Appendix I	List of Analytical Results for Soils
Appendix II	Basic Statistics, Correlation Matrix and Histogram Plots of Geochemical Data

1.0 Summary

The TR claims are located approximately 125 kilometres southwest of Williams Lake, British Columbia. They adjoin the northwestern portion of the claims covering the Fish Lake copper-gold porphyry deposit.

The claims were located to cover the drainage area of a gold anomaly in a bulk stream sediment sample. The property is underlain by sediments of the Kingsvale Formation, which are intruded by a Tertiary quartz-diorite stock. Target mineralization is a "porphyry" style low-grade gold deposit.

A small soil grid was established which returned weak and sporadic results. Geologic mapping did not locate mineralized or altered bedrock/float in the area of anomalous soils, but bedrock exposure must be considered poor.

More exploration work covering a larger portion of the claim block is required to determine the source of the original bulk stream sediment anomaly.

2.0 Description of Property

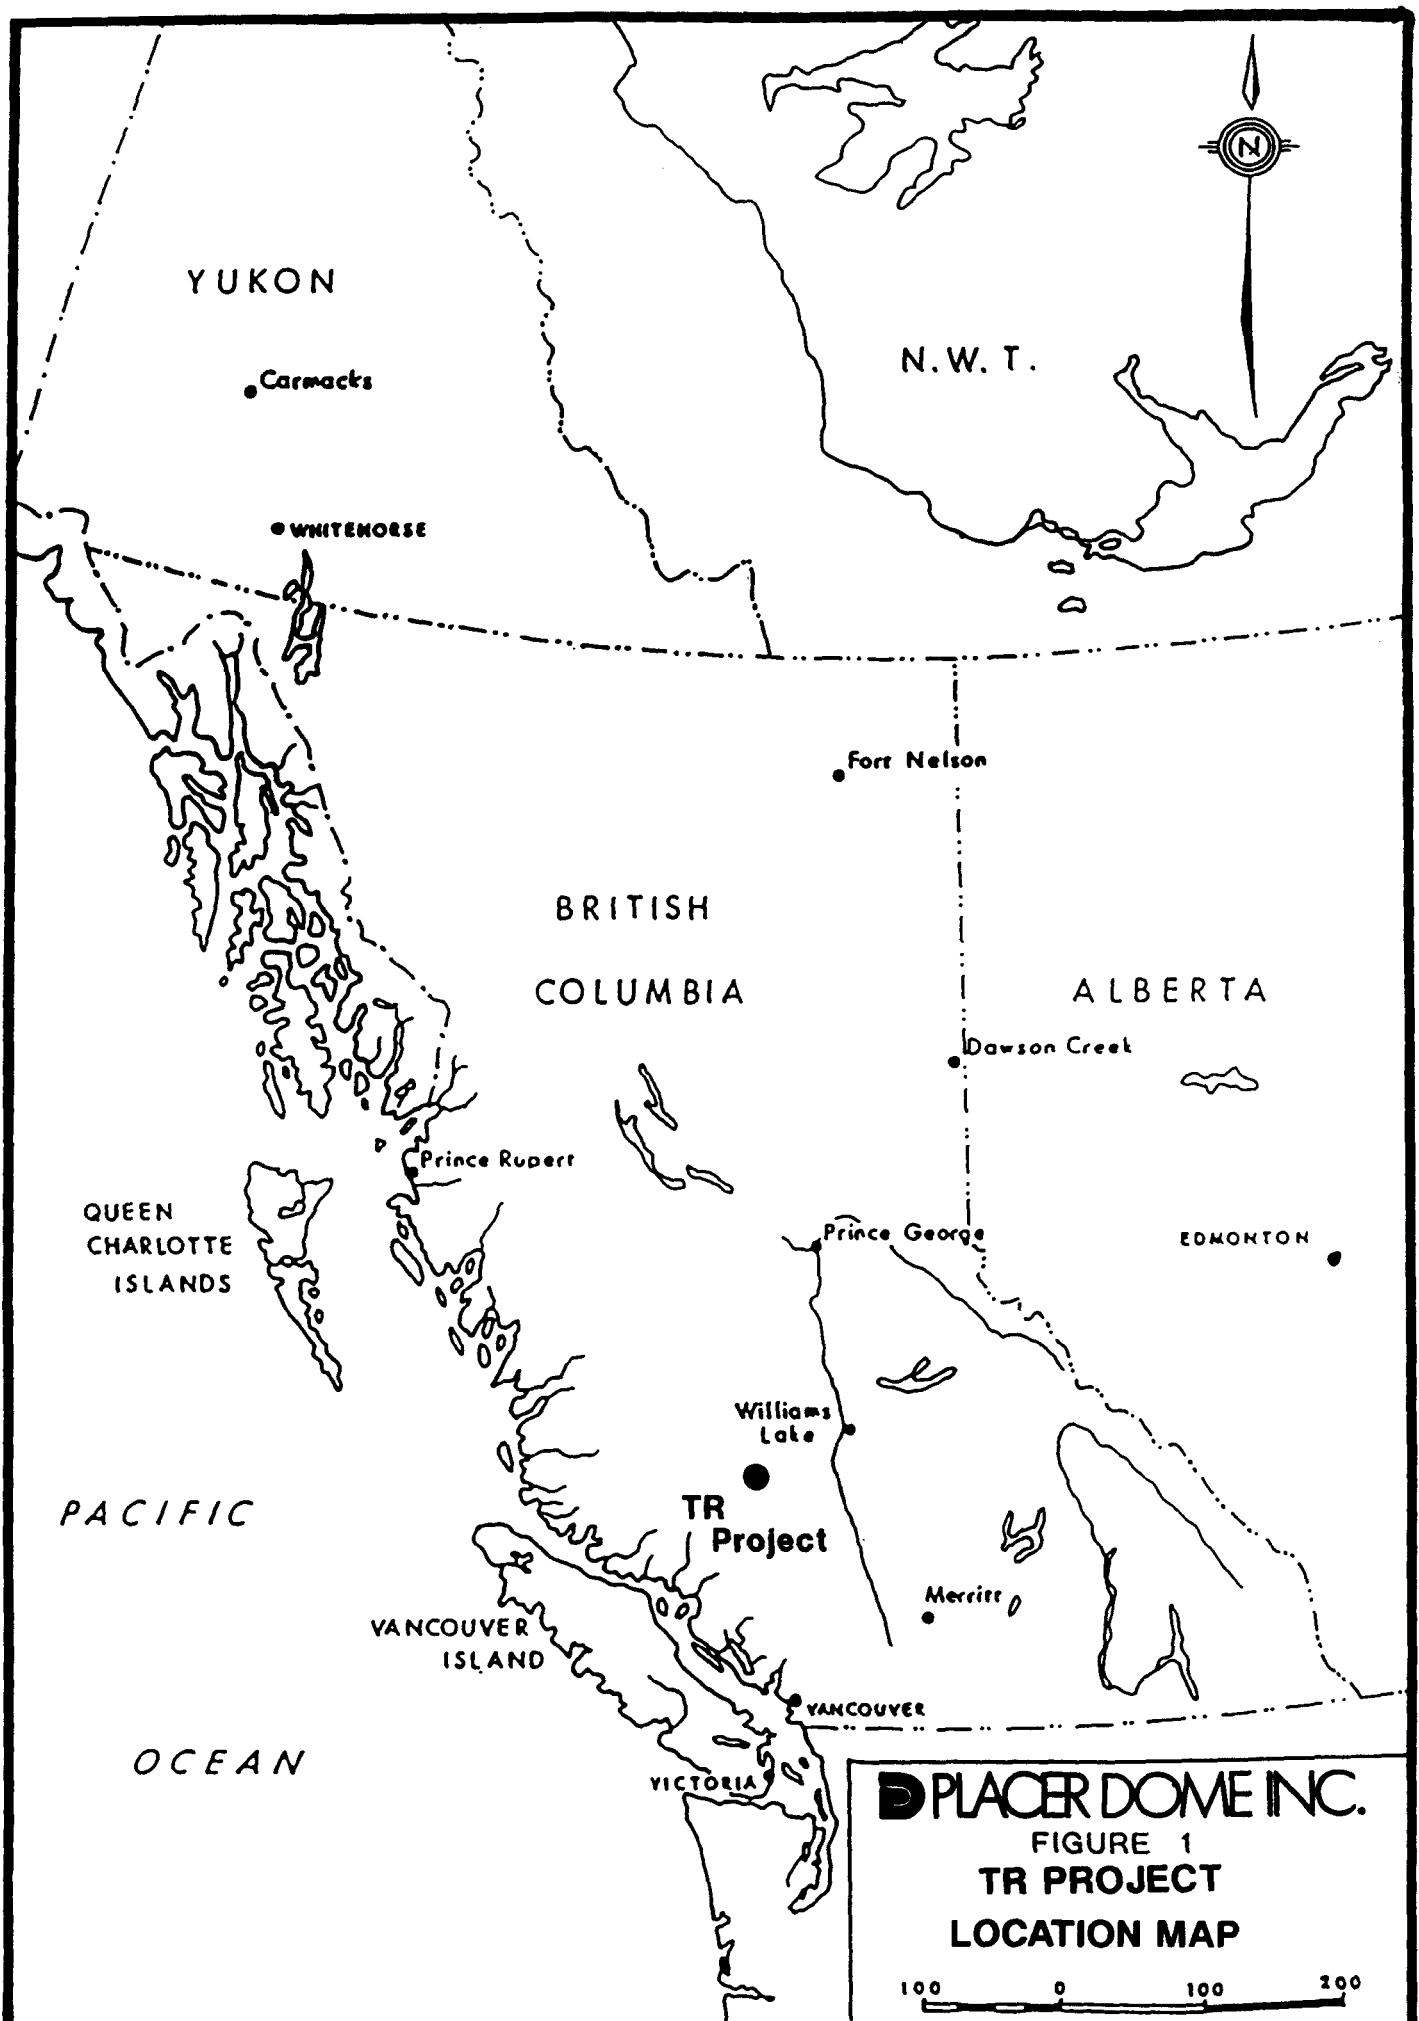

2.1 Objective

The TR claims were staked to cover the drainage system of a 2950 ppb gold anomaly in the -150 mesh fraction of a bulk stream sediment sample. A small soil grid was established and prospecting/mapping traverses were conducted in an attempt to locate the source of the anomaly.

2.2 Location and Access

The TR property is located approximately 250 kilometres north of Vancouver in the Chilcotin Plateau. The claims are roughly centred on Cone Hill, which is immediately east of the Taseko River and eight kilometres north of Fish Lake.

Access is via Highway 20 from Williams Lake to Hanceville, followed by approximately 80 kilometres of good quality gravel road to the property (see Figure 1). This road traverses the western edge of the claim block; access to the rest of the property is by foot.

2.3 Physiography

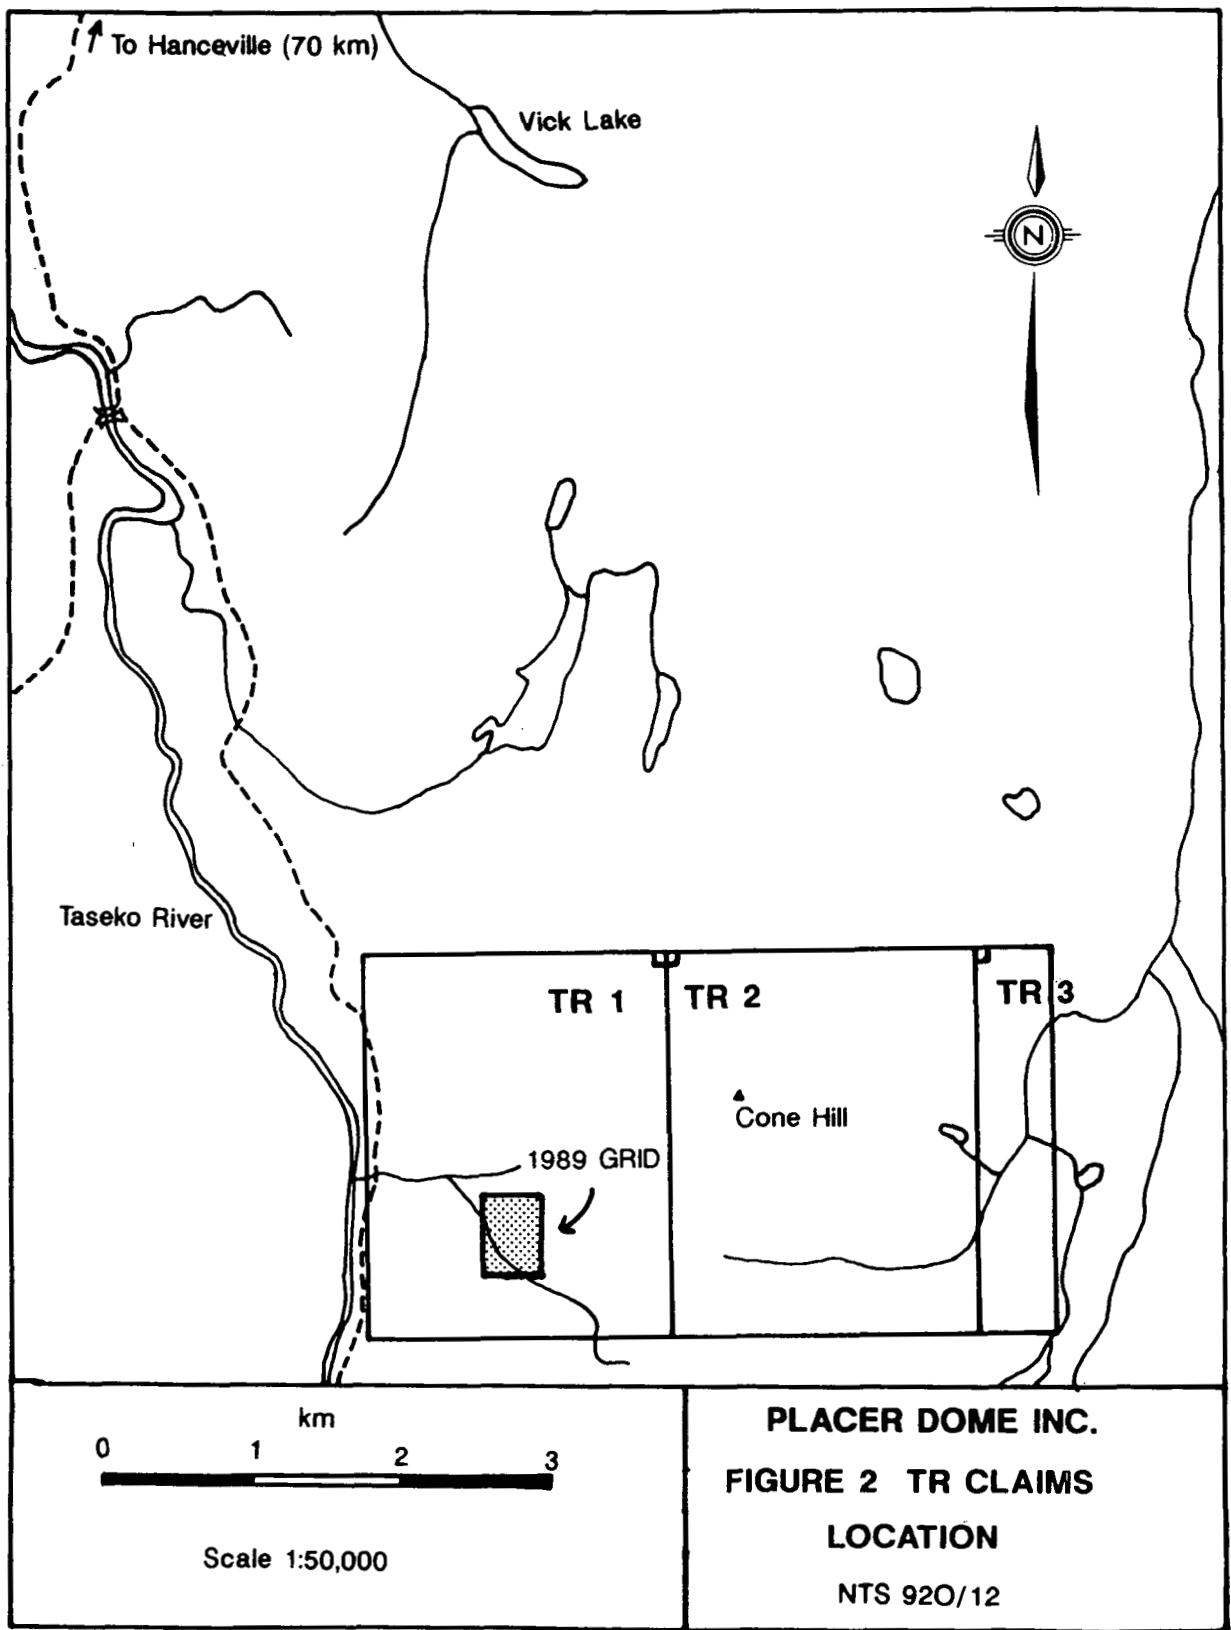

The property covers the relatively gentle slopes of Cone Hill. Forest cover consists of spruce, pine and poplar. A large forest fire burn covers the northwestern slope of Cone Hill. Elevations range from 4000 to 5800 feet. There is no current land use, with the exception of potential timber harvesting.

2.4 Claim Status

The TR property consists of three modified grid mineral claims. A claim schedule is listed below in Table 1 and the claims are shown on Figure 2. The expiry dates shown take into account the assessment work documented in this report being accepted as applied.

Table 1

<u>Claim Name</u>	<u>Units</u>	<u>Record No.</u>	<u>Expiry Date</u>	<u>Owner</u>
TR 1	20	2984	Jul. 14, 1992	Placer Dome Inc.
TR 2	20	2985	Jul. 14, 1992	Placer Dome Inc.
TR 3	5	2986	Jul. 14, 1992	Placer Dome Inc.

2.5 History

There is little documented exploration activity in the immediate area of the current claims. Brinco Mining Limited conducted a regional geochemical survey in 1984, and staked claims covering the Cone Hill area. Preliminary surveys detected sporadic anomalous gold-in-soil values on Cone Hill (Epp, et. al., 1985). Some hand trenching was conducted to follow-up the anomalies, but bedrock was not reached. Brinco's claims subsequently lapsed.

The Fish Lake copper/gold porphyry deposit is located immediately southeast of the TR claims. Exploration work by several companies in the 1960's and early 1970's has outlined a deposit of 200 million tonnes grading 0.24 % copper and 0.48 g/t gold.

3.0 Regional Geology

The claim area is underlain by rocks forming part of the Tyraughton Trough successor basin. Mid-Jurassic to late Cretaceous sedimentary and volcanic rocks of the Kingsvale Group form a belt of northwest trending, folded, and faulted lithologies.

Younger plutonic to hypabyssal stocks and dyke complexes have intruded the Kingsvale Group. Relatively flat lying basaltic lavas of the Pliocene and Miocene age overlie considerable portions of the Kingsvale Group and the plutonic rocks.

Large scale transcurrent movement has occurred along the northwest trending Yalakom fault. Smaller scale related faults trend north-northwesterly.

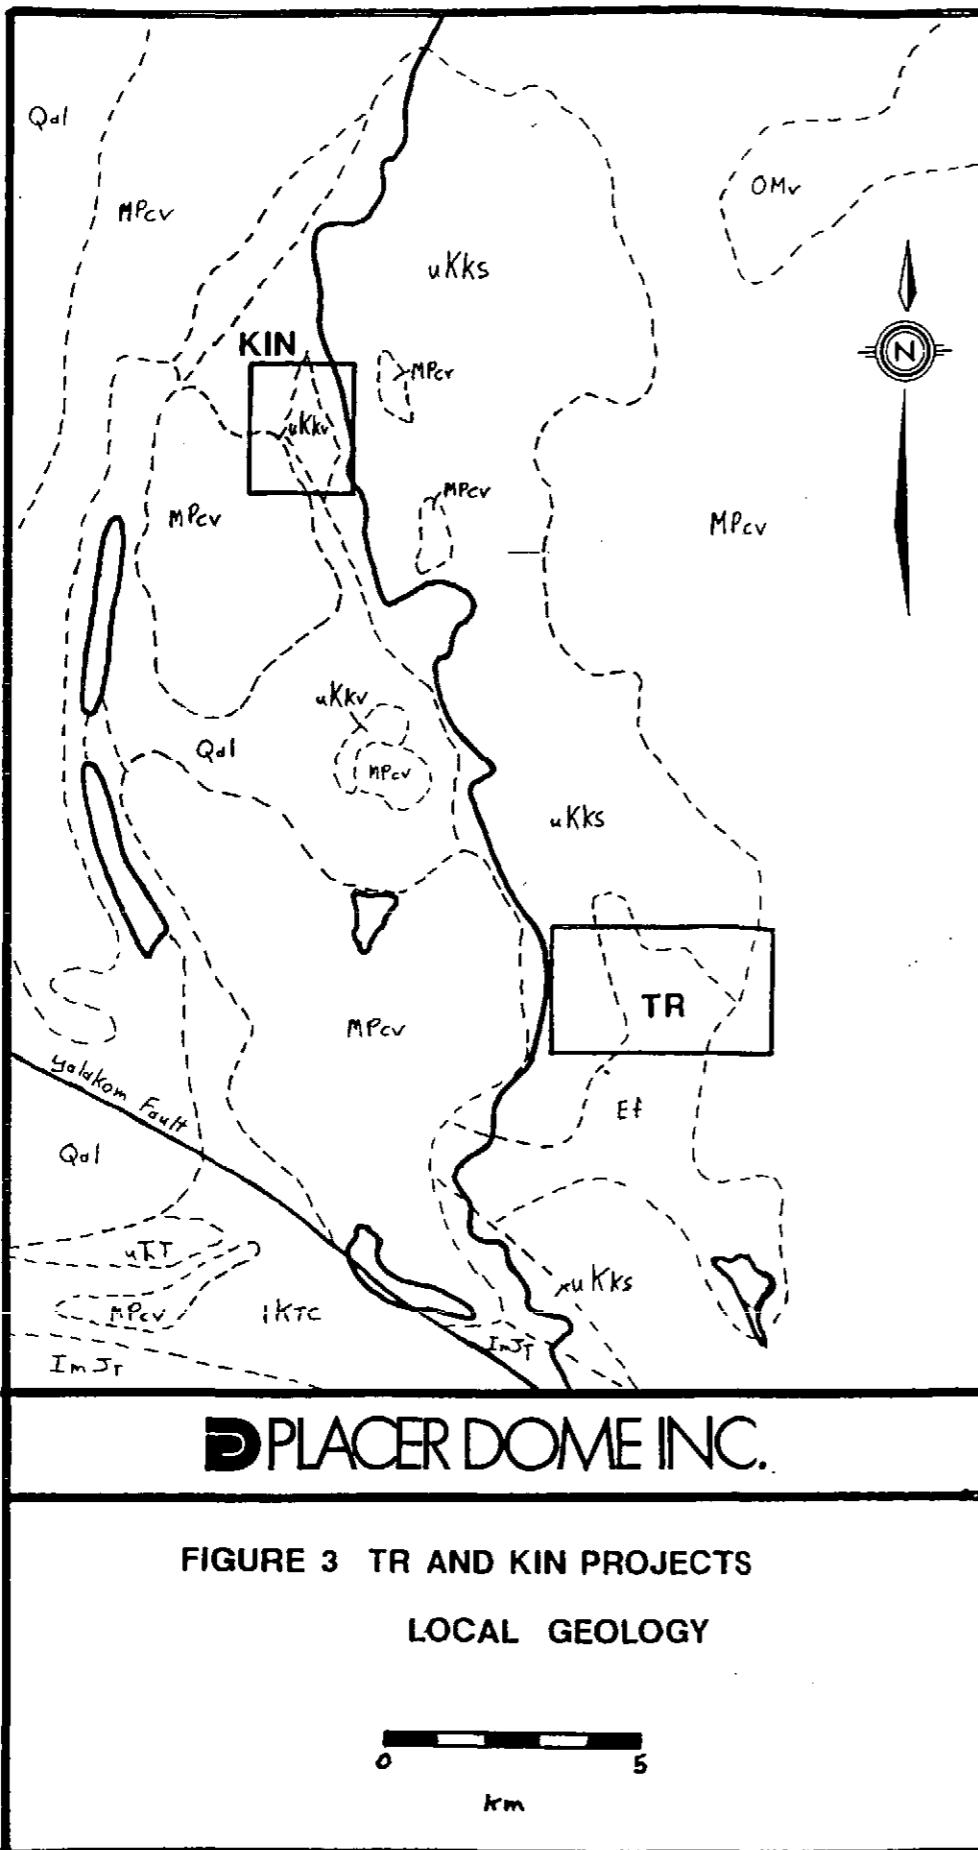

4.0 Property Geology

The geologic setting of the TR claims is illustrated on Figure 3. The property is underlain by volcanic and sedimentary rocks of the Kingsvale Group. They consist of well bedded sandstone, conglomerate, greywacke, and lithic tuff. These units trend north-northwesterly and tend to dip steeply, and are exposed mainly on the western side of the property.

The Kingsvale units have been intruded by a Tertiary stock of quartz diorite composition. It is typically medium grained and displays distinctive phenocrysts of hornblende and biotite.

The Kingsvale and Tertiary intrusive rocks are exposed as a window within the relatively flat lying basaltic lavas of Pliocene or Miocene age. A north-northwest trending fault likely parallels the western claim boundary along the Taseko River.

No altered or mineralized bedrock or float were located during the cursory geologic mapping of the property.

LEGEND

SEDIMENTARY AND VOLCANIC ROCKS

QUATERNARY

PLEISTOCENE AND RECENT
[Qd1] Tills, gravel, sand, clay, and silt

UPPER MIOCENE AND/OR PLIOCENE
OOLIC TONAL GROUP

TERtiARY EOCENE

[Ef] Felsite, feldspar porphyry, biotite feldspar porphyry

Compilation by H.W. Tipper 1978

5.0 Soil Geochemical Survey

The geochemical survey on the TR claims included collection of 227 soil samples from a small grid and two reconnaissance lines along the sides of a west flowing creek. Survey control was maintained by compass and hip-chain. Lines on the grid are spaced 50 metres apart. Soil samples were collected at 25 metre intervals along the lines.

5.1 Sample Collection

A narrow bladed spade, a plastic spoon, and Kraft paper bags were used in the field to obtain and package the samples. Soil material was collected from the BC or B-horizon. Sample depths ranged from 15.0 to 40.0 centimetres, but commonly average 30.0 centimetres. Notes on the nature of the soil material collected and on-site conditions were recorded to aid interpretation of the geochemical results.

Soils on the TR Claims are generally well-drained and dry. They are very poorly developed and typically consist of a very thin organic layer over a very thin to non-existent grey leached layer, the A2-horizon. The B-horizon, or zone of metal and mineral accumulation, is only occasionally recognized as a distinct layer; commonly it is gradational into the C-horizon or parent material. The BC-horizon is typically medium to dark brown in colour; sometimes it has a lighter tan or greyish tint.

Examination of the sample field notes reveals that soils within the property have developed on either colluvium or till. This material is probably locally transported, however geochemical anomalies in colluvium and till should be traceable to their source. From examination of local air photographs, the regional ice movement appears to have been from the north to the south.

5.2 Sample Preparation and Analysis

All the soil samples were delivered to Eco-Tech Laboratory in Kamloops where they were oven dried and sieved to produce a -80 mesh fraction. A sub-sample was weighed for geochemical analysis. Each sample was analyzed for gold, silver, copper, zinc, lead, and arsenic. The digestion and detection techniques used for each element are given in Table 2 below.

Table 2

Analytical Extraction and Detection Techniques used by Echo-Tech Laboratories Ltd.

<u>Element</u>	<u>Unit</u>	<u>Grams</u>	<u>Digestion</u>	<u>Detection Limit</u>	<u>Instrumentation</u>
Cu	ppm	0.5	Aqua-Regia	1 ppm	Atomic Absorption
Zn	ppm	0.5	Aqua-Regia	1 ppm	Atomic Absorption
Pb	ppm	0.5	Aqua-Regia	2 ppm	Atomic Absorption (background corrected)
Ag	ppm	0.5	Aqua-Regia	0.1 ppm	Atomic Absorption (background corrected)
Au	ppb	10.0	Fire Assay	5 ppb	Atomic Absorption
As	ppm	0.5	Aqua Regia	1 ppm	Hydride Gen. A.A.

5.3 Data Treatment and Presentation

A list of the analytical results for the soil samples is given in Appendix I. Basic statistics and histograms were employed to examine the structure of the results for each element (Appendix II). Log-transformed data was used for calculation of the correlation matrix and construction of the histograms because preliminary examination of the raw geochemical results indicated that the distributions for most elements, except possibly lead and silver, are lognormal.

Plots illustrating the spatial relationships of the soil sample data are presented in Plates I to VI. Element concentrations at each sample site are classified into fixed ranges (class intervals) as

determined from the histograms. Symbols of fixed dimension were assigned to each class interval.

6.0 Discussion of Geochemical Results

Tabulated below are the basic statistics for soil geochemical results from the TR property.

<u>Element</u>	<u>Minimum Value</u>	<u>Mean</u>	<u>Maximum Value</u>	<u>Standard Deviation</u>
Copper	15 ppm	36 ppm	102 ppm	13 ppm
Zinc	42 ppm	86 ppm	211 ppm	25 ppm
Gold	3 ppb	11 ppb	90 ppb	11 ppb
Arsenic	3 ppm	13 ppm	70 ppm	10 ppm
Lead	1 ppm	6 ppm	17 ppm	3 ppm
Silver	.05 ppm	.09 ppm	.30 ppm	.05 ppm

Examination of the correlation matrix (Appendix II) for this element suite reveals a moderate statistical correlation between copper and arsenic values, and copper and lead values. A scatter plot of copper versus arsenic does demonstrate a correlation, but a plot of copper versus lead shows little correlation.

The following range of values are considered to be background, threshold, and anomalous concentrations for each element.

<u>Element</u>	<u>Background</u>	<u>Threshold</u>	<u>Anomalous</u>	<u>Plate No.</u>
Copper	< 30 ppm	30-50 ppm	> 50 ppm	I
Zinc	< 100 ppm	100-125 ppm	>125 ppm	II
Gold	< 5 ppb	5-20 ppb	> 20 ppb	III
Arsenic	< 15 ppm	15-20 ppm	> 20 ppm	IV
Lead	< 17 ppm	N/A	N/A	V
Silver	< 0.5 ppm	N/A	N/A	VI

Plots of the geochemical results for the various elements illustrate that underlying bedrock lithology does not appear to control element distribution. It is also noted that although background for gold is less than 5 ppb, gold distribution for concentrations less than 20 ppb appear to be a function of analytical noise rather than a response to natural features.

Higher concentrations of copper, zinc and arsenic do not clearly define multi-element geochemical anomalies, but rather separate sporadic areas of interest. Gold concentrations greater than 20 ppb form poorly defined and weak anomalies, but do indicate two general areas of interest. No anomalous levels of lead or silver were obtained.

The two areas of elevated gold values are located at the northern and southern portions of the grid, although the values are weak. Anomalous arsenic values are concentrated in the northwestern corner of the grid, and are open to the northwest. Copper and zinc anomalous values, form small isolated clusters.

7.0 Conclusions and Recommendations

The source of the bulk stream sediment gold anomaly was not located by the small survey conducted on the TR claims. Sporadic anomalous soil values in gold, arsenic, copper, and zinc were determined. Although these anomalies are not significant in themselves, they do provide an indication that a mineralized source may be located nearby.

More work is recommended to attempt to locate the source of the bulk stream sediment anomaly. Geologic mapping, soil geochemistry, and magnetometer and VLF-EM surveys should be completed over the claim block. These surveys will target specific areas for trenching and/or drilling.

10.0 Statement of Qualifications

I, Robert B. Pease, of 1872 Whistler Court, Kamloops B. C., do hereby certify that:

1. I graduated from the University of Waterloo, Waterloo Ontario, with an Honours B. Sc. Degree in Earth Sciences, in 1981.
2. From 1976 until the present, I have been engaged studying geology, or working in mineral exploration or mine geology, in various regions of Canada. I have been employed continuously by Placer Dome Inc., or subsidiaries, since 1982.
3. I am an Associate of the Geological Association of Canada, and a member of the Canadian Institute of Mining and Metallurgy.
4. I personally supervised and participated in the field work as described in this report, and have assessed the resulting data.

Respectfully Submitted,

Robert B. Pease
