SUMMARY

A part of the Quinto Mining's Lumby Project has been completed in the contiguous claim groups. The program was assigned to more closely locate, define and evaluate geophysical and geochemical surveys completed in 1987. This year's work consisted of soil geochemistry VLF-EM-16 geophysics and geological mapping.

A total of 783 soil samples and 22.3 kilometers of VLF-EM-16 survey were completed between October and November 30, 1988.

A. INTRODUCTION

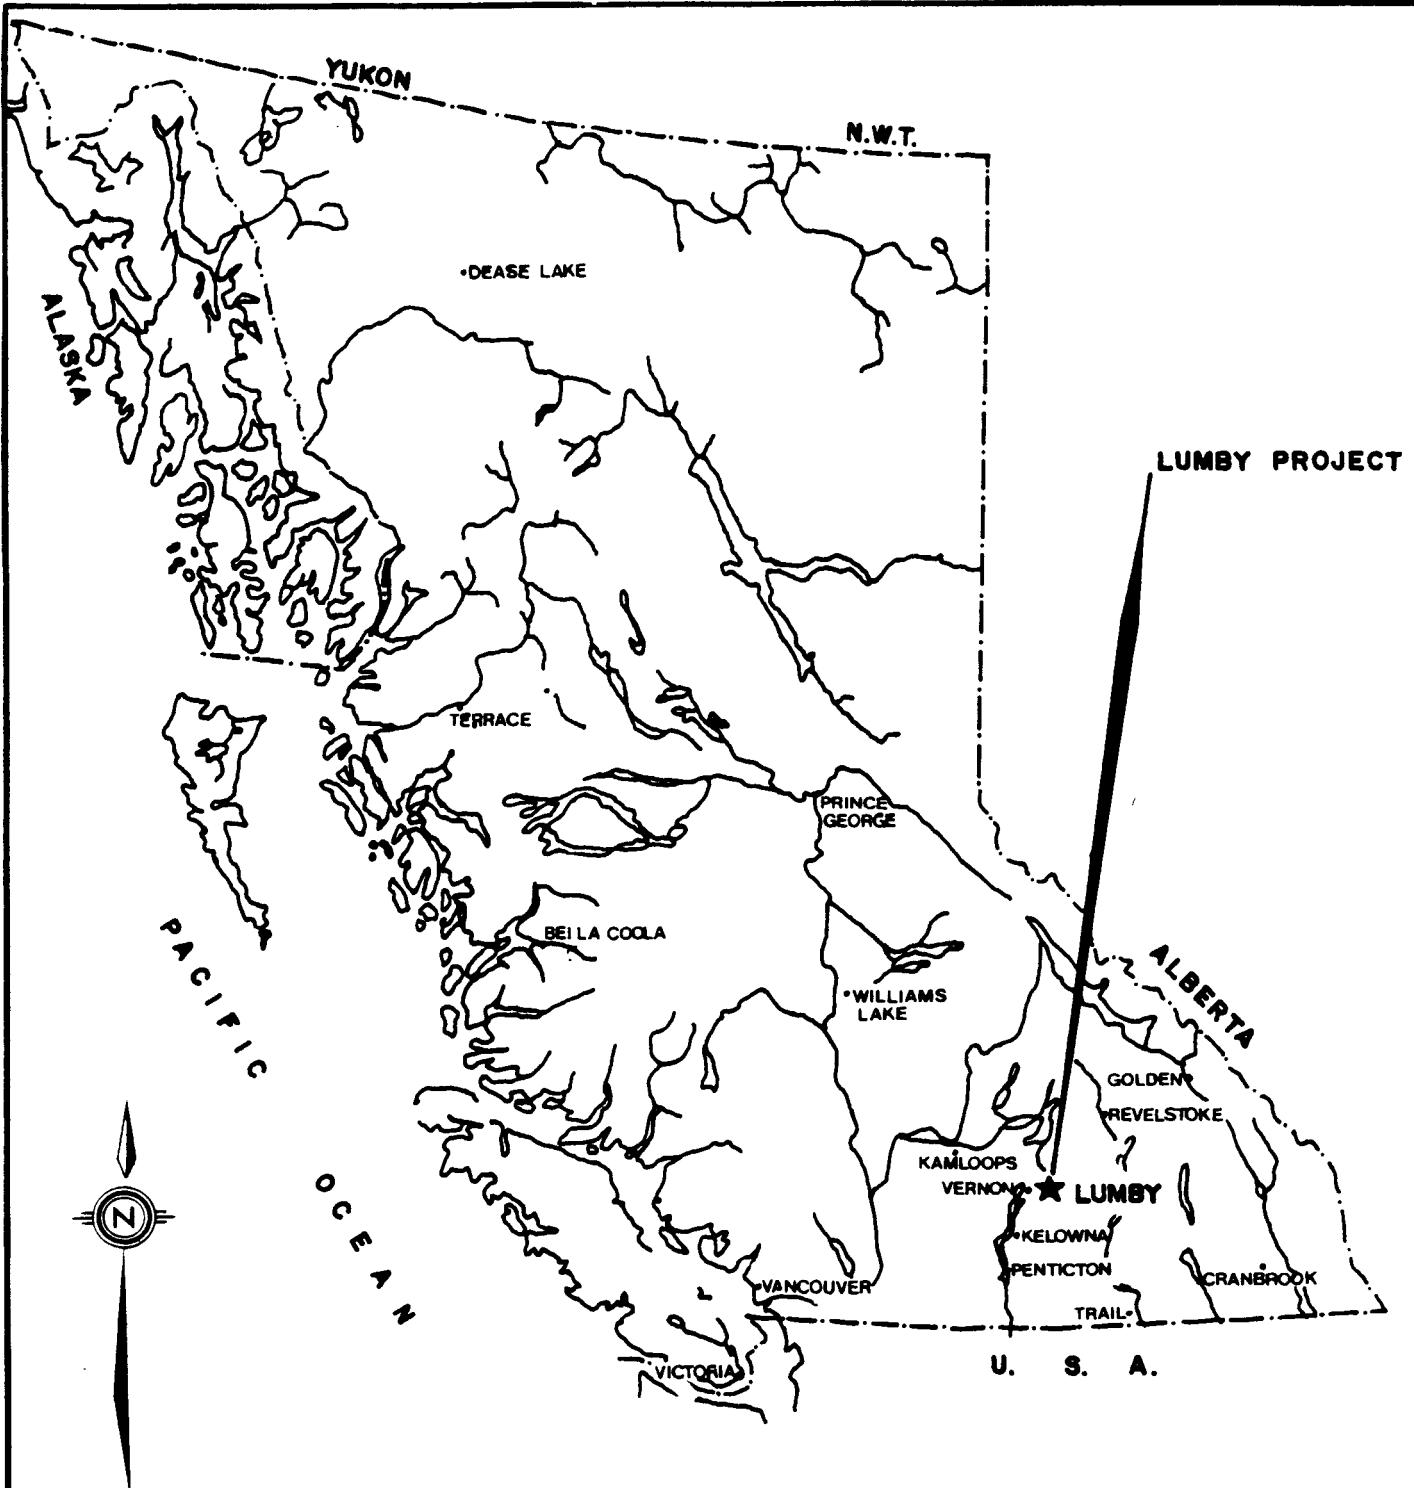

This report is to provide the results of a geochemical and electromagnetic survey was done for the Quinto Mining Corporation to follow up the initial work done in May and June 1987. Through the months of October and November 1988, a grid was surveyed over the southern area of the PS-4 claim and northern of the PS-2 and PS-7 claims. North/south lines, spaced along a central base line at 100 metres, have marked stations at 25 metre spacing.

B. LOCATION AND ACCESS

The Lumby Project is located at Lumby, B.C. 26 kilometers east of Vernon, B.C. on provincial highway No. 6 in the Okanagan Valley. The claims are accessed by a series of logging and ranch roads. Scheduled air service to the area from Vancouver is via Kelowna, located one hour's drive south of Lumby (see Map A).

C. CLAIM STATUS

The property consists of 24 two-posted claims purchased by Quinto in 1983 and 12 adjoining mineral claims (247 units) grouped into three claims groups. The claims and their record numbers are listed in Map B.

D. PREVIOUS WORK

The mining history of the Lumby area was started about 1900 when the local school teacher's property on the outskirts of the village was hand-mined and gold-silver ore produced from an east-west mineralized zone, marked now by a 4-metre inclined shaft, and known as the Teacher's Zone.

The property has had a history of mineral exploration dating back to the mid-1960s. Between 1968 and 1981, a small-scale (100 TPD) silver/base metal mine was operating at the base of Saddle Mountain. An estimated 40,000 tons of material was mined and milled on the

1:50,000

THE QUINTO MINING CORP.

LUMBY PROJECT

GRID AND CLAIM LOCATION MAP

property during this period. Since acquiring the property including mine and mill workings in 1983, Quinto Mining Corp. has successfully conducted continuing explorations and development programs. This work has largely been centered on the Plateau Shear Zone located roughly one kilometer east along strike from the old silver mine. Extensive percussion and diamond drilling on this zone has partly outlined a structurally controlled gold deposit hosted by mesothermal pyritic quartz veins. The geochemical and geophysical work done during 1987 is now being expanded upon.

E. PHYSIOGRAPHY

The southern portion of the claims cover a round-topped hill isolated by two broad, flat agricultural valleys. The hilltop, known as Saddle Mountain, rises 460 metres (1,500 feet) above the valley floor to an elevation of 950 metres (3,100 feet). Slopes vary from gentle on the northeast to very steep on the southwest and average 30°. The north and west slopes are well timbered, while the south are open and grassy. Much of the marketable timber has been removed, leaving a network of passable logging roads.

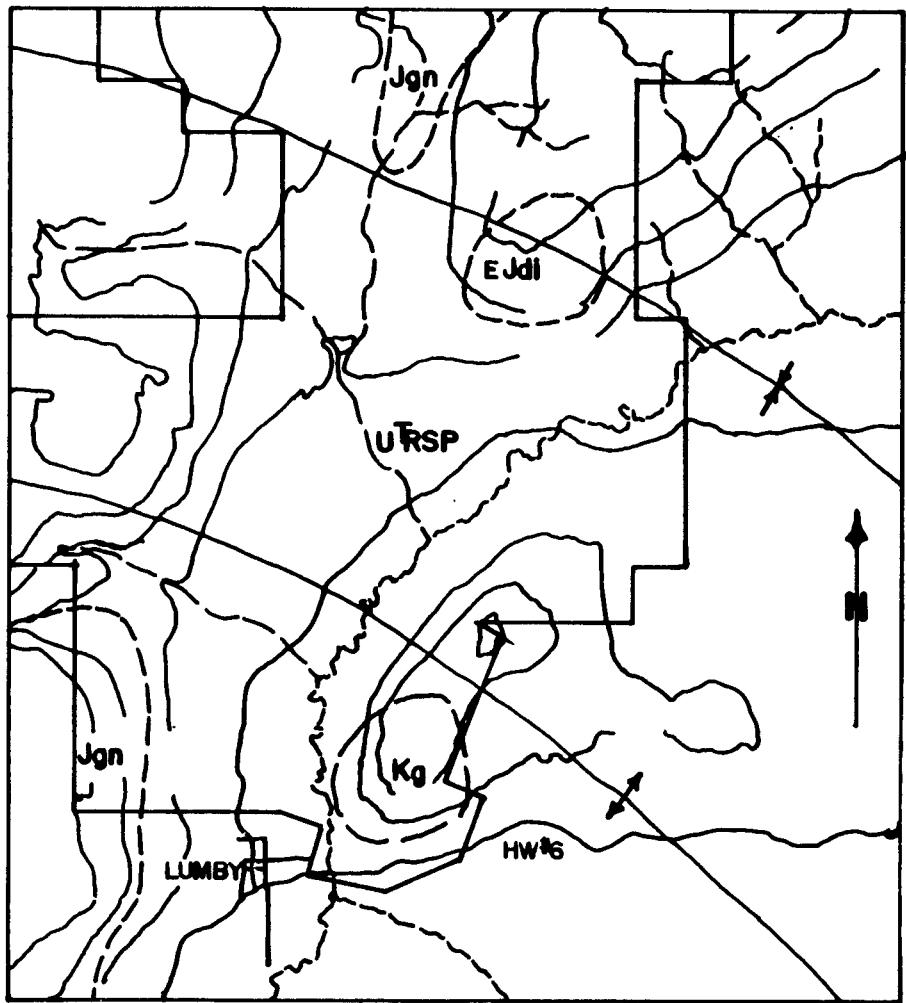

F. GEOLOGY

The Geological Survey of Canada reports that the basement rocks in the Lumby area belong to the Sicamous Formation of the Slocan Group of Upper Triassic Age. These rocks consist of shale, argillite, massive siltstone, phyllite, tuff and calcareous pelite, minor conglomerate, limestone, greenstone, chloritic phyllite and andalusite-staurolite and kyanite schists. These rocks have been intruded by three ages of igneous stocks.

Previous work in the area described the geology of Saddle Mountain as a series of Monashee Group metasediments of Archean Age in intrusive contact with hornblende diorite (Jones, 1959). More recent studies indicate the area is underlain by sediments and volcanic rocks of Triassic Age. Geological mapping by Quinto's staff on the Saddle Mountain portion of the claims agree with these later observations (see Map C).

G. PURPOSE OF THE SURVEY

The purpose of the survey was to further survey the Vance South Zone referred to in the report by A. Allen and David Kuran dated November 1987 by doing additional geochemical and electromagnetic surveys.

LEGEND

MESOZOIC

Cretaceous

Kg Granite, granodiorite: lesser quartz monzonite and quartz diorite.

H. GEOCHEMICAL SURVEY

A total of 783 soil samples were taken from 15 to 60 centimeter-deep holes. They assayed for gold, silver, copper, lead, zinc and arsenic. Grades are reported in PPB for gold and PPM for the other elements. Gold was analyzed by A.A. from a 20-gram sample. The sample locations and metal values are plotted on Figures 1 to 6. The assay values were statistically analyzed and anomalous thresholds for each element on each different grid was calculated.

The assay results are included on the Geochemical Analysis Certificates, 23 sheets from the Acme Analytical Laboratories Ltd. of Vancouver, B.C. See Appendix herewith.

I. ELECTROMAGNETIC SURVEY

On the target zone a total of 22.3 line kilometers of VLF-EM-16 survey was completed operating on Station NNA - Cutler Main 24.0 khz. A rented Geonics EM 16 instrument was used. In-phase, quadrature readings and conductive zones are included on Figure 7 herewith.

J. SURVEY RESULTS

The Vance South zone covers a portion of a circular airborne anomaly interpreted as being peripheral to the diorite intrusion mapped by the G.S.C. Figure 7 shows the results of the ground VLF-EM-16 follow-up survey. Six east-to-west moderate to strong anomalies are present.

Figure 1 shows an extremely anomalous gold value slightly downhill from the most northerly conductor. All elements of Ag, Au, Zn, Cu, Pb draw a reasonable correlation with these conductors.

In general, the geochemistry shows some isolated mono-elemental anomalies as well as some very interesting multi-elemental anomalies which are coincidental with VLF-EM-16 conductors. The background values for gold and silver are in concert with the rare anomalies being many times higher than the anomalous thresholds.

K. CONCLUSION

The results of the geochemical and geophysical surveys conducted on the BS and PS claims show that the potential for locating base and precious metal occurrences exist on the claims. The Vance South Zone most northerly conductor shows remarkable correlation with anomalous values of all metals. The other parallel EM conductors show weaker but identifiable geochemical responses and may reflect deeper overburden cover.

CERTIFICATE

December 20, 1989

I, Alfred R. Allen, certify that:

I am a graduate of the University of British Columbia and hold the following degrees therefrom:

B.A.Sc., Geological Engineering, 1939
M.A.Sc., Geological Engineering, 1941

I am a Life Member of the Association of Professional Engineers of the Province of British Columbia.

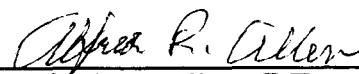

I have practised my profession for the past 40 years.

I hold no interest in the property of Quinto Mining Corporation, but I presently hold 10,000 shares of the company stock.

My report on the Lumby Property, Vernon Mining Division, B.C., is based on examinations of the property by the writer in 1969, May and June 1987 and October through November 1988.

This report entitled Assessment Report on the B.S. and P.S. Claims Group may be used in whole or in part by The Quinto Mining Corporation for all corporate purposes.
