INTRODUCTION

The Hen property is located within the Quesnel Trough, a linear belt of Mesozoic volcanic and sedimentary rock that is host to a multitude of significant copper-gold porphyry, stratabound and vein gold deposits. The property was first explored in the mid 1960's in the search for porphyry copper mineralization and received a little attention in the early 1980's for its gold potential, however, no systematic grid work that might form a basis for a more thorough evaluation was ever carried out on the claims. This report comprises the results of a detailed soil geochemical, rock geochemical, geological and magnetometer survey of a one by three kilometre central portion of the 64 unit (3,953 acre) claim group following recommendations for Phase 1 Exploration in a report by Price (1988). Strong gold soil anomalies associated with induced polarization anomalies (1965 work) and other geological and geochemical features indicate much additional exploration is merited. The potential for locating a low to moderate grade open pit deposit or a higher grade stratabound or skarn-gold deposit is considered excellent.

LOCATION, ACCESS AND TOPOGRAPHY

The property is located approximately 85 kilometers northeast of Williams Lake and 30 kilometers northeast of Horsefly (Figure 1). The last four kilometers to the property may require a four wheel drive vehicle. The remainder of the roads are paved or all-weather gravel.

The property is characterized by rolling hills and occasional clefts with elevations ranging from 3000 to 3800 feet. There is abundant water for drilling and a large number of overgrown roads that could be cleared for easy access.

TULLOCH RESOURCES INC.

HEN PROJECT

HEN 1-5 CLAIMS
CARIBOO M.D.

FIGURE:1

CLAIMS

The property consists of 64 metric units with government records showing the following (Figure 2):

<u>Claim</u>	<u>Units</u>	<u>Record No.</u>	<u>Expiry Date</u>
Hen 1	12	6311(8)	10 August 1989
Hen 2	12	9301(8)	15 August 1989
Hen 3	16	9302(8)	24 August 1989
Hen 4	12	9337(9)	13 September 1989
Hen 5	12	9303(8)	24 August 1989

The claims are currently under option to Tulloch Resources Inc. which can earn a 100% interest subject to a 2½% net smelter royalty.

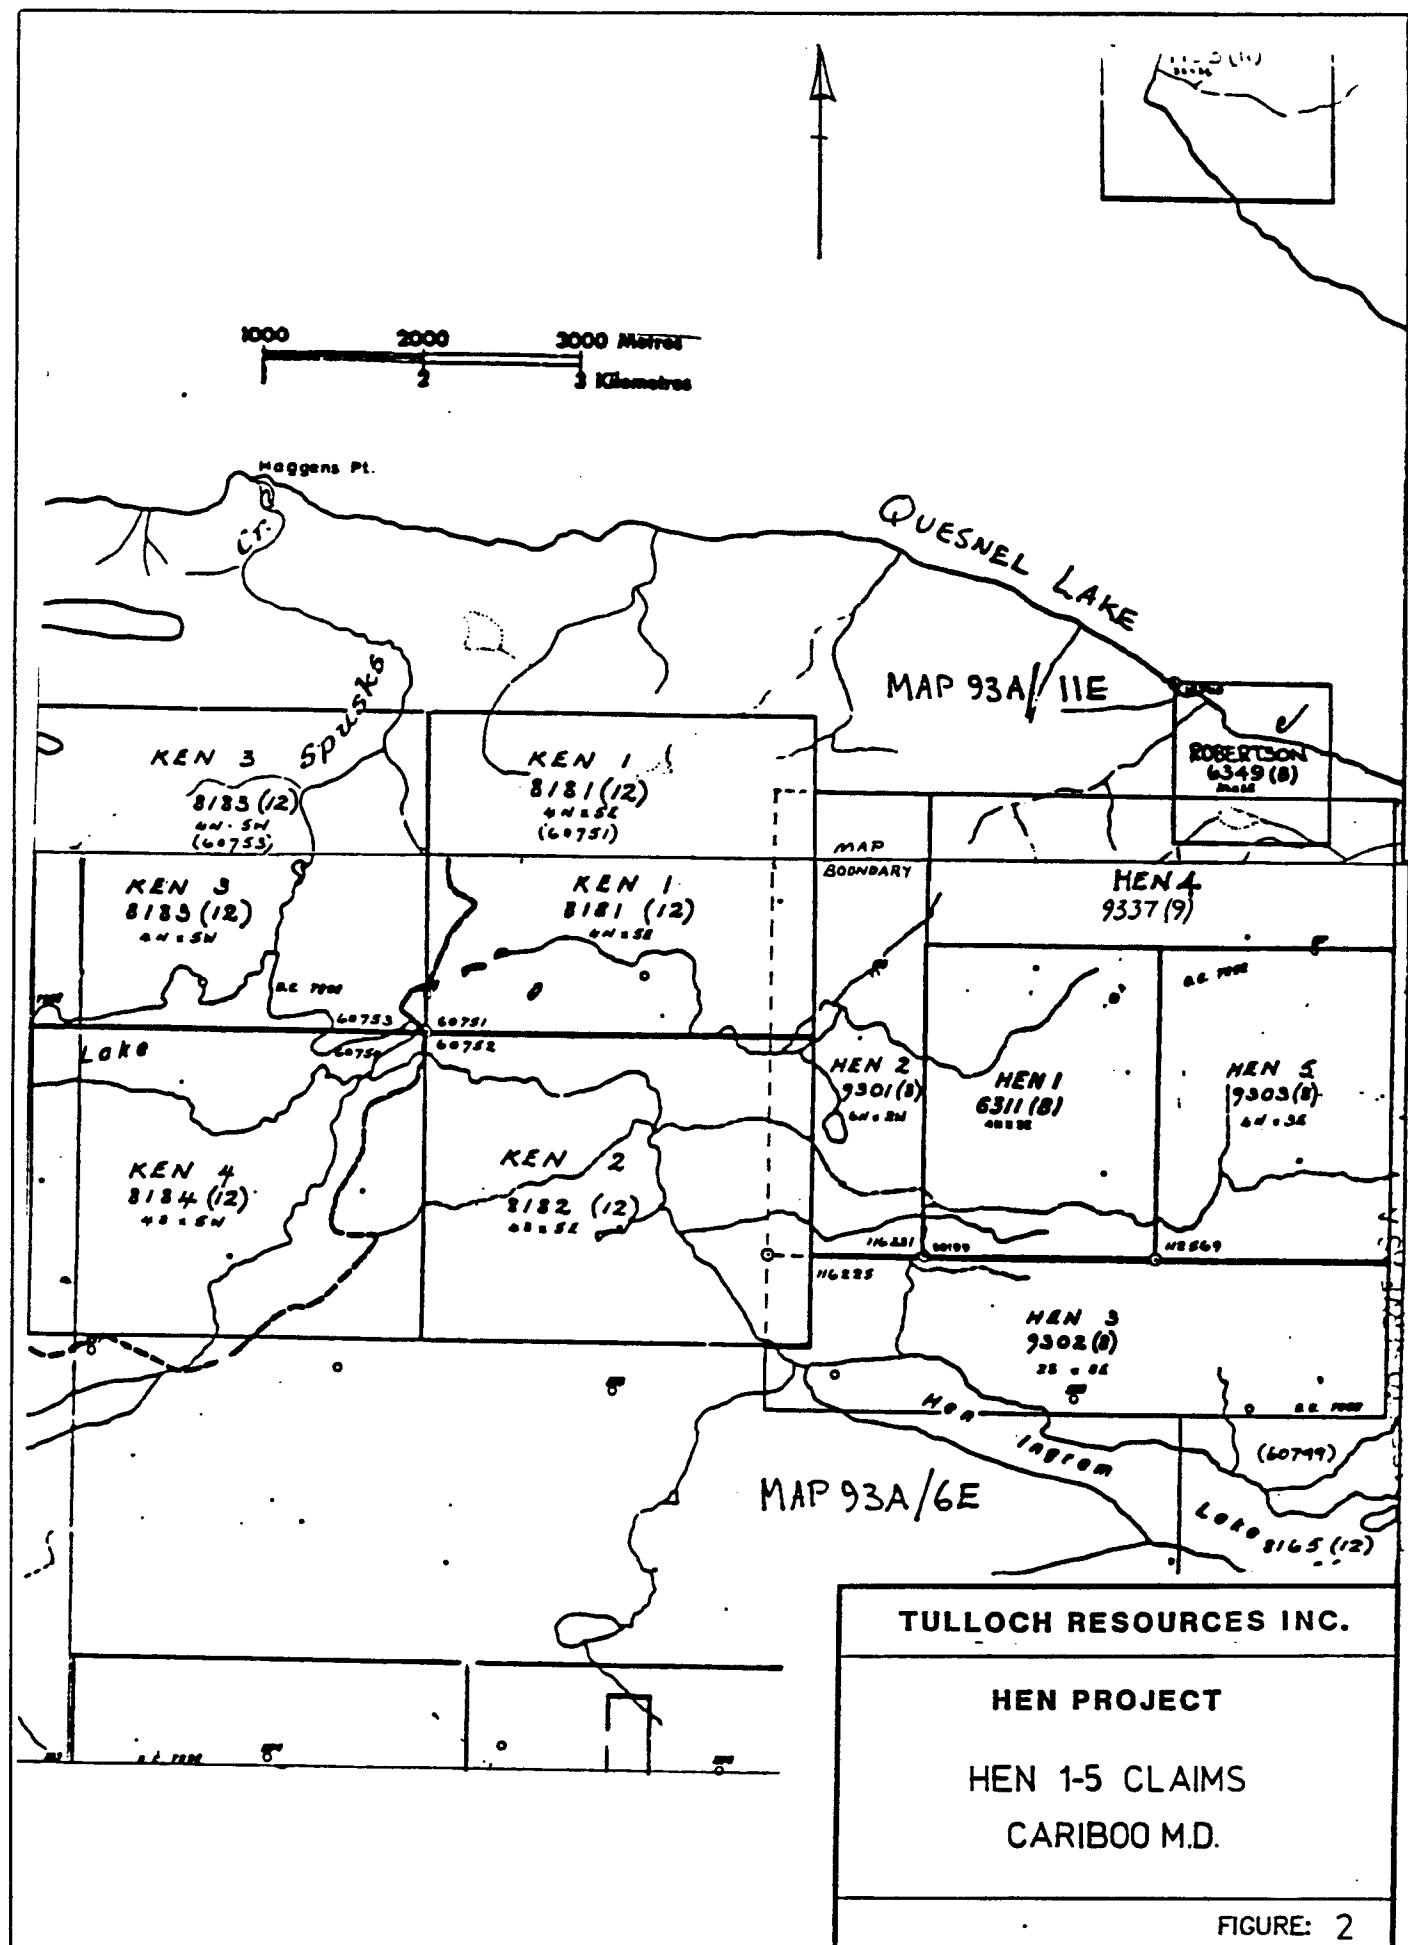

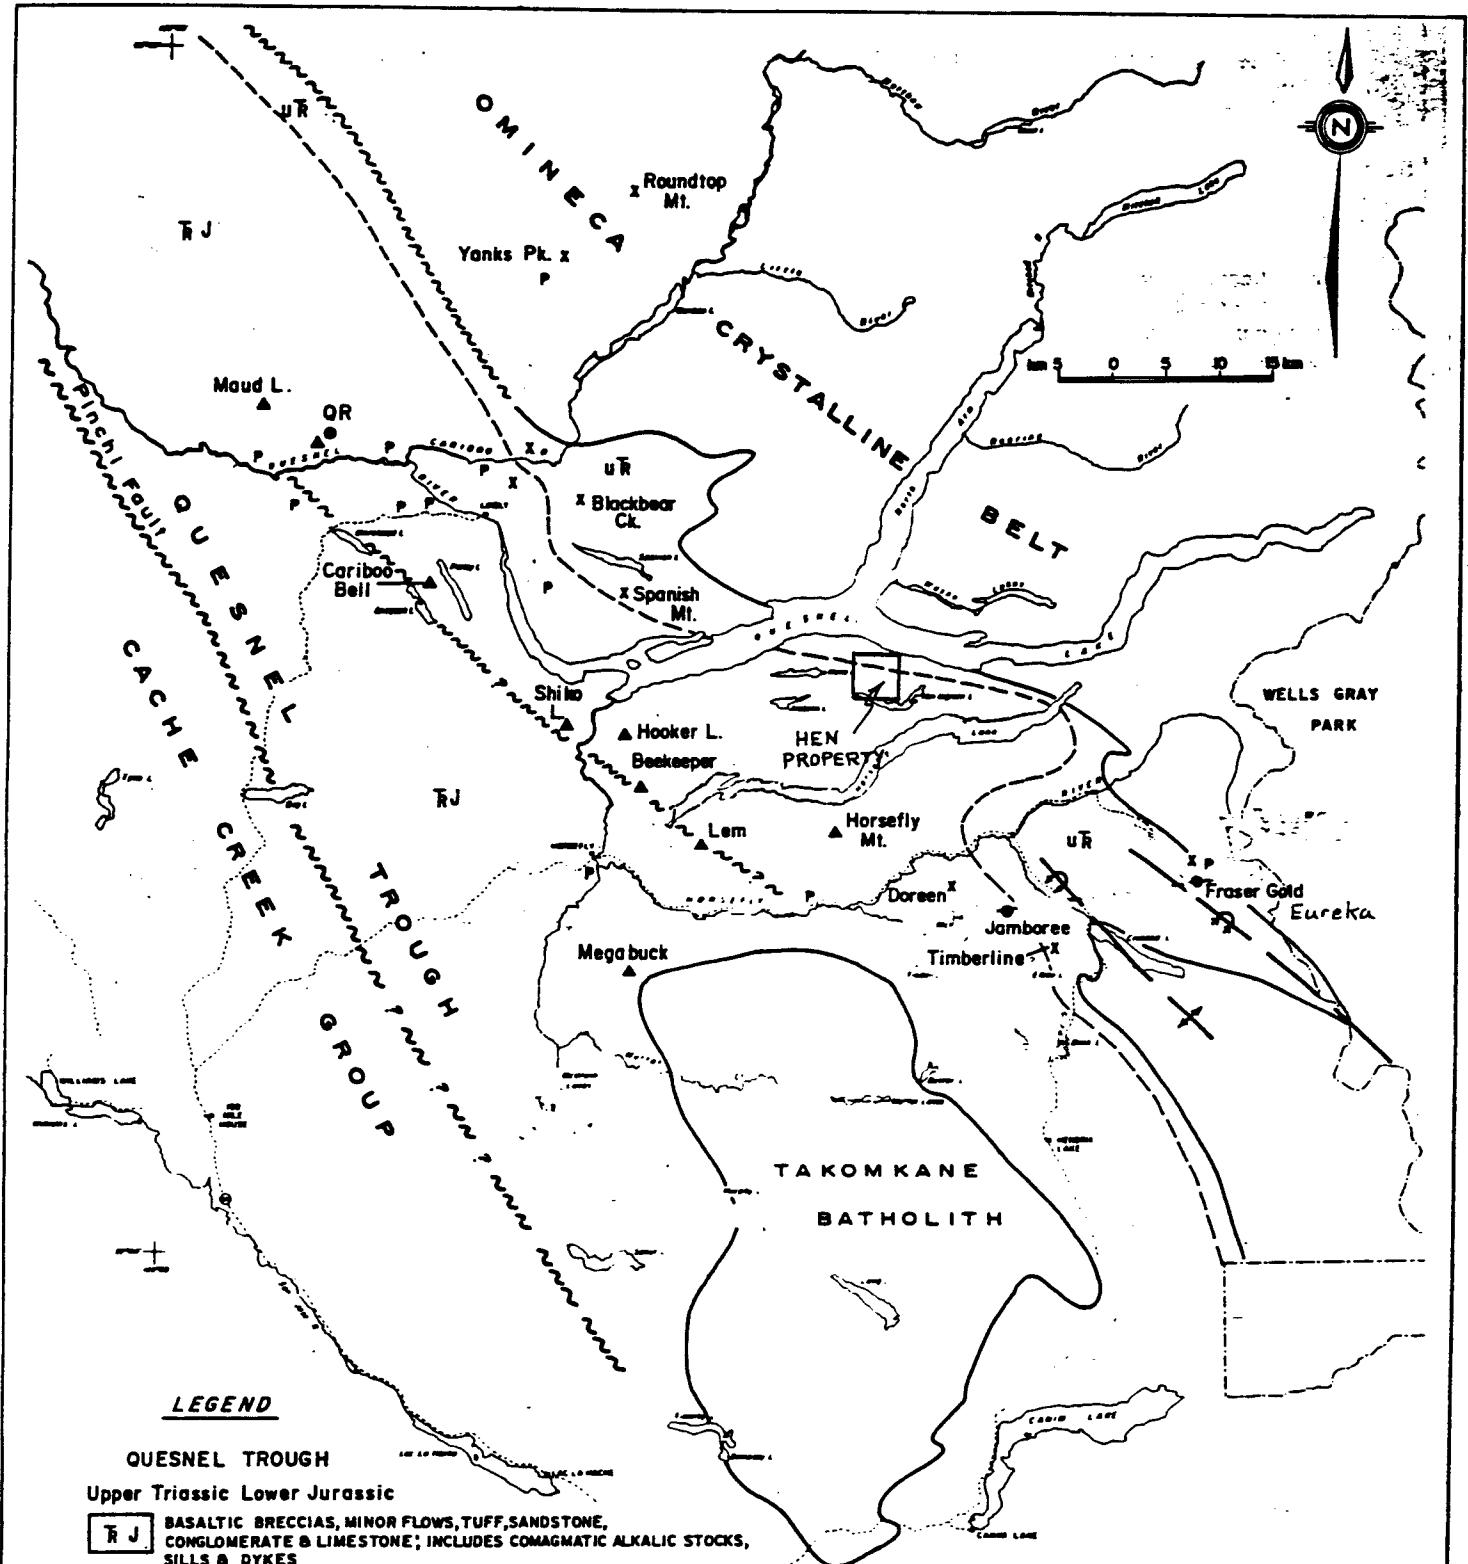

FIGURE: 2

REGIONAL GEOLOGY & MINERALIZATION

The Hen property is found within the Quesnel trough, a belt of Upper Triassic to Lower Jurassic volcanics and sediments bounded on the west by the Paleozoic Cache Creek Group and on the east by Paleozoic and Pre-Cambrian rocks of the Omineca Crystalline Belt (Figure 3). In the Horsefly area the Trough is composed of alkalic volcanic, volcaniclastic and sedimentary rocks intruded by co-magmatic stocks and dikes. The basal sequence (Upper-Triassic) in the area is composed of black argillites and is located along the eastern boundary of the Trough. This unit is succeeded by augite porphyry breccias and flows, with minor interbedded argillite, and volcaniclastics and argillites of Lower Jurassic age. Lower Jurassic volcanic centres are characterized by coarser clastic deposits (sandstone, grit and conglomerate) and sometimes wedges of massive limestone. The local geology is illustrated in Figure 4.

Mineralization is associated with the co-magmatic stocks (Cu-Au porphyries) such as the Cariboo-Bell with 117 million tons grading .31% Cu and .012 oz/ton Au (also a higher grade zone grading .38% Cu and .018 oz/ton Au) and in a number of other mineral environments. These include vein situations (Spanish Mountain), zoned alkalic stocks (Lem & Beekeeper), and stratabound deposits such as the QR (950,000 tons of .21 oz/ton Au) and Eureka (11 million tons .04 to .05 oz/ton Au). Semi-conformable stratabound targets are of primary interest especially if the gold is extractable by open pit methods.

- 10 10a, green and purplish brown pebble and cobble conglomerate and sandstone; 10b, green andesitic volcanic rocks, andesitic feldspar porphyry, argillite, limestone, and pebble conglomerate

CENOZOIC

MESOZOIC

PREVIOUS WORK

The previous work on the property has been described by Price (1988) and, briefly, consists of trenching and drilling of I.P. targets during the mid 1960's in the search for porphyry copper mineralization. Some rumours of significant gold intersections grading 0.10 oz/ton obtained in drilling at that time could not be verified because of lost reports. In early 1980 the main trench on the property was sampled to depths of 75 feet in nine percussion holes (Jones 1981). This trench is shown on Map 1 with some of the holes that have been located.

In light of the exploration results described in this report, the results of the 1980 drill program are important and a few of the better sections are highlighted below (Gold in oz/ton):

Footage	P1	P5	P6	P8	P9	P4
1 - 10	.065	.011				
10 - 15	.014	.004		.009		
15 - 20	.003	.020		.005	.011	
20 - 25	.012	.012		.008		
25 - 30	.011	.022		.005	.003	
30 - 35	.027	.005		.008	.004	
35 - 40	.040			.006	.006	
40 - 45				.005	.022	
45 - 50	.010		.019		.003	
50 - 55	.004		.009		.014	
55 - 60			.012			
60 - 65			.020			
65 - 70	.003		.020			
70 - 75						.001/.013 (Reanalysis)

In addition to the above drilling, several chip samples were taken in the same trench, the best results being:

<u>Interval</u>	<u>Gold*</u>		<u>Silver*</u>
	ppm	oz/ton	ppm
10 m	.370	.011	0.5
10 m	.780	.022	0.4
2 m	.210	.006	1.9
2 m	.120	.004	1.0
2 m	.110	.003	0.5
10 m	.180	.005	0.3
8 m	.740	.022	1.1

* Geochemical quality analysis; conversion to oz/ton by this author.

WORK PROGRAM

B-horizon soils were collected over a grid with lines spaced at 50 m and a sample spacing of 25 m. The grid was laid out with a cut and picketed base line running 330°, parallel to the regional lithologic trend, and centred about the large trench around which most exploration work has been carried out. Crosslines were cut and picketed every 100 m, 0.5 km north and south of 100 N. The cut portion extends 1 km each side of the baseline. The extremities of these lines were flagged and 50 m lines intermediate to the cut lines were also flagged. Because of widespread pyrrhotite concentrations on the property, compassing proved difficult. Distances on cut lines were chained and other lines were measured by hip chain. Approximately 63 line-km of sampling was completed (2600 samples collected).

Soils were analyzed at Min-En Laboratories Ltd. for acid-leachable gold using atomic absorption. Rock samples, mostly collected in old trenches, were similarly analyzed and assayed where highly anomalous. Certificates are reproduced in Appendix 1 and 2.

A magnetometer survey was carried out using a Scintrex MP-2 total field instrument. Drift was minimal during the survey and corrections were not made. Approximately 18 line-km of surveying was completed.

Field work on the property was carried out by Guinet Management Inc. under this author's supervision. Geological mapping at 1:5000 was done by M. Baulding, geological technician.

SOIL AND ROCK GEOCHEMISTRY

Soil results for gold reveal large areas of strong response, almost entirely located west of the baseline and well away from the main trench which has received most attention. The I.P. chargeability anomalies obtained earlier (Halof, 1965) have been superimposed on the gold results as accurately as possible. The trend of the I.P. response has been interpreted by this author and is believed most reasonable in terms of the magnetic, lithologic and geochemical trends. In a general sense, the most abundant gold soil response appears to coincide with the more extensive I.P. development and indicates that the remainder of the property exhibiting strong I.P. response should be soil-sampled for gold.

Map 4 illustrates the soil copper response and again reveals most of the relief in the data is located west of the baseline. The trend is northwesterly, similar to the regional lithological trend. Several other elements (Appendix 2) when plotted display the same distribution and trend as copper thus indicating a major change in geology/mineralization either side of the baseline.

Rock sampling was carried out in existing trenches and from outcrop where available. A large number of anomalous results as high as 5000 ppb (0.15 oz/ton) were obtained with a particular area of interest being 400 m west of the baseline on 99 N.

MAGNETOMETER SURVEY

Map 3 illustrates the property magnetics contoured at 58000 gammas. The property appears to be divided into two major segments with most of the area east of the baseline being greater than 58000 gammas and much of the rest of the property lower. Within the area west of the baseline, linear highs trending northwesterly similar to the geochemical trends probably relate to changes in the volcanic and sedimentary lithologies. Again, most relief in the data occurs on the west side of the baseline.

GEOLOGY

Map 2 presents geological observations obtained from the trenches and limited outcrop on the property. In general, a sequence of mixed tuffaceous volcanics and fine-grained sediments is intruded by dioritic or gabbroic stocks. The volcanics and sedimentary succession is silicified, skarn-like and difficult to map with the available outcrop. Within the main trench, fractures trenching 220° exhibit bleaching and propyllitic alteration. The multi-element geochemistry undertaken in this program will expedite mapping in future as will additional geophysical work, such as an induced polarization survey, and trenching.

CONCLUSIONS

The first phase of exploration has served to demonstrate that considerable additional work on the property is merited. The results obtained in the 1980 percussion drilling are sub-economic but significant. If one notes that the best soil gold response is located west of the area drilled yet is relatively subdued in the vicinity of the holes, then the potential for locating better mineralization is excellent. In addition, the re-analysis of the last sample in hole P4 hints at potential sampling errors that could be caused by nugget gold effect. Thus careful re-evaluation of this trench might produce even better results than obtained previously.

RECOMMENDATIONS & BUDGET

It is recommended that a detailed I.P. survey be completed over the existing area of gold anomalies to better define and locate the 1965 anomalies. This should be followed by trenching and diamond drilling. Also, the existing grid should be extended to cover the areas exhibiting the 1965 I.P. anomalies. A budget to complete this work in two phases is outlined below.

PHASE 2

I.P. survey of existing gold anomalies: 20 line-km	\$ 25,000.00
Geological re-examination & trenching, supervision	20,000.00
TOTAL PHASE 2	\$ 45,000.00

Contingent upon delineation of suitable drill targets, a second phase of exploration is recommended:

PHASE 3

Diamond drilling of gold - I.P. anomalies 6000' @ \$30.00/ft.	\$ 180,000.00
Assays	20,000.00
Geochemical survey of balance of property	65,000.00
Geological evaluation, line cutting, trenching & supervision	50,000.00
TOTAL PHASE 3	\$ 315,000.00

Certificate of ASSAY

Company: GUINET MANAGEMENT

File: 8-1911/P1

Project:

Date: OCT 27/88

Attention: G. MEDFORD/V. GUINET

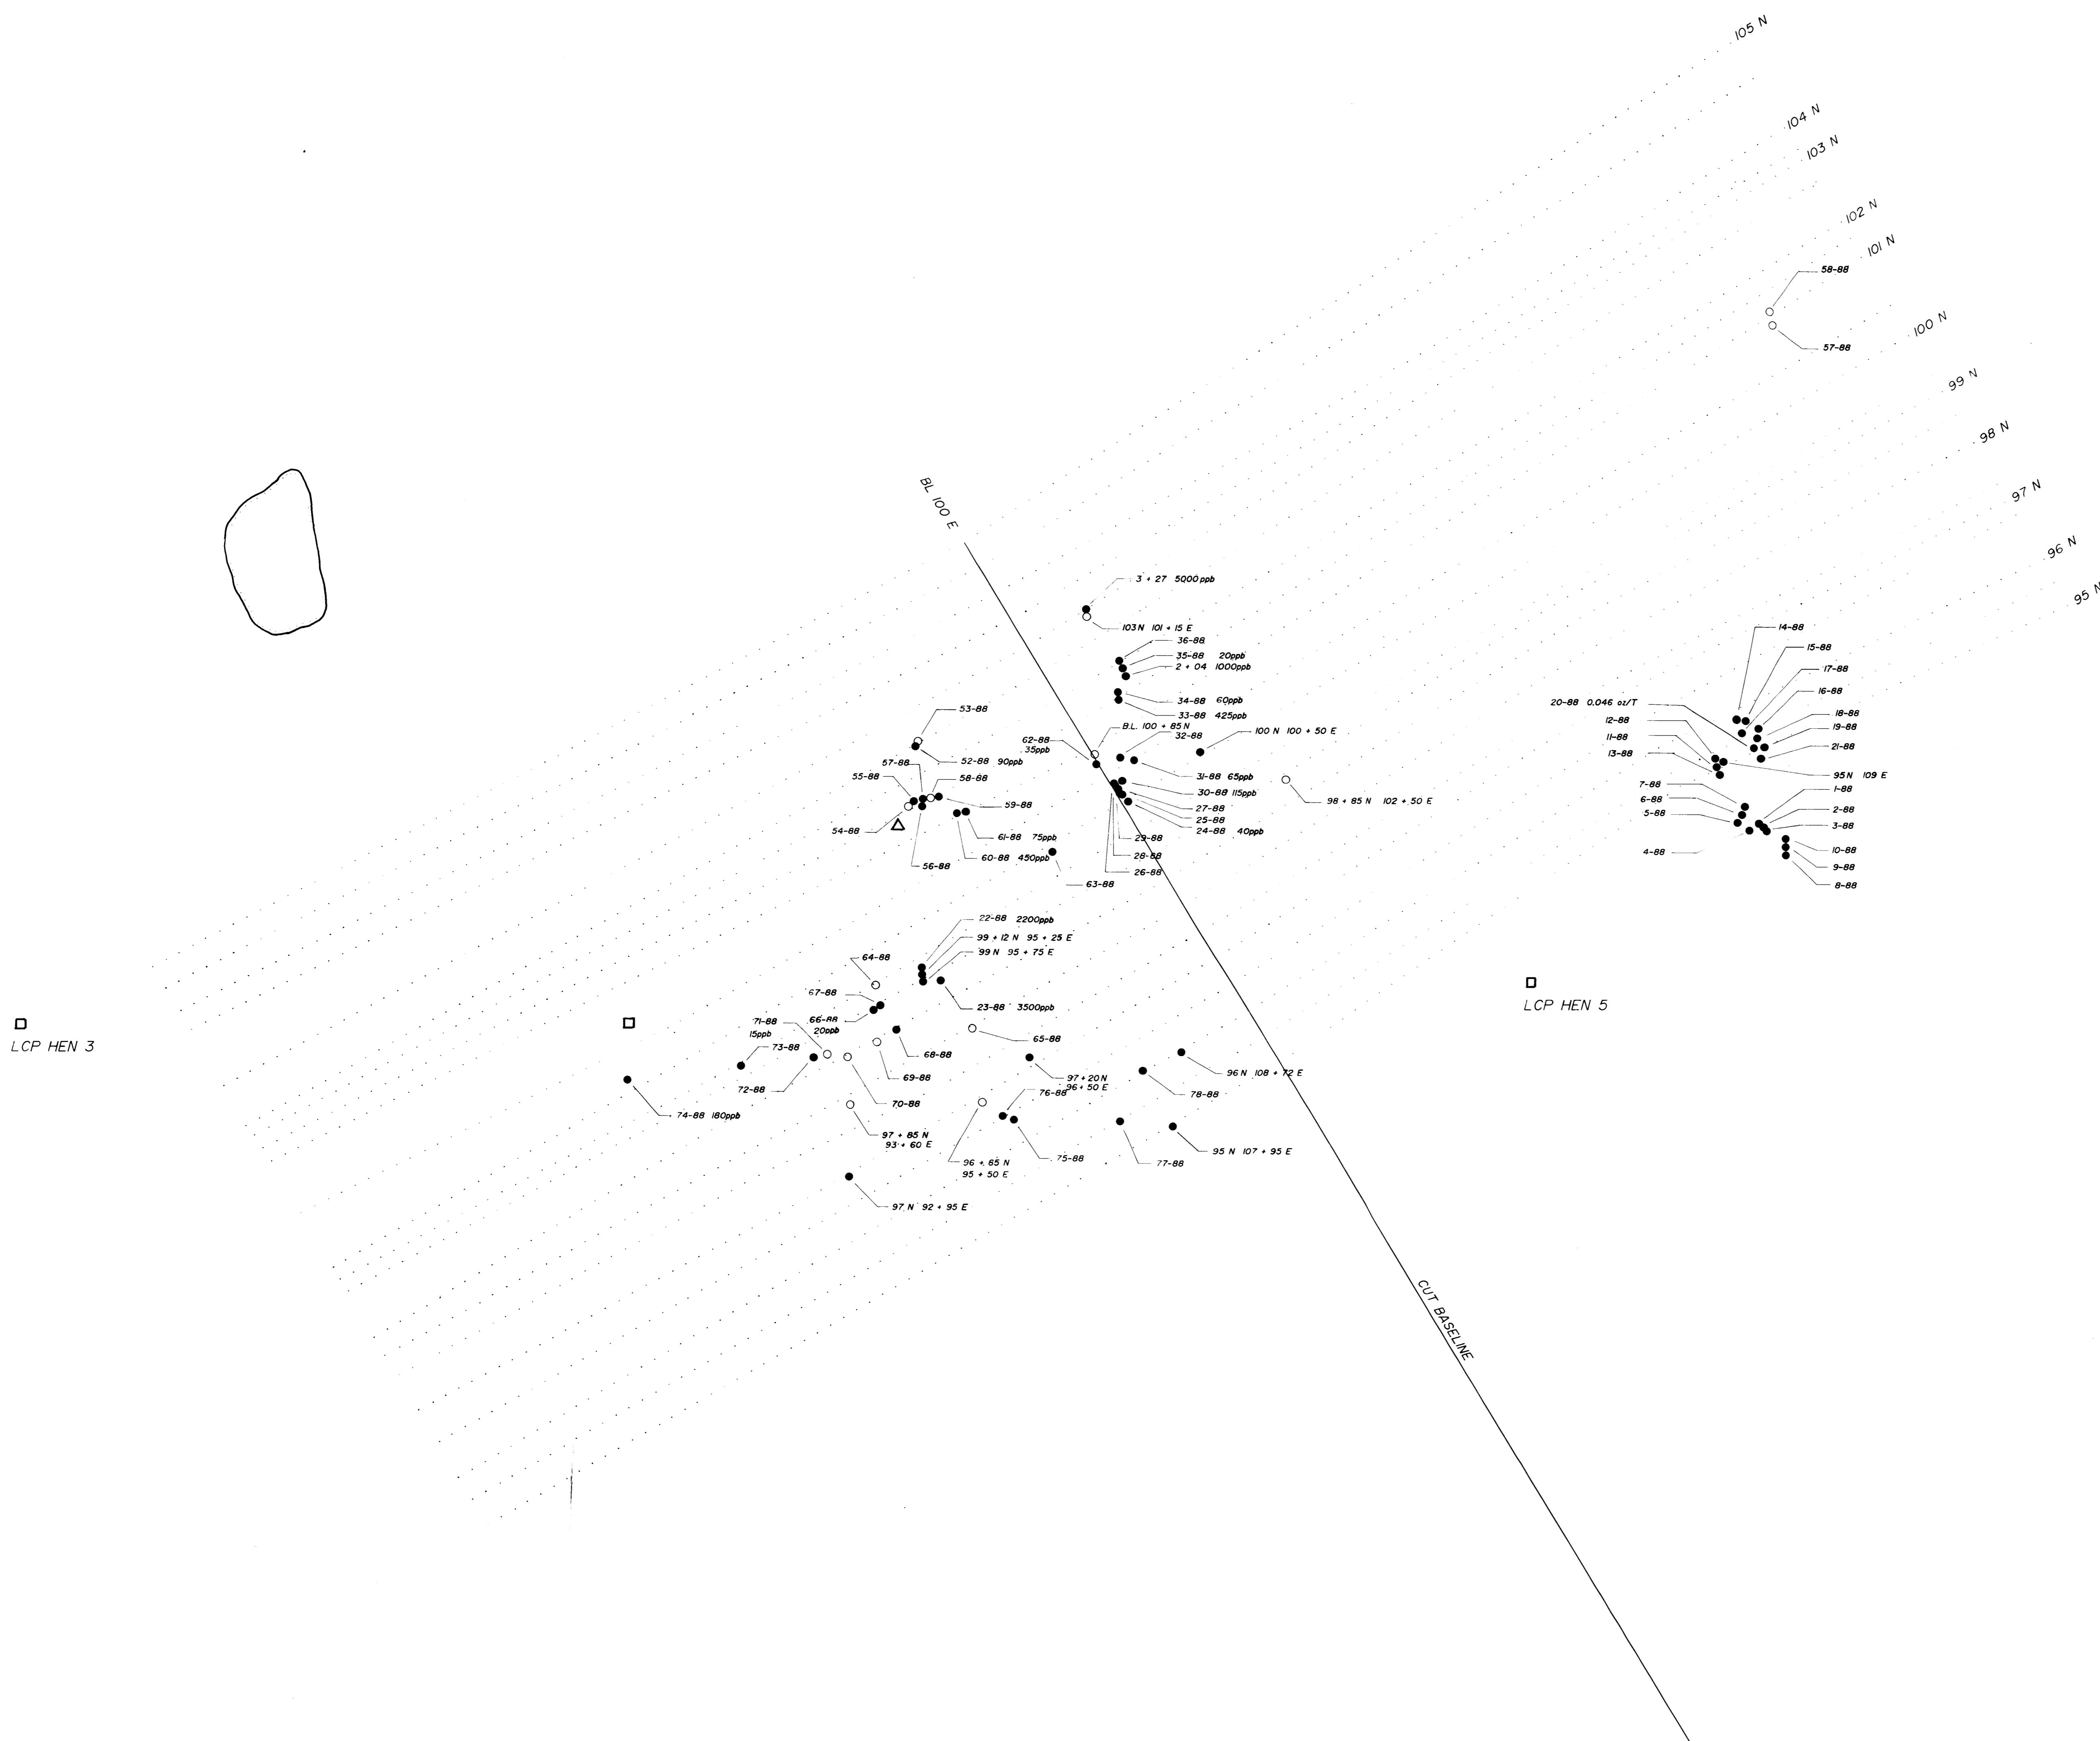

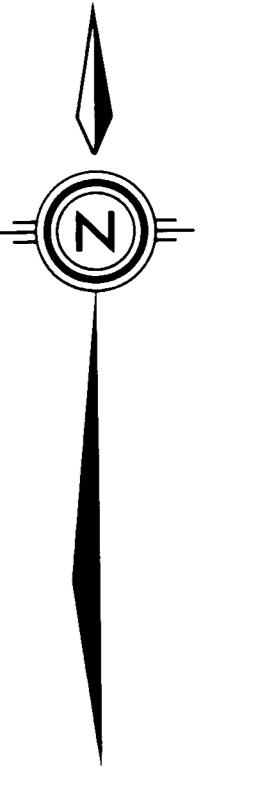

Type: ROCK GEOCHEM

We hereby certify the following results for samples submitted.

Sample Number	AU G/TONNE	AU OZ/TON
HEN 88 20	1.59	0.046

Certified by

John Guinet

L I T H O L O G I E S

JURASSIC and/or CRETACEOUS

- diorite grading into gabbro, dikes, sills, stocks.
- lamprophyre

TRIASSIC and/or JURASSIC

- mixed volcanic and sedimentary sequence, tuffs, siltstones, mudstones, generally silicified
- tuffs, frequently bedded

L E G E N D

- strike/dip
- jointing
- outcrop
- geological contact (defined, undefined)
