppb.

Six clay breccia core samples were analyzed for total acid soluble iron, oxide iron and sulphide iron. Results are shown in the following table:

| Hole<br>Number | Total<br>Acid<br>Sol.<br>Fe % | Oxide<br>Fe % | Sulphide<br>Fe % | Calculated<br>Pyrite<br>% |
|----------------|-------------------------------|---------------|------------------|---------------------------|
| 88 Gas 3       | 3.48                          | 0.80          | 2.68             | 5.8                       |
| 88 Gas 3       | 3.30                          | 0.92          | 2.38             | 5.1                       |
| 88 Gas 3       | 2.86                          | 0.90          | 1.96             | 4.2                       |
| 88 Gas 8       | 3.94                          | 4.04          | Nil              | Nil                       |
| 88 Gas 8       | 4.50                          | 4.54          | Nil              | Nil                       |
| 88 Gas 8       | 4.28                          | 4.30          | Nil              | Nil                       |

Three samples are from Hole 88-3 which contain disseminated pyrite and three are from Hole 88-8 which contain no pyrite. Soluble iron content is actually greater in Hole 88-8 but it occurs in the more oxidized state as narrow hematite veins. This indicates that the northern portion of the Clay Breccia Zone was subjected to more oxidizing conditions than the southern portion.

Origin of the clay breccia is uncertain. It is thought that the breccia occupies a westerly dipping thrust fault and that it has been altered by hydrothermal solutions. The enrichment in molybdenum in the Discovery Zone and Clay Breccia Zone suggests a genetic link between them.

#### Limonite-Stained Zone

Within the Gas 3 claim, along the Kelsch Lineament, 500 metres northeast of the Kelsch Showing, an area of limonite-stained granite and volcanic rock is poorly exposed at the base of a northwesterly facing slope. Trace amounts of disseminated pyrite were seen in several samples. The four samples taken are not anomalous in Au, As or Cu.

#### Malachite-Stained Zone

Near the border of Gas 11 and Gas 15 claims, outcrops of small quartz veins and silicified volcanics are exposed

20.

over a northerly striking area measuring 600 by 50 metres. Within this area, a 5-metre-wide, 10-metre-long, north-striking zone contains fractures coated with malachite. Ten grab samples contain up to >10,000 ppm copper, 20 ppb gold and 320 ppm arsenic.

BACKHOE TRENCHING

In May, a Case 455 backhoe was used in an attempt to find bedrock near gold-bearing quartz float. Fifteen 2- to 3-metre deep pits were dug south of line 73+00N (Figure 3) but none reached bedrock. Overburden consists of gravel ± till. Two pits at 71+50N, 79+10E contain an upper layer of gravel over 1.3 metres of clay till underlain by sandy gravel. Two trenches, D1 and D2 (Figure 6) near the Discovery Showing, reached bedrock below 1 to 2 metres of overburden.

## SOIL GEOCHEMISTRY

Three detailed grids and reconnaissance traverse lines were soil sampled. Details regarding each soil survey are listed below:

| <u>Grid Name</u> | <u>Line Spacing (m)</u> | <u>Sample Spacing (m)</u> | <u># of Samples</u> | <u>Grid (km)</u> | <u>Elements Analyzed</u> |
|------------------|-------------------------|---------------------------|---------------------|------------------|--------------------------|
| Discovery        | 100                     | 25                        | 423                 | 17.0             | Au,As                    |
| Kelsch           | 50 & 100                | 25                        | 312                 | 12.2             | Cu,Au,As                 |
| Gas 1            | 50 & 100                | 25                        | 783                 | 31.3             | Cu,Au,As                 |
| Recce            | 250                     | 100                       | 1,355               | 135.0            | Cu,Au,As                 |

All soil samples were taken from the "B" soil horizon. Sample material ranges from till to gravel to sand.

Geochemical values greater than 9 ppb Au, 19 ppm As and 100 ppm Cu are plotted on Figures 4a, 4b and 4c.

### Discovery and Kelsch Grids

Gold values greater than 9 ppb show a moderate degree of correlation with the Discovery and Kelsch Lineaments (Figure 4).

Widespread low gold values in the southeastern quadrant of the Discovery Grid are thought to represent the dispersion of gold in outwash sediment from Pleistocene drainages along the Kelsch and Discovery Lineaments.

Only seven samples on the two grids contain more than 100 ppb Au with the highest value of 270 ppb over the Discovery road cut outcrop. Two samples (180 and 100 ppb Au)

at the eastern end of Line 80N on the Kelsch Grid should be followed up for possible quartz breccia-type mineralization.

Where Line 74N crosses the Discovery Showing, three adjoining samples have values of 25, 30 and 60 ppb Au.

Arsenic values greater than 20 ppm are almost entirely confined to a small anomalous area "D" around the Discovery Zone. Maximum value of the six anomalous samples is 300 ppm As.

Soil samples on the Kelsch Grid were analyzed for copper. No values are greater than 50 ppm.

#### Gas 1 Grid

##### Gold (Figure 5a)

The largest concentration of gold values greater than 9 ppb is in the 200- by 600-metre anomaly "A" that extends east-northeast of the Gas 1 Showing. Soil above the Gas 1 Showing is not anomalous in gold. The axis of anomaly "A" is parallel to and 200 metres north of the Gas 1 Lineament.

In a total of 68 samples within anomaly "A", 25 are greater than 9 ppb, nine are greater than 49 ppb and three are greater than 99 ppb. The maximum values is 840 ppb.

Anomaly "A" lies in an area of approximately 1% scattered outcrops of granodiorite and Jurassic volcanics. Drift cover is probably less than 4 metres thick. Bedrock mineralization with gold values greater than the Gas 1 Showing may exist under anomaly "A".

Other scattered high values in gold are difficult to interpret due to complete and probably deep drift cover.

#### Arsenic (Figure 5b)

Arsenic anomalies are more restricted than gold anomalies. Arsenic values greater than 19 ppm form two anomalous areas, "B" and "C", located within gold anomaly "A". Only two of the 20 anomalous values are greater than 100 ppm with a maximum of 146 ppm arsenic.

#### Copper (Figure 5c)

Two anomalies (E and F) contain samples with values greater than 50 ppm Cu. Area "E", with seven samples and a maximum value of 176 ppm Cu, is approximately coincident with "B" arsenic anomaly. Area "F" does not correlate with any other arsenic or gold anomaly. This anomaly overlies unaltered granodiorite (25% exposure). The cause of this anomaly is unknown.

#### Reconnaissance Traverses

Three contiguous samples, anomalous in gold (50, 50 and 60 ppb), located in the north-central Gas 3 claim (Figures 2 and 5a), are included within the "A" anomaly on the Gas 1 Grid. Except for these samples and two contiguous 10 ppb gold samples on the eastern side of Gas 15, there are no two contiguous sample anomalies in gold, arsenic or copper on the 135 kilometres of reconnaissance traverses.

ACME ANALYTICAL LABORATORIES LTD. DATE RECEIVED: FEB 24 1988  
852 E. HASTINGS ST. VANCOUVER B.C. V6A 1R6  
PHONE (604) 253-3158 FAX (604) 253-1716 DATE REPORT MAILED: Feb. 29/88

GEOCHEMICAL ANALYSIS CERTIFICATE

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3:1:2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.  
THIS LEACH IS PARTIAL FOR NH4 FE CA P LA CR BE BA Ti ZN AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM.  
- SAMPLE TYPE: ROCK AuP ANALYSIS BY AA FROM 10 GRAM SAMPLE.

ASSAYER: *C. Leong* D.TOYE OR C.LEONG, CERTIFIED B.C. ASSAYERS

**APPENDIX III**

**STATEMENTS OF COSTS**

**STATEMENT OF COSTS  
GASPARD LAKE PROPERTY**

**WORK DONE:** - Geological Mapping and Geochemical Survey

**WORK PERIOD:** - October 3 - 9, 1988

**PERSONNEL:**

F.R. Harris, Senior Geologist  
#601 - 535 Thurlow Street  
Vancouver, B.C. V6E 3L6  
3 days @ \$297.00/day \$ 891.00

D.B. Fleming, Geologist  
#601 - 535 Thurlow Street  
Vancouver, B.C. V6E 3L6  
10 days @ \$187.58/day 1,875.80

W.D. Mann, Geologist  
#601 - 535 Thurlow Street  
Vancouver, B.C. V6E 3L6  
7 days @ \$187.58/day                  1,313.06

R.J. Cranswick, Geological Assistant  
#102 - 2110 West 5th Avenue  
Vancouver, B.C. V6K 1S2  
11 days @ \$114.00/day 1,254.00

T. Robinson, Geological Assistant  
9620 Glendover Drive  
Richmond, B.C. V7A 2Y5  
12 days @ \$120.00/day 1,440.00

**ROOM AND BOARD** - 43 man days @ \$45.00/day 1,935.00

## ASSAYS

2,026 soil samples analyzed for  
Ag, As, Cu @ \$7.65 15,498.90

**TRANSPORTATION - two 4x4 trucks -**  
**41 days @ \$50.00/day** **2,050.00**

**DRAFTING, REPORT PREPARATION AND WRITING**      **2,000.00**

**TOTAL** \$28,257.76

**STATEMENT OF COSTS**  
**GASPARD LAKE PROPERTY**

**WORK PERIOD:** - October 3 - 29, 1988 on Fame #1  
Statement of Work No. 83 filed December 9, 1988

**WORK DONE:**

|                                    |                    |
|------------------------------------|--------------------|
| 176.8 metres of Diamond Drilling   |                    |
| DDH 88-Gas-1 and 88-Gas-2          |                    |
| Connors Drilling Ltd.              |                    |
| 2007 West Trans Canada Highway     |                    |
| Kamloops, B.C. Invoice #14860      | \$13,439.12        |
| 2 years' work applied to Fame 1    | \$4,000.00         |
| 3 years' work applied to Fortune 1 | <u>6,000.00</u>    |
|                                    | <u>10,000.00</u>   |
|                                    | <u>\$ 3,439.12</u> |

**APPENDIX IV**  
**STATEMENT OF QUALIFICATIONS**

## STATEMENT OF QUALIFICATIONS

Name: F.R. Harris

Address: 5533 Brookdale Court  
Burnaby, B.C. V5B 2C6

Education: B.Sc. Honours Geology 1961  
University of Western Ontario  
M.Sc. Geology 1964  
University of New Brunswick

Experience: May 1960- Geological Survey of Canada  
May 1964 New Brunswick Department of  
Lands and Mines  
Summer employment

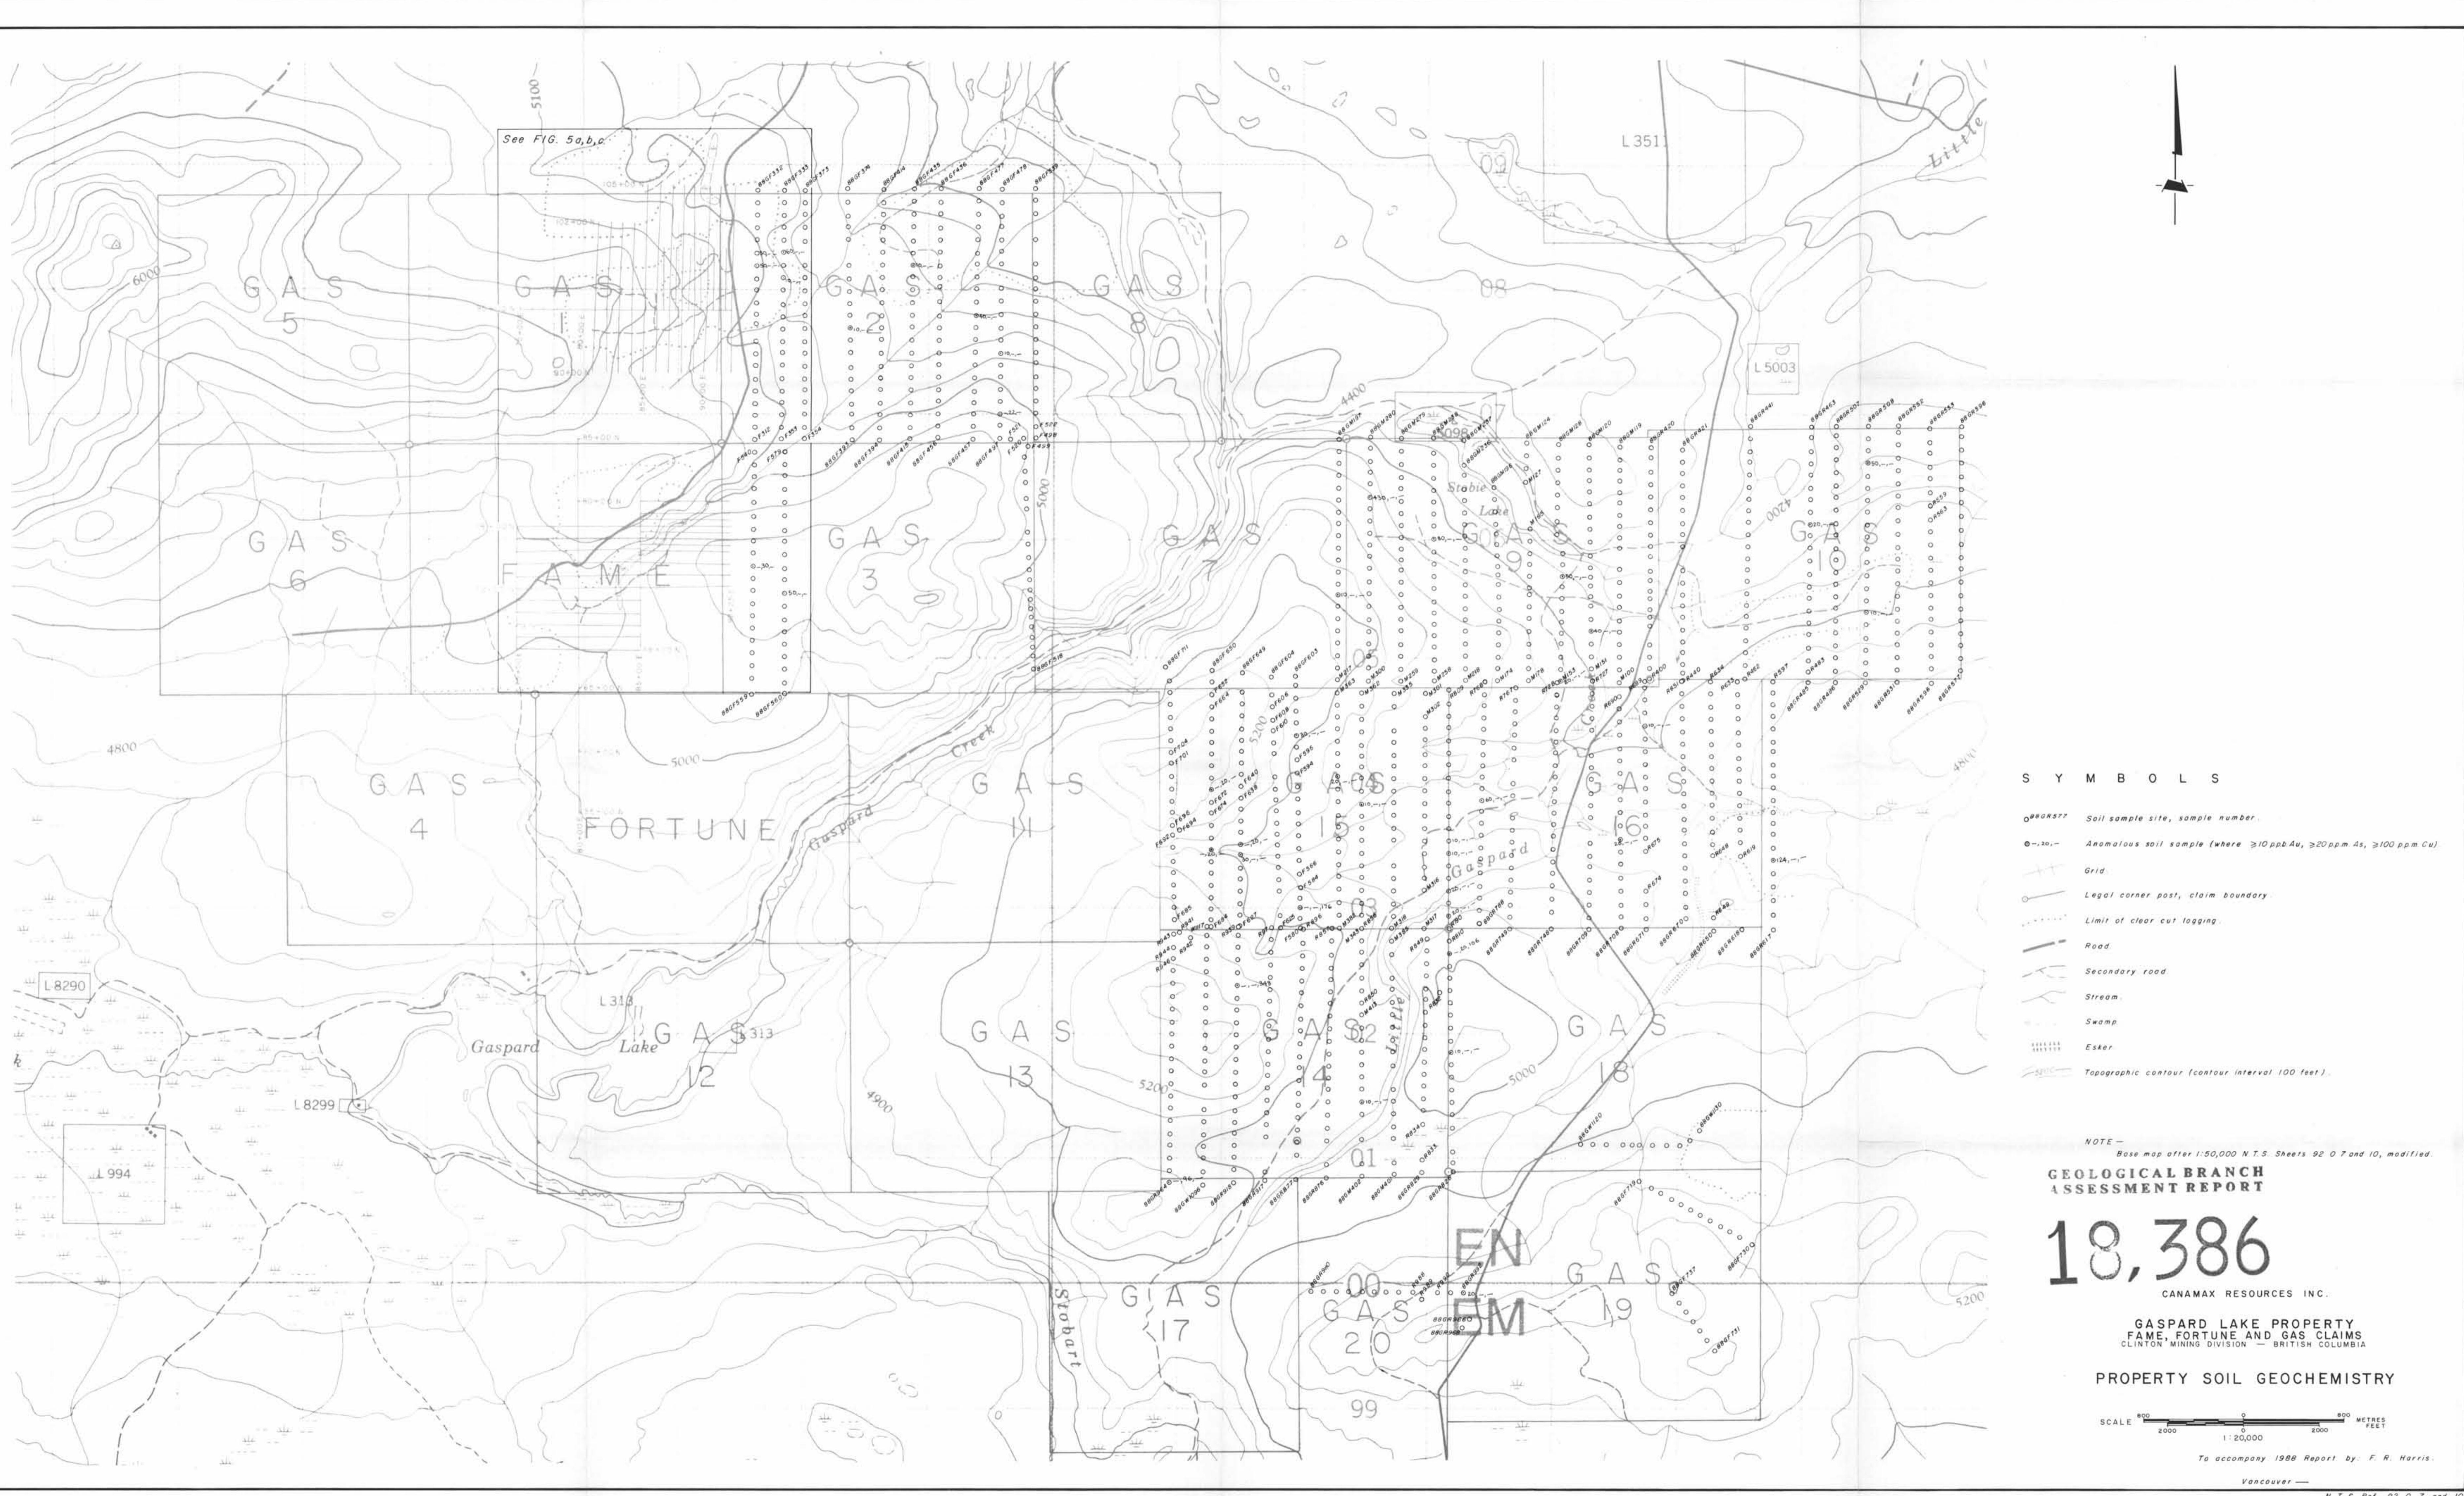

May 1964- Ontario Department of Mines,  
June 1970 Thunder Bay, Ontario  
Party Chief

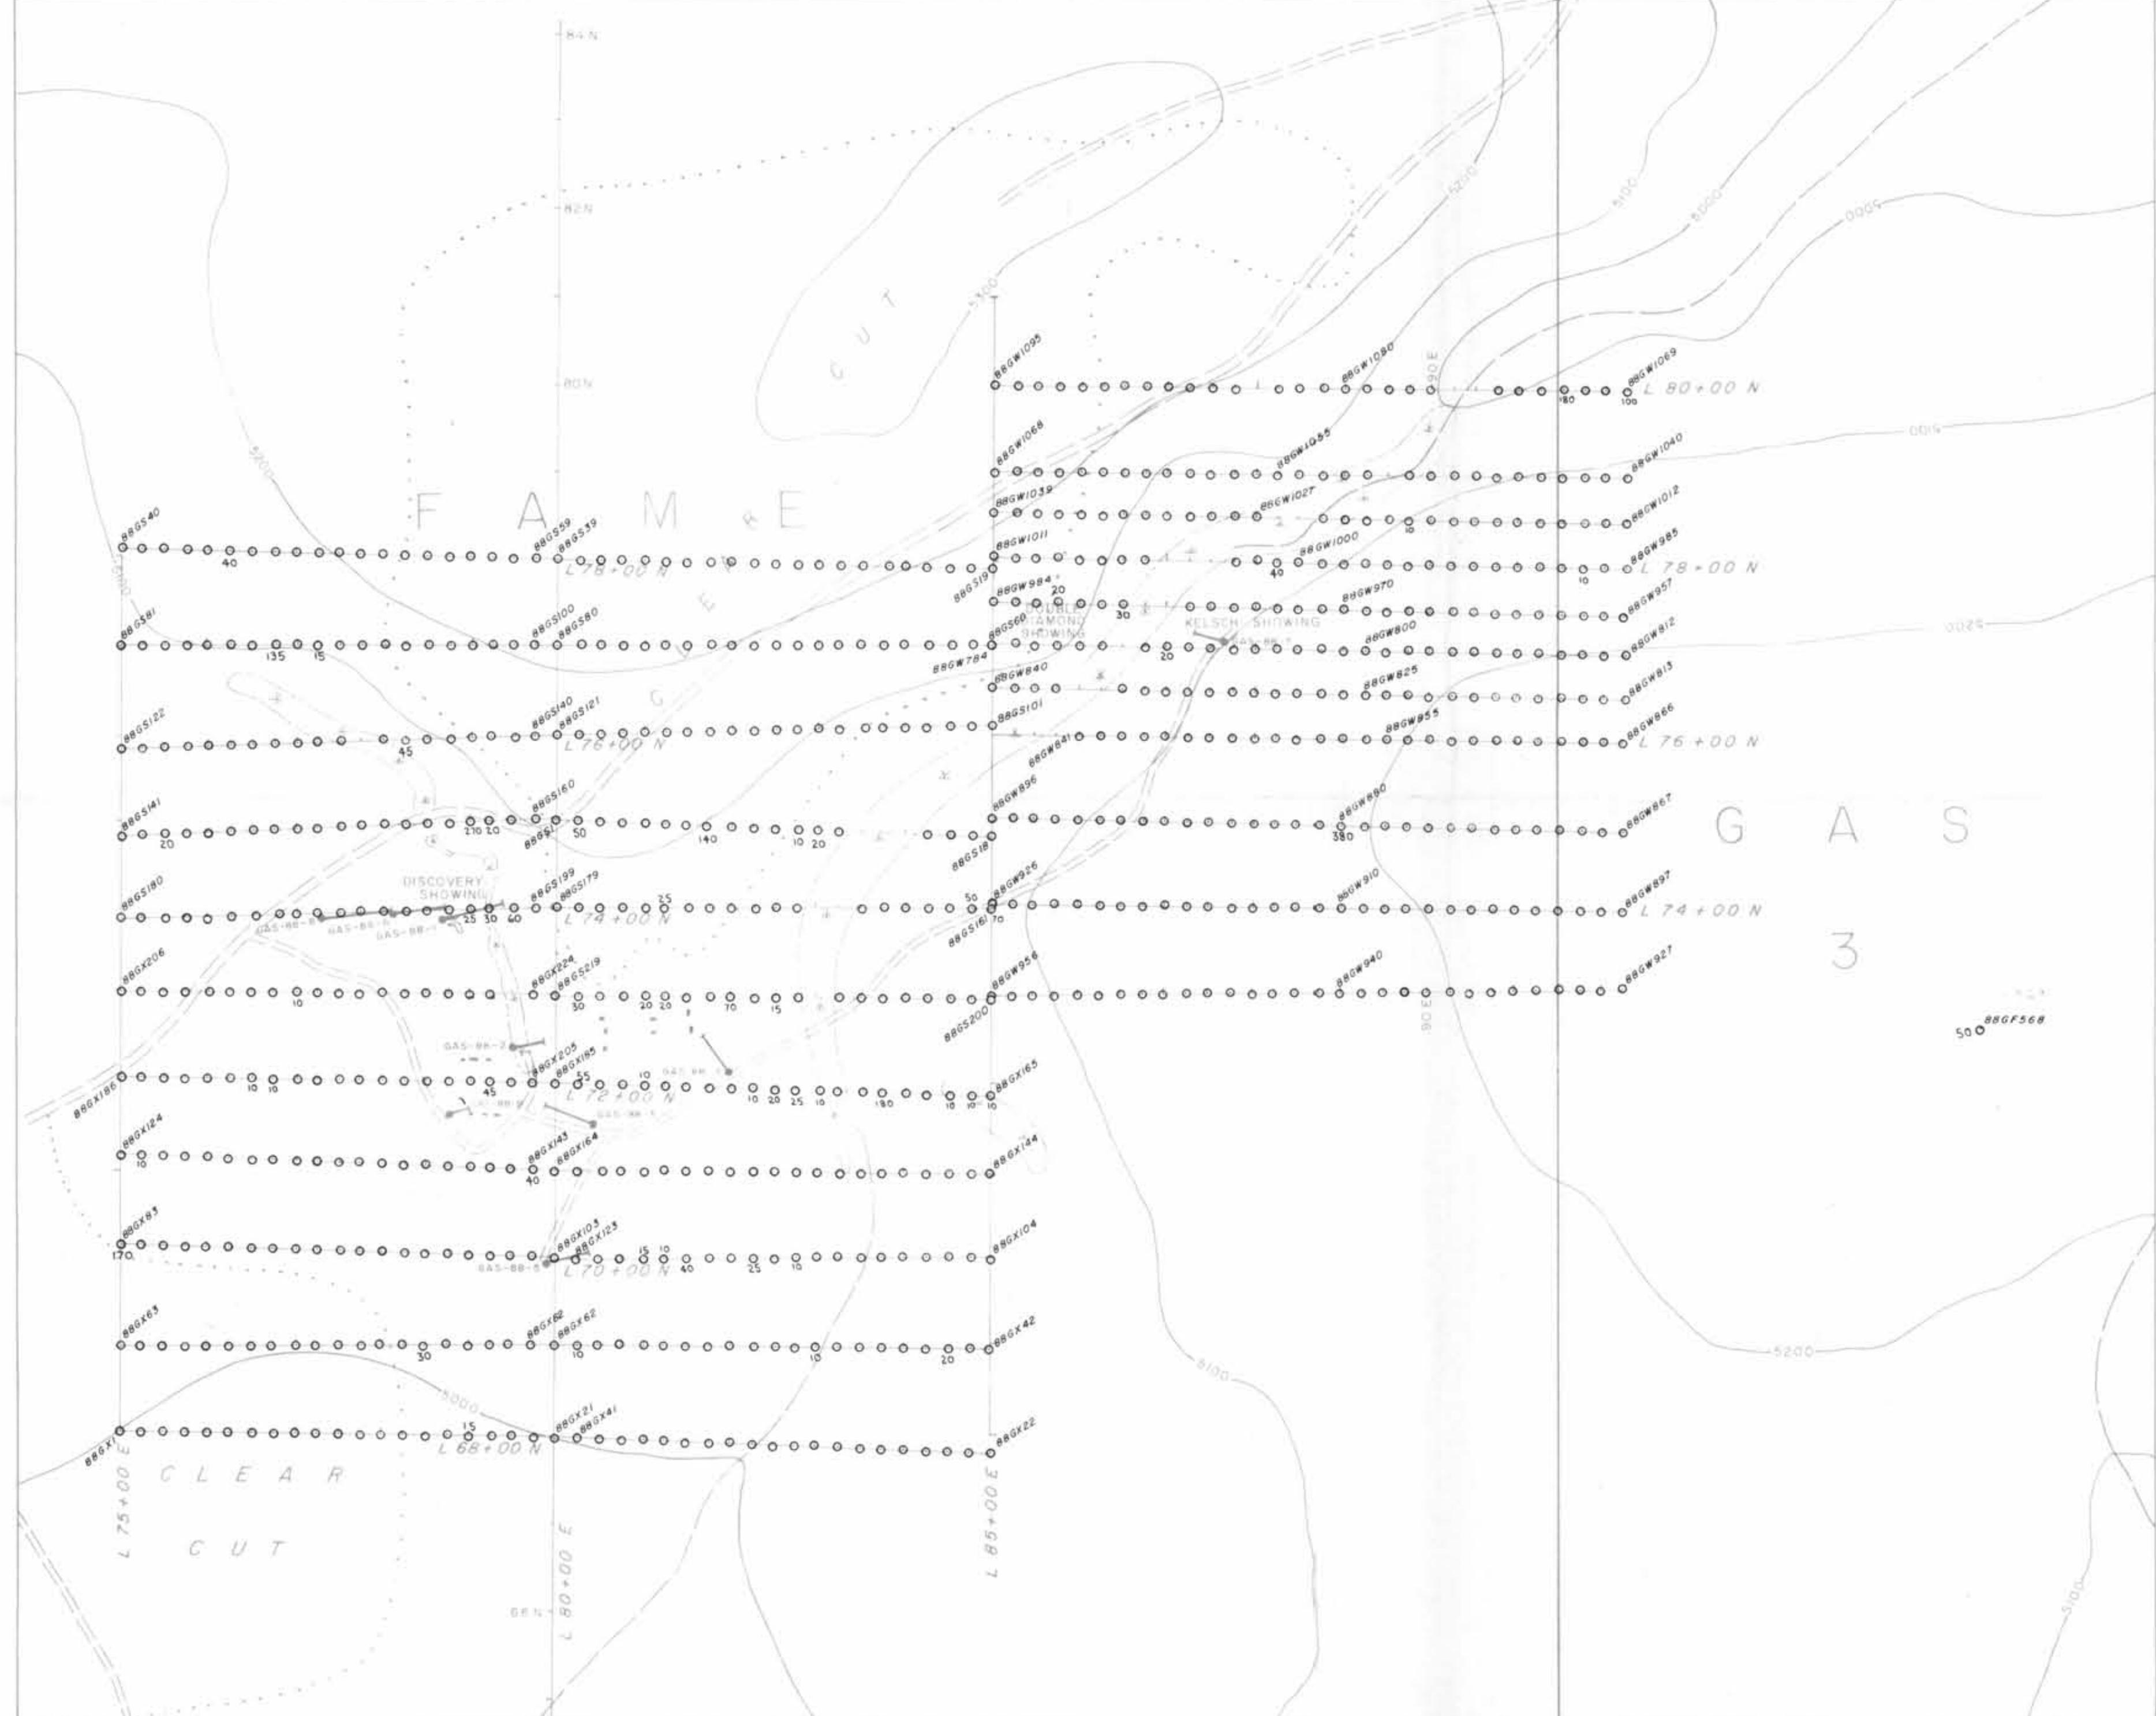

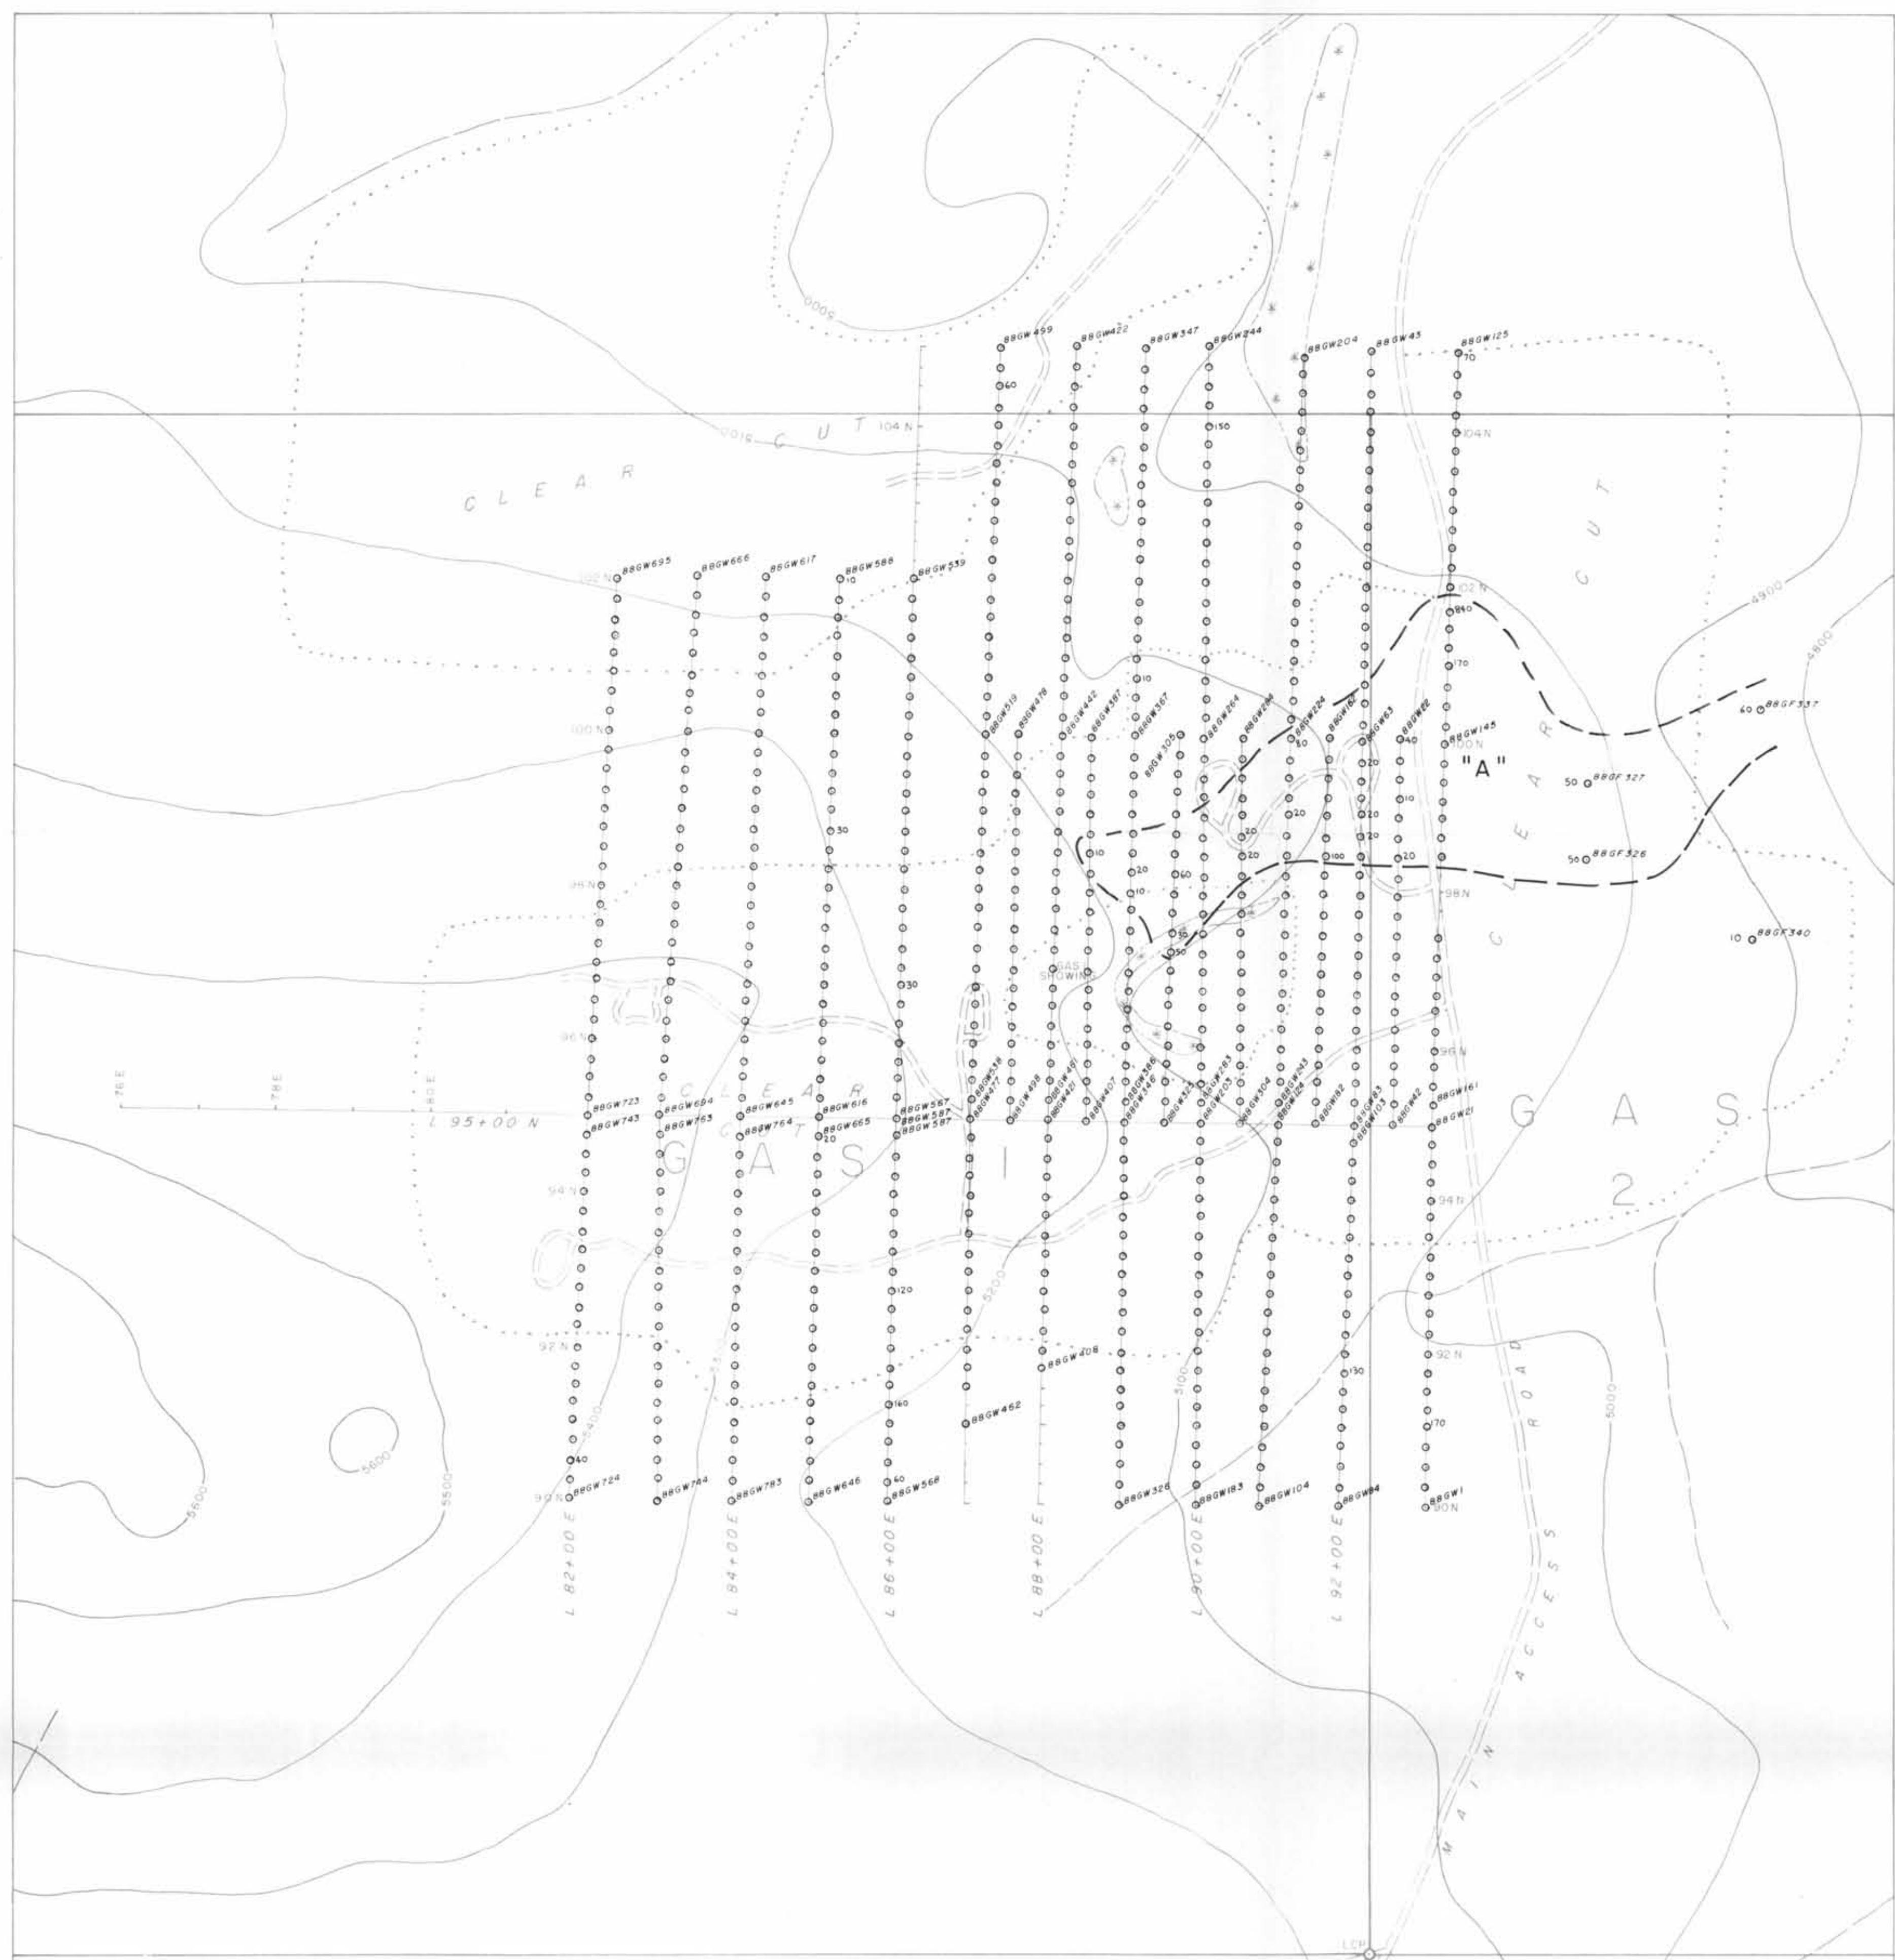

July 1970- Amax of Canada Limited  
1982 Staff Geologist  
Senior Geologist

1983- Canamax Resources Inc.  
Present Senior Geologist

#### S Y M B O L S

- Limit of geochemical anomaly \*
- Soil sample site, sample number, >9 ppb Au.
- Legal corner post, claim boundary.
- Grid line
- Trench or pit.
- Road.
- Diamond drill hole.
- Limit of clear cut logging.
- Stream.
- Swamp.
- Topographic contour (contour interval 100').

NOTE — \* Anomaly labeled as referred to in text.
