CONCLUSIONS

Geochemical sampling during 1989 indicates some potential for copper-gold mineralization. Follow-up prospecting late in the season suggests that values are mainly related to discrete veins in the periphery of a syenite stock near the contact with surrounding Triassic volcanic rocks.

RECOMMENDATIONS

Detailed follow up of anomalous soil samples and showings through the use of mapping, sampling and trenching is warranted. Further work would be contingent on results from this program.

SUMMARY

The SHELL 1-4 mineral claims, located 55 km northwest of Telegraph Creek B.C. are owned by Corona Corporation. Claims cover a syenitic stock intruded into Triassic andesitic volcanics. The property was previously explored as a porphyry copper prospect in the early 1970's and was recently acquired by Corona to test for associated gold content.

The 1989 work program was contracted by Equity Engineering Ltd. for Corona Corporation. Grid lines totalling 39 kms were cut and marked, from which 1,307 soil samples were collected. Concurrently, limited prospecting yielded 21 rock samples.

Late in August two Corona personnel spent two mandays investigating some of the soil anomalies, at which time 15 rock samples were collected. Total cost of 1989 exploration was \$42,608.27.

LOCATION AND ACCESS

The SHELL claims are located 55 km northwest of Telegraph Creek, in the Atlin Mining Division. Although present access is by helicopter, connection with the Golden Bear Mine access road which passes approximately 8 km south of the claims would be feasible.

The claims are situated on the west side of the Sheslay River. Terrain is moderately steep. Vegetation consists mainly of thin pine and occasional spruce, with underbrush throughout.

CLAIMS

Claim status is shown in the Table below and on fig. 2. All are held 100% by Corona Corporation and are located in the Atlin Mining Division.

<u>Claim</u>	<u>Record No.</u>	<u>No. of Units</u>	<u>Expiry Date</u>	*

* with application of work described in this report.

REGIONAL GEOLOGY

Geology of the Tahltan-Hackett-Sheslay River consists of Upper Triassic andesitic volcanics which have been intruded by granitic rocks assumed to be satellite plutons to the main Coast Complex. These units are in turn overlain by Late Tertiary or Pleistocene basalt and olivine basalt related to the extensive Level Mountain flows.

SHELL CLAIMS

 CORONA CORPORATION

SHELL PROPERTY CLAIM LOCATION MAP

DATE: DEC. 1989 SCALE: 1: 50,000 DRAWING No. Fig. 2

PROPERTY GEOLOGY

Although rigorous geological mapping was not part of the 1989 programme, a brief description of property geology is appropriate.

Approximately 80% of the property is underlain by fine to medium grained, dark grey/black andesitic volcanics. Disseminated pyrite (primary?) is common.

The volcanics have been intruded by an irregular shaped north-northwesterly trending tongue of the Mount Kaketsa stock. This is a fine to medium grained, K-spar rich rock, tentatively defined as a syenite, although it may in part be a highly K-spar flooded monzonite.

Mineralization consists of pyrite, chalcopyrite, pyrrhotite and malachite/azurite. Most commonly these are found in narrow, discontinuous fracture veins peripheral to the syenite, with lesser disseminated mineralization in the syenite.

GEOCHEMISTRY

Between June 23 and July 10 a contract crew from Equity Engineering cut and marked a 2 km baseline and 35 km of grid lines at 100 m spacing. The grid was tied into the SHELL 1 & 2 L.C.P. Grid lines and baseline were sampled at 25 m spacing, yielding 1,307 soil samples. Samples were collected from the 'B' horizon, which is generally well developed beneath a thin organic cover. At several sites, usually in the southern half of the grid, lack of soil precluded proper sample collection.

Samples were shipped to Acme Analytical Labs in Vancouver for analysis by standard geochemical techniques. A 0.5 gram sample was tested for 30 element content by ICP, with a separate 10 gram sample analyzed for gold using FA/AA techniques.

Analytical results are attached as Appendix 'C', with copper, gold and zinc values plotted on figures 4, 5 and 6.

DISCUSSION OF RESULTS

Gold values range from 1 to 743 ppb. Elevated values, most of which are on the western portion of the grid, are clustered in north trending linear zones, subparallel to the apparent syenite/andesite contact. As this portion of the grid is characterized by high relief, thin soil and fair bedrock exposure, it is expected that gold content in soil will be of similar magnitude to the underlying rock.

Copper displays a much wider range of values than gold, from 20 to 33,931 ppm., although overall distribution is similar. Elevated values are concentrated in the steep rocky area from 200 to 500 m south of the baseline and in the southeast corner of the grid where chalcopyrite bearing veins are exposed in steep cliffs above the Sheslay River. Values can be related to bedrock geology with the syenite tongue reflected by copper-in-soil in the 50 to 800 ppm range, the surrounding andesites with 20 to 200 ppm, and the highest values overlying the syenite/andesite contact zone.

Zinc values are also widely variable, from a background of approximately 100 ppm. to a high of 8119 ppm. Elevated zinc values occur in two populations; those associated with high copper throughout the grid and a separate zinc anomaly in the northwest quadrant of the grid. As zinc anomalies were not investigated during follow-up work no explanation as to their source or significance will be attempted.

Overall geochemical results suggest that potential for a large porphyry copper-gold system on the Shell claims is limited.

PROSPECTING

Limited prospecting was undertaken by Equity personnel concurrently with the soil sampling and by Corona following receipt of initial results. During this work, a total of 36 rock samples were collected. Analysis was by Acme Analytical Labs of Vancouver, using both 30 element ICP and gold by FA/AA. Sample descriptions are attached as Appendix 'A' and analytical results as Appendix 'B'. with rock sample sites are plotted on Fig. 7.

Prospecting indicates that copper and gold values are both restricted to narrow (<30 cm) pyrite/chalcopyrite bearing quartz veins found near the periphery of the syenite.

STATEMENT OF QUALIFICATIONS**DARREL L. JOHNSON**

I, Darrel L. Johnson, resident of the District of Coquitlam, B.C. declare that:

1. I hold a B.Sc. degree in geology, granted by the University of British Columbia in 1970;
2. I have worked as a geologist in all phases of mineral exploration work throughout B.C. since 1970;
3. I have been employed by Corona Corporation as a Senior Geologist since 1988;
4. I prepared this report based on published information for the area, discussions with contract personnel and visits to the property.

Darrel Johnson

ROCK DESCRIPTIONS

SHELL CLAIM GROUP

<u>Sample No.</u>	<u>Type</u>	<u>Description</u>
32101	grab	rusty sediments with chalcopyrite, pyrite.
32102	grab	rusty sediments with pyrite.
32251	float	argilllic altered intrusive with pyrite, chalcopyrite, pyrrhotite, molybdenite
32252	float	sericite and clay altered intrusive with pyrite and chalcopyrite.
32253	float	sericite/epidote altered intrusive with pyrite and chalcopyrite.
32254	grab 10 cm	sericite/epidote altered sheared intrusive with pyrite and chalcopyrite.
32255	grab 20 cm	sericite/epidote altered sheared intrusive with pyrite and chalcopyrite.
32256	grab 1 m	sericite/epidote/chlorite altered intrusive with pyrite, chalcopyrite, malachite, magnetite
32257	chip 1 m	sericite/epidote/chlorite altered intrusive with pyrite, chalcopyrite, malachite, magnetite.
32258	grab 5 m	sericite/epidote/chlorite altered intrusive with pyrite, chalcopyrite, magnetite.
32259	Grab 10 m	sericite/epidote/chlorite altered intrusive, sheared with pyrite chalcopyrite malachite.
32260	grab 4.5 m	sericite/epidote altered intrusive, with pyrite, chalcopyrite, magnetite, in shear zone.
32261	grab 25 cm	sericite/epidote altered intrusive with pyrite, chalcopyrite, magnetite, malachite in shear zone.
32262	grab 50 cm	chlorite/epidote altered intrusive with pyrite, chalcopyrite and massive magnetite.
32263	grab 4 m	epidote/chlorite-sericite altered intrusive with pyrite, chalcopyrite, malachite and quartz.
32264	grab 50 m	sericite/chlorite/epidote altered intrusive with quartz, calcite, pyrite and chalcopyrite.
32265	grab 2 m	sericite/calcite altered volcanic with pyrite, chalcopyrite and manganese stock.

<u>Sample No.</u>	<u>Type</u>	<u>Description</u>
32266	grab 10m	sericite/chlorite/epidote altered andesite and argillite with pyrite and chalcopyrite.
32267	grab 2m	sericite/chlorite/epidote altered intrusive with pyrite and chalcopyrite.
32268	grab 15m	sericite/chlorite/epidote altered intrusive with pyrite and chalcopyrite.
32269	grab 50cm	chlorite-sericite altered banded argillite with pyrite, sheared.
14051	drill core	muddy stuff, DDH #3, 170'-180'
14052	drill core	mud, DDH #3 180'-185'
14053	drill core	DDH #3 148'-156'
14054	drill core	DDH #3 156'-160'
14055	drill core	DDH #3 283'-289', epidote and sulphides.
14056	drill core	DDH #3 290'-300' sulphide stringers.
14057	drill core	DDH #3 393'-398 pyritic veinlets epidote volcanics.
14058	subcrop	copper stained rock from soil hole 13+00N 5+75E
14059	subcrop	barren fresh andesite, 13+00N 5+78E.
14060	subcrop	andesite rock from pit 13+02N 5+75E.
14061	grab	barren andesite 12+89N 3+75E.
14062	chip 3 cm	white transparent quartz vein with blebs of chalcopyrite and malachite.
14063	1 m chip	host of 14062, mafic trachyte volcanic.
14064	grab	30 cm shear with 1 cm blue quartz vein.
14065	1 m chip	20 cm yellow jarosite Fe-stained siliceous fine-grained shear.

APPENDIX C
ANALYTICAL RESULTS - SOILS

GEOCHEMICAL ANALYSIS CERTIFICATE

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR MM FE SR CR P LA CR MG BA TI B W AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM.
 - SAMPLE TYPE: Soil -80 Mesh AU** ANALYSIS BY FA+AA FROM 10 GM SAMPLE.

DATE RECEIVED: JUL 12 1989 DATE REPORT MAILED: July 20/89 SIGNED BY: C. L. D. TOYE, C. LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

GEOCHEMICAL ANALYSIS CERTIFICATE

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM.
 - SAMPLE TYPE: P1-P28 SOIL P29 ROCK AU** ANALYSIS BY FA+AA FROM 10 GM SAMPLE.

P - Pluvicized

S4E12DATE RECEIVED: JUL 17 1989 DATE REPORT MAILED: July 27/89 SIGNED BY C. L. Tung, D.TOE, C.LEONG, J.WANG; CERTIFIED B.C. ASSAYERS
