LIST OF FIGURES

1. Introduction

The Happy Days Claim Group is located on the south side of Greenstone Mountain some 27 kilometres southwest of Kamloops. Access is from the Trans-Canada Highway west of Kamloops at Cherry Creek, then along good gravel roads to the Dominic Lake area (Fig 1.).

The claims are located at elevations between 1 350 and 1 650 meters. Upland pine forests cover an area of moderate relief containing a number of small lakes. Glacially derived overburden reaches depths of 30 m but some outcrop is present. Ice direction was from the northwest. Extensive clear-cut logging has made large areas of the property quite accessible.

A program consisting of geochemical soil sampling, magnetometer survey, and VLF-EM survey was carried out on two grids situated on the Happy Days claim and the Happy Days 4 claim. The work program was conducted during the period July 9 to July 19, 1990.

2. Property Description

The Happy Days Claim Group consists of the following claims:

<u>Claim Name</u>	<u>Units</u>	<u>Record No.</u>	<u>Expiry Date</u>
Happy Days	20	169	Dec. 30, 1992
Happy Days 4	18	1334	Aug. 8, 1995*

* Upon approval of assessment work described in this report. The Statement of Work was submitted August 3, 1990.

The claims are owned by Teck Corporation (70%) and Cominco Ltd. (30%) in a joint venture agreement with Teck as operator. The Happy Days and Happy Days 4 claims are subject to a production royalty agreement with Antelope Resources.

3. Previous Work

The area has been explored periodically since 1960 when Kennco conducted an exploration program on their DRG claims (Ass. Rpt. #325). Subsequent programs are described in the following reports:

Assessment Report No.	1009	Dominic Mining Co., 1967
"	1099	Noranda 1967
"	2511	Cominco 1970
"	3713, 4004	Mid-North Exploration 1972
"	5673	Cominco 1975
"	7337	Cominco 1979
"	8238	Cominco 1980
"	8580	Cominco 1980
"	17550	Teck Corp. 1988
"	17669	Cominco 1988

The Kennco survey (1960) outlined a broad area of anomalous molybdenum mineralization in the vicinity of the Roper Lake Stock, a calc-alkaline granitic pluton. A weaker pattern of copper and molybdenum values in soil extends to the north and northwest of the Roper Lake area in the direction of the alkalic Durand Lake Stock. The sporadic anomalous values are associated with a small plug of feldspar porphyry and fine to medium-grained diorites intruding overlying Nicola Volcanics. Subsequent work by Cominco has outlined a large low-grade molybdenite deposit centered on the Roper Lake Stock.

Induced polarization surveys conducted by Cominco personnel in 1980 (Ass. Rpt. 8580) outlined small weakly anomalous areas to the east of the Roper Lake Stock and north of Cornwall Lake. Further geological and geochemical surveys were recommended for this area.

4. Current Program

The current program was designed to further test the anomalous area northwest of Roper Lake to assess the gold potential of that area. In addition, the area of weak IP response north of Cornwall Lake was studied (Fig. 1).

On the Dominic Lake grid northwest of Roper Lake, 3.85 kilometres of line were run with chain and compass. Four east-west lines, 200 metres apart, were established and tied into a north-south baseline. On the Happy Days 4 grid, one

1 400 metre line running north south and a 500 metre crossline were located.

a) Geochemical Survey

A total of 77 samples were collected on the Dominic Lake grid at 50 metre intervals. A further 40 samples were collected on the Happy Days grid, also at 50 metre spacings. Most of the samples were collected from the top B-horizon which was generally found at depths ranging from 15 cm to 25 cm. A mattock was used to dig a hole through the A horizon to the top B horizon.

The soil samples were delivered to Kamloops Research and Assay Laboratories. The samples were dried and the minus 80 mesh fraction collected. Gold analyses were done at KRAL using a FA/AA method with a detection limit of less than 5 ppb. The additional 29 elements were analyzed by an ICP method at Acme Analytical Laboratories. Detailed descriptions of analytical methods and copies of assay certificates are in the Appendix.

On the Dominic Lake grid, copper and molybdenum values correlate reasonably well with results of earlier programs. The new gold data indicate the area to be weak relative to gold with a minor northwest trend suggested on the west side of the grid (OE) and one value of 200 ppb coinciding with high Cu at 3.OE on Line 6N (Fig.2).

On the Happy Days grid a narrow zone of weakly anomalous copper was encountered with values roughly three times back

ground. This area roughly coincides with one of the weak IP anomalies from earlier work (Fig.5).

b) Magnetometer Survey

The instrument used for the survey was a Sharpe MF-2 Fluxgate Magnetometer. The unit has a scale sensitivity of 5 gammas. A base station was established on the access road to the property and daily readings taken. Readings were taken at 25 m intervals along the grid lines. Substations were established along the baseline to check and adjust for diurnal variation.

The contrast in magnetic properties of the different rock units made this survey a useful mapping tool. The magnetic property of the diorite is useful in distinguishing it from the monzonitic phase and from the adjacent volcanic rocks in overburden covered areas. The current work on the Dominic Lake Grid has extended the known surface and near surface occurrence of diorite further to the south than previous surveys.

The very flat magnetic response on the Happy Days grid and the generally low values in the 2 000 gamma range indicate this area to be underlain by a thick sequence of Nicola Volcanics.

c) VLF-EM Survey

A Crone Radem instrument was used to receive signals from transmitters at Cutler, Maine, and Seattle, Washington. The dip angle readings of the in-phase component were recorded at

25 m intervals along the gridlines. Data obtained from the Cutler transmitter were filtered using the Fraser method. Positive filtered values are plotted and contoured in 5 degree increments.

On the Dominic Lake grid a system of very weak northwest trending structures have been outlined utilizing the Seattle data. They parallel regional topographic features and appear to correlate with the distribution of soil sample values (Fig.4).

Limited VLF-EM data from the Happy Days grid suggests a possible northwest - southeast linear feature coincident with the higher copper in soils area (Fig.7).

5. Conclusions and Recommendations

On the Happy Days grid, a small zone of weakly anomalous copper values in soil is associated with a weak IP response. However, the zone is of very limited extent and the area is underlain by a thick blanket of Nicola Volcanics as indicated from the magnetic survey and limited outcrop exposure. No further work is recommended for this area.

On the Dominic Lake grid, sporadic but widespread anomalous values in copper and molybdenum and, to a lesser extent, gold were obtained from soil sampling. More favourable intrusive rocks underlie this area as noted by surface exposures and the strong magnetic response. Soil cover is thin and the anomalous values are likely to be

locally derived. A short percussion drilling program could quickly test the more promising areas.

6. Statement of Costs

Equipment Rental and Supplies

Crone Geophysics and Exploration	
1 Crone VLF-EM Unit	
2 weeks rental at \$600/month	\$ 300
T. Hasek and Associates	
Fluxgate Magnetometer MF-2	
2 weeks rental at \$600/month	300
3/4 ton 4 X 4 ton pickup	
6 days at \$25/day	150

Soil Sample Analysis

7. Statement of Qualifications

I, Lorne Allan Bond, of the City of Kamloops, British Columbia do hereby certify that:

1. I am a qualified, practising Geologist.
2. I am a graduate of Loyola College (University of Montreal), with a B.Sc. (1967) in Geotechnical Sciences.
3. I have practised my profession since 1967 while employed with Sherritt-Gordon Mines Ltd., Cominco Ltd., and Afton Operating Corporation.
4. This report describes geophysical and geochemical exploration performed under my direction during the period July 9 to July 19, 1990.

Lorne A. Bond

Senior Geologist

Afton Operating Corporation

October 15, 1990

7. Statement of Qualifications

I, Louis Hee-Choi Tsang, of the City of Kamloops, British Columbia, do hereby certify that:

1. I am a qualified, practising geologist.
2. I am a graduate of the university of British Columbia with a B.Sc. (1972) in Geology and Geophysics.
3. I have practised my profession since 1972 while employed with Granisle Copper Ltd., Highmont Operating Corporation and Afton Operating Corporation.
4. I supervised the field work on the Happy Days claim group described in this report.

Louis H. C. Tsang

Exploration Geologist

Afton Operating Corporation
