APPENDICES

The Likely Property is located adjacent to the town of Likely in central British Columbia. The claims are underlain by Triassic basalt flows, tuffs, siltstones, argillites and phyllites which have been intruded by felsic to intermediate stocks and dykes.

An initial program of prospecting, gridding and rock and soil geochemistry was carried out on the property by Corona Corporation between May and September, 1989. This initial program investigated mineral occurrences and soil anomalies outlined on the property by previous operators. In addition several new occurrences of gold in bedrock were discovered.

During August and September 1989 a program of soil and rock geochemistry and magnetometer and VLF-EM surveys was conducted in order to investigate the more promising anomalies and gold occurrences.

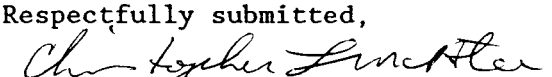
Soil geochemical traverses were completed in the vicinity of Hepburn Lake and Rose Gulch. Prospecting and rock geochemisty were directed at soil anomalies found earlier in the season. Results from the rock and soil geochemistry were generally discouraging.

Magnetometer and VLF-EM surveys totalling 13.9 line kilometres were completed in the vicinity of Fisher and Grogan Creeks. Two new gold in bedrock occurrences had been found in this area by the initial exploration program. In addition a diorite intrusion was mapped along the creek bottoms.

Several linear conductive and magnetic trends were outlined by the geophysical surveys. They are not co-incident with known gold mineralization or gold-in soil anomalies.

Due to the discouraging nature of the results of the initial and follow up exploration programs conducted during 1989 further work is not recommended.

Respectfully submitted,



Christopher L. McAtee M.Sc.
Project Geologist - Corona Corporation

1.0 INTRODUCTION

The LIKELY 2, 4, 5 and 6 claim groups lie on the eastern boundary of the Quesnel Trough, an area of Mesozoic volcanic and sedimentary rocks extending along the eastern edge of the Intermontane Belt.

The claims were staked between November 1978 and October 1985 to cover placer gold showings and quartz veins in the Likely, B.C. area.

This report details the 1989 exploration program which was carried out on June 12, July 6, and from August 25 to September 13, 1989. The program consisted of soil sampling on the E2, AUG 1 and NOB #1 claims, rock sampling on the CAT, JUNE, AST 1 and EASY #1 claims, and a 13.9 km Magnetometer and VLF-EM survey on the EASY #3, EASY #5, EJL, LAKE 1 and JUN 10 claims.

2.0 PROPERTY DESCRIPTION

The LIKELY 2, 4, 5 and 6 claim groups are located in the Cariboo Mining Division and are comprised of 274 units in 25 located mineral claims (Figure 2).

All the claims of the LIKELY 2, 4, 5 and 6 claim groups are owned by Corona Corporation of Vancouver, B.C., with details as follows:

Claim Name	Units	Record No.

3.0 LOCATION AND ACCESS

The LIKELY 1, 2, 3 and 4 claim groups lie to the north, northwest, and southeast of the Village of Likely, B.C., which is located at 52°37′ North Latitude and 121°34′ West Longitude (Figures 1 and 2).

CLAIM MAP

LIKELY 1,2,3,4 CLAIM GROUPS

PREPARED BY: M.K.	SCALE: 1:50,000	PROJECT NO.: 1056
N.T.S.: 93A/11W, 12E	DATE: AUG. 1989	MAP NO.: FIG. 2

The area is accessible from Highway 97 at 150 Mile House by 75 km of all weather road to Likely. Numerous logging roads, which vary from good two-wheel drive roads to overgrown walking paths, provide access to all parts of the property.

4.0 PHYSIOGRAPHY

The area is composed of low plateaus, canyons and rounded hills with elevations from 700 m on the Quesnel River to 1,433 m above sea level on Spanish Mountain. Rock outcrop is confined to the creek and river bottoms, canyons and roadcuts.

Vegetation consists of lodgepole pine, spruce, balsam, and poplar. A dense growth of willow, alder and immature spruce occupies the logged areas of the property.

5.0 EXPLORATION HISTORY

Small scale placer operations have been worked in this area since the 1860's. Gold-bearing quartz veins were discovered on the northeast side of Spanish Mountain in 1933. There have also been reports of hard rock exploration on Cedar Creek and Gold Creek in the early days.

The Bullion Mine, which yielded approximately 59,700 ounces of placer gold, operated from 1894 to 1905 with intermittent small scale activity from 1933 to the present.

Exploration in the area since the early 1960's has resulted in the discovery of Placer Dome's QR gold deposit between lower Maude Creek and Slide Mountain, and the Mount Polley porphyry copper-gold deposit owned by Imperial Metals Corporation and Corona Corporation.

Prospector R.E. Mickle began acquiring claims in the Likely area in 1977. He optioned these claims to Carolin Mines Ltd. in 1981. The claims are now the subject of an option agreement between Carolin Mines and Corona Corporation.

Listed below is a summary of exploration work performed by various companies from 1978 until the present time.

1978 - Silver Standard Mines - Soil geochemistry, 4 diamond drill holes - Gold Creek.

1979, 1981 - Aquarius Resources Ltd. - Geochemical surveys and trenching - Peso claims.

1981 - Carolin Mines - Aquarius Resources Ltd. - Airborne EM and magnetometer survey, 3 geochemical grids.

1982 - Carolin Mines - Aquarius Resources Ltd. - Minor trenching.

1984 - Mt. Calvery Resources - Carolin Mines Ltd. - Comprehensive program of line cutting, grid establishment, geochemical soil survey a n d backhoe trenching.

1987 - Dome Exploration (Canada) Ltd. - Carolin Mines Ltd. - 1,356 m of percussion drilling in 28 holes, limited trenching.

6.0 GEOLOGY

The property lies on the eastern boundary of the Quesnel Trough, which in this area consists of Upper Triassic coarse grained augite and augite-olivine basalt and monolithic flow breccia with minor greywacke, mudstone and conglomerate. This volcanic sequence is underlain by Triassic metasediments comprised of argillites, slates, quartzites and phyllites.

Spanish Mountain - CAT Claim

The main rock type on Spanish Mountain is a dark grey, fine grained phyllite which is interbedded with impure quartzite horizons of varying thickness and extent.

Gold is associated with both short gash and massive quartz veins. On the CAT claim short 1 to 10 cm, 20 cm, 66 cm, and 90 cm gash quartz veins have been found. These veins strike northeast-southwest with westerly to vertical dips and are generally barren of sulphides. An equal number strike northwest-southeast and dip northeast to vertical. Galena and tetrahedrite? were observed in some cases (Figure 8).

Pyrite occurs as cubic and prismatic aggregates which commonly weather out to produce a fine honeycomb (aerobar) texture in which native gold is often observed. This feature is particularly evident at the vein contacts and extends into the wallrock for a few centimetres, especially if the wallrock is argillaceous. Pyrite cubes up to 3 cm in diameter give the rocks a mottled appearance, especially in the quartzites.

In the phyllites, pyrite also forms small pods and stringers. A gold foil coating the insides of weathered pyrite cavities can sometimes be observed associated with quartz veins, and gold can sometimes be panned from the quartz. Mariposite occurs in scattered patches, especially noticeable in the lighter coloured rocks.

Fisher and Grogan Creeks - EASY #5, JUN 10, and EJL Claims

The main rock unit is a vesicular basalt with minor tuffs. Up to several percent disseminated sulphides are present with pyrrhotite vesicle fillings fairly common. Highly magnetic mafic volcanic rocks were found on Grogan Creek at the 89L-SR116 rock sample site and a mafic diorite stock was mapped on Fisher and Grogan Creeks (Figure 3).

Gold Creek

Gold Creek has received considerable attention in the past by way of closely spaced geochemical sampling and a series of four diamond drill holes (Godfrey, 1980). The steep roadside exposure near the mouth of Gold Creek consists of fine grained volcanic flows which are in contact with an angular volcanic talus deposit.

At this exposure, irregular, closely spaced, hematite stained, criss-crossing alteration zones are typically from 2 to 10 cms wide, but locally 25, 50 and 100 cms wide. The rock in these zones is thoroughly decomposed and is commonly accompanied by quartz veins from 2 to 5 cm wide in vertical or steeply dipping fractures.

Poquette Lake Area - EASY #1, #4, 6, TY and MARK FRACTION Claims

The dominant rock type in this area is vesicular basalt with minor agglomerate, tuff, andesite and argillite. A narrow felsic dyke was mapped near the EASY #1 - EASY #4 boundary and a diorite stock outcrops south of Poquette Lake on the EASY #1 claim (Figure 4).

JUNE, ROSE 3, NOB #1, AST 1, AUG 1 and E2 Claims

On the JUNE and DUG claims mafic volcanics, tuffs and vesicular basalts outcrop on the south side of the Cariboo River and at the LK showings. A series of rusty argillites and phyllites are exposed in Rose Gulch (Figure 5). Basalt, basalt porphyry and andesites are exposed along a road on the north shore of the Quesnel River west of Likely on the AST 1 claim. Basalt also outcrops on the steep north facing slope south of the Quesnel River on the AST 1 claim. No outcrop was observed on the AUG 1 and E2 claims in the area soil sampled (Figure 7) but rusty volcanic flows outcrop 1.5 kms to the west on a road near the EASY #1 - E2 claim boundary.

7.0 EXPLORATION PROGRAM

During 1989 a program of rock and soil geochemistry and magnetometer and VLF-EM geophysical surveys was conducted on the LIKELY claims. The purpose of the surveys was to delineate a magnetic diorite intrusive and gain further structural information in the Fisher and Grogan Creek areas. Also, rock sampling in the vicinity of soil anomalies was undertaken on Gold Creek, Spanish Mountain, Poquette Creek and on the AST 1 claim north and south of the Quesnel River. A small soil survey was conducted on lower Rose Gulch and north of Hepburn Lake.

Field work on lower Rose Gulch (NOB #1 claim) was carried out by Steve Robertson, geologist, and Bob Mickle, prospector, on July 6, 1989. Steve Robertson and assistant Jonathon Cowan conducted the soil survey north of Hepburn Lake (AUG 1 and E2 claims) on June 12, 1989 and Chris McAtee, geologist, collected rock samples from August 25 to September 13, 1989.

Line re-establishedment and the magnetometer and VLF-EM surveys were conducted by geologists Chris McAtee and Gary Roste from August 31 to September 13, 1989.

7.1 Grid Emplacement

The Mt. Calvery Resources grid established in 1984 was re-established in the Fisher and Grogan Creeks area. Odd numbered lines were re-established from 341 to 355 North and new intermediate lines were established from 344 to 354 North (Figure 3). Grid stations were established every 25 metres. A total of 13.9 kilometres of grid lines were established.

Two contour soil lines were established with 25 metre stations north of Hepburn Lake and two soil traverses were run on lower Rose Gulch (Figures 5 and 7). All lines were run by hipchain and compass and marked with flagging.

7.2 Geochemical Survey

A total of 53 soil samples and 24 rock samples were collected during the field program. Soil samples were taken at a minimum depth of 20 cms, generally in the B-horizon. The soil samples were dried and sieved and the -80 mesh fraction was analyzed by Eco Tech Laboratories of Kamloops, B.C. using their 30 element I.C.P. package. The samples were also analyzed for gold at Eco Tech by fire assay with an atomic absorption finish.

Rock samples were dried, crushed and pulverized and a -140 mesh split was analyzed for gold plus 30 elements using the above mentioned techniques. Twenty rock samples were analyzed by Eco Tech Labs and 4 samples were run by Acme Analytical Laboratories, Vancouver, B.C. Assay results are presented as Appendix A and plotted on Figures 4, 5, 6, 7 and 8.

7.2.1 Hepburn Lake - AUG 1 and E2 Claims

Gold in soils north of Hepburn Lake range from <5 to 55 ppb and silver ranged from 0.2 to 4.8 ppm. Anomalous silver values are found at both ends of line H-2 (Figure 7).

7.2.2 Rose Gulch - NOB #1 Claim

Anomalous gold values of 845 and 500 ppb were found on lower Rose Gulch (Figure 5). The coincident gold (845 ppb) and arsenic (125 ppm) soil anomaly at RC 2+00E is most likely derived from rusty argillites which outcrop at the sample location. The 500 ppb gold value obtained in glacial soils at RC 5+00E is probably a result of placer enrichment.

7.2.3 Spanish Mountain - CAT Claim

Five rock samples which returned gold values of 5 to 2290 ppb were collected on the CAT claim (Figure 8). A 153 cm wide rusty fractured quartz vein containing 5 x 10 mm patches of galena returned 2.29 g/t (.067 opt) and 1117 ppm Pb (74801, resampling of 74468). This vein, which trends 020°, could not be followed to the north or south. Narrow quartz veins found at spot high gold soil locations returned low gold values (74802 to 74805, Figure 8).

7.2.4. JUNE Claim

A weak gold-copper-silver soil anomaly and spot high gold values were found on the JUNE claim 2 kms northeast of Quesnel Forks, B.C. (McAtee, 1989, Figure 9). A ground check of the gold-copper-silver anomaly at 8+50 to 9+50E and the gold high at 6+50E showed overburden and angular float. Float rocks consist of silicified bleached tuffs with disseminated pyrite, calcite stringers and mariposite. Rock samples 74806 and 74807 taken near 12+50E returned low gold values of 10 and 50 ppb. Rocks sampled were silicified bleached tuffs with 1-10 mm quartz-carbonate veinlets containing minor sphalerite and galena (Figure 5).

7.2.5 AST 1 Claim

A gold-copper soil anomaly was found 1.7 kms northwest of Likely near line 392N, 74W (McAtee, 1989 - Figure 9). Numerous northeast and northwest trending shears in the area show soft, rusty decomposed zones in silicified, epidote altered basalts and tuffs. Seven rock samples taken in this area returned values of 35 to 220 ppb gold (Figure 6).

A gold-arsenic soil anomaly found 2.8 kms WNW of Likely on the AST 1 claim was also investigated. Angular, silicified, bleached basalt chips which were collected from the soil returned values of 35 to 80 ppb Au and 160 to 406 ppm As (Figure 6, Appendix A).

7.2.6 Poquette Creek - Sawmill - EASY #1 Claim

Additional rock sampling and geological mapping were conducted on Poquette Creek and on the road west of Potter's Sawmill. Diorite was mapped and sampled on the west side of Poquette Creek south of the sawmill road cutoff (Figure 4). Altered, hematite stained diorite near L364N, 49W returned values of 2 and 1 ppb Au, 71.8 and 27.7 ppm Ag, and 5014 and 1736 ppm Pb (74821 and 74822, Appendix A). Two samples of altered mafic diorite near L366N, 46+50W (74823 and 74824) also returned low gold values of 4 ppb (Figure 4).

A northerly trending fault zone is exposed on the west side of the switchback road for 100 metres from L369N, 42+50W. Intensely folded, faulted and fractured basalts with 2.5 to 5 cm wide east-west striking quartz and carbonate veinlets outcrop along the roadcut. A 45 cm wide quartz-carbonate vein (74820) assayed 110 ppb Au and 862 ppm As (Figure 4). Also, a shallow dipping 51 cm wide quartz vein in rusty altered volcanics (74819) returned 20 ppb gold.

7.3 GEOPHYSICAL SURVEY

VLF-EM and Magnetometer surveys were conducted on the Likely grid. Data was collected at 25 metre intervals and was processed and interpreted by E.R. Rockel of Interpretex Resources Ltd. His detailed report is included as Appendix B.

7.3.1 VLF-EM Survey

Several weak to moderate strength conductors cross the grid on northwest and east-west trend (Figures G-3 and G-4, Appendix B). These conductors are interpreted as faults or fracture zones.

7.3.2 Magnetometer Survey

Two magnetic high lineaments and one magnetic low lineament have been outlined on the Likely grid. E.R. Rockel of Interpretex Resources Ltd. interprets magnetic lineaments L-1 and L-2 as basic dykes and lineament L-3 as oxidation within a fault zone (Appendix B, Figures G-1 and G-2). There is some evidence for L-1 and L-2 as basic dykes since pyroxenite subcrop was found at the western end of lineament L-1 and 50 metres north of L-2 (Figure 3). No evidence was found on the ground for a fault along lineament L-3, but the area is covered with overburden. If fault L-3 exists, it is possible that L-2 has been downfaulted relative to L-1 as mentioned by Interpretex.

It was initially thought that the magnetic diorite intrusive, which outcrops in Fisher and Grogan Creeks, could be outlined more exactly by means of a magnetometer survey. In the field it was found that magnetic pyrrhotite is common in both the dioritic and volcanic rocks. Therefore the magnetometer survey was unable to discriminate between the different lithologies.

8.0 CONCLUSIONS AND RECOMMENDATIONS

The results from the soil geochemical program described in this report failed to outline a contiguous gold anomaly. Investigation of one station, anomalous soil samples from this and previous exploration programs failed to locate significant gold mineralization in bedrock.

Results from the magnetometer and VLF-EM surveys outlined several linear magnetic and conductive trends. The VLF conductors have been interpreted as faults or fracture zones. Linear magnetic highs have been interpreted as mafic dykes. A linear magnetic low was interpreted as a fault. The geophysical

anomalies are not coincident with gold-in-soil anomalies and cannot be correlated to any known mineralization on the property.

Due to the lack of success in this and previous exploration programs in locating a significant zone of gold mineralization in bedrock or encouraging drill targets no further work is recommended.

APPENDIX "B"

APPENDIX REPORT

ON

VLF-EM AND MAGNETIC SURVEYS

OVER THE LIKELY PROJECT GRID

LIKELY, BRITISH COLUMBIA

1.0 INTRODUCTION

A geophysical program consisting of electromagnetic (VLF-EM) and magnetic surveys was carried out on the Likely grid in the Cariboo Mining Division near Likely, B.C. The survey was carried out in September 1989.

2.0 OBJECTIVES

- to establish a correlation between magnetic minerals and mineralized trends,
- to test the effectiveness of VLF-EM in following possible mineralized trends and to establish new unrecognized conductive trends,
- to establish geophysical areas of interest for future exploration.

3.0 SURVEY SPECIFICATIONS

Survey Parameters

- survey line separation - 100 m.
- survey station spacing - 25 m.
- VLF-EM and magnetic survey total 13.9 km.

Equipment Parameters

VLF Electromagnetic Survey

- Geonics EM-16 used for all survey
- transmitting station - Seattle, Wa.
  - Annapolis, Md.
- direction faced - easterly
- in-phase (dip angle) and out-of-phase (quadrature) components measured in percent at each station

Total Field Magnetic Survey

- measured total magnetic field in gammas
- magnetic variations controlled by automatic magnetic base station recording every 30 seconds
- instrument accuracy +/- 1 gamma
- station repeatability better than +/- 3 gammas

Equipment Specifications - see Appendix I

....2

4.0 DATA

Calculations

Total Field Magnetic Survey

Total field magnetic readings were individually corrected for variations in the earth's magnetic field using magnetic base station values. The formula used for magnetic corrections was;

CTFR = TFR + (DBL - BSR)

where: CTFR = Corrected Total Field Reading
TFR = Total Field Reading
DBL = Datum Base Level = 58400 gammas
BSR = Base Station Reading

Presentation

- Magnetic data were profiled and are presented on Figure # G-1 at a scale of 1:5000
- Magnetic data were contoured and are presented on Figure # G-2 at a scale of 1:5000
- Seattle VLF-EM in-phase and out-of-phase readings are presented in profile form on Figure # G-3 at a scale of 1:5000
- Annapolis VLF-EM in-phase readings are presented in profile form on Figure # G-4 at a scale of 1:5000
- The geophysical interpretation is presented on applicable magnetic and VLF-EM data maps.

5.0 INTERPRETATION

5.1 Discussion of Results

Total field magnetic data over the Likely grid area appeared to be relatively noise free. Magnetic readings range from about 57100 nT to over 58600 nT. The magnetic datum value for the total field magnetic profile map, Figure # G-1, was determined by statistical analysis to be 57300 nT. This datum value, which graphically shows if a magnetic reading is above or below the mean value for the grid, was the threshold between dashed and solid contours on the total field magnetic contour map, Figure # G-2.

The background magnetic environment in the survey area was quiet and exhibited magnetic readings near the mean value for the grid. A weak regional trend, seen as a gradual change from lower values in the west to higher values in the east, is observed on the Likely grid.

The magnetic profiles are dominated by a number of strong highs in the central portion of the survey area. The strong magnetic highs are often made up of a number of long and short wavelength magnetic anomalies. Most magnetic anomalies observed on the grid exhibited monopolar response. Where possible, individual magnetic high trends were delineated and labeled as magnetic lineaments. These magnetic high

...3

lineaments are designated "L1" and "L2" on Figure # G-1 and Figure # G-2. A magnetic low feature which appears to separate "L1" and "L2" was interpreted on the Likely grid and labeled "L3" on the magnetic profile and contour maps.

Seattle VLF-EM data were noise free and few cultural sources were observed. A power transmission line on the southwest edge of the grid produced strong negative in-phase values. Although the Annapolis transmitter had better orientation for conductor coupling than the Seattle transmitter, the Annapolis data set was so noisy that quadrature results were considered totally unreliable and therefore were not profiled. Due to the low signal to noise ratio, only Annapolis anomalies displaying line to line continuation were interpreted.

Several VLF-EM conductors, generally trending northwest, were delineated over the Likely grid. Important conductors are labeled "C1" to "C6" on Figure # G-3 and Figure # G-4.

5.2 Conclusions

Magnetic results over the Likely grid show a quiet magnetic background with numerous northwest trending magnetic high features cross-cutting the grid. The relatively quiet magnetic background indicates that the area is underlain by either a homogeneous rock type or rock types with similar magnetic susceptibilities.

Within the quiet magnetic background, the relatively narrow magnetic features making up lineaments "L1" and "L2" are believed to represent basic dykes due to the long, narrow nature of these anomalies. Supporting this interpretation, the monopolar response of the magnetic anomalies making up these lineaments suggests that the causative body may extend to great depth. Short wavelength highs reflect narrow, near surface features and longer wavelength highs reflect deeper bodies.

Lineament system "L1" is a group of east trending, 50 m. to 75 m. wide anomalies forming parallel lineaments in the southern portion of the Likely grid. "L1" exhibits moderate to strong magnetic intensity with anomalies ranging from 500 nT to 2000 nT above background and shows no correlation with VLF-EM conductivity. "L1" was interpreted using magnetic profile character as a guide to determine strike direction. These magnetic anomalies are believed to represent a group of relatively narrow dykes containing magnetic minerals.

Magnetic high lineament "L2" consists of an individual high trending approximately east from lineament "L3" at line 34800N and gradually weakens and dies out completely at line 35100N. "L2" is believed to represent a deeper magnetic body than lineament "L1", due to its longer wavelength. The magnitude of this anomaly suggests that "L2" may also represent a dyke containing magnetic minerals.

...4

Magnetic low lineament "L3" was delineated based on magnetic contour terminations and offsets as well as correlation with weak VLF-EM conductor "C6". Magnetic low lineament "L3" is believed to represent oxidization within a fault zone. The coincidence of "C6" with "L3" supports this interpretation. If lineament "L3" has faulted the magnetic material interpreted as magnetic dykes, then the deeper lineament "L2" may represent material which has been faulted down relative to "L1".

Conductor "C1" is an east trending Seattle conductor characterized by weak to moderate in-phase response with moderate quadrature response following the in-phase response (positive quadrature). "C1" is interpreted to have weak conductance and is thought to represent a structural feature, possibly a fracture zone.

Conductor "C2", "C3" and "C4" are Seattle conductors trending approximately northwest. As with "C1", these conductors are interpreted to have weak conductance and are believed to represent structural features. System "C4" is also visible on Annapolis VLF-EM data and is therefore considered a more definite target then conductors seen only on one set of data.

Conductor "C5" is a weak to moderate Annapolis conductor which is coincident with "C3" seen on the Seattle VLF-EM profile map and is believed to represent another structural feature.

Conductor "C6" is a weak Annapolis conductor which shows fair correlation with magnetic low lineament "L3". This conductor system may represent conductive material such as fault gouge within the "L3" interpreted fault.

6.0 RECOMMENDATIONS

Conductor "C4", although without significant magnetic associations, is a relatively well defined conductor system and can be considered a target for additional exploration on the ground. Conductor "C3", where coincident with "C5", is also a candidate for ground investigation. The interpreted fault conductor "C6" may be important, especially where it cuts between magnetic lineaments "L1" and "L2". This region of conductor "C6" warrants investigation on the ground.

AUTHOR'S NOTE

Data interpreted in this report were accumulated without supervision by Interpretex Resources Ltd. and were supplied by the Client to the writer(s). These data and the locations on the ground from which these data were accumulated are, except when specified otherwise by the writer(s), assumed to be reliable and correct and were interpreted using this assumption.

APPENDIX I

Equipment Specifications

GEONICS LIMITED
VLF EM 16

Source of Primary Field:	VLF transmitting stations
Transmitting Stations Used:	Any desired station frequency can be supplied with the instrument in the form of plug-in tuning units. Two tuning units can be plugged in at one time. A switch selects either station.
Operating Frequency Range:	About 15-25 Hz
Parameters Measured:	(1) The vertical in-phase component (tangent of the tilt angle of the polarization ellipsoid). (2) The vertical out-of-phase (quadrature) component (the short axis of the polarization ellipsoid compared to the long axis).
Method of Reading:	In-phase from a mechanical inclinometer and quadrature from a calibrated dial. Nulling by audio tone.
Scale Range:	In-phase ±150%; quadrature ±40%
Readability:	±1%
Reading Time:	10-40 seconds depending on signal strength
Operating Temperature Range:	-40 to 50° C.
Operating controls:	ON-OFF switch, battery testing push button, station selector, switch, volume control, quadrature, dial ±40%, inclinometer dial ±150%
Power Supply:	6 size AA (penlight) alkaline cells. Life about 200 hours
Dimensions:	42 x 14 x 9 cm (16 x 5.5 x 3.5 in)
Weight:	1.6 kg (3.5 lbs)
Instrument Supplied With:	Monotonic speaker, carrying case, manual of operation, 3 station selector plug-in tuning units (additional frequencies are optional), set of batteries
Shipping Weight:	4.5 kg (10 lbs.)
Name and Address of Manufacturer:	Geonics Limited 1745 Meyerside Drive/Unit 8 Mississauga, Ontario L5T 1C5

MODEL G-816

PORTABLE PROTON MAGNETOMETER

Sensitivity:	±1 gamma throughout range
Range:	20,000 to 90,000 gammas (worldwide)
Tuning:	Multi-position switch with signal amplitude indicator light on display
Gradient Tolerance:	Exceeds 800 gammas/ft
Sampling Rate:	Manual pushbutton, one reading each 6 seconds
Output:	5 digit numeric display with readout directly in gammas
Power Requirements:	Twelve self-contained 1.5 volt "D" cell universally available flashlight-type batteries. Charge state or replacement signified by flashing indicator light on display.
Temperature Range:	Console and sensor: -40° to +85°c Battery pack: 0° to +50°C (limited use to -15°C; lower temperature battery belt operation - optional)
Accuracy (Total Field):	±1 gamma through 0° to ±50°C temperature range
Sensor:	High signal, noise cancelling, interchangeably mounted on separate staff or attached to back pack
Size:	Console: 3.5 x 7 x 11 inches (9 x 18 x 28 cm) Sensor: 3.5 x 5 inches (9 x 13 cm) Staff: 1 inch diameter x 8 ft. length (3 cm x 2.5 m)

Weight:

Console (w/batteries):	5.5lbs.	2.8kgs.
Sensor and signal cable:	4.0lbs.	1.8kgs.
Aluminum staff:	2.0lbs.	0.9kgs.
Total Weight	11.5lbs.	5.2kgs.

EG & G Canada
Exploranium/Geometrics Division
Unit #1
640 Hardwick Road
Bolton, Ontario LOP 1AO

MODEL G-856

PROTON PRECESSION MEMORY MAGNETOMETER

Display	Six digit display of magnetic field to resolution of 0.1 gamma or time to nearest second. Additional three-digit display of station or day of year.
Resolution	Typically 0.1 gamma in average conditions. May degrade to lower resolution in weak fields, noisy conditions or high gradients.
Accuracy	One gamma, limited by remnant magnetism in sensor and crystal oscillator accuracy.
Clock	Julian clock with stability of 5 seconds per month at room temperature and 5 seconds per day over the temperature range of -20 to +50 degrees Celsius.
Tuning	Push button tuning from keyboard with current value displayed on request. Tuning range 20 to 90 kilogammas.
Gradient Tolerance	Tolerates gradients to 5000 gammas/meter. When high gradients truncate count interval, maintains partial reading to an accuracy consistent with data.
Cycle Time	Complete field measurement in three seconds in normal operation. Internal switch selection for faster cycle (1.5 seconds) at reduced resolution or longer cycles.
Manual Read	Takes reading on command. Will store data in memory on command at operator's discretion.
Self-Cycle	Internal switch will cause the instrument to self-cycle, storing automatically, for time dependent measurements. Available intervals are 5, 10 and 30 seconds, 1,2,5, and 10 minutes depending on switch position.
Memory	Stores 1,000 readings in portable mode, keeping track of time and station number. In base station operation, records last four digits of field at discrete intervals, allowing storage of over 2,500 readings.
Output	Plays data out in standard RS-232 format at selectable baud rates. Also outputs data in byte parallel, character serial BCD for use with digital recorders.
Inputs	Will accept an external sample command.
Special Functions	An internal switch allows adjustment of polarization time and count time to improve performance in marginal area or improve resolutuon or to speed operation.

cont'd

G-856 cont'd

Physical	Instrument console: 7 x 10½ x 3½ inches (18 x 27 x 9 cm) 6 lbs (2.7 kg) Sensor: 3½ x 5 inches (9 x 13 cm) 4 lbs (1.8 kg) Staff: 1 inch x 8 feet (3 cm x 2.5 m) 2 lbs (1 kg)
Environmental	Meets specifications from 0 to 40 degrees Celsius. Operates satisfactorily from -20 to 50 degrees Celsius. Weatherproof.
Power	Operates from 8 D-cell flashlight batteries (or 12 volts external power). May be operated at 18 volts external power to improve resolution. Power failure or replacement of batteries will not cause loss of data stored in memory.
Standard Accessories	Sensor Staff Chest Harnes Two sets of batteries Operating Manual Applications Manual for Portable Magnetometers
Optional Accessories	RS-232 Interface Cable Rechargeable Battery Pack (mounts inside case in place of normal batteries) and Charger Cold weather battery belt Digital Tape Recorder with Interface Cables
