INTRODUCTION

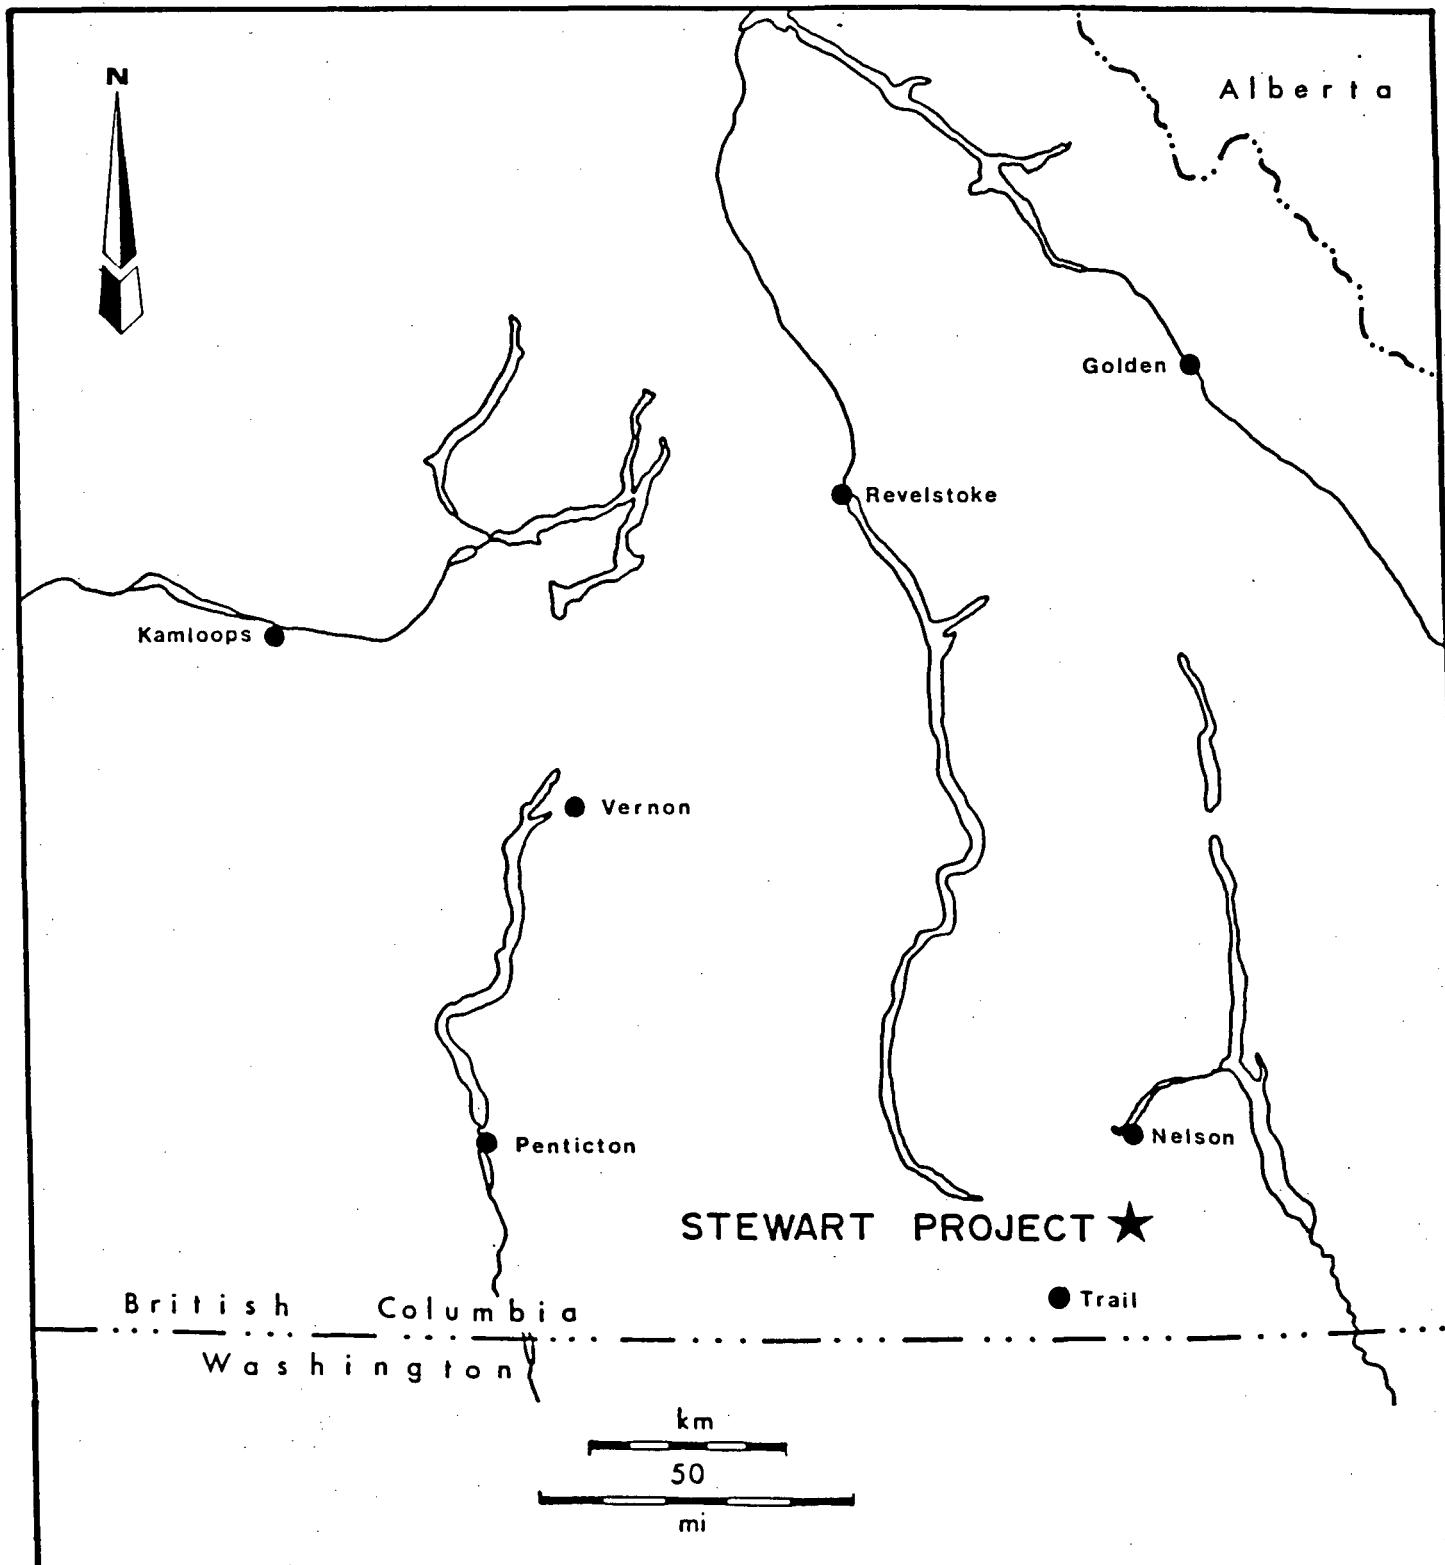

The Stewart property, which was first staked in 1978, has seen considerable exploration by various companies. In excess of \$1,000,000 has been spent on the property to date. In 1988 Minnova optioned the ground and subsequently carried out geological reconnaissance. This work involved pan concentrate sampling of major drainages and rock sampling of mineral occurrences. Their work outlined gold anomalies in pan concentrates in the northwest corner of the property.

In 1989 Discovery Consultants of Vernon, B.C. was commissioned to do follow-up exploration to locate the source of these pan concentrate gold anomalies. A program of contour soil sampling followed by geological mapping and prospecting, rock sampling and a soil geochemical grid was completed in the northwest corner of the property. This report describes the work done and discusses the results of the work.

LOCATION AND ACCESS

The Stewart property is located approximately 28 km and 4 km west of Ymir, B.C. in the Nelson, M.D (Figure 1). Its northwest corner, the subject of this report, is located along the Stewart Creek logging road west of Stewart Pass (Figure 2). A westerly flowing tributary of Craigtown Creek cuts the most northerly part of the study area.

Access to the study area is via the Stewart Creek logging road from Highway 6 between Nelson and Ymir. It can also be reached by the Erie Creek logging road from Highway 33, 4 km west of Salmo.

CLAIM MAP

PHYSIOGRAPHY

The northwest corner of the Stewart property occurs in glaciated, moderately rugged terrain with elevations ranging from 1370 to 1980 metres above sea level. Much of the area is covered by various vegetation with only the upper most ridge tops having any extensive rock exposures. The overburden is variable ranging from a few inches near the ridge tops to several metres along the drainages. Soil development varies from poor to good with the best soil development in the valley bottoms.

PROPERTY

The Stewart property consists of 189 units in 12 claims and 3 reverted crown grants, of which, the Stewart 6, 7 and 8 claims cover the study area. Owners of the property are Eric Denny and Jack Denny of Ymir, B.C. Minnova currently holds the property under option.

The following are the particulars for the Stewart claims.

<u>Claim</u>		<u>Record Number</u>	<u>Units</u>	<u>Expiry Date</u> *

REGIONAL GEOLOGY

Recent mapping by the B.C. Geological Survey Branch (Hoy and Andrew, 1988) indicates that this area is underlain by Elise Formation volcanic rocks that have been intruded by plutonic rocks of the Nelson Intrusions. To the east clastic rocks of the Hall Formation are present. The Elise and Hall Formations are part of the Rossland Group of Lower and Middle Jurassic age.

Throughout the region the Elise volcanics are known to be host to copper-gold vein deposits. Vein and porphyry or stockwork molybdenum - copper deposits are present within or immediately adjacent to the Nelson Intrusions.

LOCAL GEOLOGY

In the study area (Figure 3) the western half is underlain by intermediate to mafic flows and fine pyroclastic units of the Elise Formation (Unit 1). Also present is an augite porphyry. Locally these flows are amygdaloidal and at one locality some poorly preserved pillow lavas were noted. Within the volcanic assemblage are coarse pyroclastics - agglomerate or volcanic breccias (Unit 1a).

These rocks are typically green to grey green, fine-grained and massive. Locally there is some banding, particularly in the pyroclastic horizons. They are fresh, exhibiting no alteration. Locally, minor amounts of pyrite were observed.

Intruding the volcanic assemblage and underlying the eastern half of the area are various intrusive rocks. The most prominent type is a feldspar porphyry (Unit 3). This unit is best exposed along the ridge north of the Stewart Creek logging road. Also present is a quartz-feldspar porphyry (Unit 4) and a hornblende diorite (Unit 2). As with the volcanic rocks these units exhibit no alteration. Locally, trace to minor amounts of pyrite were observed in the feldspar porphyry and quartz-feldspar porphyry.

Near the northwest corner of the map area a granodiorite to quartz monzonite dyke is present (Unit 2a). It is exposed at one locality along the ridge across a width of 25 to 50 metres.

Intruding the Elise volcanics and feldspar-porphyry are narrow rhyolite dykes of Tertiary age (Unit 5). These dykes are siliceous and contain pyrite throughout, in amounts ranging from trace to 20%. These rocks also exhibit no alteration. The thickness of these dykes varies from a few centimetres to 72 metres.

SOIL GEOCHEMISTRY

Introduction

The initial phase of the 1989 exploration program was to do contour soil sampling upslope from the anomalous pan concentrate samples. In total, 551 contour soil samples were collected. Samples were collected at approximately 50 metre intervals along contours separated by approximately 60 metres of vertical relief (Figure 4). The results of this sampling are tabulated in Appendix 1 and Au, Ag, As, Cu and Pb values are shown in Figures 6, 8, 10, 12 and 14.

As a follow-up to the contour soil sampling a 50 metre by 25 metre grid was established over the main anomalous area outlined by the contour soil sampling. Prepatory to the sampling a 1600 metre baseline was established. Lines were turned off at 50 metre intervals with sampling at 25 metre intervals along the lines (Figure 5). A total of 422 samples was collected. Results of this work are tabulated in Appendix 2 and Au, Ag, As, Cu and Pb values are shown in Figures 7, 9, 11, 13, 15.

In both surveys, whenever possible, the "B" horizon was sampled. All samples were collected in numbered kraft paper bags from an average depth of 15 to 20 centimetres. The samples were sent to Bondar-Clegg and Company Ltd. in North Vancouver for analysis. The -80 mesh fraction was analysed for gold by the fire assay/atomic absorption method and for 29 other elements by I.C.P. methods following hot HNO₃-HCl extraction. A list of elements, with detection limits and extraction and analytical methods, is tabulated in Appendix 3.

The table of results (Appendices 1 and 2) show the maximum, minimum, 1st quartile, median, 3rd quartile and 95 percentile values for each element.

Contour Soil Sampling

A broad moderately to strongly anomalous area was outlined on the slope north of the main Stewart Creek logging road. Values within the anomalous zone ranged from 30 to 728 ppb Au. To the west an isolated value of 918 ppb Au was obtained.

South of the road a few isolated anomalous gold values were obtained. Strongly anomalous values ranged from 106 to 511 ppb Au.

Histograms were plotted for Au, As, Bi, Cu, Fe, Pb, Sb and Zn (Appendix 4). A two population distribution is shown in histograms for Au, As, Bi and Sb. This appears to be reflective of the two main rock types present - andesitic volcanics and intrusive phases of the Nelson Batholith, including the younger rhyolite dykes. Histograms for Pb, Zn, Fe and Cu show normal population, although slightly skewed.

Scatter diagrams for Au versus As, Cu, Fe, Mn, Pb and Zn (Appendix 5) were also plotted. These diagrams exhibit a random distribution and therefore little or no correlation between gold and any of these elements.

The re-analysis of selected samples has indicated that lab report V89-05228.0 (sample numbers 578-797) has some significant errors, especially in the As values. The As values are too high by a factor of at least 10 times.

Grid Soil Sampling

The grid geochemical soil survey outlined a north-south trending linear gold anomaly downslope from a rhyolite dyke exposed on the ridge (Figure 7). Several small anomalies were also delineated. These may also be related to unexposed rhyolite dykes. Strongly anomalous gold values are those greater than 230 ppb and moderately anomalous values are those greater than 85 ppb. Values in soils range from less than 5 ppb to 1100 ppb.

Plots for arsenic (Figure 11) and copper (Figure 13) show a distinct correlation of anomalous values with the intrusive rock. A small copper anomaly in the volcanics may possibly be related to minor chalcopyrite observed in talus on float upslope from the anomaly.

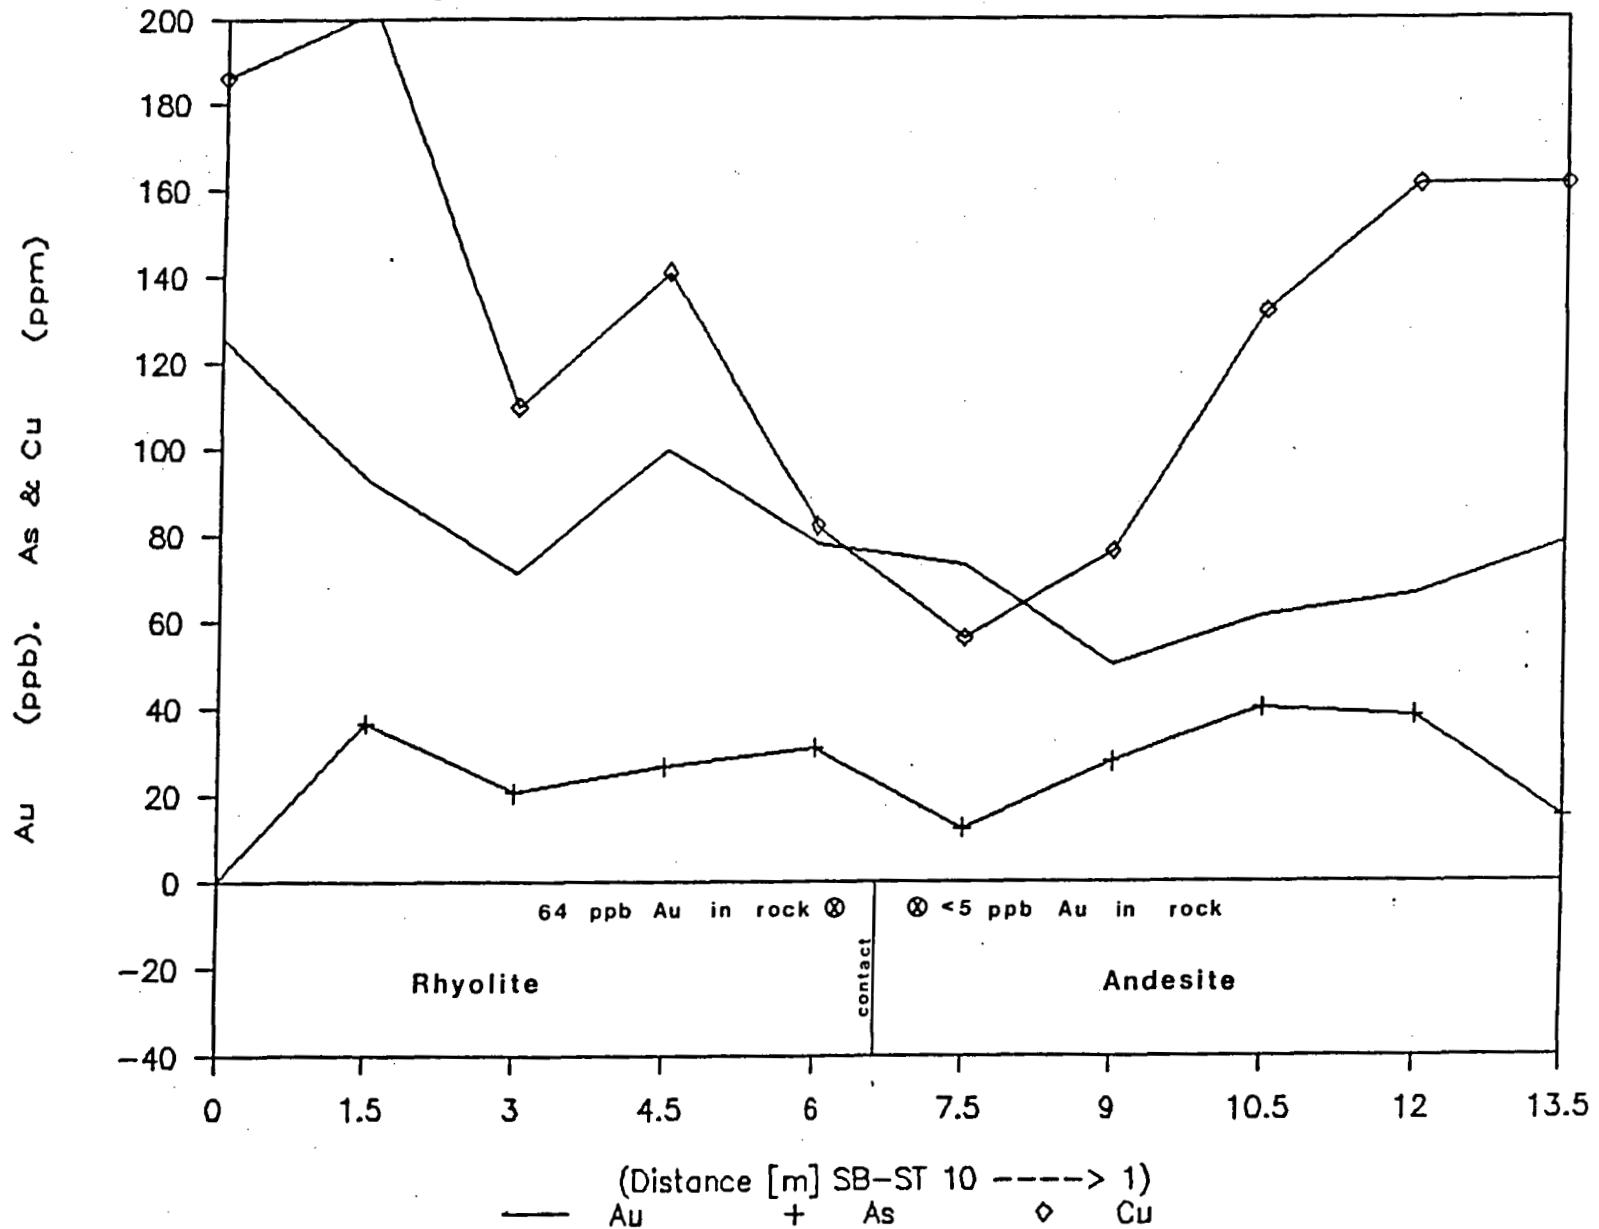

Histograms were plotted for Au, As, Bi, Cu, Fe, Pb and Zn (Appendix 6). Gold and bismuth indicate the presence of two or more populations. The other elements show a normal distribution.

Scatter diagrams were plotted for Au versus As, Cu, Fe, Mn, Pb, Zn (Appendix 7). There is a suggestion of a weak correlation between gold and iron. There does not appear to be any correlation between gold and any of the other elements.

In addition to the grid survey an orientation profile consisting of 10 samples was completed over exposures of rhyolite and andesite located along the Stewart Creek road (Sample site SB-ST89-8). Samples were collected at 1.5 metres intervals from the "C" horizon immediately above outcrop. The profile across the contact between these two rock types indicates elevated gold

Project 519 – STEWART

Figure 2A: Orientation Soil Profile for Au, As, Cu

values over the rhyolite (Figure 2a). Rock samples collected from these rocks also indicates the presence of higher gold values in the rhyolite. Profiles for copper and arsenic show no distinct difference over the two rock types. The arsenic profile is flat while the copper profile fluctuates with the lowest values occurring at the rhyolite-andesite contact.

The source of gold appears to be the pyrite in the rhyolite. Weathering of the pyrite and subsequent enrichment give rise to the soil geochemical anomalies. Most of the soils in the area are reddish-brown colour and probably limonitic. A possible explanation for the observed anomalies is that gold is scavenged by the iron oxides and subsequently enriched in the soil.

ROCK GEOCHEMISTRY

Several rock samples of outcrop and float were collected from various localities in the study area. The majority of rock types were sampled. All results are shown in Table 1 and also on Figure 3.

Samples containing elevated to anomalous gold values were from the volcanic rocks and rhyolite dykes. The highest gold values were obtained from material that contained appreciable amounts of pyrite. A single value containing 0.041 ounces/ton gold was obtained from a float sample containing abundant rhyolite pebbles located at the location of a contour soil sample that returned a value of 981 ppb gold.

CONCLUSIONS AND RECOMMENDATIONS

In the northwest corner of the Stewart property intermediate volcanic rocks of the Elise Formation have been intruded by intrusive rocks of the Nelson Batholith and younger rhyolite dykes. These rocks are unaltered and except for varying amounts of pyrite contain no other sulphide minerals except for very minor chalcopyrite observed in talus at a single locality. A molybdenum occurrence located in the southeast corner of the study area was not investigated by this study.

Soil geochemistry, both contour and detailed grid, indicated the presence of gold anomalies north of the Stewart Creek logging road. These anomalies tend to be linear and oriented north-south. They show possible correlation with exposures of pyrite bearing rhyolite.

A possible source of the gold anomalies is interpreted to be the pyrite in the rhyolite dykes. Weathering of the pyrite may have caused an enrichment in gold in limonitic soils immediately above and downslope from the rhyolite. Rock sampling indicates that the rhyolites do contain more gold than other rock types in the area.

The lack of outcrop in the area does, however, preclude a position identification of the source of the Au anomalies. Given their broad extent and high amplitude further work is definitely warranted. In addition, the host Elise volcanics are well known for hosting Au deposits elsewhere in the area.

Follow up work utilizing IP, detailed mapping, trenching and drilling should be considered as a high priority. Other anomalies identified by the contour soil survey should also be detailed and followed up.

Respectfully submitted,

W.R. Gilmour

STATEMENT OF QUALIFICATIONS

I, W.R. GILMOUR of 13511 Sumac Lane, Vernon, B.C., V1B 1A1,
DO HEREBY CERTIFY THAT:

1. I am a consulting geologist in mineral exploration associated with Discovery Consultants, Vernon, B.C.
2. I have been practising my profession for 19 years.
3. I am a graduate of the University of British Columbia with a Bachelor of Science degree in geology.
4. I am a Fellow of the Geological Association of Canada.
5. This report is based upon knowledge on the Stewart property gained from direct supervision of exploration work on the property.

W.R. Gilmour

Vernon, BC
January 5, 1990

ANALYTICAL PROCEDURES

Geochemical Analysis

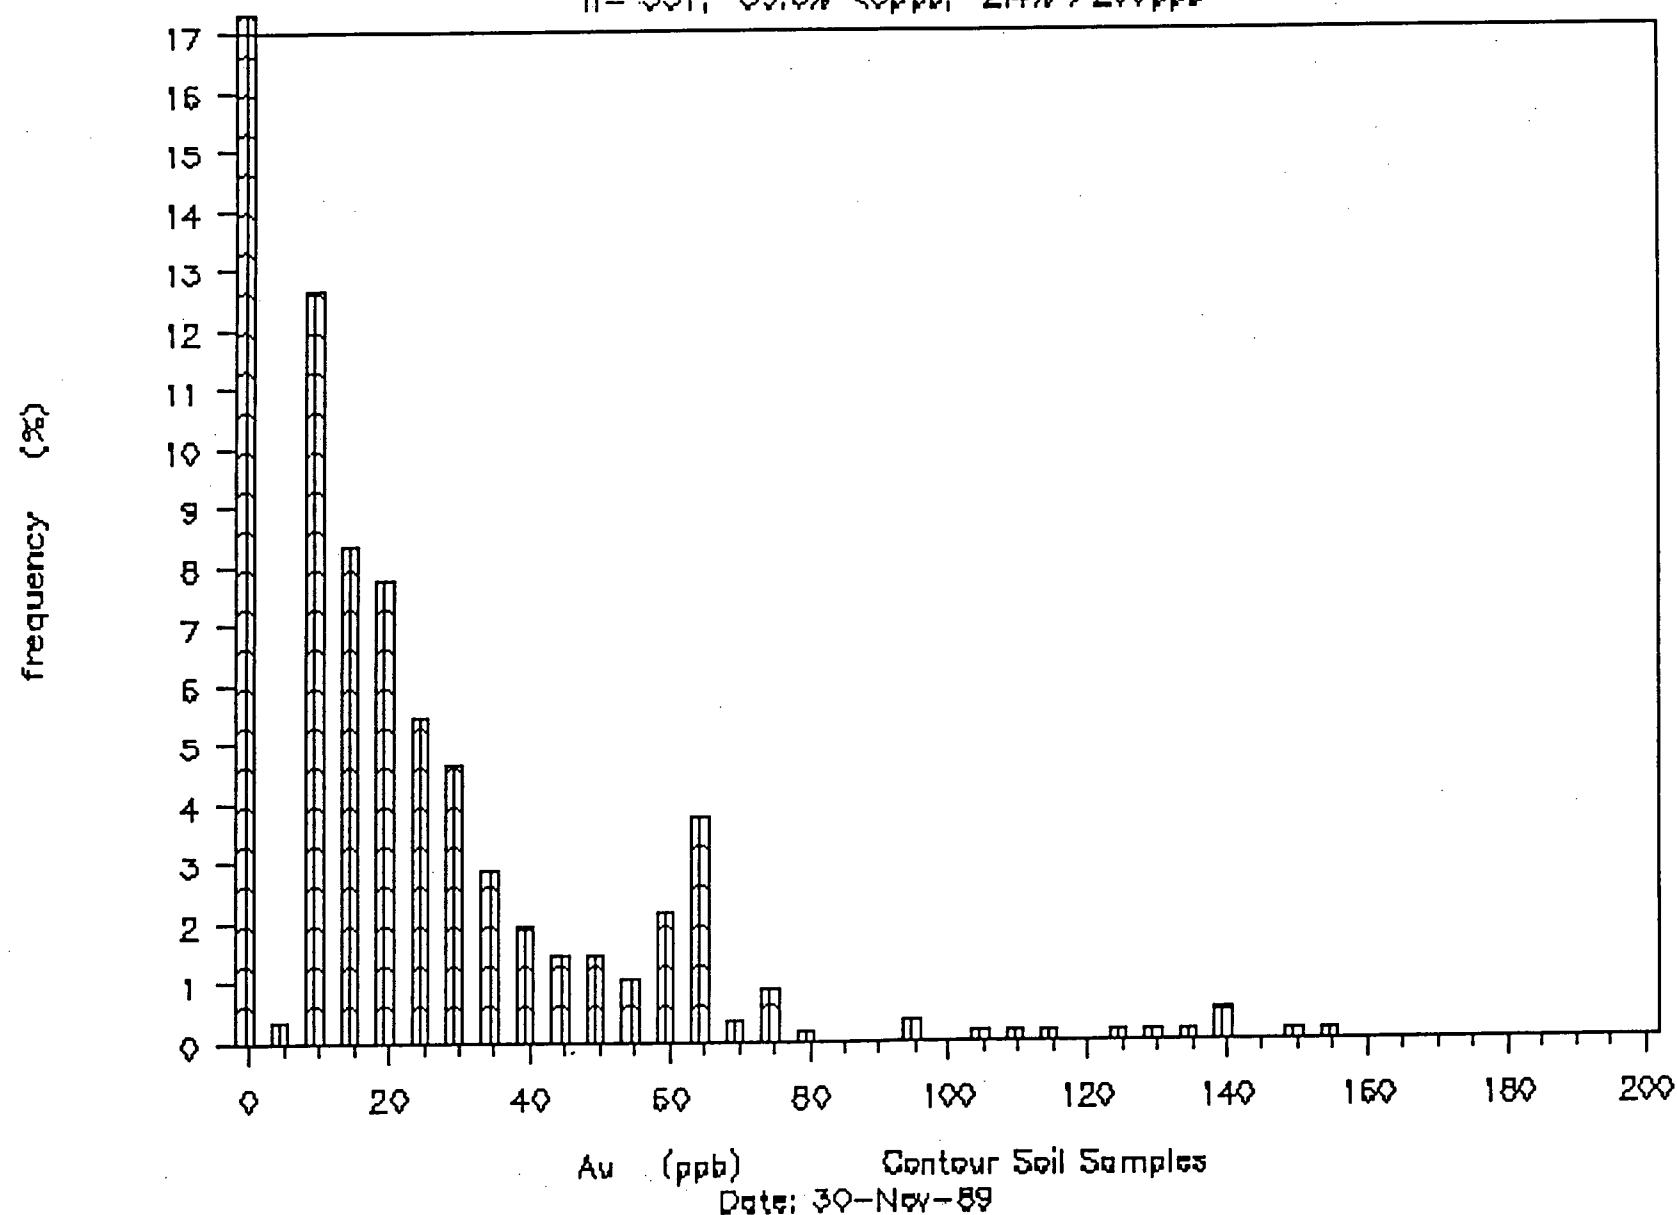

by Bondar-Clegg :

ELEMENT	LOWER DETECTION LIMIT	EXTRACTION	METHOD
Au Gold	5.0 ppb	fire-assay	fire assay AA
Ag Silver	0.2 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
As Arsenic	5.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Ba Barium	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Be Beryllium	0.5 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Bi Bismuth	2.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Cd Cadmium	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Ce Cerium	5.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Co Cobalt	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Cr Chromium	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Cu Copper	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Fe Iron	0.05 pct	HNO ₃ -HCl hot extr	ind. coupled plasma
Ga Gallium	2.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
La Lanthanum	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Li Lithium	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Mn Manganese	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Mo Molybdenum	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Nb Niobium	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Ni Nickel	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Pb Lead	2.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Sb Antimony	5.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Sc Scandium	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Sn Tin	20.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Sr Strontium	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Ta Tantalum	10.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Te Tellurium	10.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
V Vanadium	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Y Yttrium	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Zn Zinc	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma
Zr Zirconium	1.0 ppm	HNO ₃ -HCl hot extr	ind. coupled plasma

APPENDIX 4

Project 519 - Stewart (Au histogram)

n = 551, 39.6% <5ppb, 2.4% >200ppb

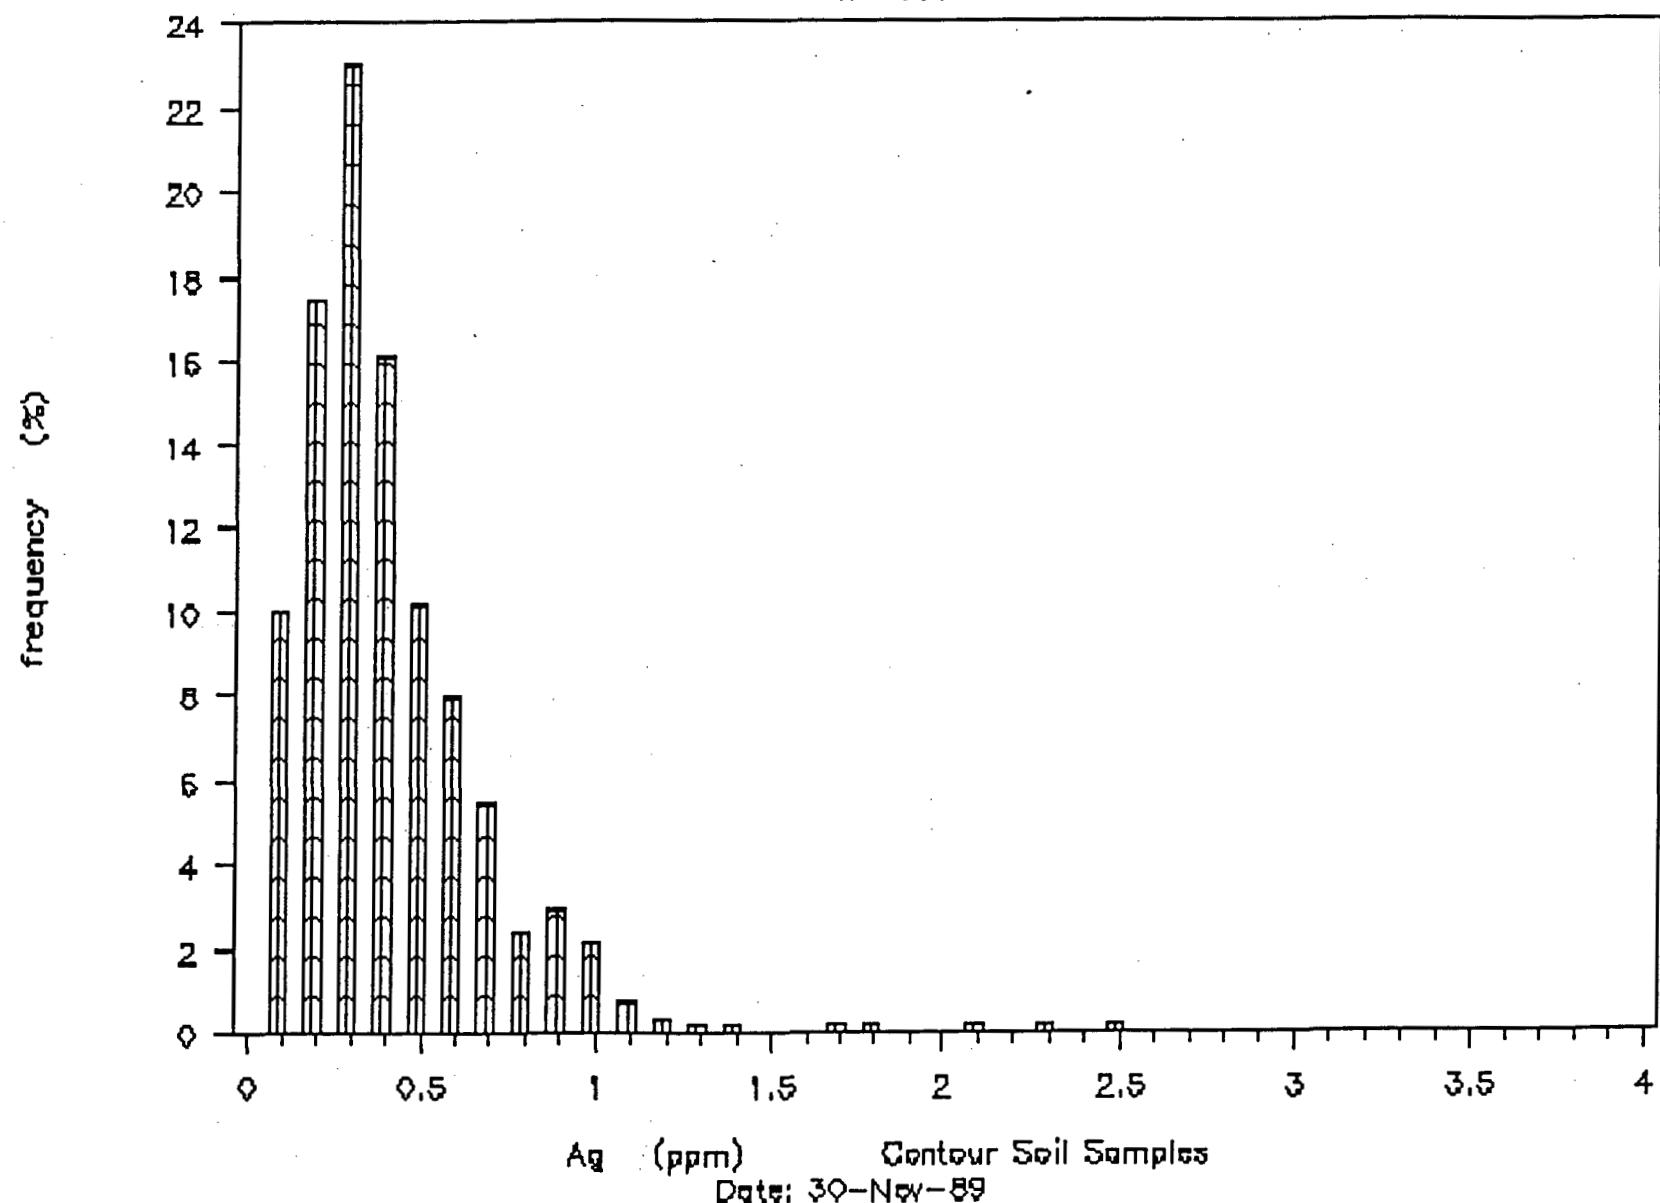

Au (ppb) Contour Soil Samples

Date: 30-Nov-89

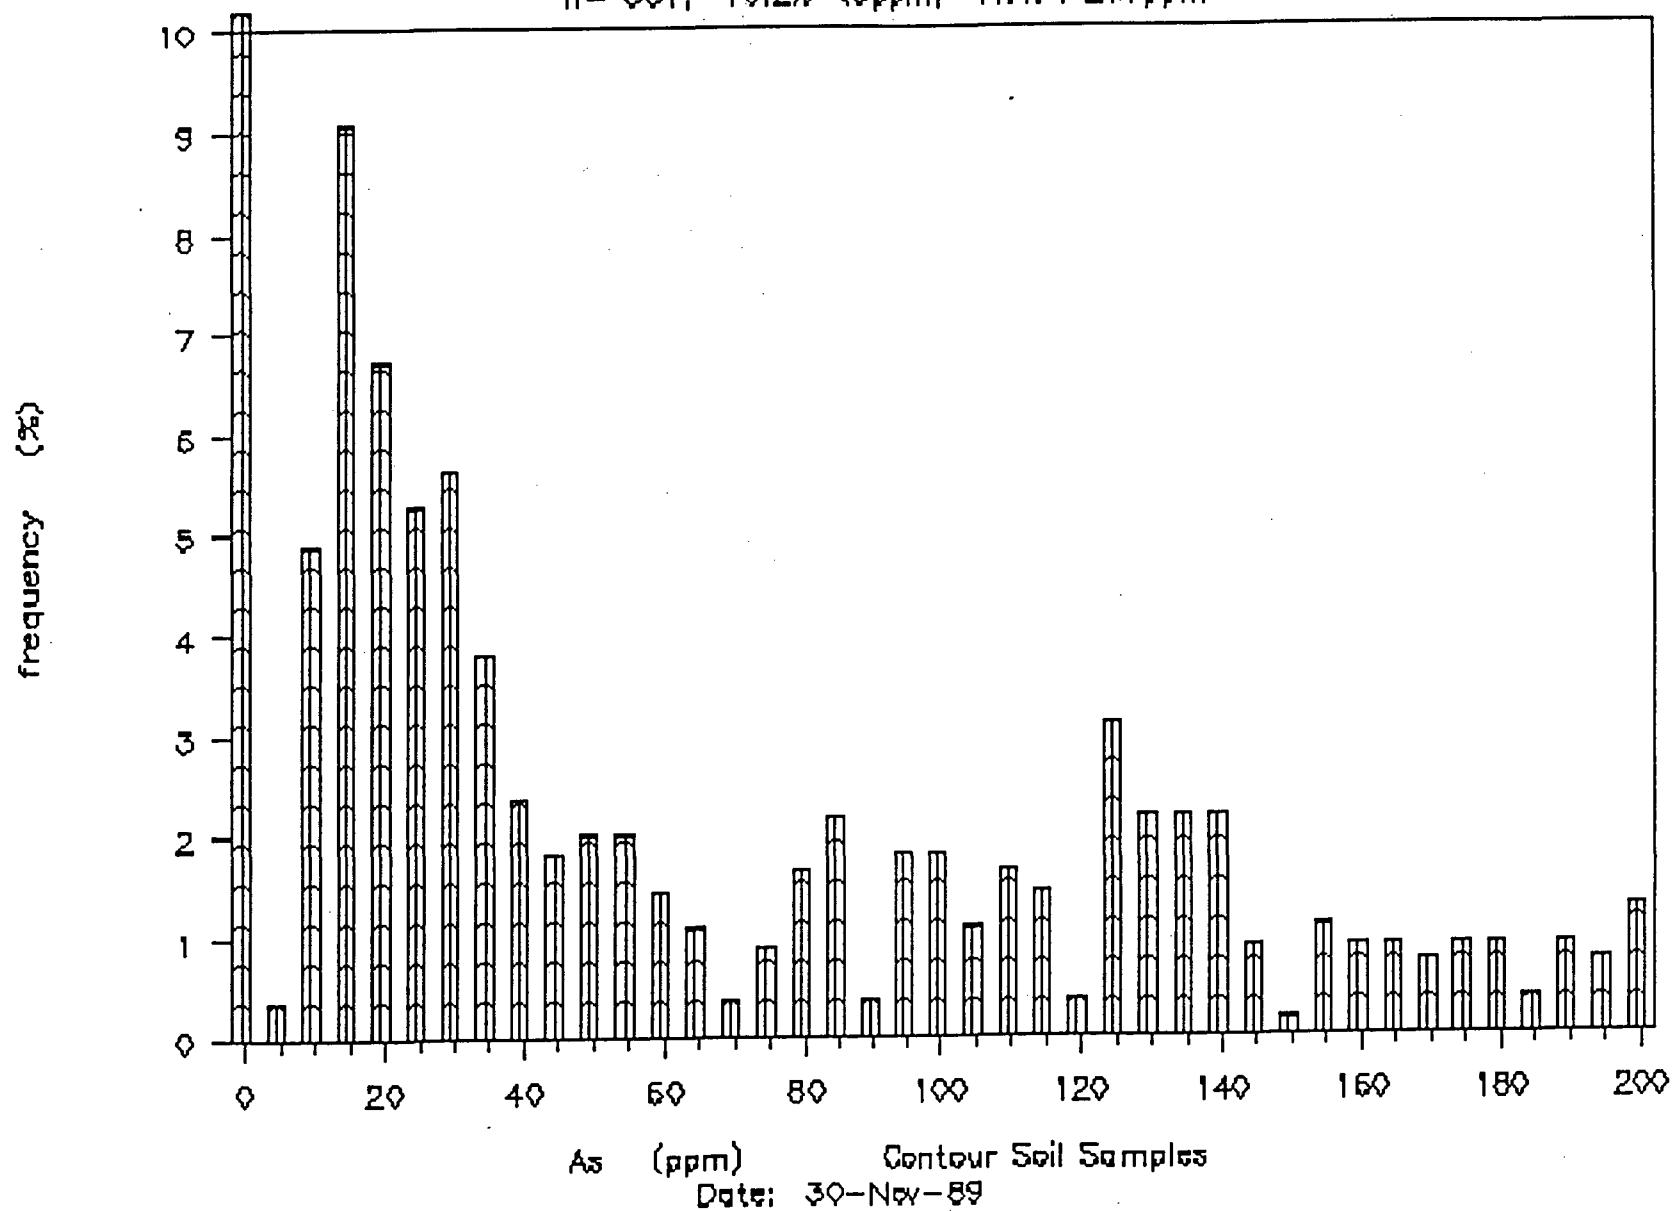

Project 519 - Stewart (Ag histogram)

n = 551

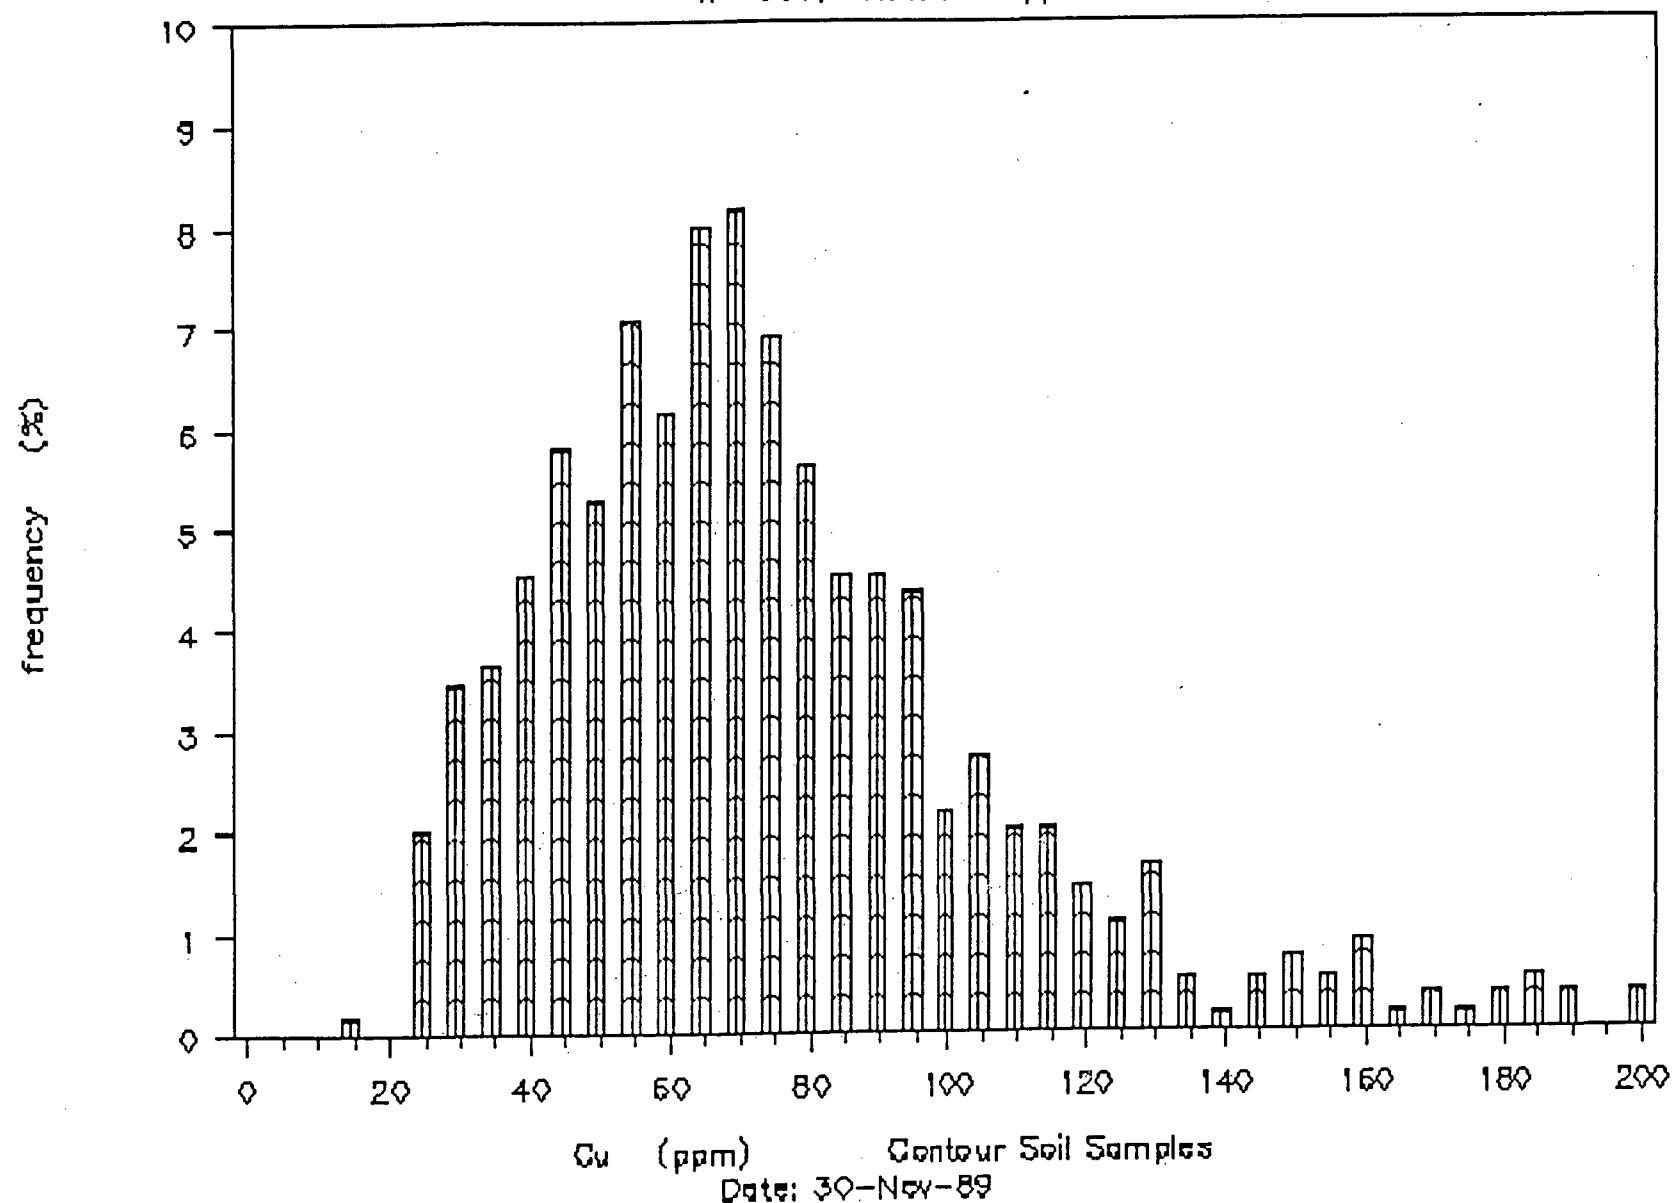

Project 519 - Stewart (As histogram)

n = 551, 19.2% < 5 ppm, 1.3% > 200 ppm

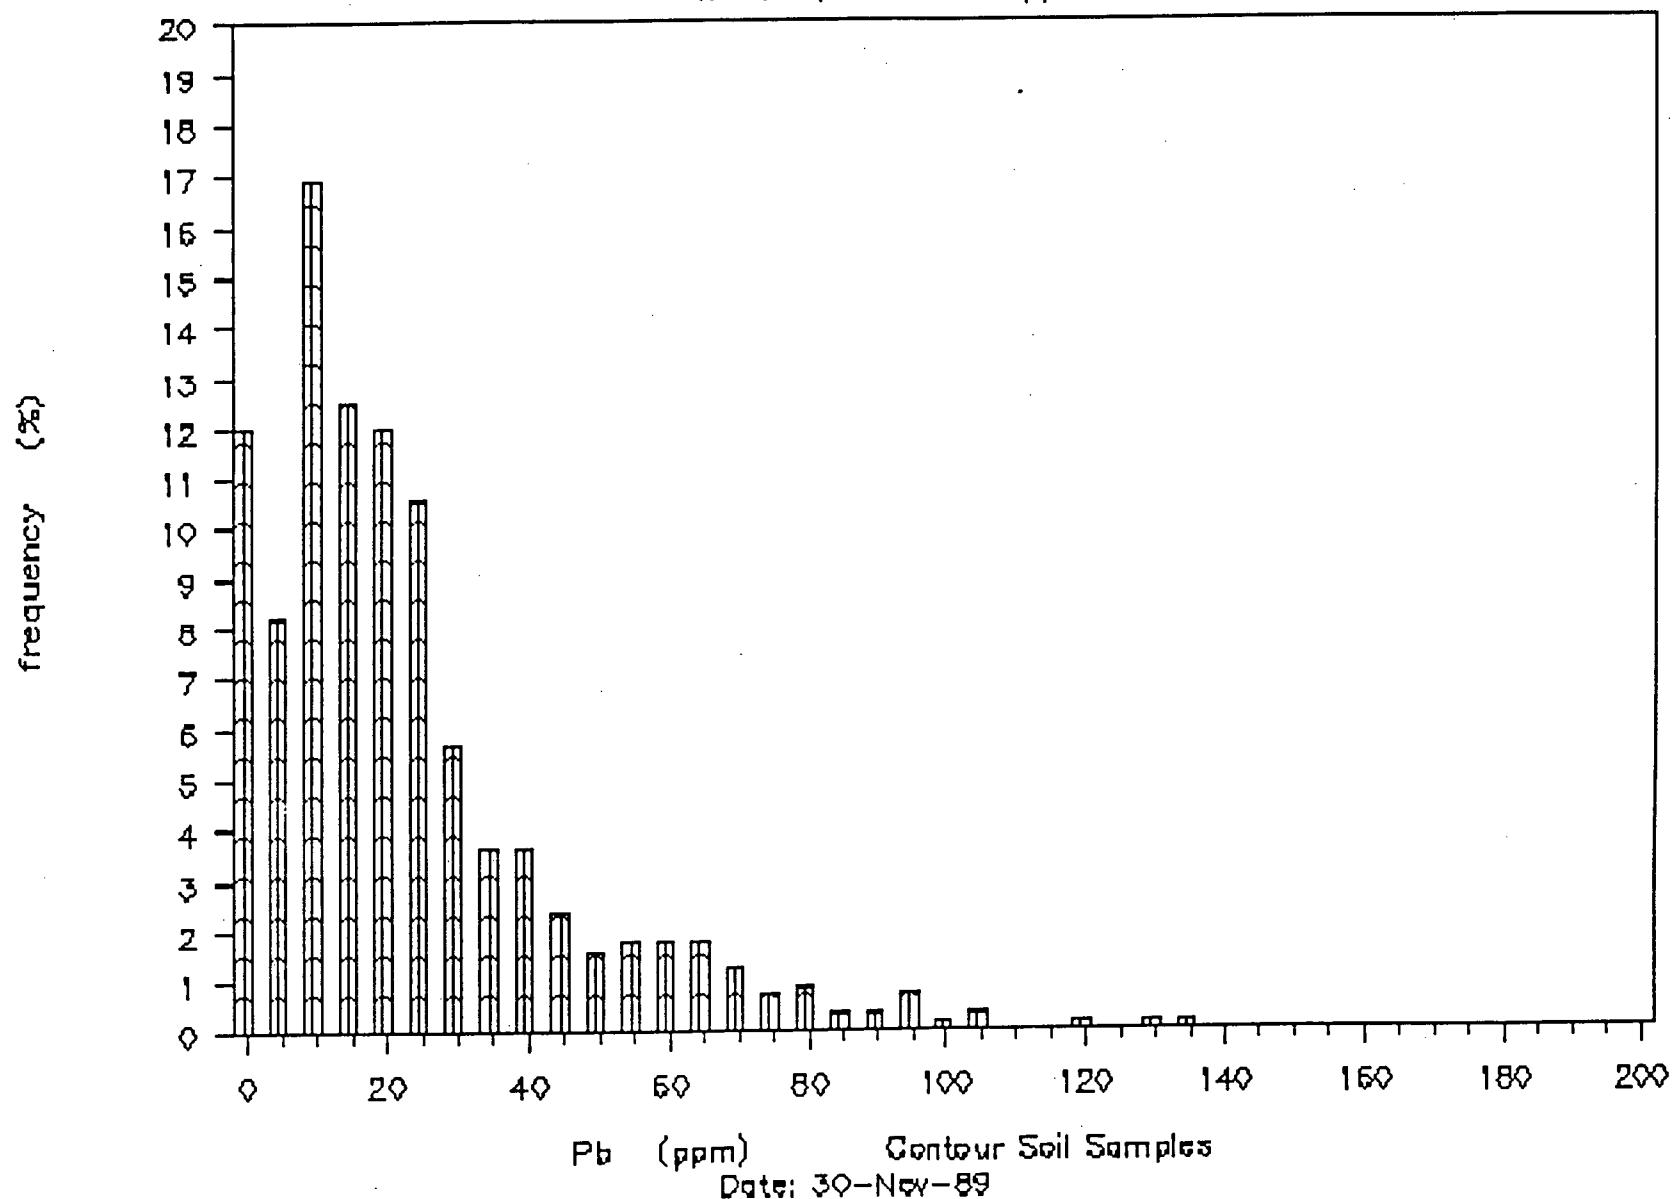

Project 519 - Stewart (Cu histogram)

n = 551, 9.9% > 200 ppm

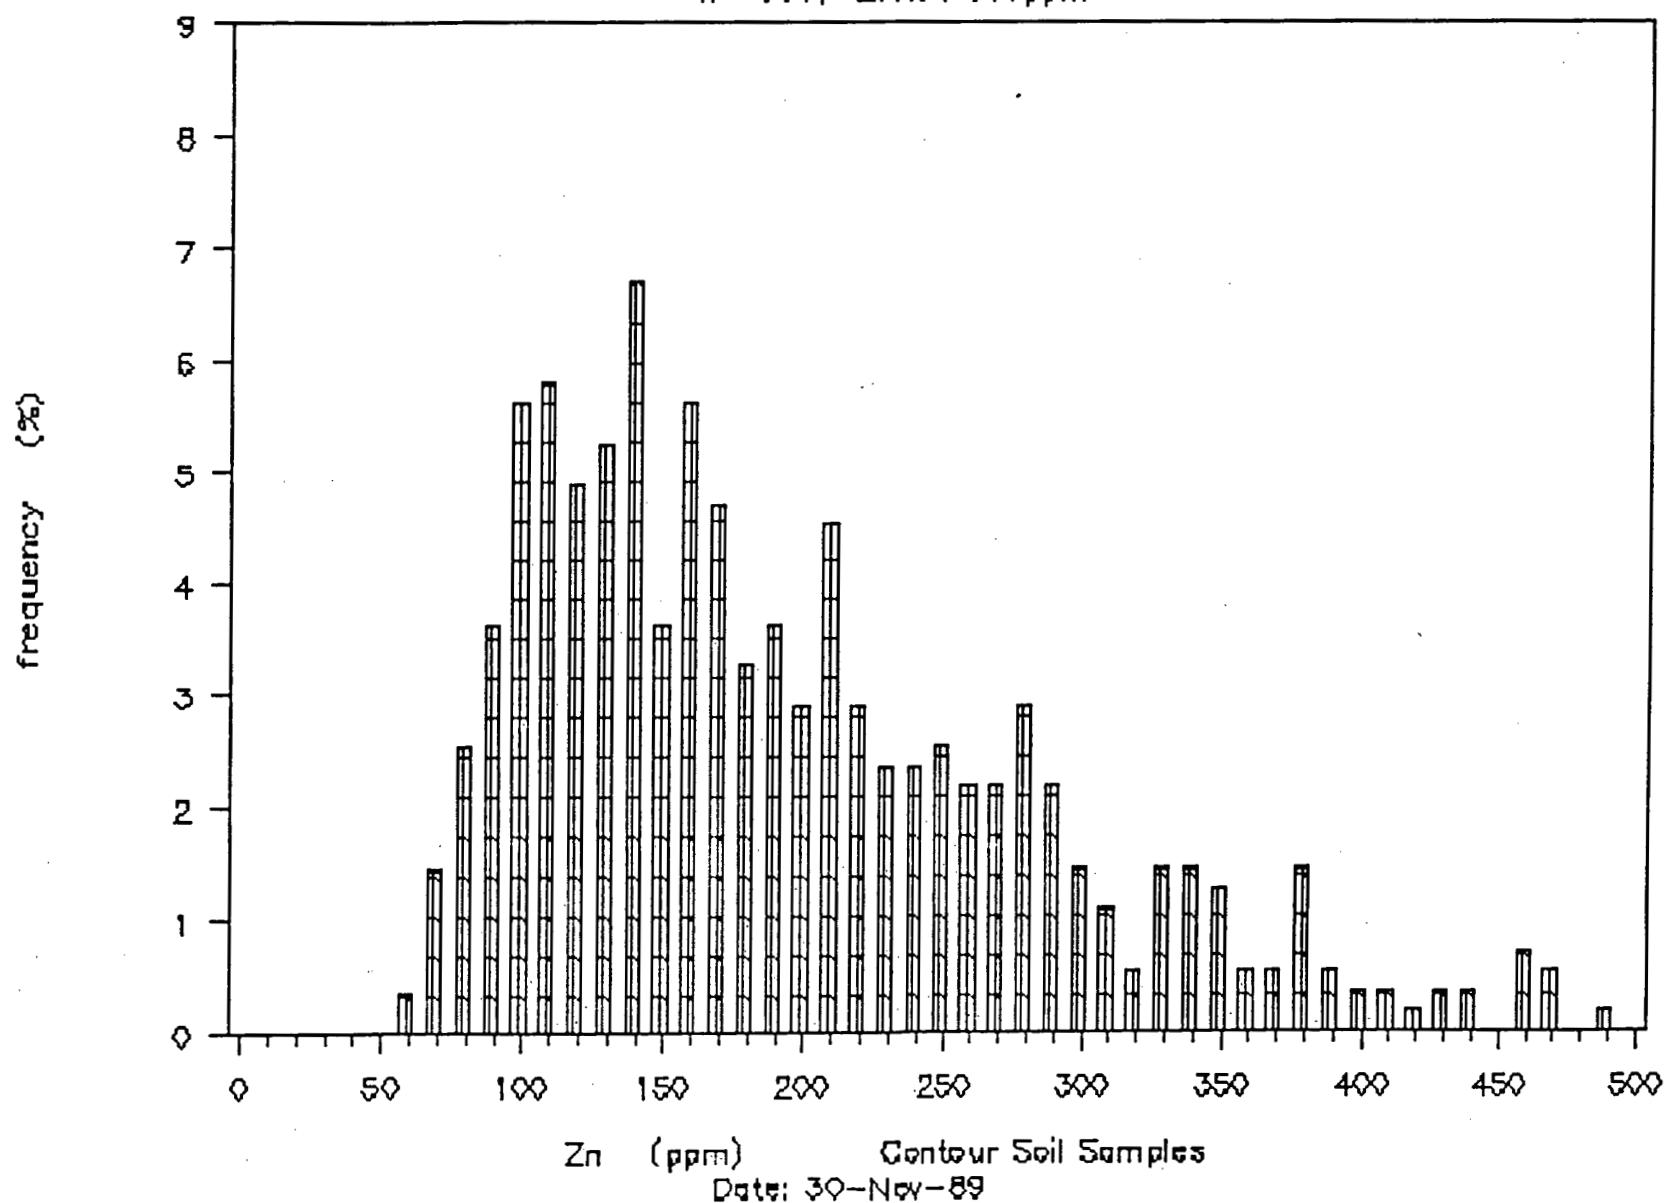

Project 519 - Stewart (Pb histogram)

n = 551, 9.2% > 200 ppm

Project 519 – Stewart (Zn histogram)

n= 551, 2.4% >500ppm

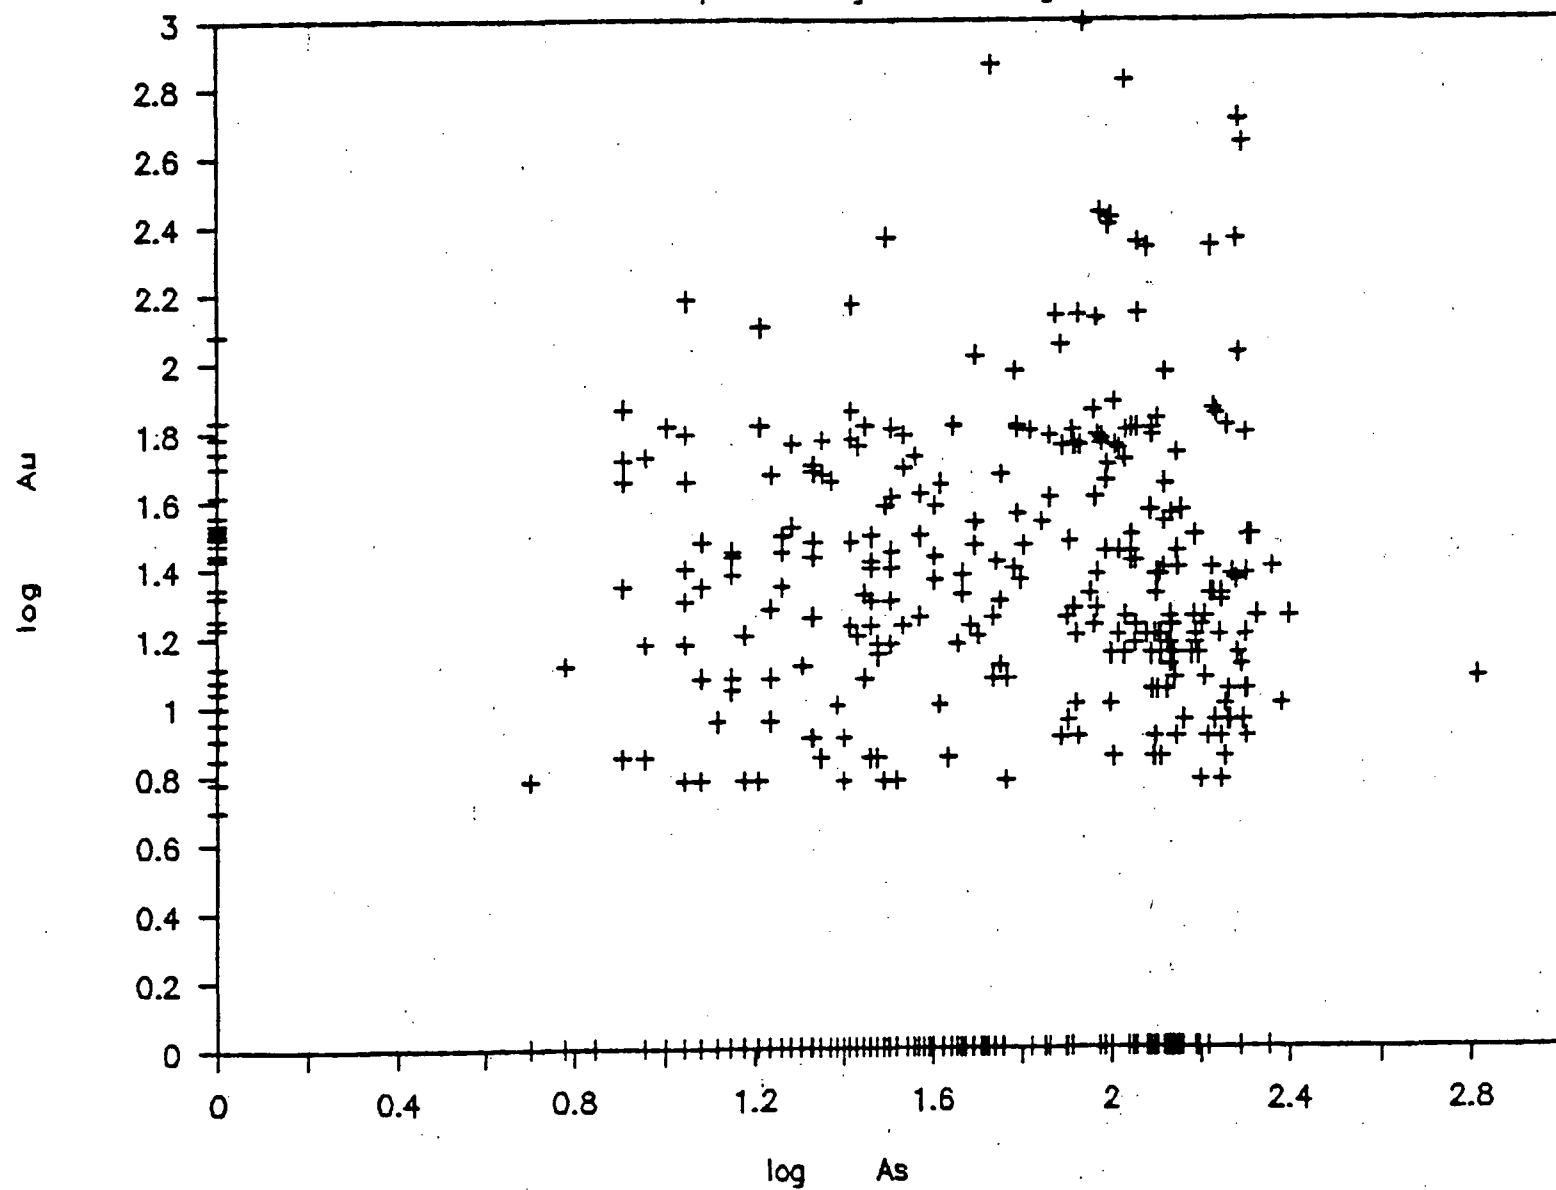

APPENDIX 5

Project 519 - STEWART

(XY Plot)

soil samples

log Au vs. log As

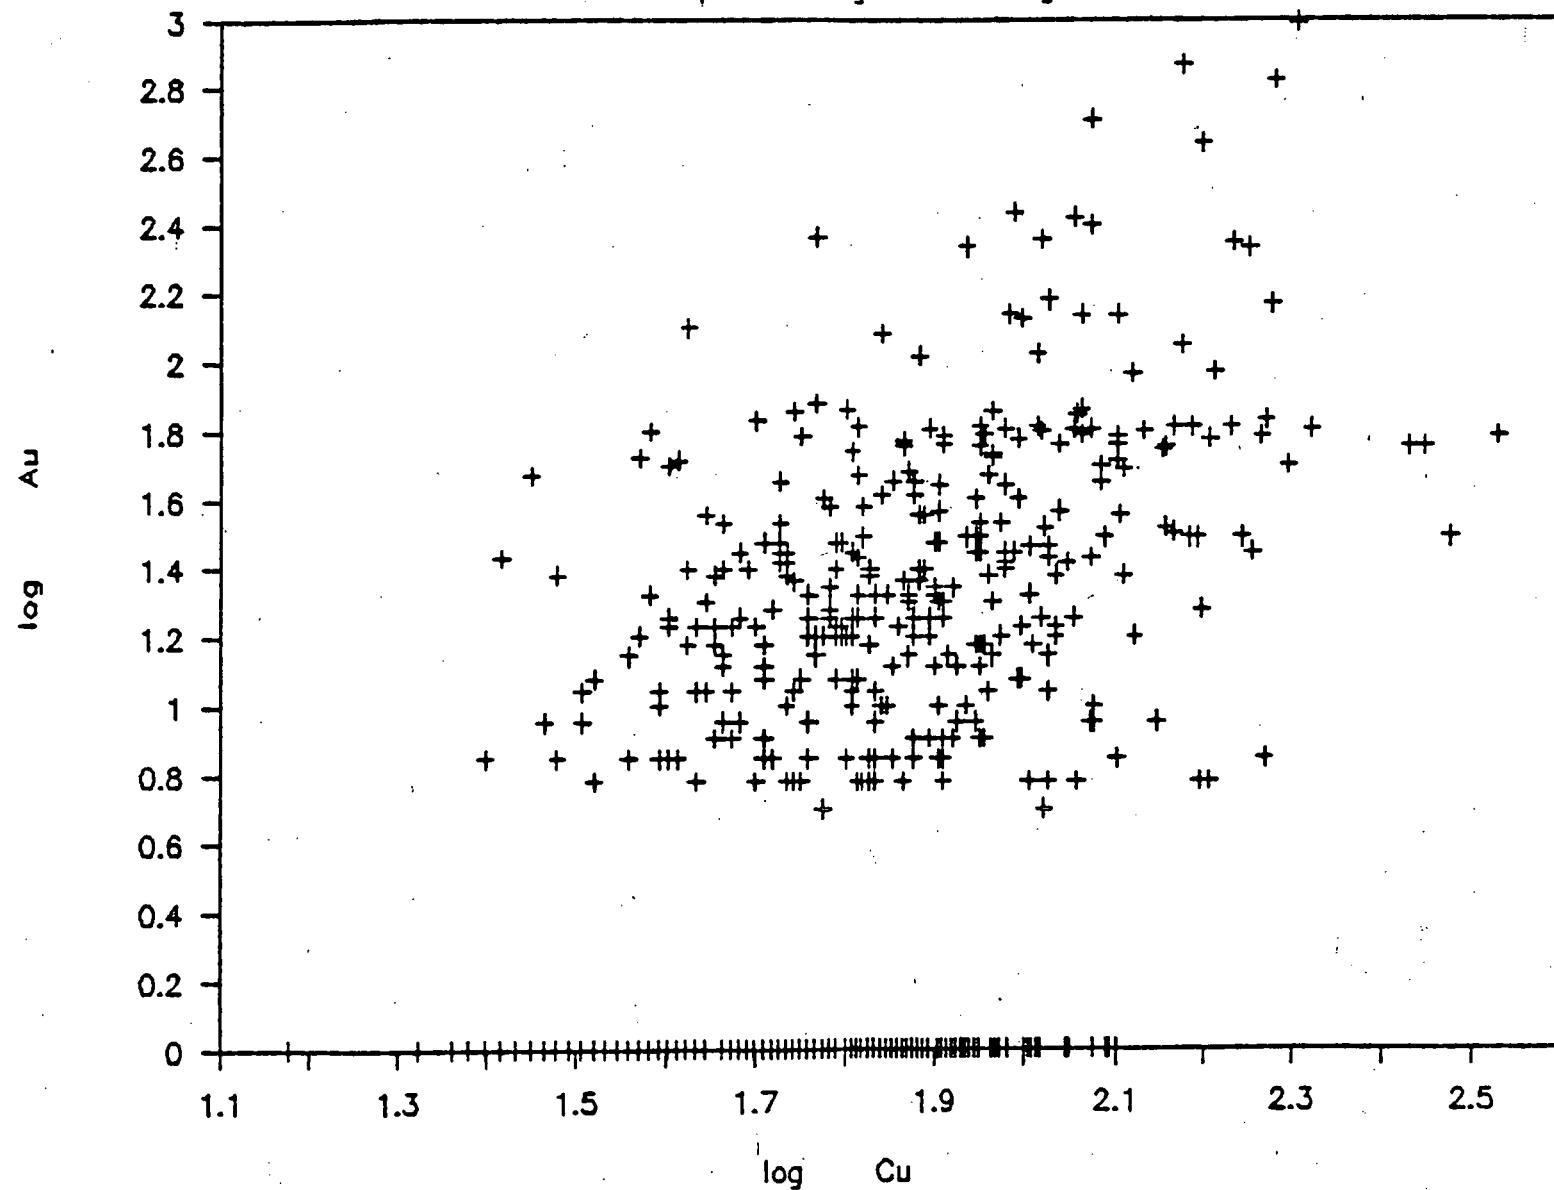

Project 519 - STEWART

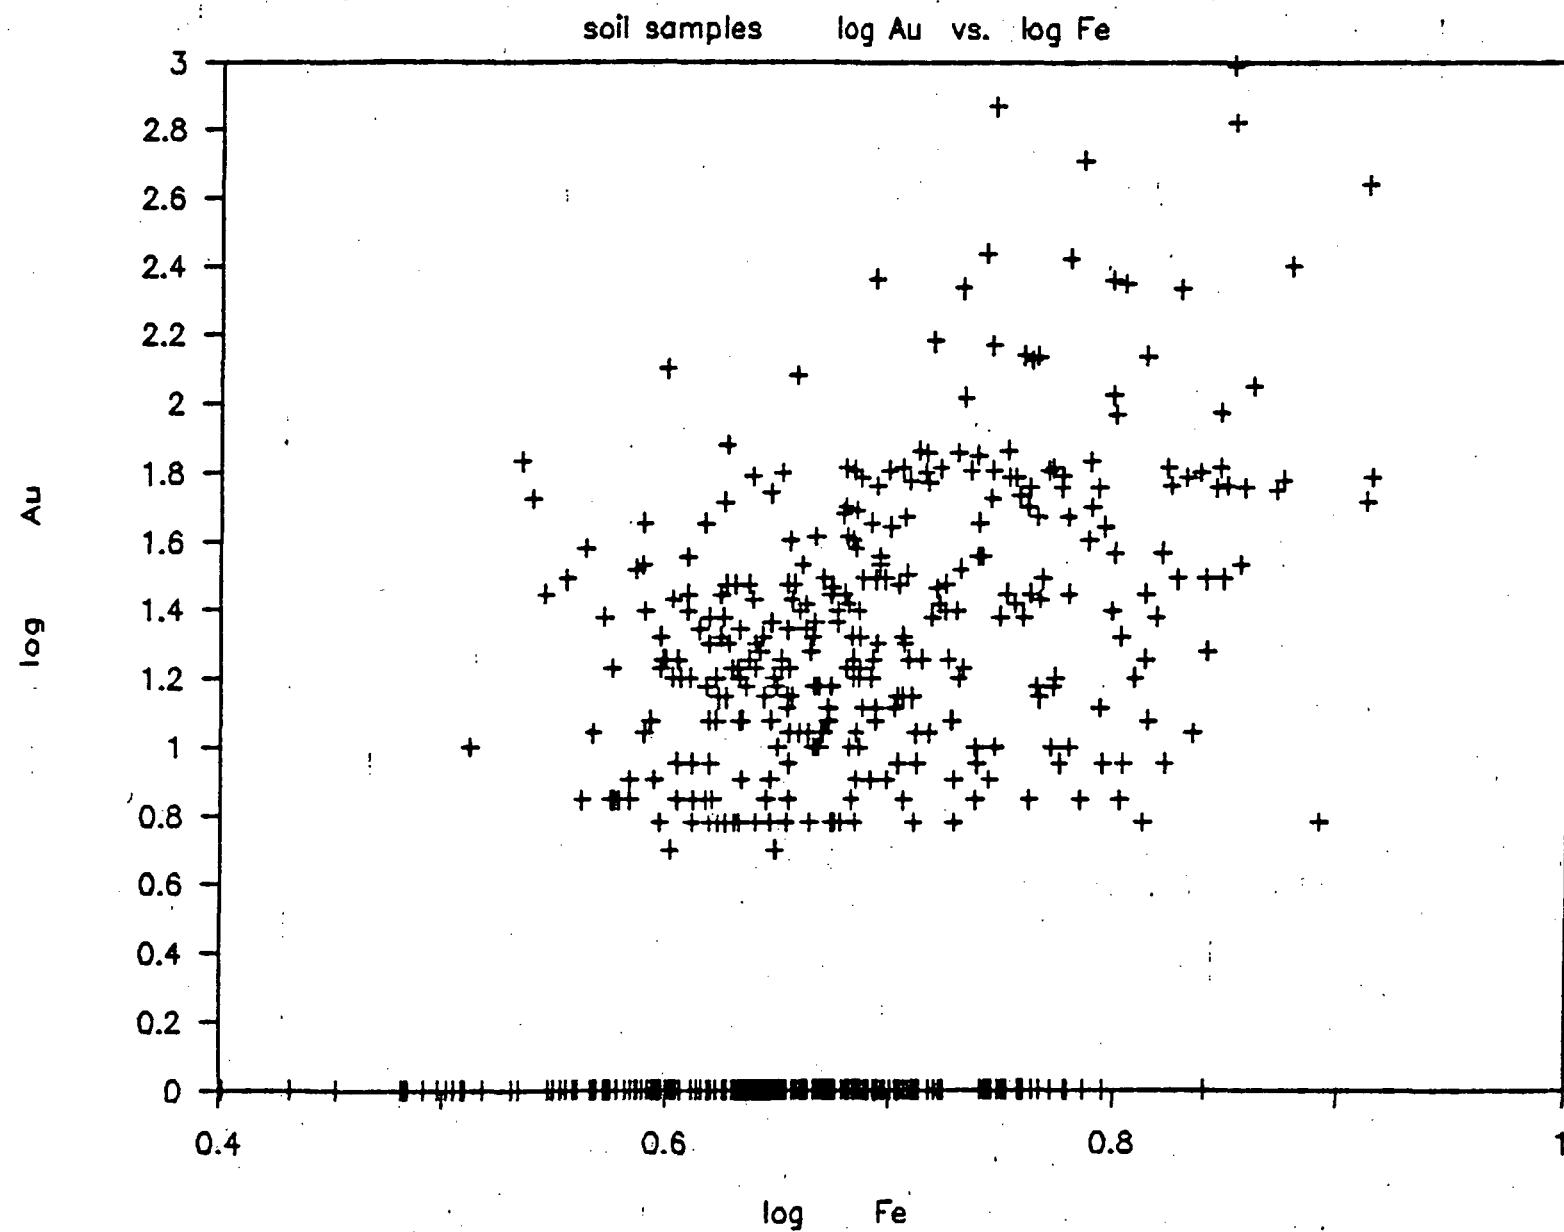

(XY Plot)

soil samples

log Au vs. log Cu

Project 519 - STEWART (XY Plot)

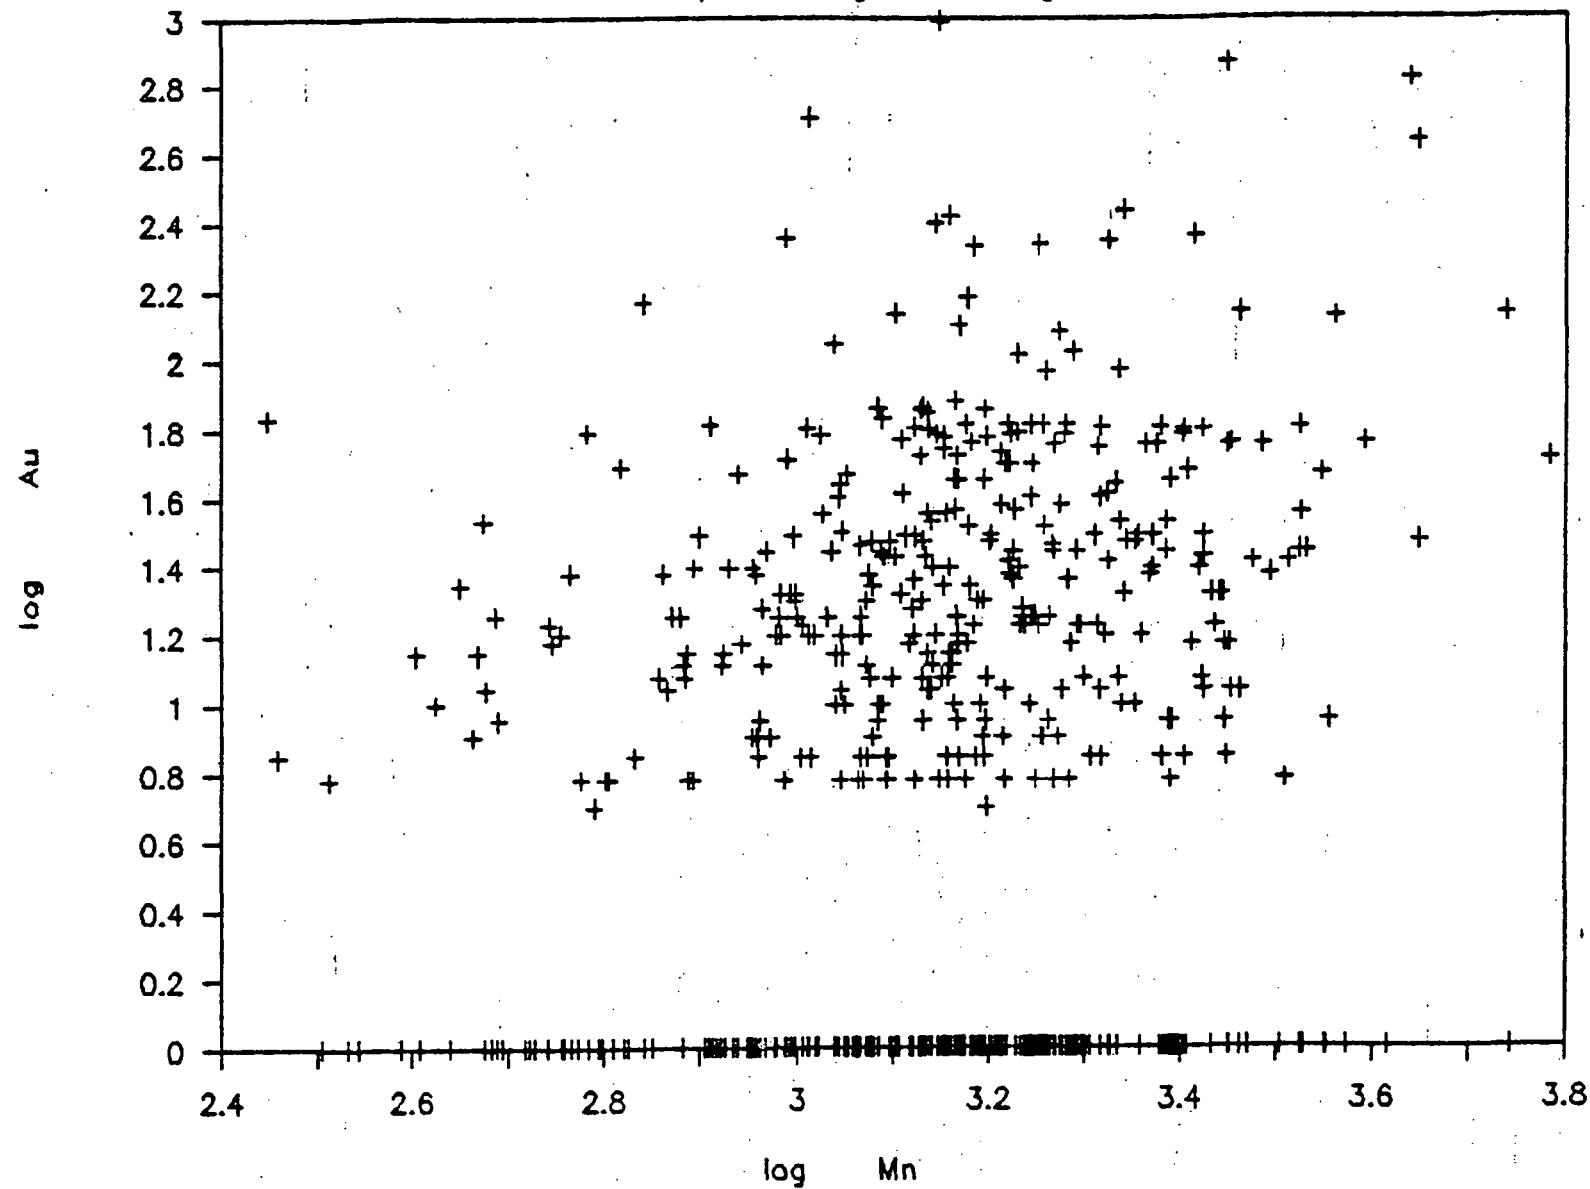

Project 519 - STEWART

(XY Plot)

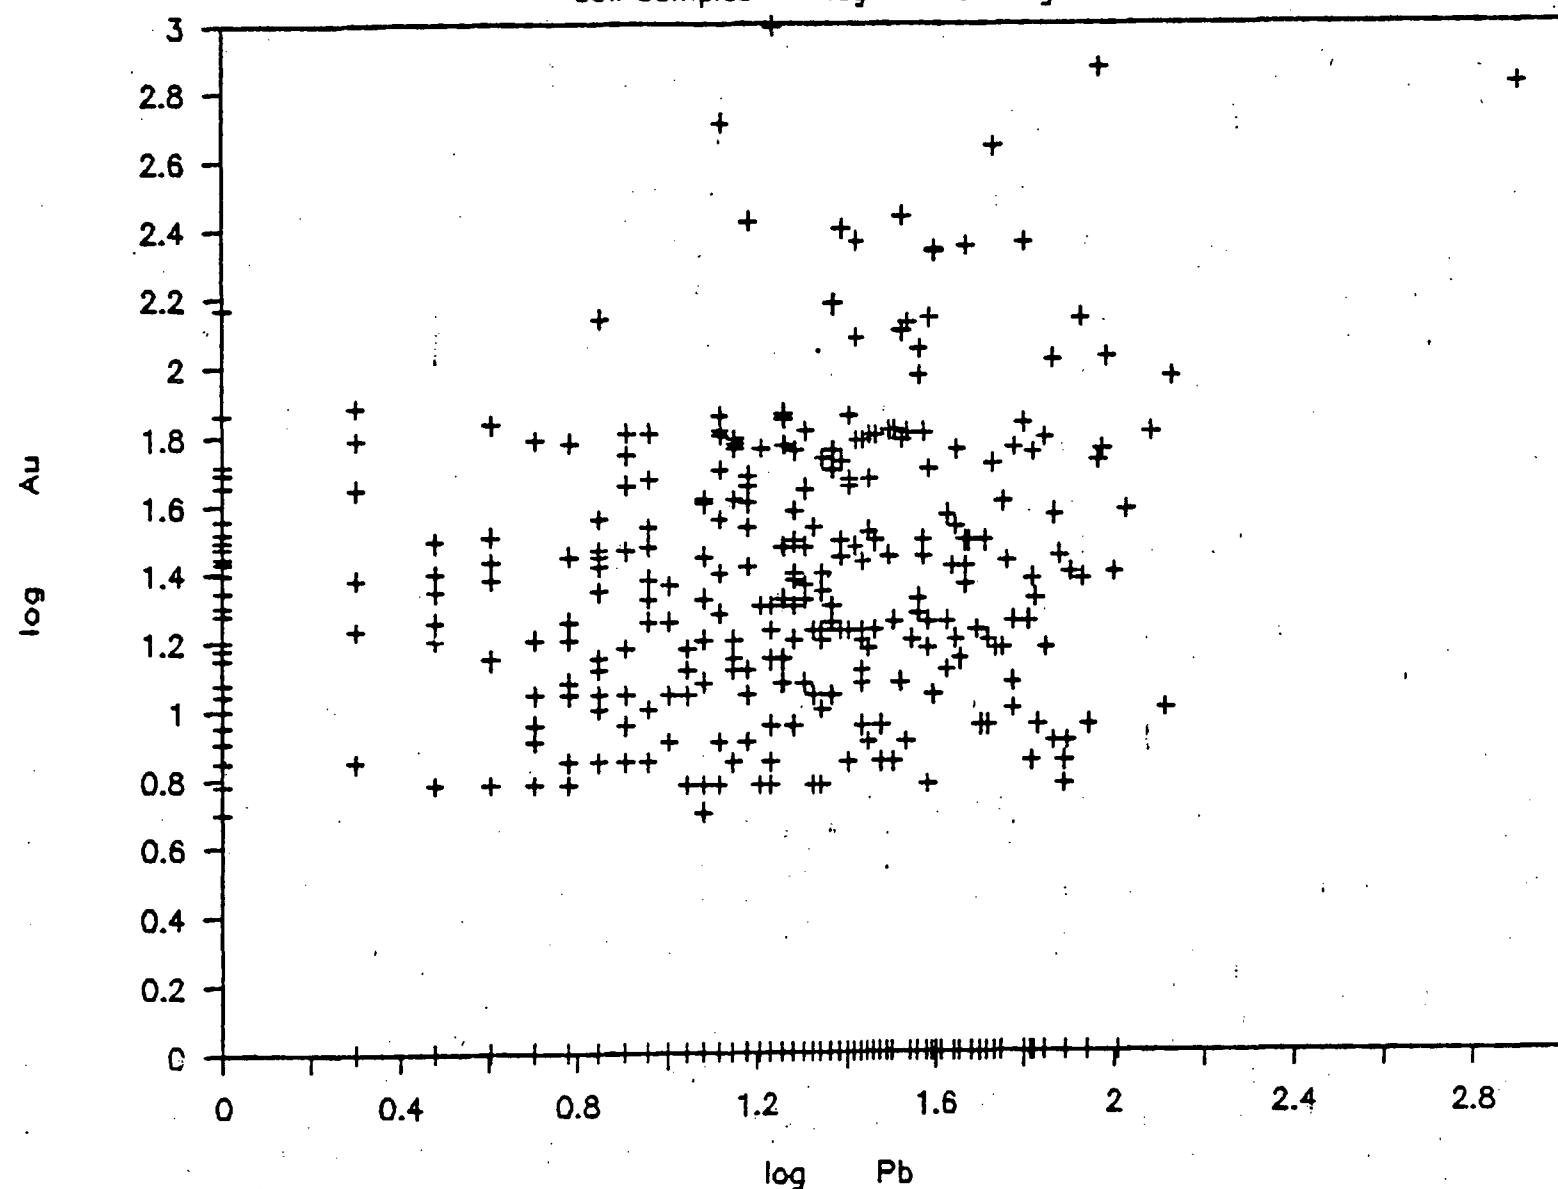

soil samples

log Au vs. log Mn

Project 519 - STEWART (XY Plot)

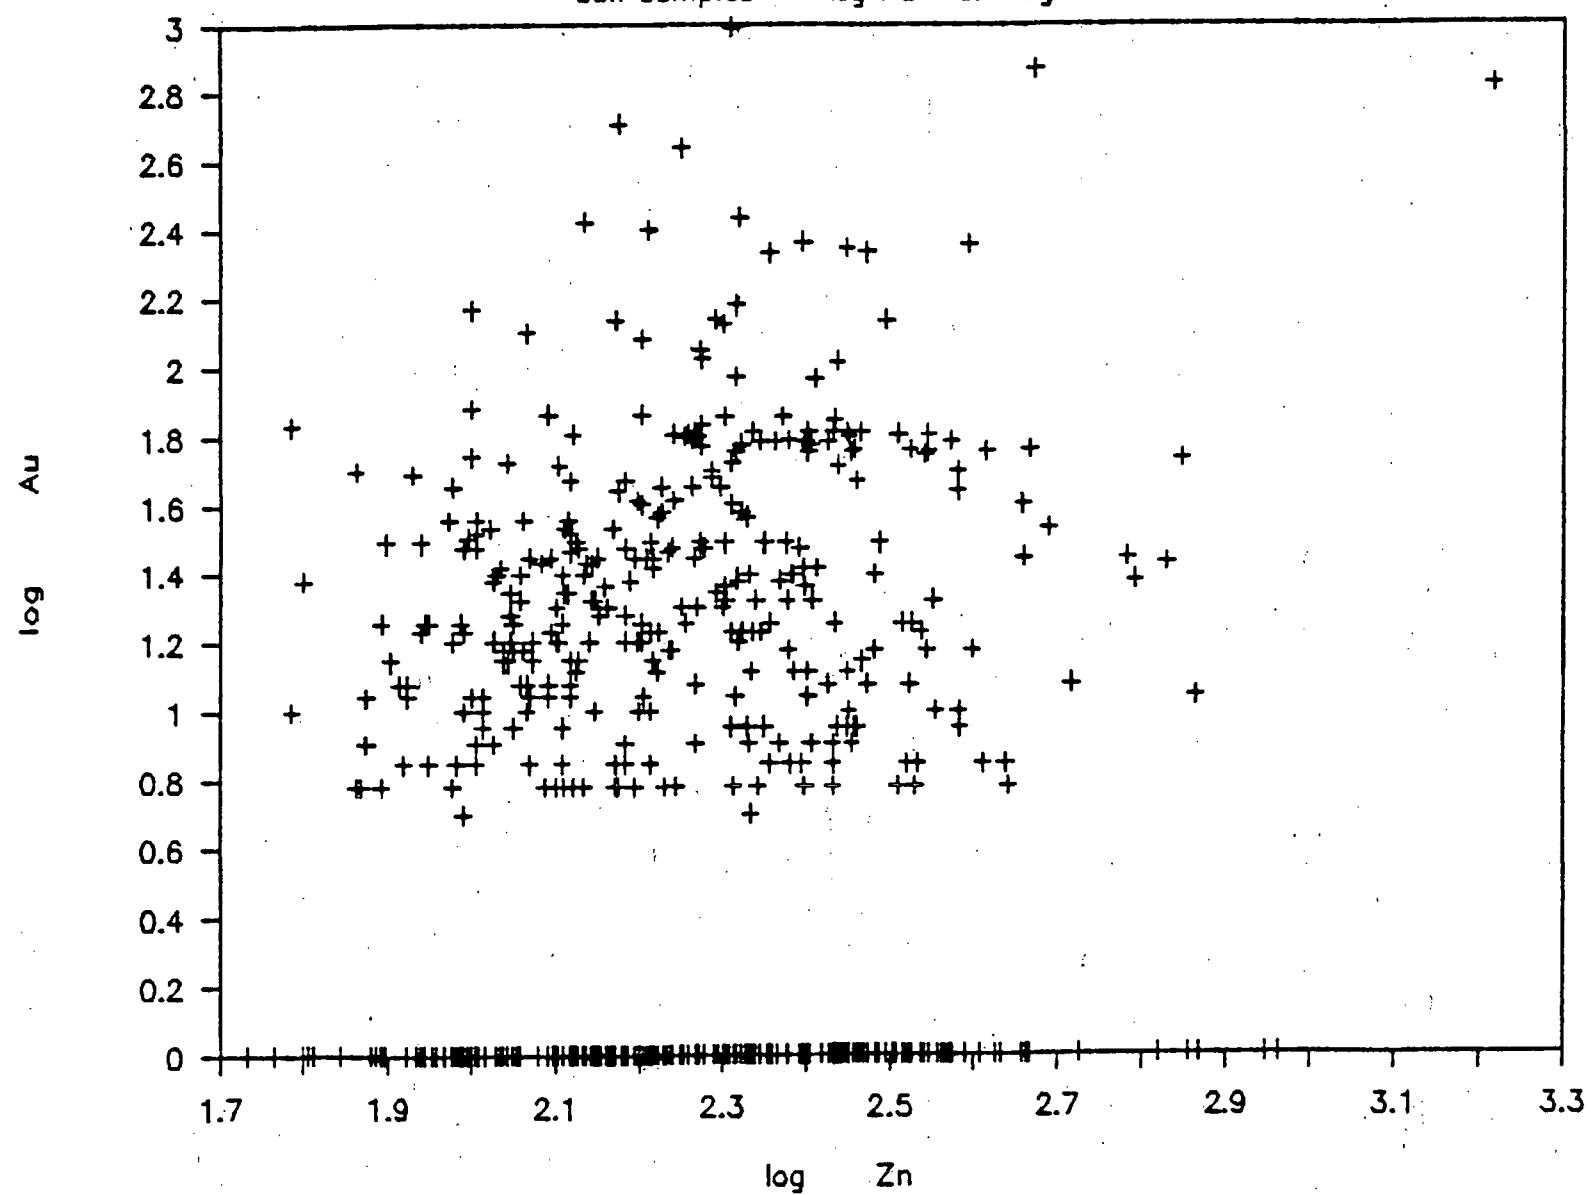

soil samples log Au vs. log Pb

Project 519 - STEWART

(XY Plot)

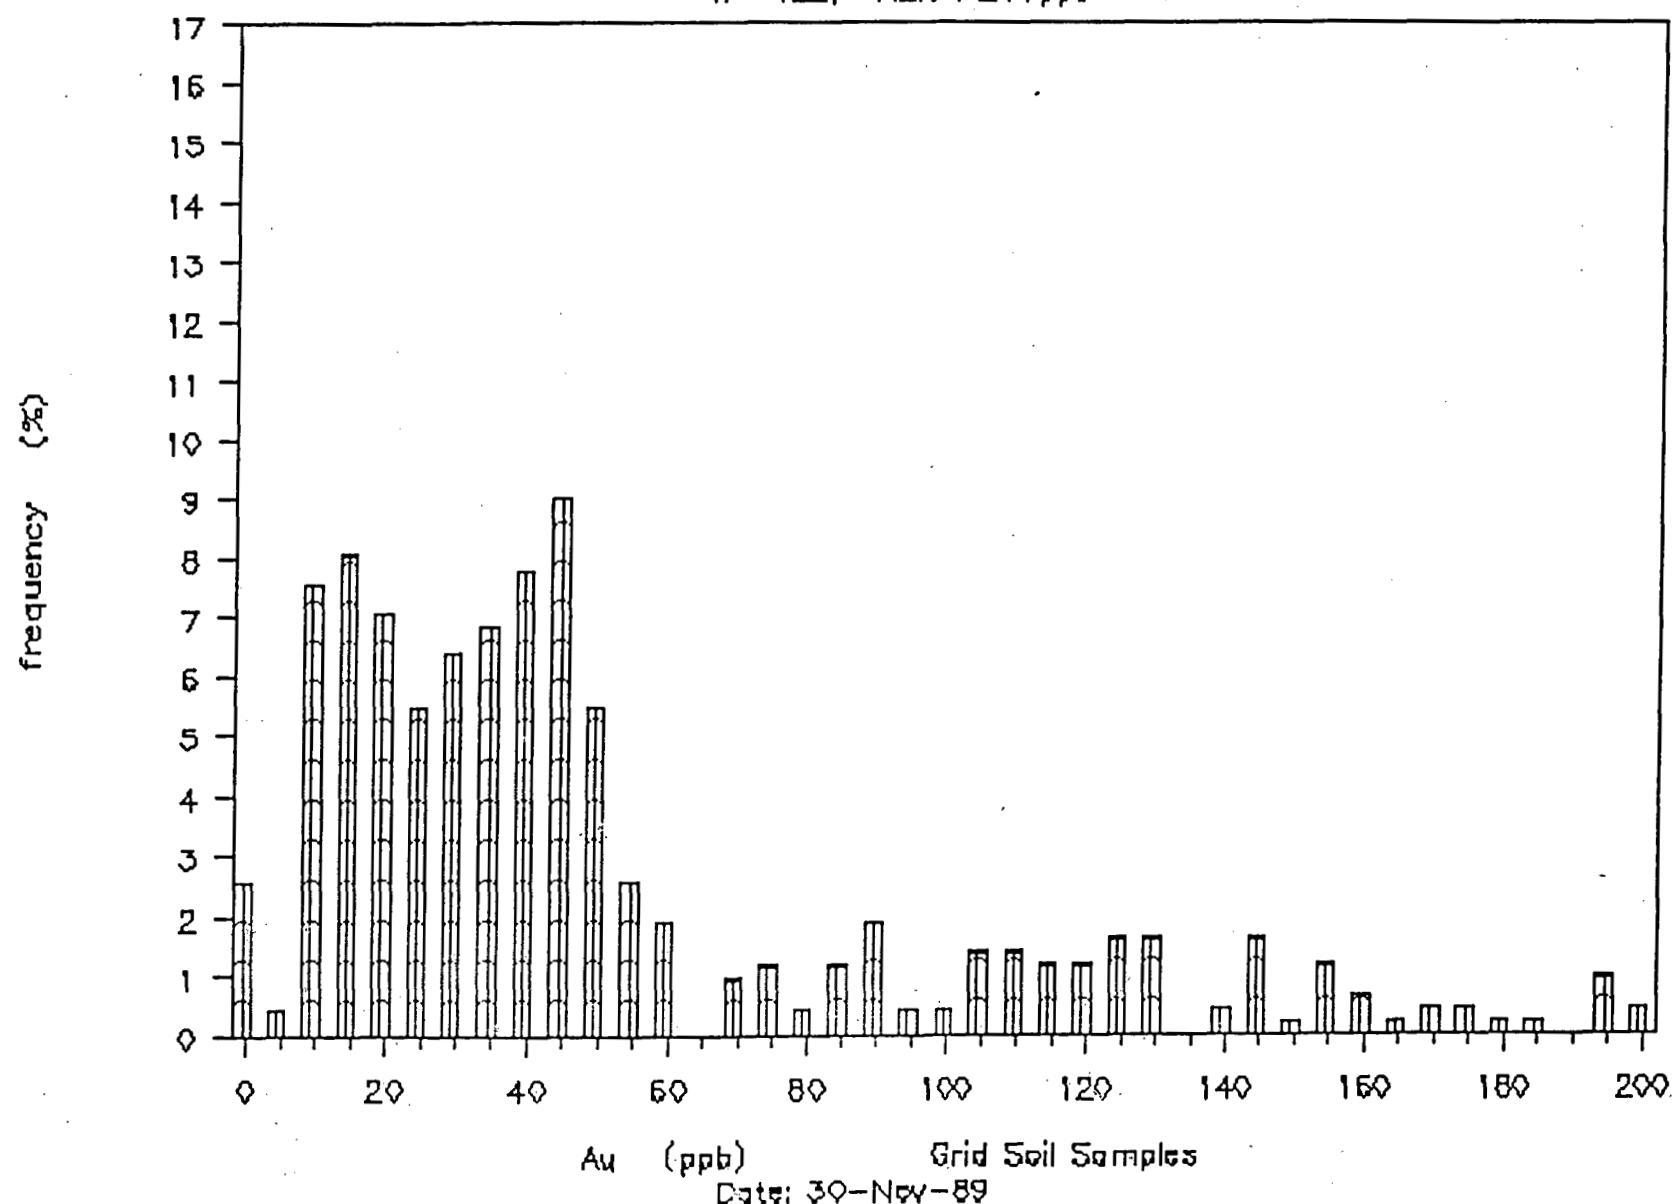

soil samples log Au vs. log Zn

APPENDIX 6

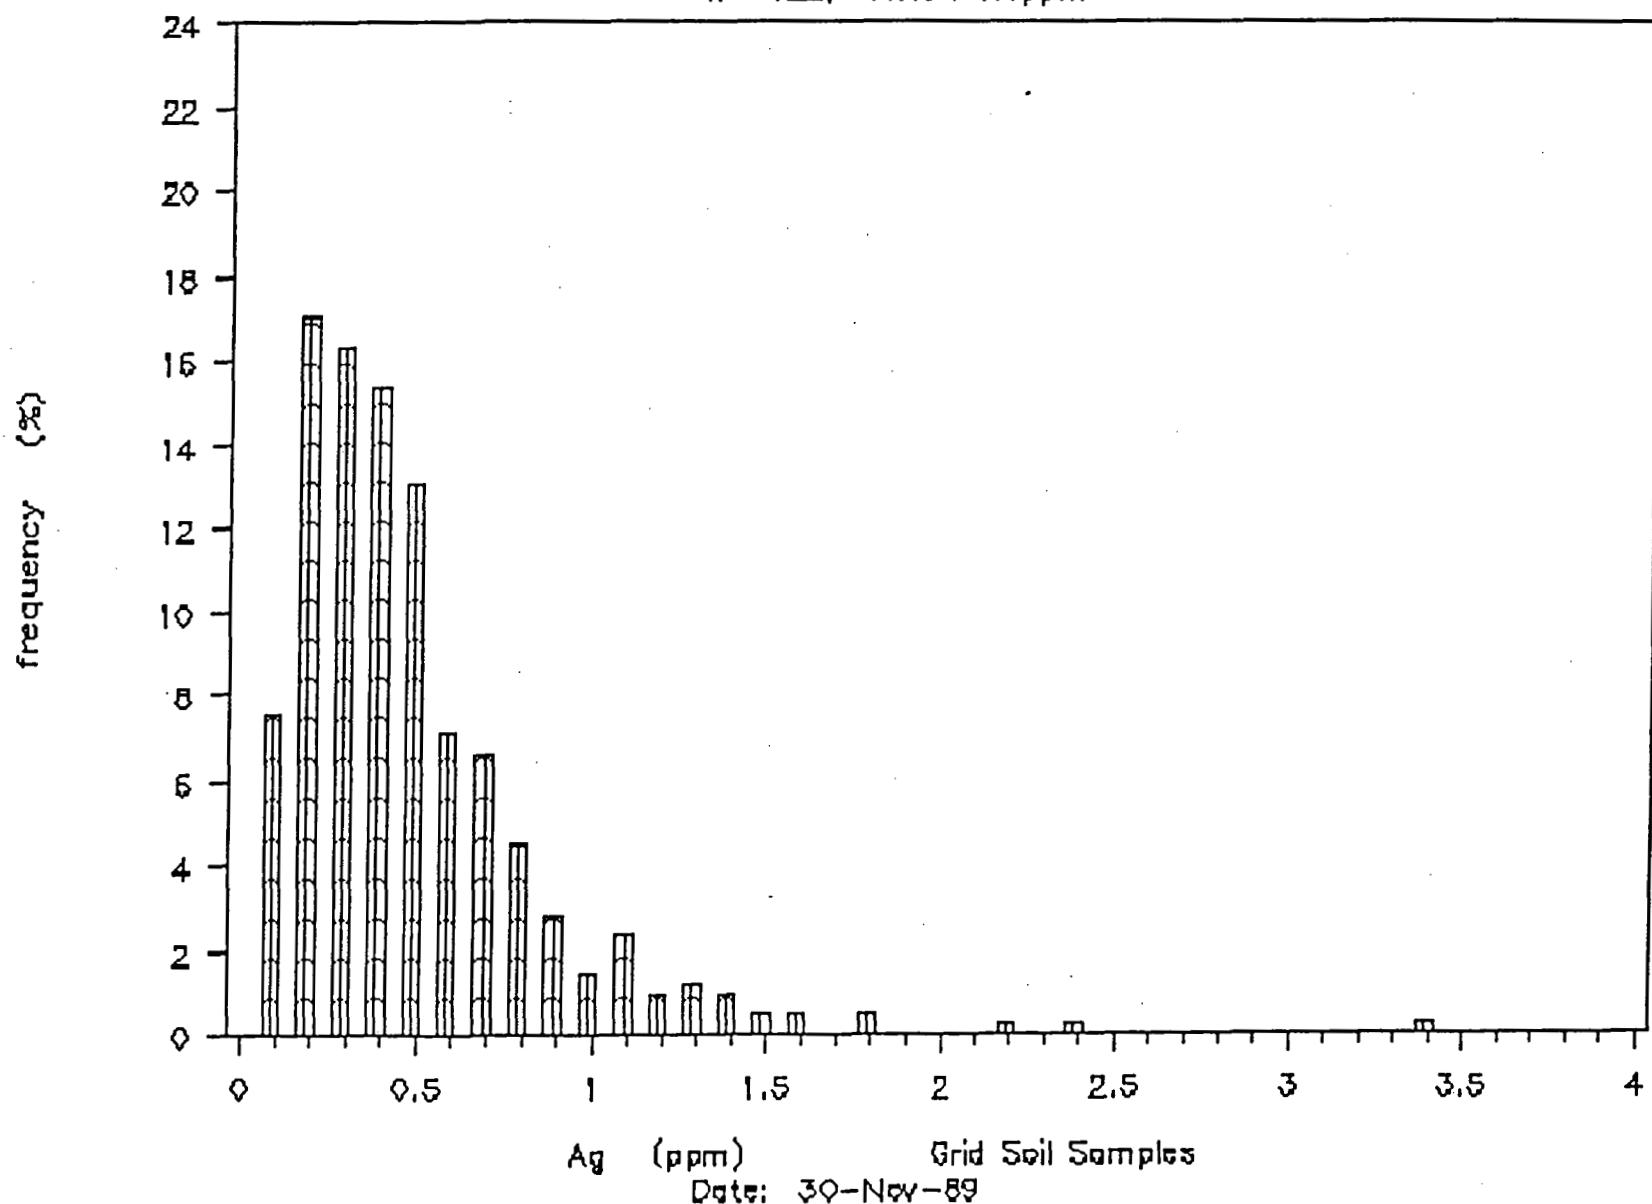

Project 519 - Stewart (Au histogram)

n = 422, 5.2% > 200 ppb

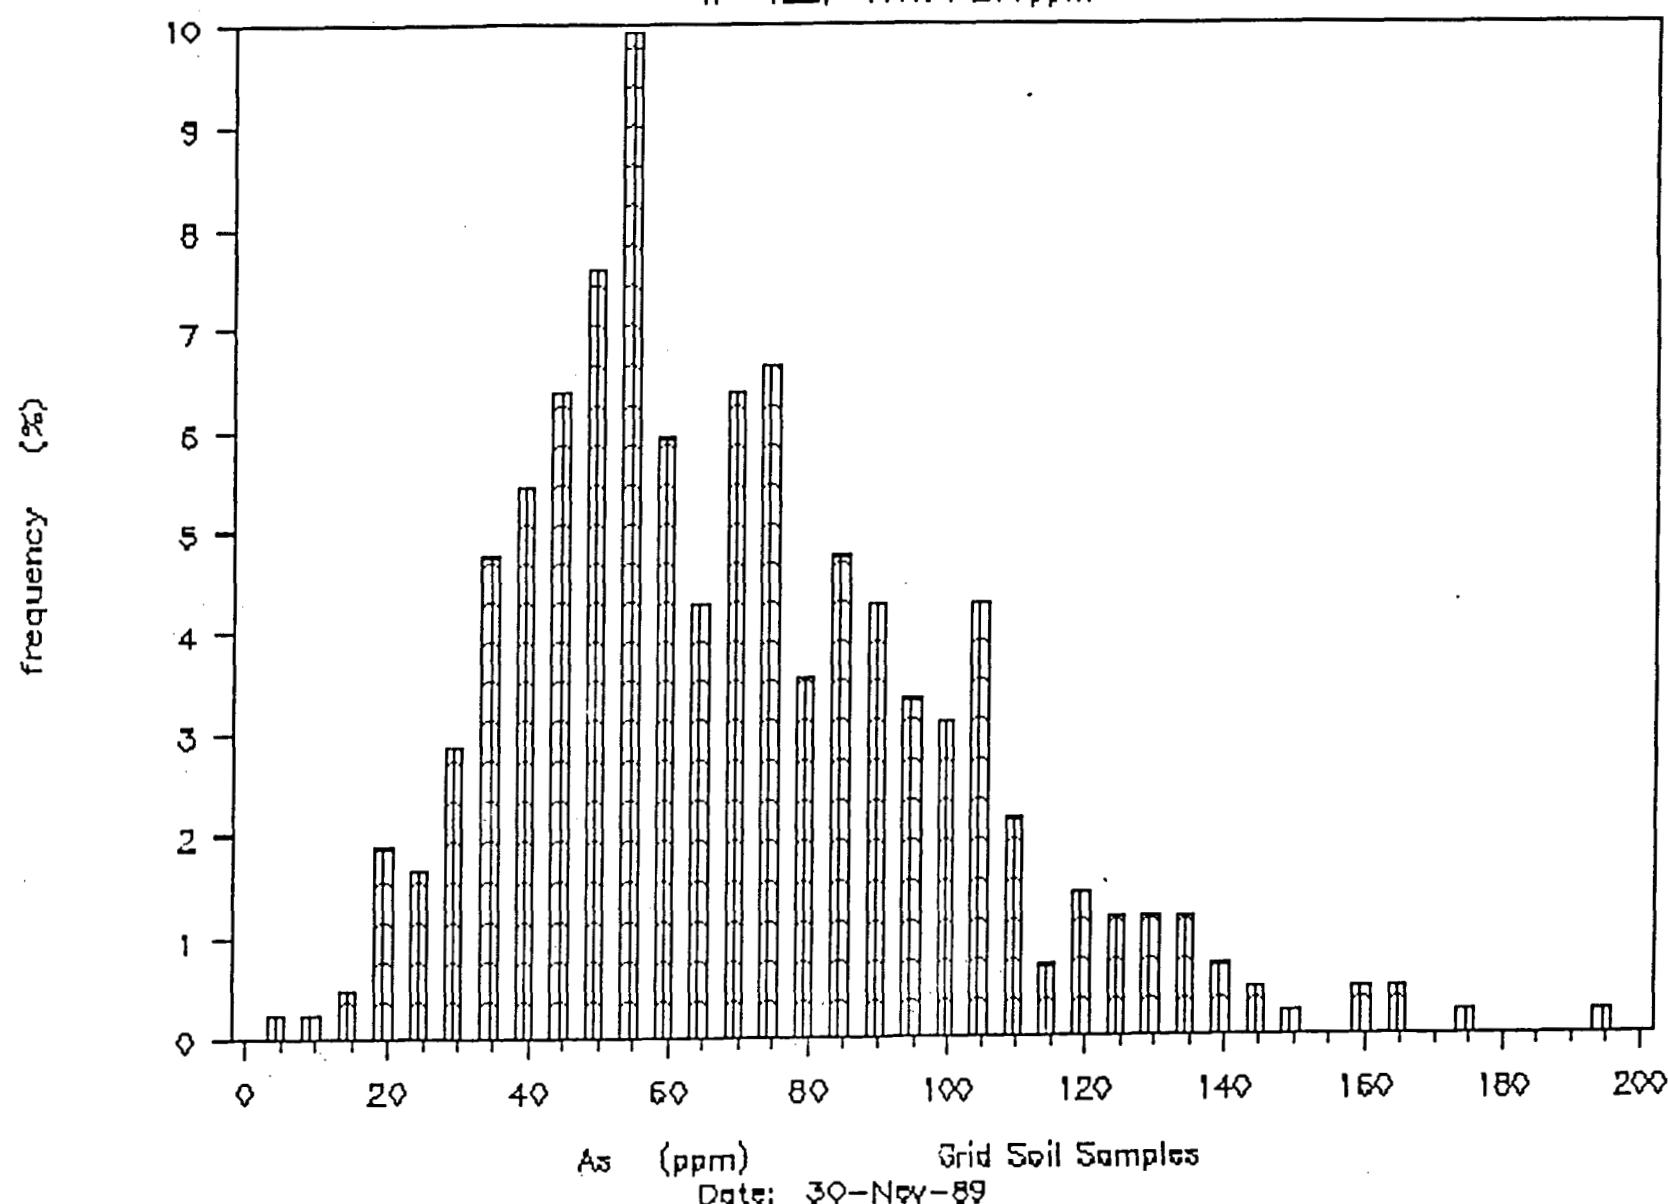

Project 519 - Stewart (Ag histogram)

n = 422, 0.5% >4.0 ppm

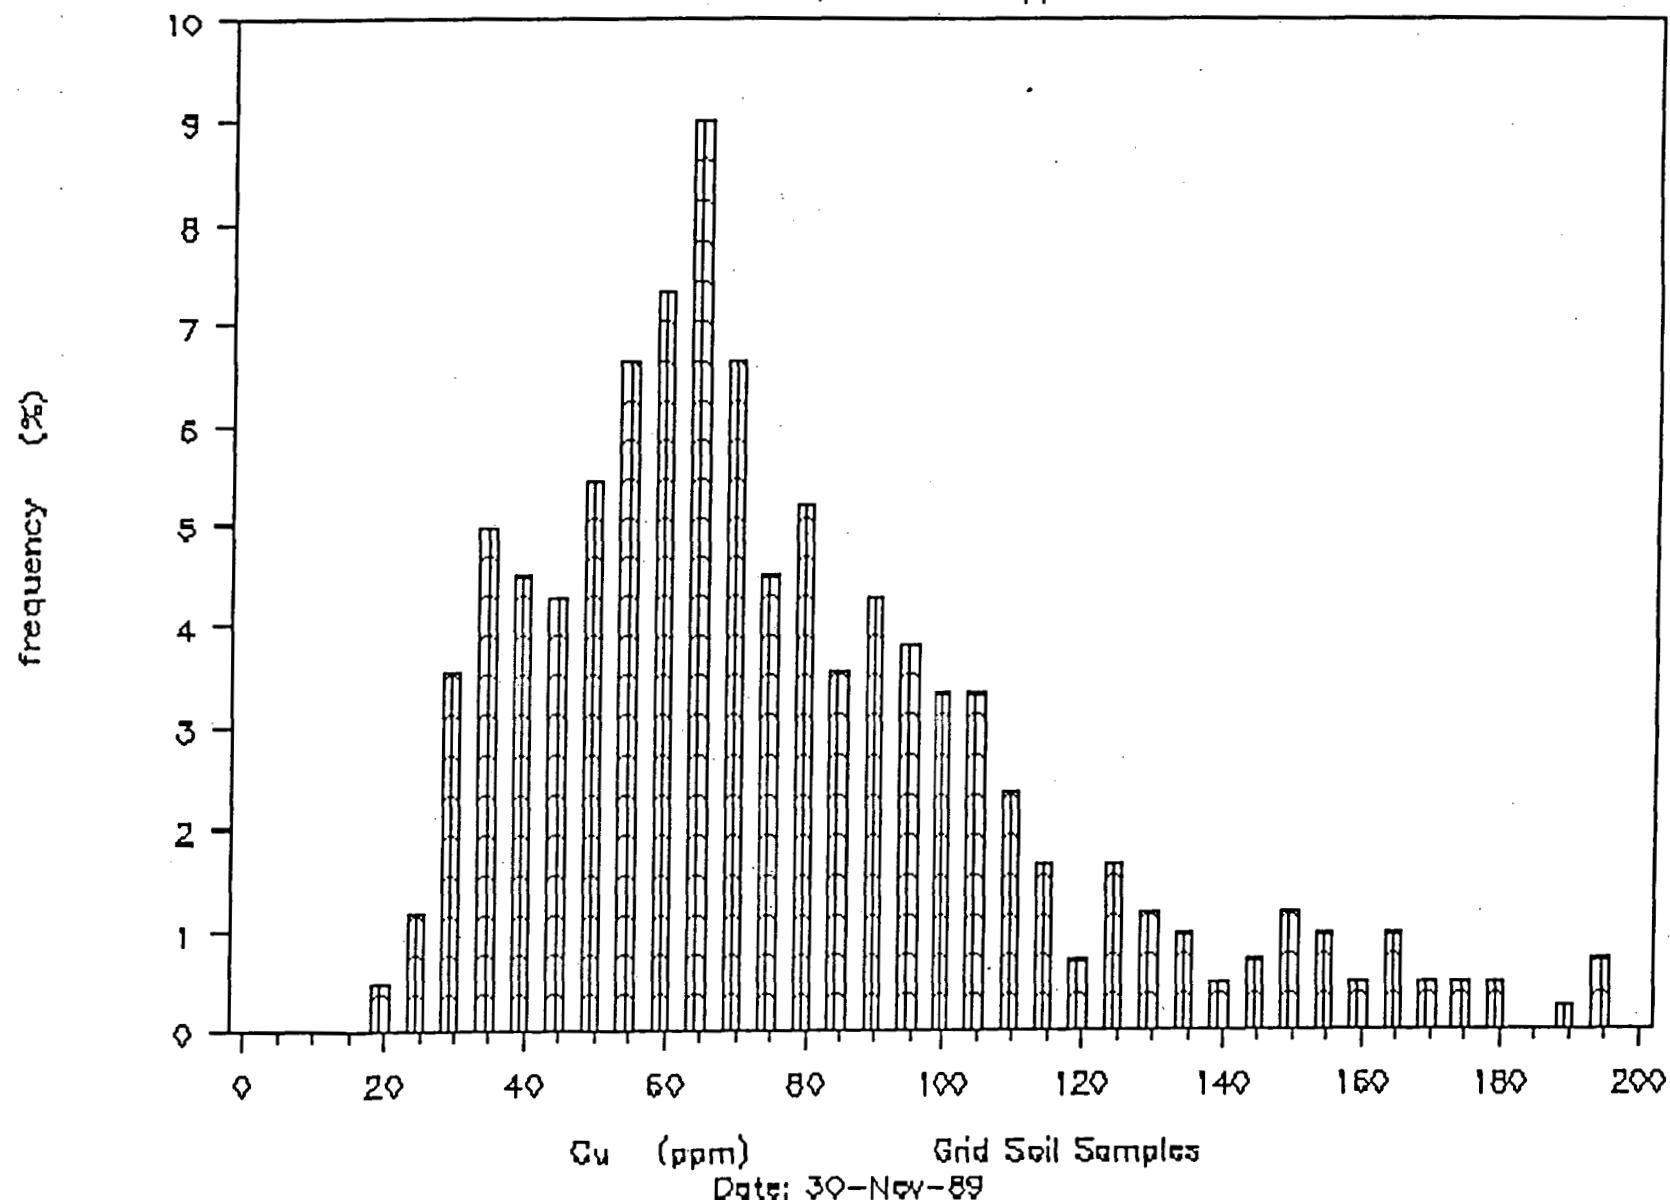

Project 519 - Stewart (As histogram)

n = 422, 1.4% > 200 ppm

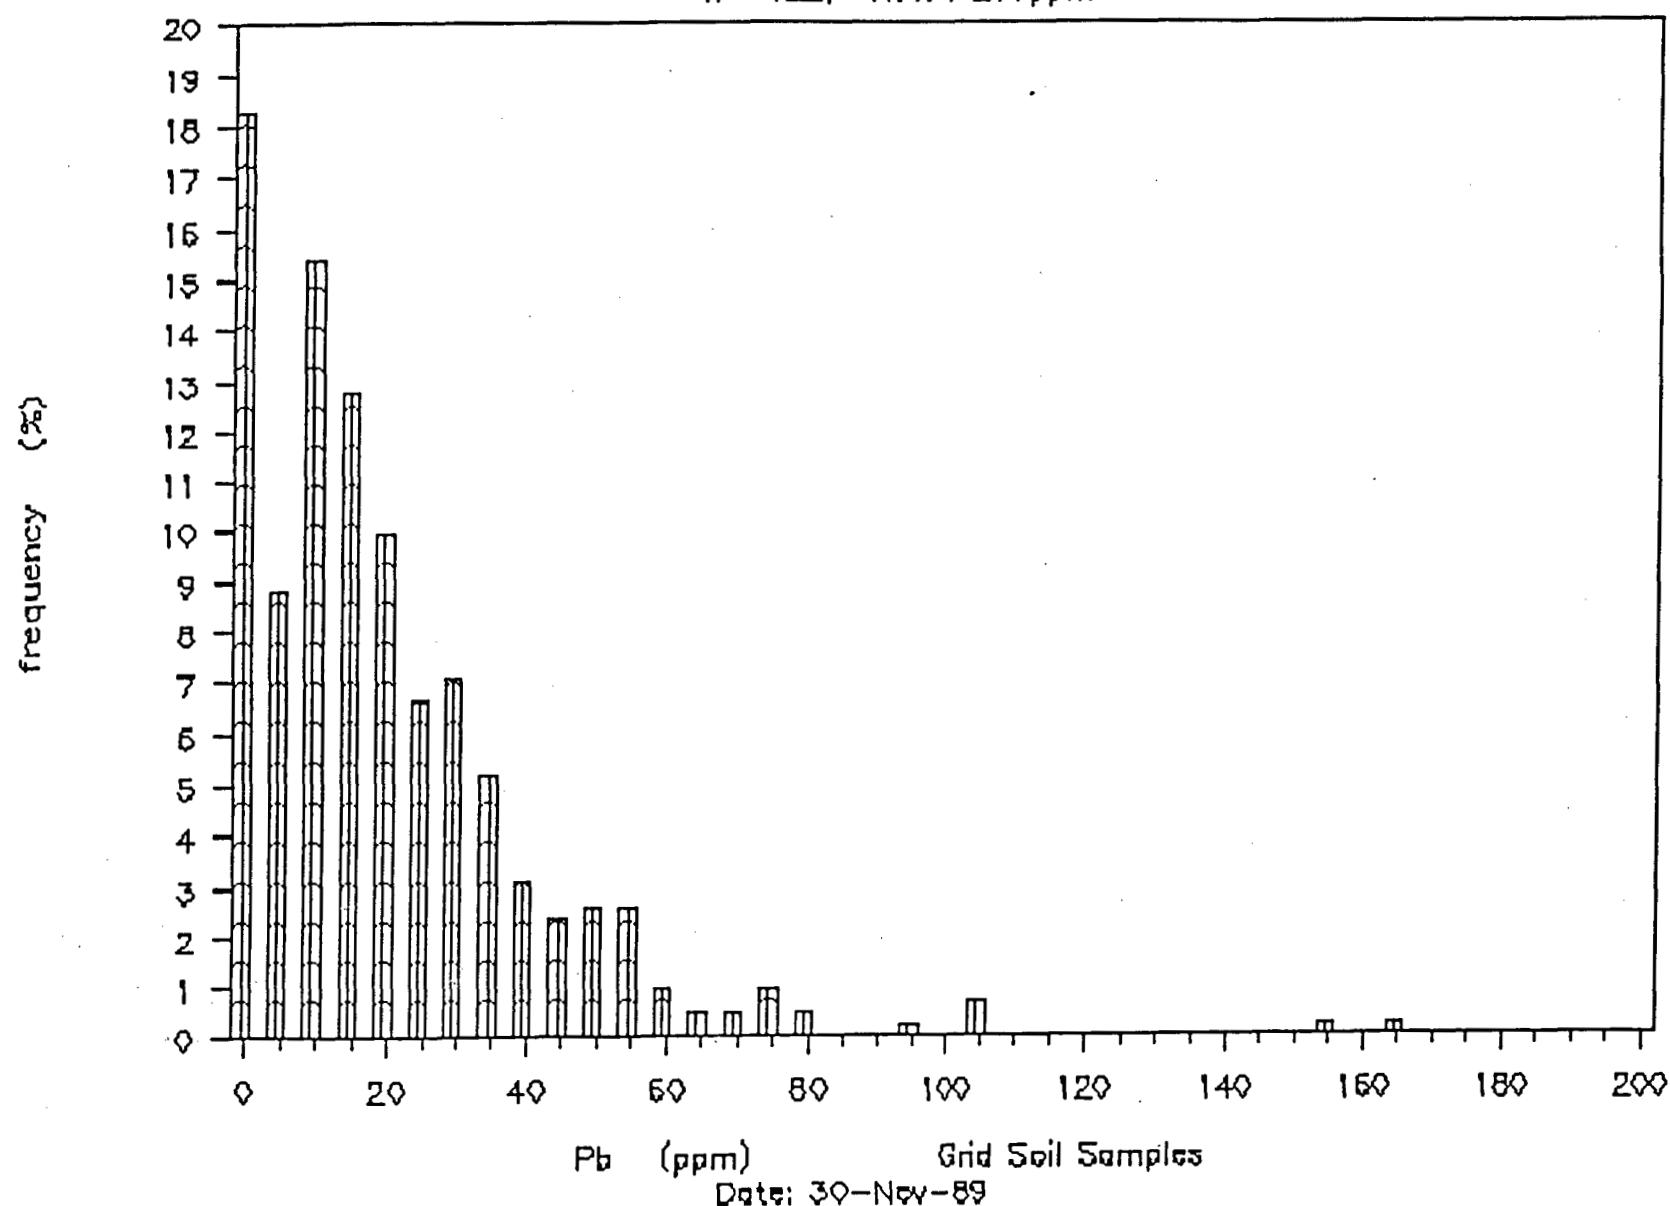

Project 519 – Stewart (Cu histogram)

n=422, 2.4% >200 ppm

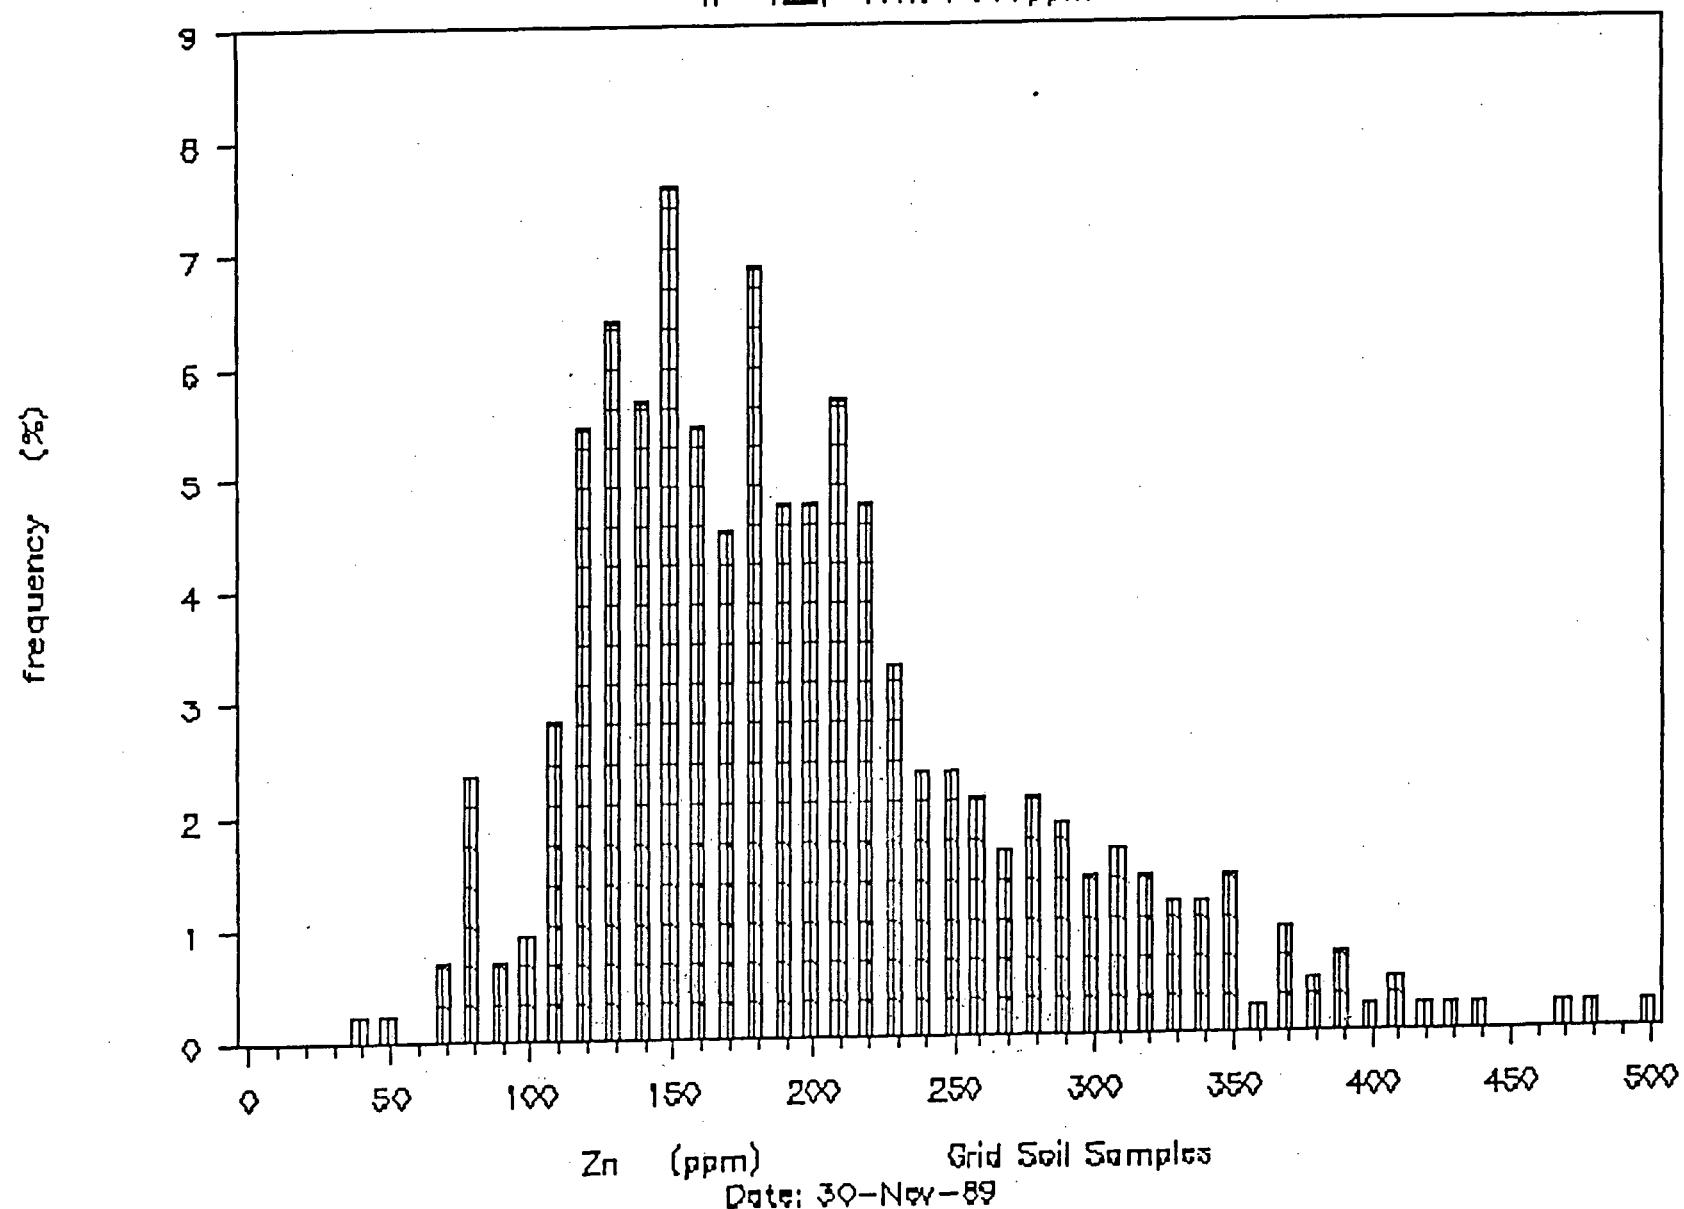

Project 519 - Stewart (Pb histogram)

n = 422, 0.5% > 200 ppm

Project 519 - Stewart (Zn histogram)

n = 422, 1.4% > 500 ppm

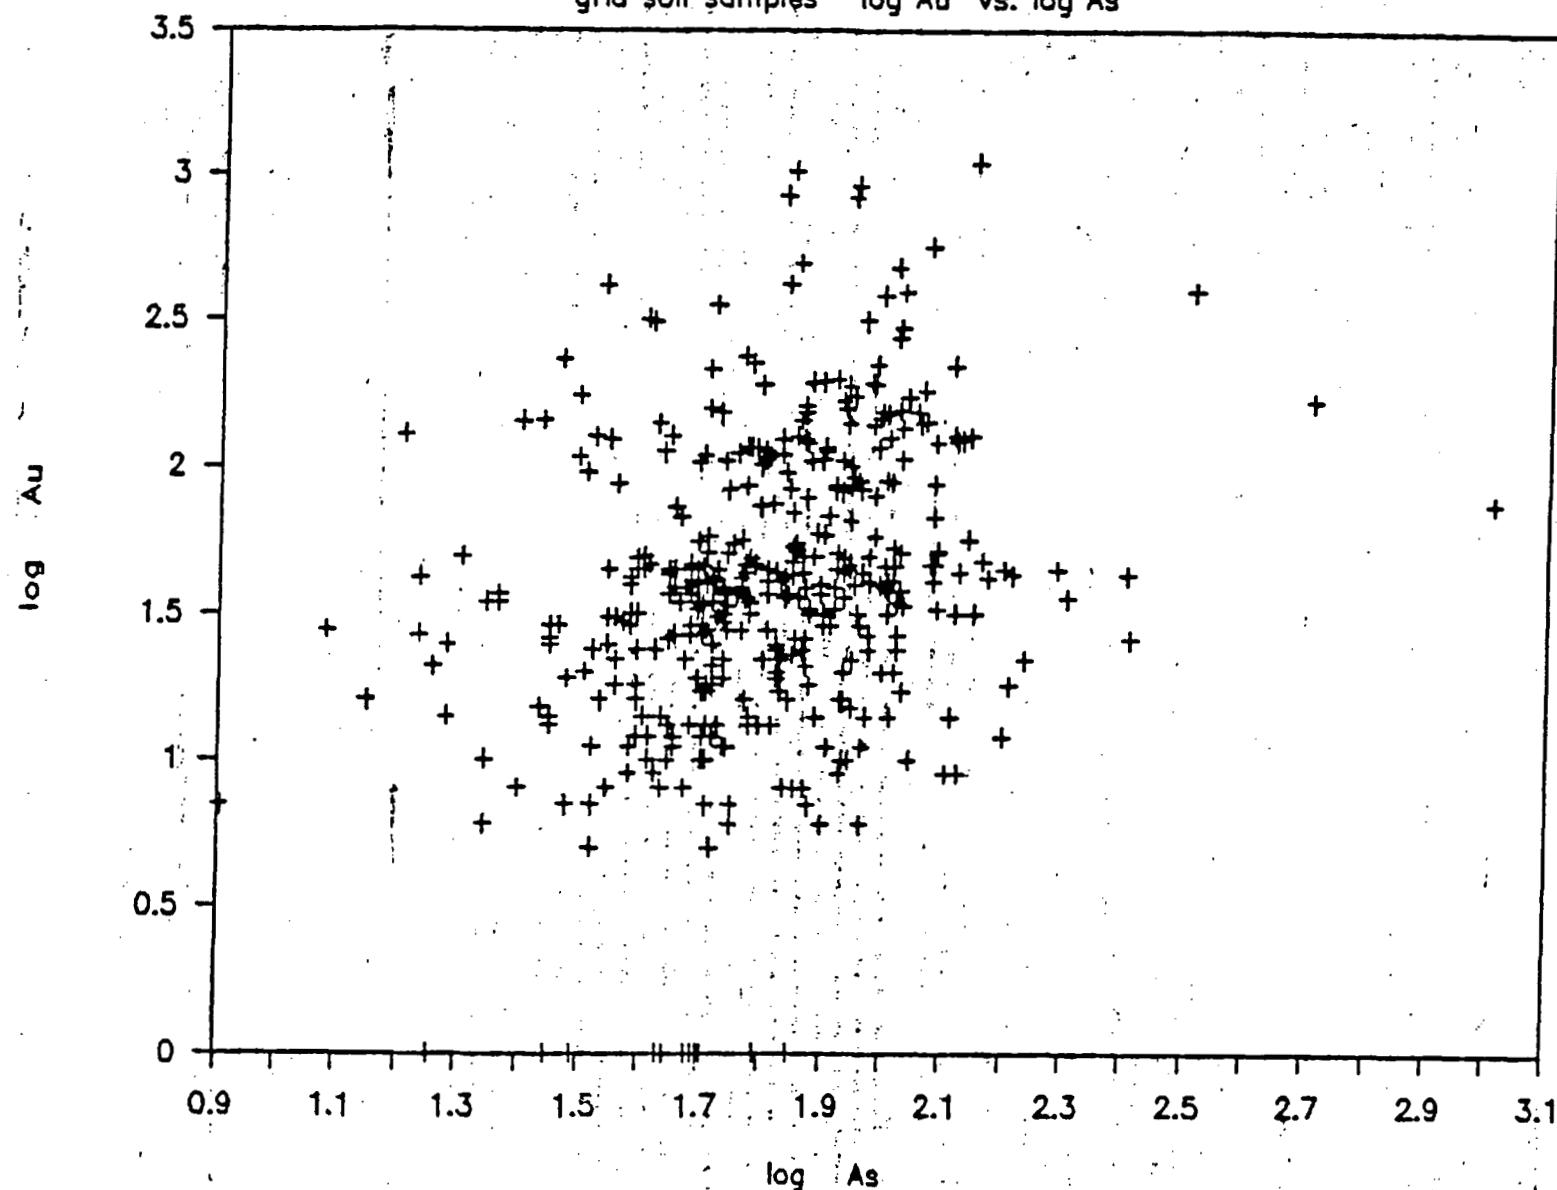

APPENDIX 7

Project 519 - STEWART

(XY Plot)

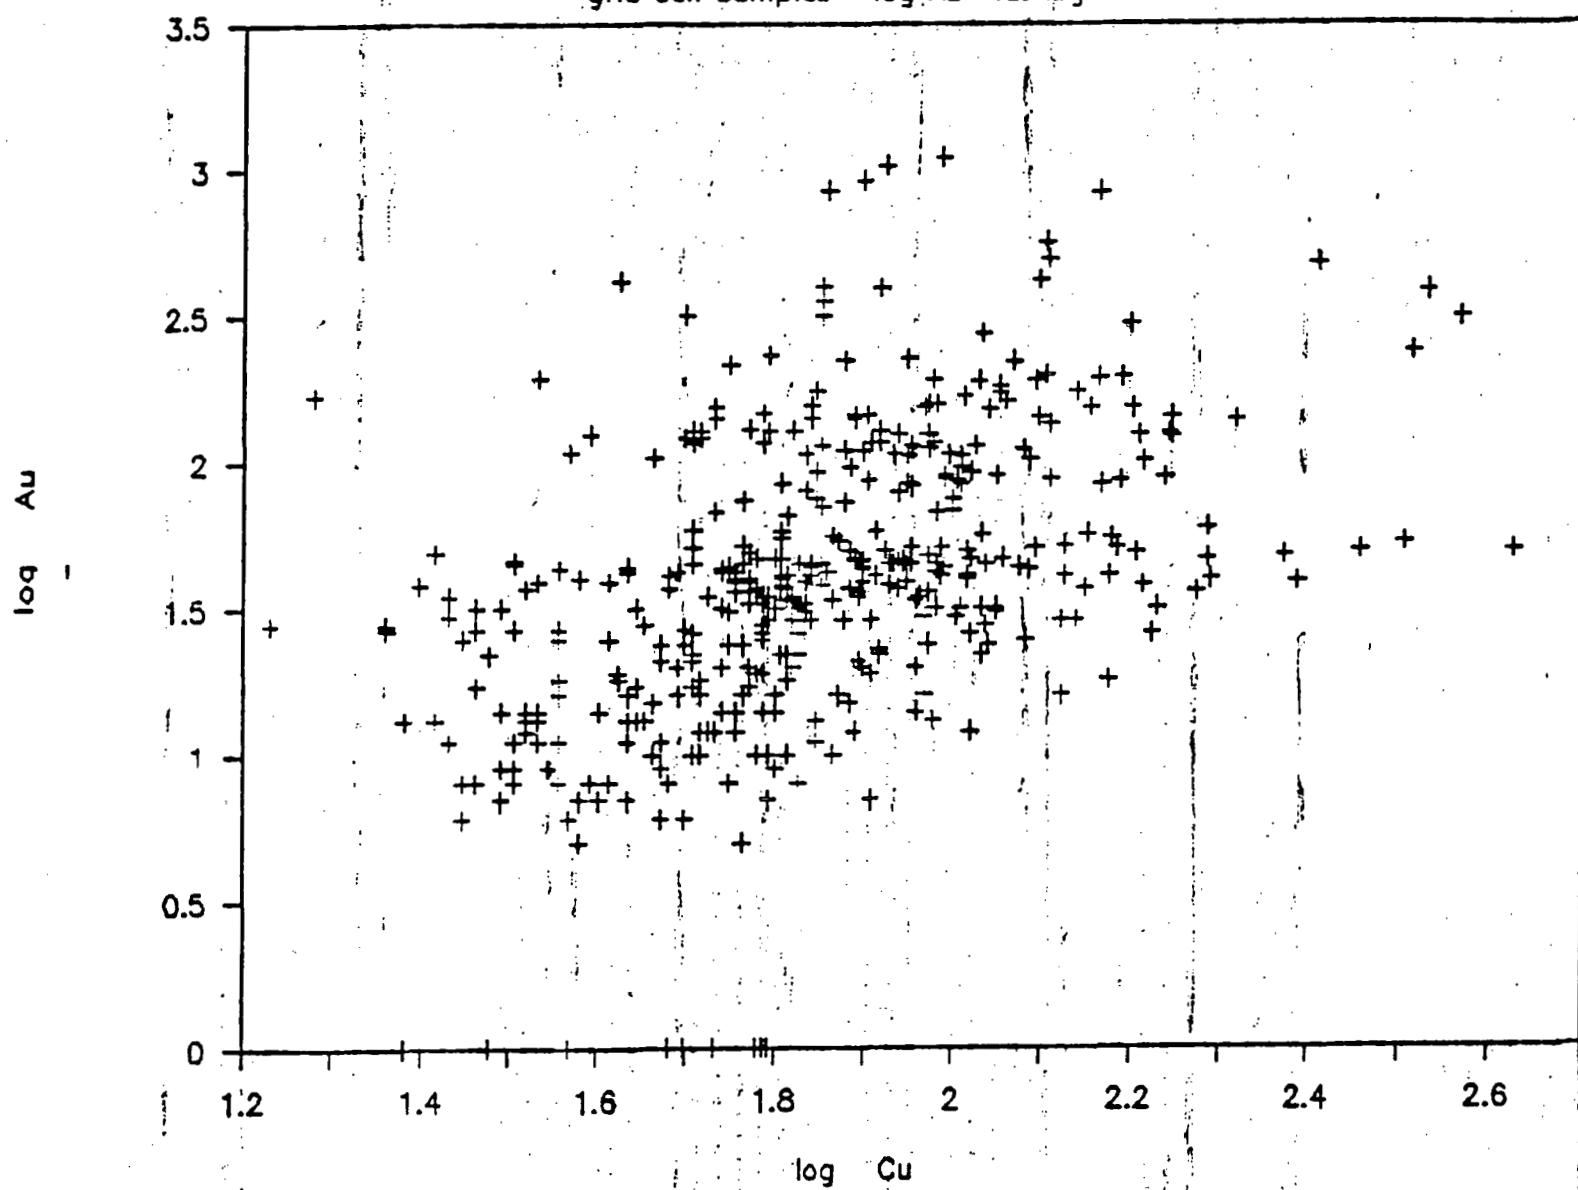

grid soil samples log Au vs. log As

Project 519 - STEWART

(XY Plot)

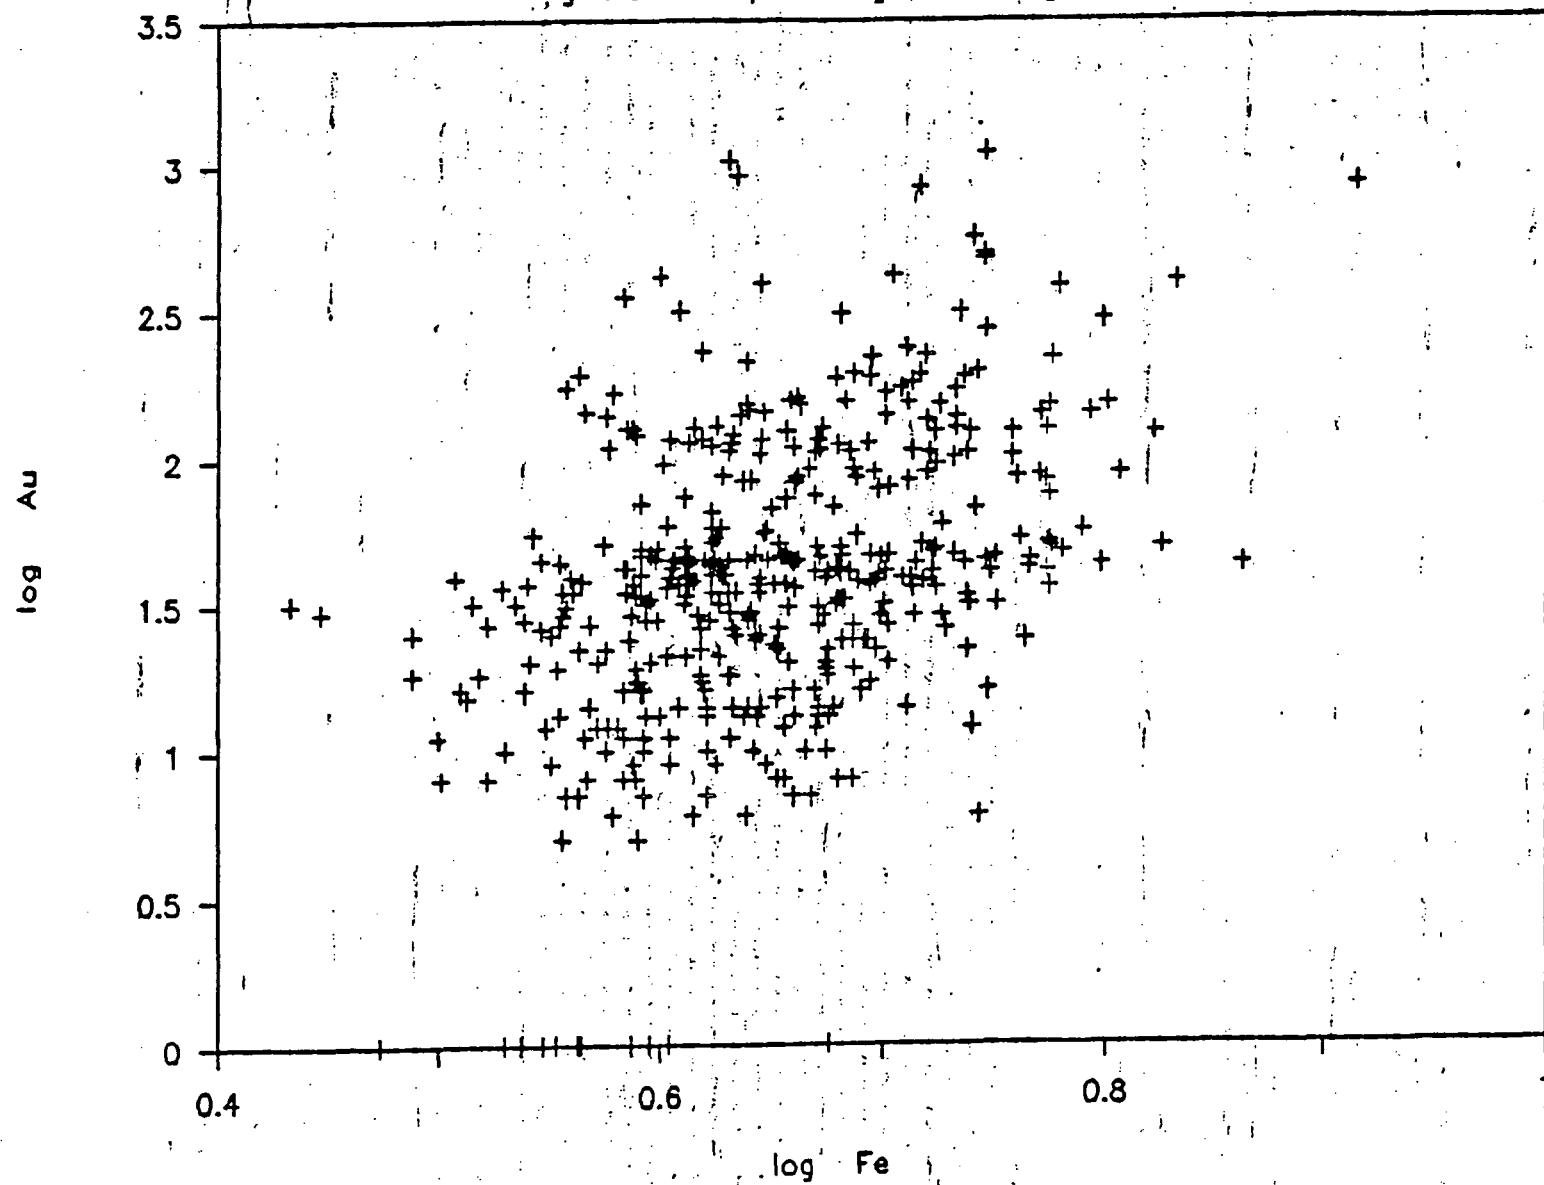

grid soil samples log Au vs. log Cu

Project 519 - STEWART

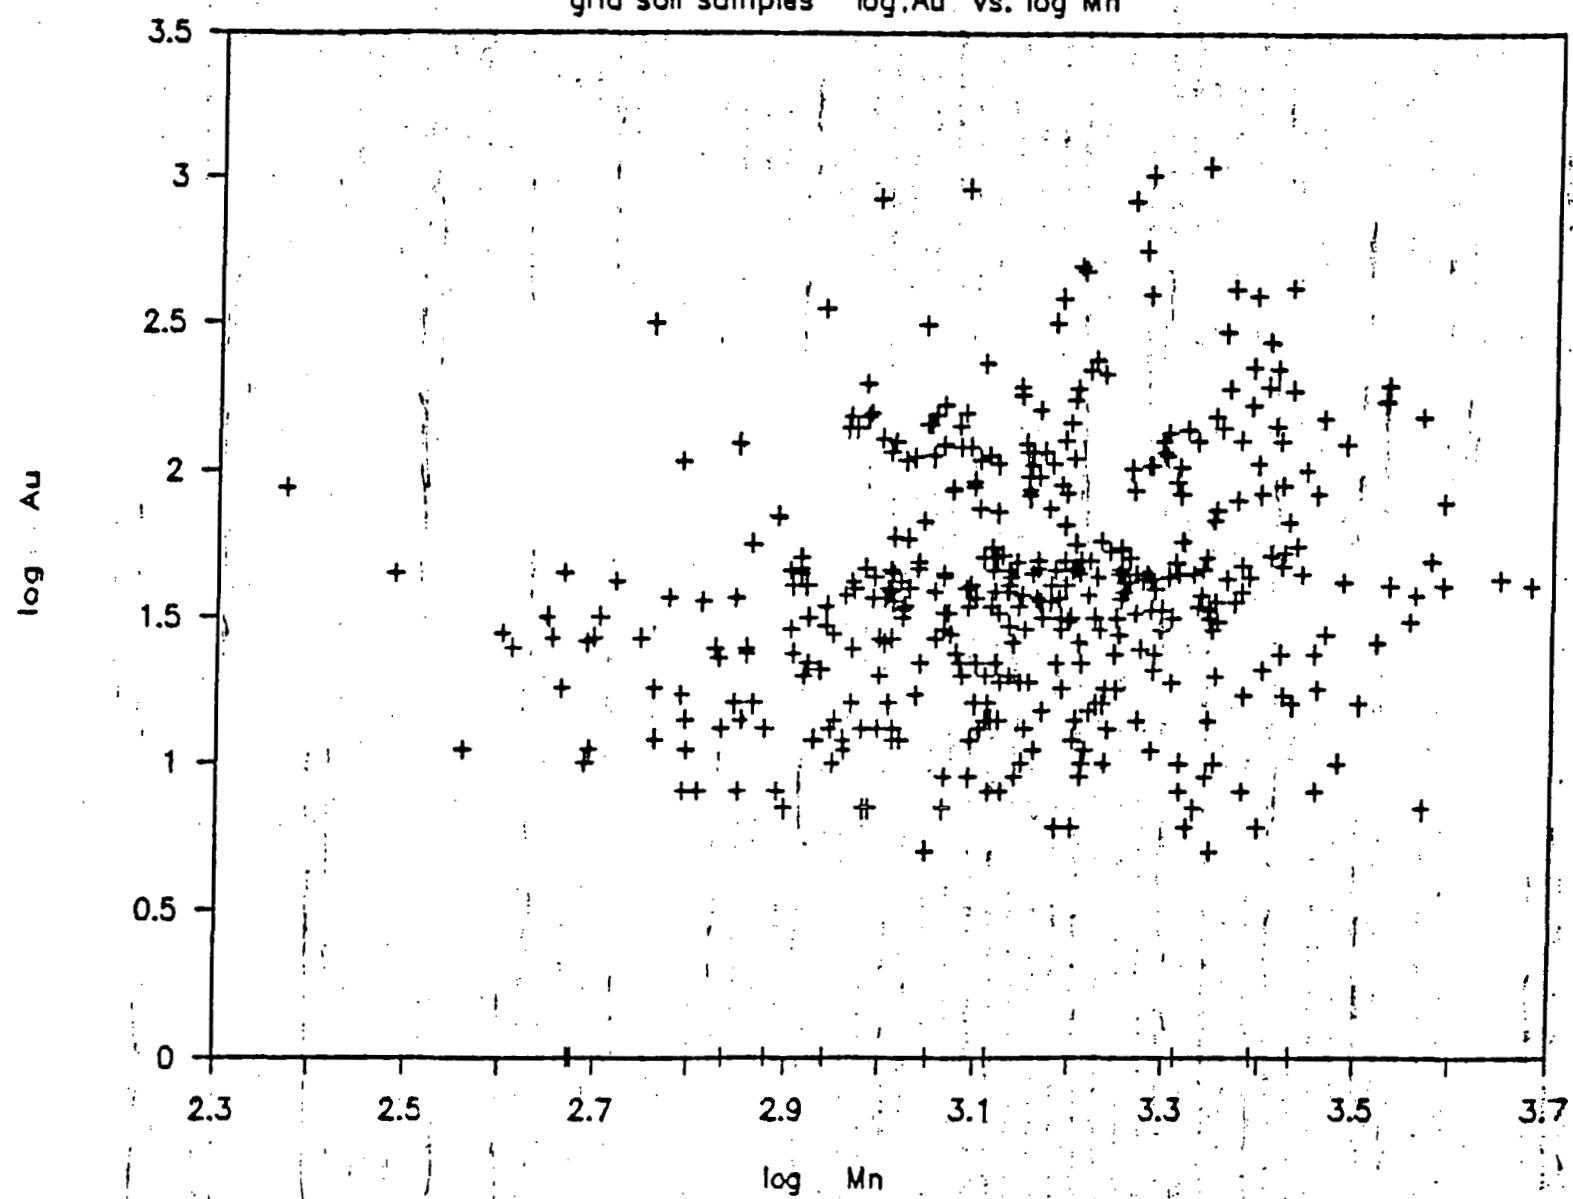

(XY Plot)

grid soil samples log Au vs. log Fe

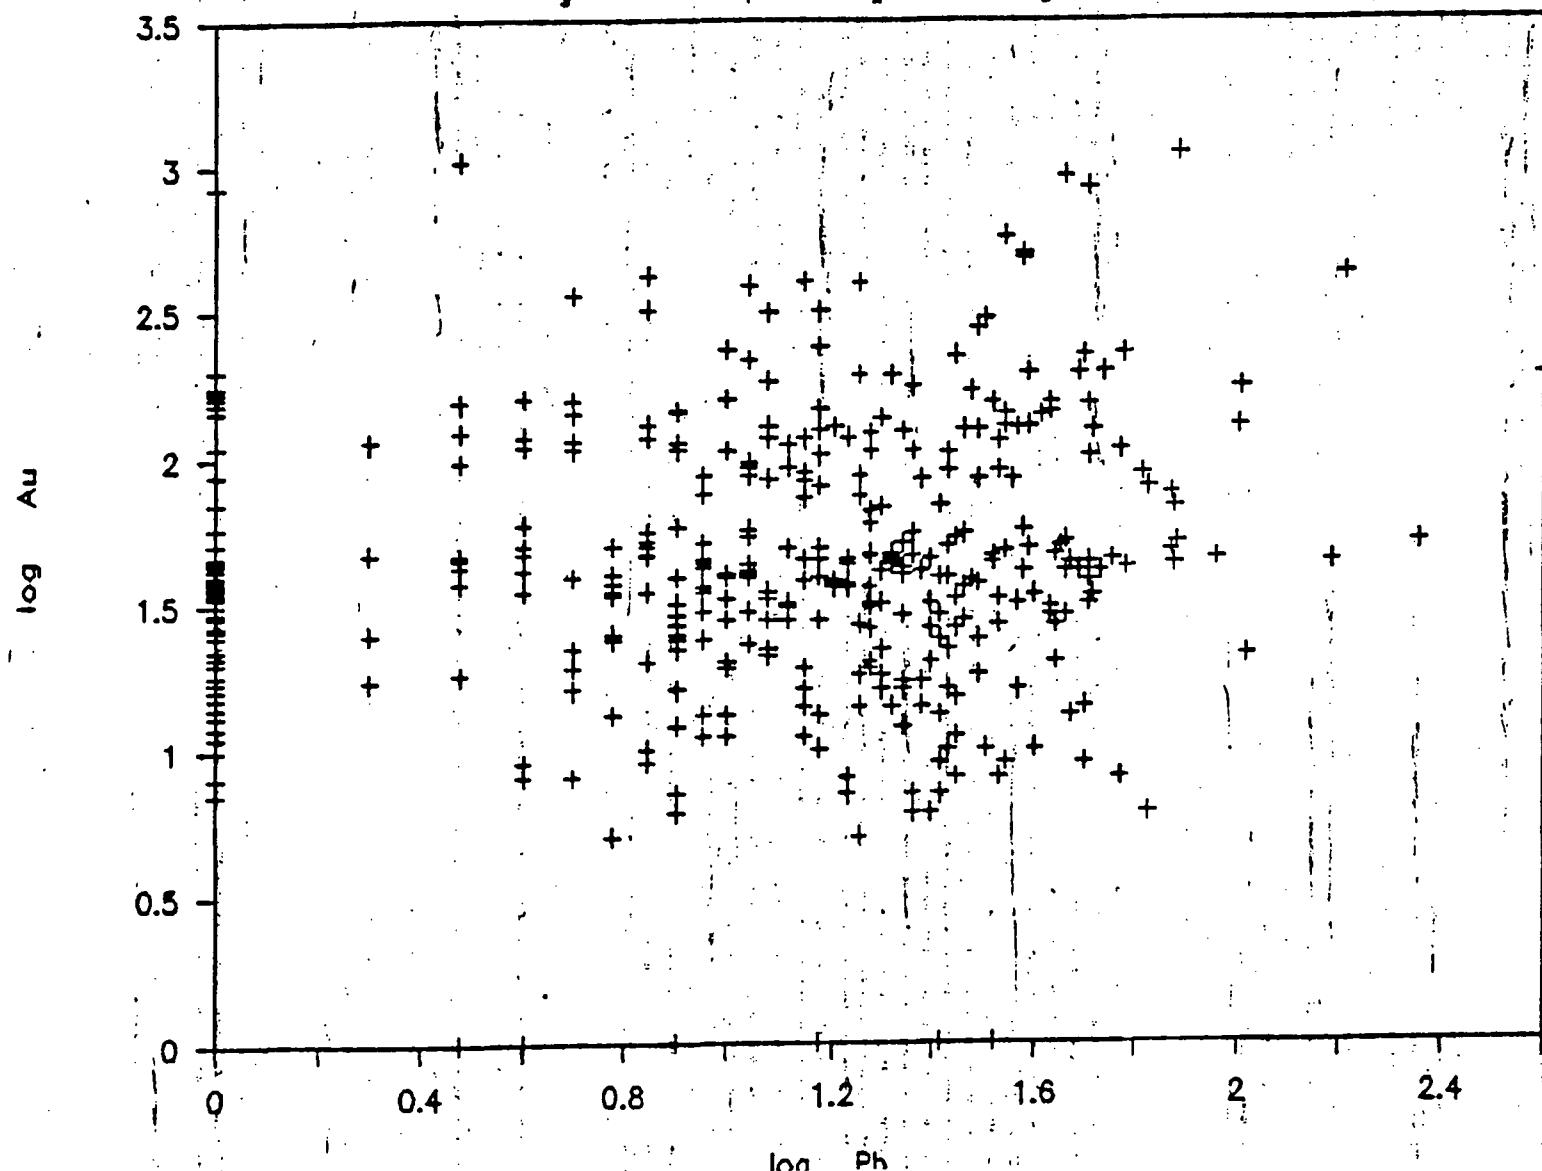

Project 519 - STEWART (XY Plot)

grid soil samples log.Au vs. log Mn

Project 519 - STEWART (XY Plot)

grid soil samples log Au vs. log Pb

Project 519 - STEWART

(XY Plot)

grid soil samples log Au vs. log Zn
