## INTRODUCTION

The Wren Mineral Group consists of the Crow, Jay, Robin, Sparrow and Wren claims totalling 35 units, slightly overlapping, resulting in a true coverage of 30 units (Figure 1). These claims, owned 100% by Castle Minerals, were optioned by Noranda Exploration in March, 1990. Claim information is listed below.

TABLE 1

Claim Name	Record No.	Mining Div.	Units	Type	Expiry Date
Crow	3821	Lillooet	1	TP	Sept. 21/90
Jay	3819	Lillooet	1	TP	Sept. 21/90
Robin	3820	Lillooet	1	TP	Sept. 21/90
Sparrow	3817	Lillooet	12	MG	Sept. 21/90
Wren	3835	Lillooet	20	MG	Oct. 5/91

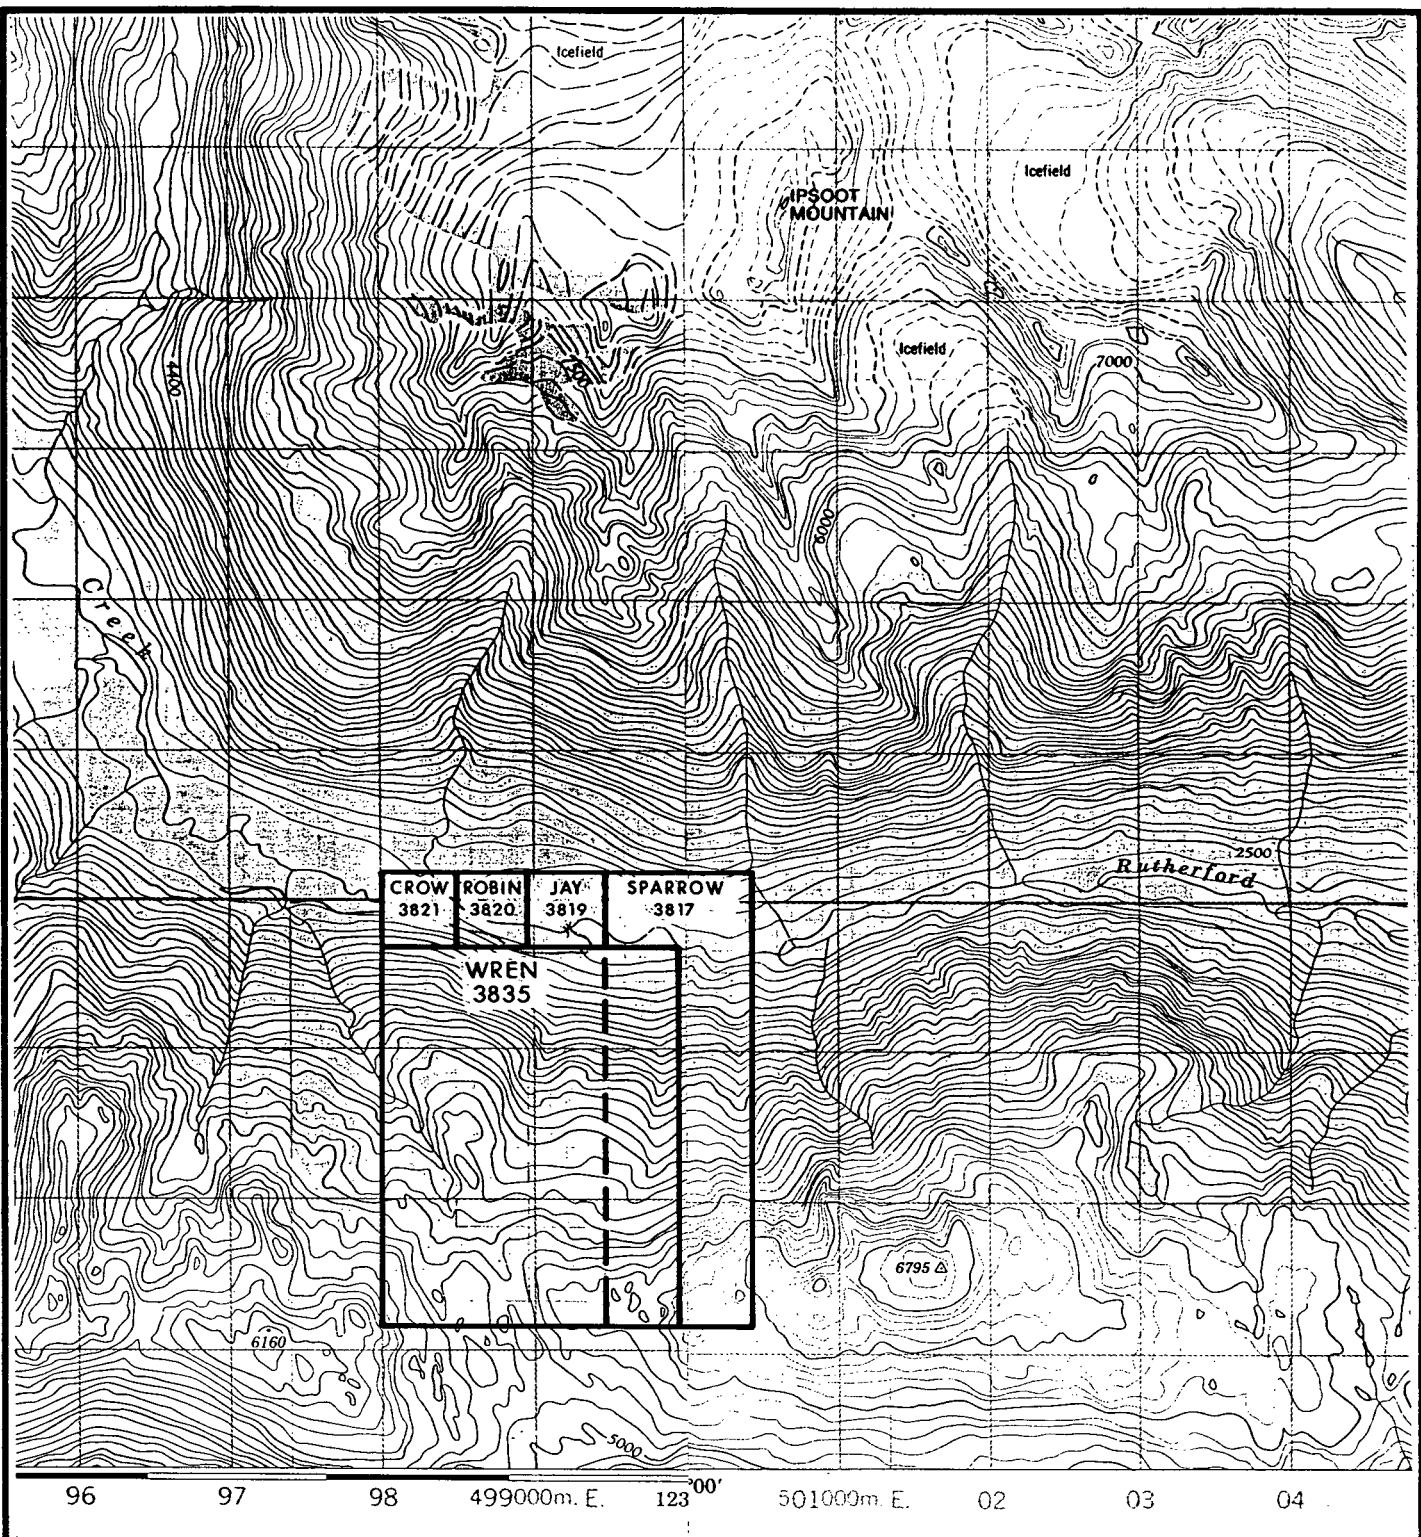

## LOCATION AND ACCESS

The Wren Mineral Group is a gold prospect located on the south side of the Rutherford Creek in southwestern British Columbia. The claims are located in moderately steep, mountainous terrain approximately 120 km north of Vancouver. The town of Pemberton is 10 km north, and the Village of Whistler is approximately 15 km to the south (Figure 2 & 3). Terrestrial co-ordinates for the centre of the claim block are as follows:

50°16' North Latitude  
123°00' West Longitude  
N.T.S. 92J/6E and 7W

The property is at an elevation which ranges from 800 m (2600 feet), along Rutherford Creek, to over 2150 m (7060 feet) at the ridge top which divides the east flowing Rutherford Creek and Soo River drainages.

Access to the property is along a low-maintenance, dry weather, logging road which trends westward along the north side of Rutherford Creek. This road connects with the Vancouver-Pemberton Highway (B.C. Highway 99) approximately 10 km south of the town of Pemberton. The north boundary of the Wren Mineral Group is immediately south of a logging bridge which crosses Rutherford Creek. The lower, northern, portions of the claim group was logged during 1986 and 1987 and several logging roads cross the property.

## PHYSIOGRAPHY, CLIMATE AND VEGETATION

The Wren prospect is located in the Pacific Ranges subdivision of the Coast Mountains Physiographic Province (formally referred to as the Coast Plutonic Complex). The area surrounding the claims has a rugged topography with surface elevations ranging from 600 to over 2100 m (2000 to 7000 feet). Mountains rise abruptly on either side of Rutherford Creek valley; the highest peak on the property is approximately 2150 m (7060 feet) above sea level.

The climate during the summer is generally warm although brisk winds are common on unprotected ridges and peaks. The weather station at Pemberton Meadows (elev. 655 m) records a mean rainfall of 741 mm/year, a mean snowfall of 2824 mm/year, and a mean daily temperature varying from a low of -6.1°C to a high of 18.6°C. However, conditions are more severe at higher elevations. The area's climate is likened to that of the western interior of British Columbia (Drysdale, 1916).

Treeline is approximately 1600 m on north facing slope. At lower elevations cedar, cottonwood, white pine, Douglas fir, and hemlock fir are common with Douglas and hemlock fir being more common at higher elevations. Alpine fir, mosses and grasses are found above treeline.

## WORK OBJECTIVE

The 1990 field programme was designed to determine the extensions of geochemically anomalous areas and to produce a detailed geology map. This was necessary to give a more broad understanding of the property geology, and determine the system responsible for existing anomalies.

Field work commenced on June 23, 1990 and was completed on July 25, 1990. A core of 3 geological staff worked continuously on the project with 3 other personnel present for various periods. A 4-person geophysics crew worked at the property for 12 days.

## HISTORY OF DEVELOPMENT

The area was first staked in the mid-1970's by the Rainbow Syndicate (Newmont Exploration (40%), Union Oil Company of Canada (40%), Bethlehem Copper Corp. (20%), John McGoran). The claims were called the GL claims and were staked after a regional silt sampling programme found anomalous Zn and Au in the Rutherford Creek drainage. A preliminary geologic map was compiled showing layered volcanic tuffs and flows, and a soil survey was completed. Soils were analyzed for Cu-Au-Ag, with a few analyzed for Zn. A geochemically (Au-Ag) anomalous zone, 200 m x 250 m, was outlined and contained up to 780 ppb Au. Panning the soils within the anomalous area returned visible flakes of angular gold. In 1980 a single line I.P. test survey was conducted, and a 100 m long anomaly was outlined. A gas powered underground slusher was taken to the property and a small trench was dug across the I.P. anomalous zone exposing a silicified, pyrite bearing shear zone. However, rock samples from the trench carried only low gold values. Drilling was recommended, but the Syndicate was dissolved prior to drilling and the claims were allowed to lapse.

In 1987, Castle Minerals staked the ground as the Wren and Sparrow claims. The Syndicate's trench was relocated, and a grid was established over the northern portions of the property, east of the trench. Logging activity, especially road building, had exposed the shear zone in several widely spaced road cuts. Grid lines 50 m apart were cut over the lower slopes and were geochemically sampled at 20 m intervals. In addition to the grid sampling, all logging roads crossing the property were sampled at 20 m to 40 m intervals. Approximately 14 line km of grid lines and road traverses were sampled and a total of 899 soil samples were collected. The soils were analyzed for Au and Ag only.

Results of the 1987 geochemical programme were very encouraging with samples ranging from 1 ppb to 5690 ppb Au. At an anomalous threshold arbitrarily set at 100 ppb gold, over 15% of the samples are anomalous. Ag values are also anomalous, with values to 6.6 ppm Ag, and many of them greater than 1.0 ppm Ag. Ag and Au values are not always coincident. Selected grid lines and roads were used to test the effectiveness of ground magnetometer and VLF-E.M. surveys. The magnetometer survey results indicate that it is a useful tool for identifying changes in rock types whereas results from the VLF-E.M. survey appear to outline the limits of shear zones.

One of the VLF-E.M. anomalies is coincident with the trend of an Au anomalous soil zone.

In June and July of 1989 Castle Minerals completed five short AQ drill holes ranging in depth from 21.3 m to 61.3 m. Recovery was poor, and none of the holes intersected significant mineralization.

### REGIONAL GEOLOGY

The geology of the Pemberton map area shows it to be underlain largely by quartz diorites to granodiorites of the Coast Plutonic Complex, and highly deformed volcanic and sedimentary rocks of Lower Cretaceous Age (Figure 4). These latter rocks form northwest-trending pendants within the plutons. Meta-volcanic rocks predominate over meta-sedimentary rocks. The volcanic rocks are primarily pyroclastic tuffs and breccias interbedded with thin beds of brittle shale and siltstone. The dominant structural trend is northwesterly, and foliation in the plutonic rocks is generally northwest with steep dips. Schistosity in pendants is usually parallel or sub-parallel with contacts. It appears that deformation has been largely concentrated in narrow northwest trending zones, leaving the intervening areas with well preserved original textures, thus suggesting that deformation was controlled by deep seated major structural features.

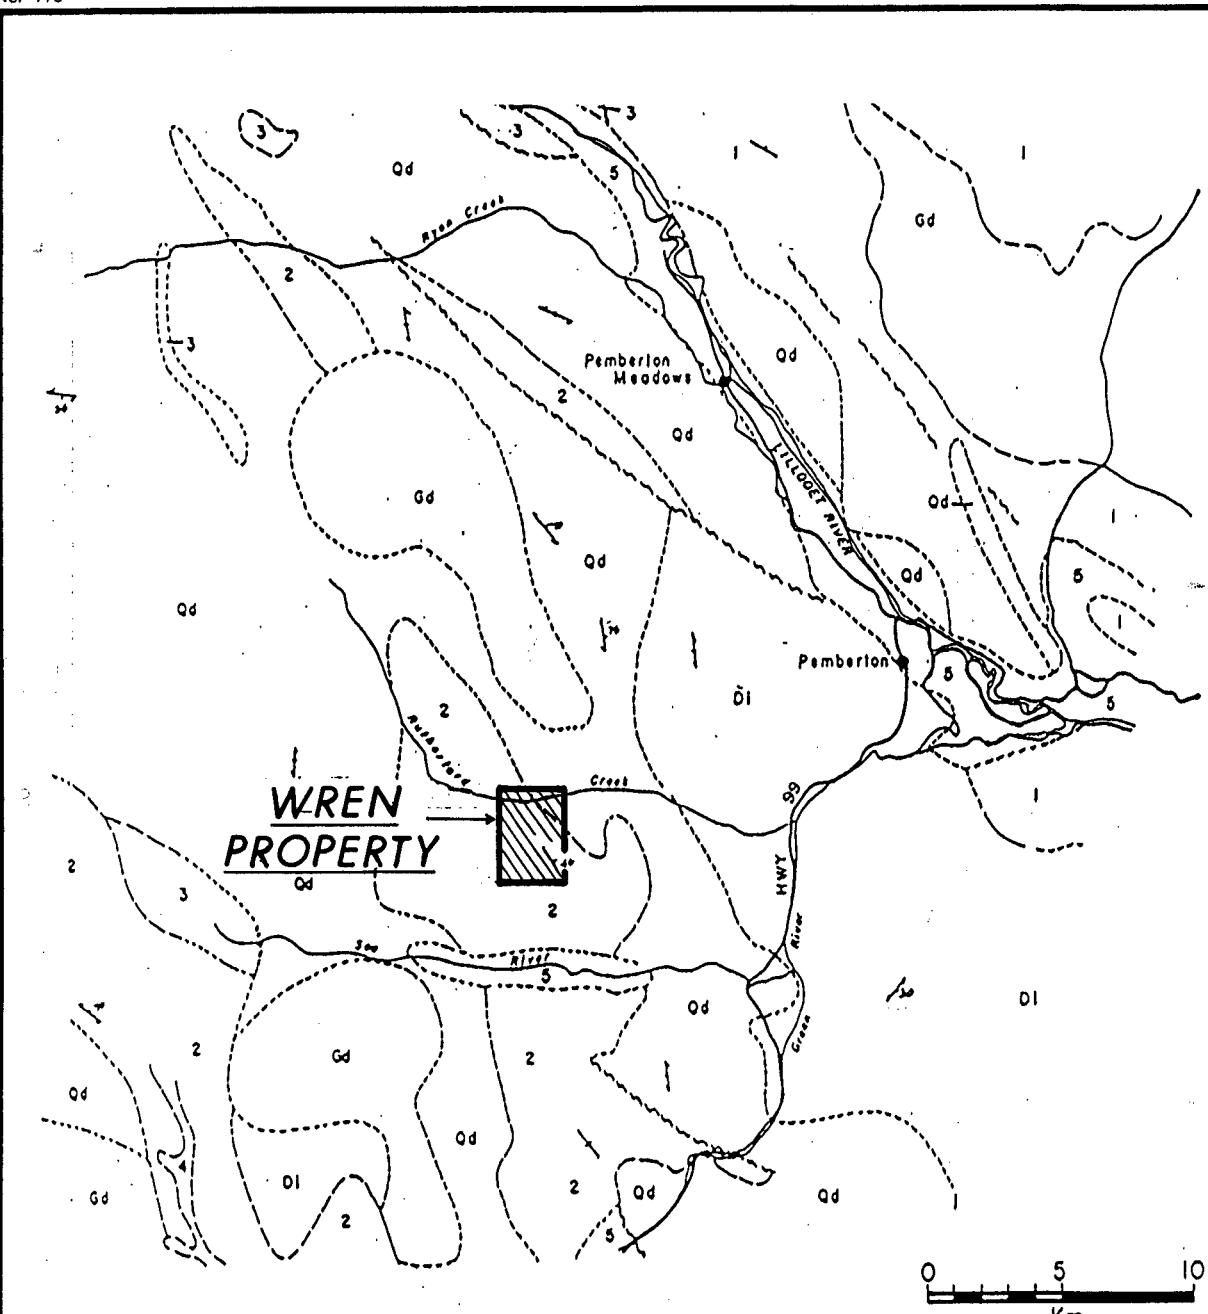

### FIELD PROCEDURE

#### 1. Grid Preparation

A grid was placed over the Wren claim group for a total of 43.0 km of line (Figure 9). The 2.3 km slope corrected base line oriented at N360 is labelled 506+00E and extends from 500+00N to 523+00N. Twenty-four cross lines, perpendicular to the base line, are spaced 100 m apart and extend 600 m west of the base line to 500+00E and 1000 m east of the base line to 516+00E. Areas of steep cliffs and ravines caused some lines to be stopped short of their intended length. The cross lines are marked and sampled at 25 m. A slope corrected tie line is present at 500+00E from 500+00N to 523+00N. Another slope corrected tie line on the western side of the grid at 512+00E runs from 523+00N to 506+00N. All stations are marked with two colours of flagging tape with the corresponding grid location written on the tape.

#### 2. Soil Collecting

1215 soils were collected at 25 m stations along the cross lines (Appendix 3). "No samples" were recorded where stations were located on talus slopes, large outcrops, or difficult log jams. An

attempt was made to collect good B horizon soils, but as much of the property has a thin veneer of soil and much of that soil is in fact developing over talus slopes, the quality of many samples was low. Humus samples were collected and labelled in swampy locations.

### 3. Geology Mapping and Sampling

Outcrop exposure is very low over most of the property. In view of this fact, outcrops noted during grid emplacement, and soil collecting were recorded. To enable a more thorough geology map to be constructed, 4 separate geological road maps were prepared. These roads ran subparallel to the lines and enabled a much more complete coverage of the property (Figures 5, 6, 7, 8).

In total, 74 rock samples were collected (Figure 9, Appendix 4). Except for rare grab samples, all rocks were chip sampled across a certain width. None of the samples collected during the 1990 field season showed anomalous gold or base metal values. A 5 cm quartz vein in the granitic plug, sampled during the initial Noranda property exam, ran 1570 ppb Au.

### PROPERTY GEOLOGY

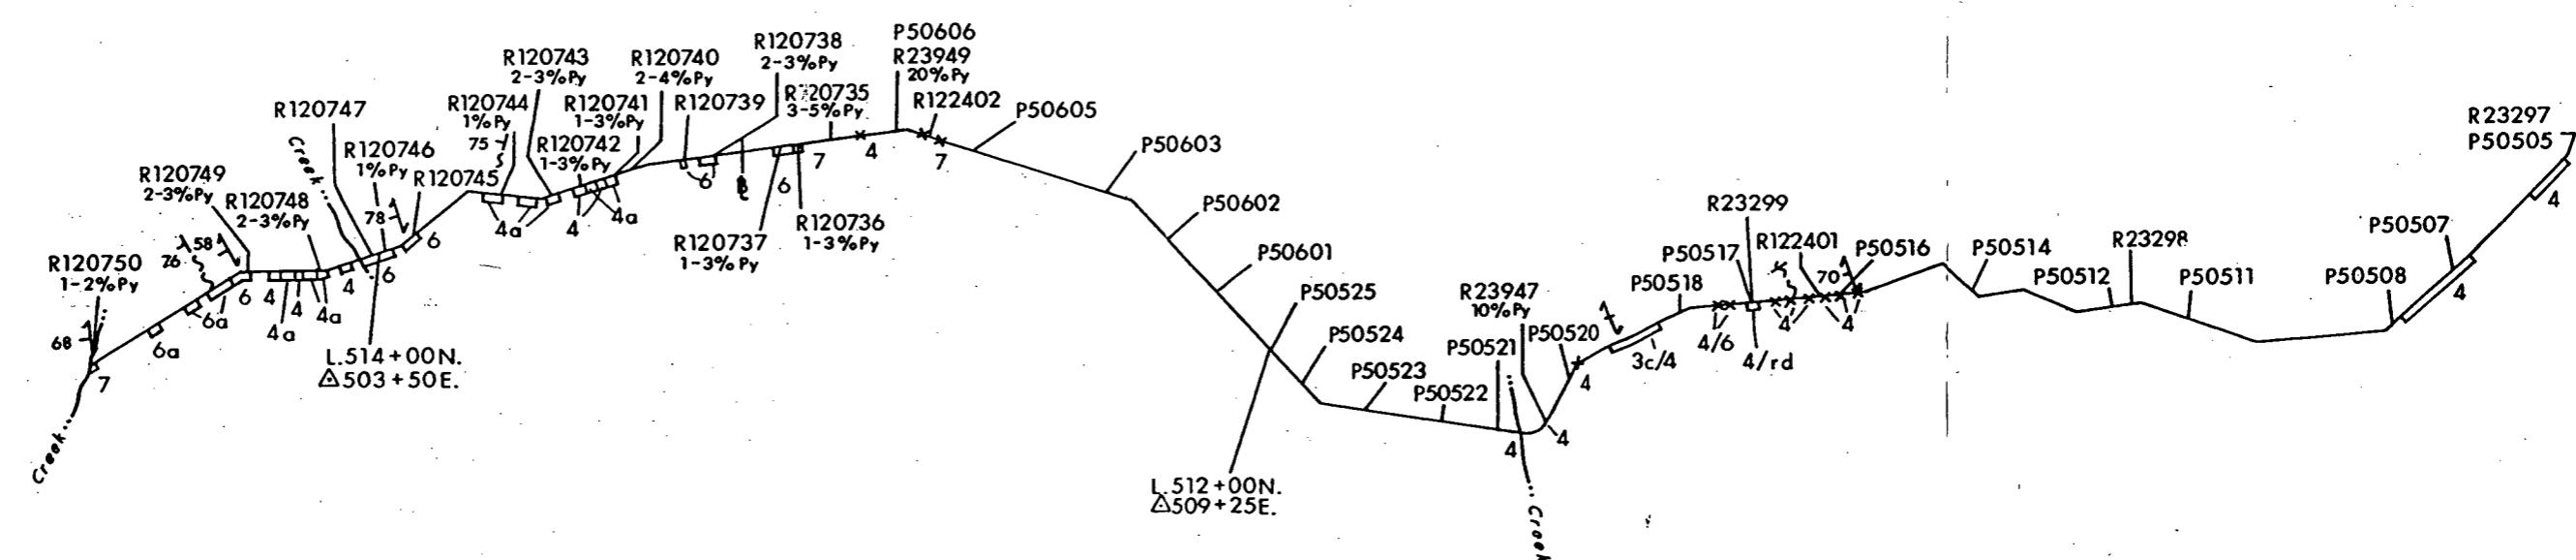

The Wren claim group is underlain by an Early Cretaceous volcanic pendant of the Gambier Group within the Coast Plutonic Complex. Metavolcanic tuff is the predominant rock type and has been subdivided based on alteration and percentage of fragments/crystals. In the south, a separate tuff unit has been mapped, subdivided on the basis of sedimentary features and it's interbedded nature. A volcanic breccia, present in the northwest part of the property extends marginally onto the grid, and a small intrusive plug is present in the north-central portion of the property (Figure 9).

The predominant volcanic tuff is medium grained and variably chloritic. It is medium grey to medium to dark green-grey in colour. Lithic and plagioclase fragments comprise 15-60% of the rock, range in size from 1-2 mm<sup>2</sup>, are broken and angular, and are contained in a fine grain matrix. Widespread moderate to strong chloritic alteration and lesser epidote alteration pervade the tuff, with local weak silicification associated with intense chloritization.

Within the above tuff, a significant zone of strong silicification occurs from Line 509+00N to Line 503+00N along the 500+00E tie line, and narrows easterly to a point at Line 505+00N,

Station 506+00E. The rock is light grey, fine grained, and strongly indurated. Tuffaceous textures are obliterated except in more weakly silicified zones where relict textures are partially visible.

A strong phyllitically altered zone of the tuff is bounded by Lines 516+00N and 512+00N and Stations 502+00E and 508+00E. Resultant from widespread shearing, the light-medium grey, fine grained tuff is weakly to extremely fissile and is moderately to strongly sericitized. Weak to strong limonitization is confined to fractures and within 1-4 cm of exposed surfaces. Feldspars are altered completely to clays and the original tuffaceous texture is destroyed. Locally, weak phyllitic alteration shows sericitic alteration haloes rimming fragments and crystals.

On the eastern edge of the property, a unit of feldspar crystal tuff extends west onto the grid, approximately to Station 510+50E, and is also present in local areas throughout the predominant tuff. Medium grey to medium green in colour, plagioclase crystals comprise 60-80% of the rock within a fine grained matrix.<sup>2</sup> The crystals are both euhedral and broken, and range from 1-2 mm<sup>2</sup>, with the majority being 2 mm<sup>2</sup>. Locally weak to moderate chloritization has occurred.

A separate tuffaceous unit, confirmed by geophysics, is located along the south edge of the property, with an east-west contact subparallel to Line 503+00N. Within this unit four distinct tuffaceous members are variably interbedded. These members are a medium-grained feldspar crystal tuff, a fine-grained light grey conchoidally fracturing tuff, a fine-grained dark grey tuff, and a dark blue-grey, very fine-grained fissile "shaley" tuff. The western and central portions of the grid show beds of up to 50 m thick, whereas to the east, the beds become thinner with large outcrops displaying interbeds 1-20 cm wide. Beds strike north-south to northeast-southwest, and consistently dip to the east 50-70°. Also on the eastern edge of the grid, contacts become more undulatory and rip-up clasts appear. Typical Bouma-type turbidite sequences are visible in large talus blocks.

A unit of volcanic breccia is located in the western part of the property, towards the north end. This unit extends marginally onto the grid. Three different members characterize this unit.

The first is a "classic" breccia with 60-80% large, (5 cm<sup>2</sup> to 20 x 30 cm), angular to subangular clasts of dark green chloritic tuff, within a fine grained, light green, epidotic, tuffaceous matrix. This interlayers with a rock of more sedimentary nature, the second member. This rock appears as a conglomerate, having

light green-grey, moderately epidotic and chloritic, rounded to sub-angular tuffaceous clasts ranging in size from 1 x 1 cm to 6 x 10 cm. In areas where small clasts predominate, the clasts comprise 70-80% of the rock. If clasts are larger, they comprise only 20-50% of the rock. The matrix is dark green, fine-grained and moderately to strongly chloritic.

The third member is described as a resorbed breccia and appears as a transition zone between the above members and the predominant volcanic tuff. This rock is similar to the "classic" breccia but has indistinct contacts between clasts and matrix, so that clasts are often barely apparent. They are distinguished from the matrix by their more chloritic nature.

A small granitic plug centred around Line 518+00N and Station 509+00E intrudes the volcanic tuff. It is medium-grey in colour, medium to coarse grained, with pervasive epidote-chlorite alteration of mafics, and locally shows potassic alteration. A general composition is 65% quartz, 20% feldspar ( $K > Na$ ), 15% biotite, <<1% sulphides (pyrite).

A fine grained, dioritic intrusive flanks the north eastern edge of the granite. Dark green-grey, with 60-70% mafics, it is moderately chloritic and locally strongly sericitic. Crystal size is <1 mm, increasing to 2 mm near contact with the granite.

Rare, north-south trending rhyolite dykes occur irrespective of lithology. Light grey and fine-grained, they are narrow (<2 m wide) with distinct contacts and locally sheared contacts.

#### STRUCTURE

Numerous faults appear throughout all lithologies. These consistently trend in a general north-south direction dipping sub-vertically, and vary from 10 cm to 2 m wide zones. One large zone of shearing is noted corresponding with the phyllitically altered tuff, and has an attitude similar to that of the faulting. Several large creeks and creek gullies cross the property in a north-south direction suggesting that these may be fault-shear related structures.

## SULPHIDES

Pyrite is evident throughout the property as disseminated grains. Content varies depending on lithology. Unaltered tuffs, breccias, intrusives, and the unit of bedded tuff in the south all display low pyrite percentages (trace - 4%). In contrast chloritic and siliceous altered tuffs have moderate contents of pyrite, (1-7%), and the phyllitically altered tuff has pyrite percentages up to 20%. All lithologies contain both cubic and anhedral pyrites. Where pyrite content is low, the pyrite will be cubic (euohedral to subhedral) and have large grain size. Where pyrite content is high, the grains are small, anhedral and commonly occur in blebs. Anhedral pyrite blebs are often associated with shearing and foliation, elongate subparallel to the direction of foliation.

Pyrrhotite was noted at one location as a massive bleb (1 x 5 cm) containing a trace amount of chalcopyrite.

Chalcopyrite was noted twice on the property. Once, as a trace amount associated with a bleb of pyrrhotite (noted above), and once as a massive bleb, contained within a rare congregation of massive pyrite.

## GEOPHYSICS

33.3 km of magnetometer survey and 3.8 km E.M. was run on the property. The Genie E.M. was used over 3 lines and proved to be relatively flat and was not continued. The magnetometer survey essentially proved useful in confirming contacts of geologic units. Please refer to the geophysical report, Appendix 1 .

## SOIL GEOCHEMISTRY RESULTS

Soil analysis has indicated a substantial coincident Ag, Cu, Pb, Zn anomalous area bounded by Lines 523+00N, 514+00N and Stations 502+00E, 508+00E (Figures 10, 11, 12, 13). Values in this anomalous area average 3.0 ppm Ag, 200 ppm Cu, 200 ppm Pb, 300 ppm Zn with spot highs of 6.4 ppm Ag, 1638 ppm Cu, 1624 ppm Pb, and 1434 ppm Zn. The anomaly appears to continue west but sampling was cut off due to topography. The anomaly is most intense between Lines 514+00N and 516+00N, and gradually fades in intensity to the north. This suggests a down slope dispersion presumably from the host phyllitic tuff unit.

A small anomalous Ag, Cu, Pb, Zn high, between Lines 511+00N, 514+00N, and Stations 500+50E and 501+25E coincides with a major creek gully indicating shear related mineralization.

One area of anomalous gold with average values of 400 ppb Au lies between Lines 516+00N and 518+00N and Stations 509+00E and 510+00E (Figure 14). This lies directly over the granitic plug and is probably related to Au in quartz veins. This is suggested by a Au value (1570 ppb) in a sample of a minor quartz vein within the granite.

Two linear north-south trending features with anomalous Au values >100 ppb occur, with spot highs averaging 300 ppb (Figure 14). One sample carried 1500 ppb Au. One feature directly corresponds with a creek gully, and as the other has a similar north-south trend, a fault/shear related emplacement is assumed.

#### SUMMARY

The Wren property is underlain by an Early Cretaceous volcanic pendant of Gambier Group rocks situated within Coast Plutonic Complex.

A meta-volcanic tuff predominates and is sub-divided dependant on clast content and alteration. Sedimentary features indicate a different tuffaceous unit lies along the southern portion of the claims. A volcanic breccia to the northwest extends marginally onto the grid and a small granitic plug intrudes the north central portion of the property.

Rock samples collected from all lithologies and from faults and shear zones failed to produce any anomalous values.

Soil samples collected over the property indicate a substantial Ag, Cu, Pb, Zn anomalous area related to the sheared phyllitic tuff unit. Au is not coincident with the other elements, but two narrow, linearly trending Au anomalies, suggest a fault/shear related emplacement.

A ground magnetometer survey confirmed geological contacts, while a very limited E.M. survey showed no response.

## CONCLUSIONS

Soil geochemistry indicates that both Au anomalies and Ag, Cu, Pb, Zn anomalies occur in structurally active areas. The substantial Ag, Cu, Pb, Zn anomaly occurs in an area of broad shearing which may extend to the west and to depth.

To test this theory, future work will include:

1. Extension of the grid to the west of the ravine which truncated lines 514+00N to 523+00N.
2. Soil sampling on the extended lines.
3. An I.P. survey over the base metal anomalous area and if possible extending onto the expanded grid.
4. Drilling based on results from the above procedures.

MEMO TO: L. Erdman

C.C. L. Bradish

FROM : T. Wong

**SUBJECT: WREN GEOPHYSICS**

**DATE** : August 08, 1990

A geophysical program consisting of reconnaissance frequency domain electromagnetics and total field magnetometer surveys was carried out on the Wren Property by Walcott and Associates during July 11 - 23, 1990. The purpose of the surveys was to aid mapping potential economic mineralization associated with shear zones found on the property.

The magnetometer survey used an EDA Omni4 recording basestation to monitor the diurnal drift of the survey data collected by an EDA Omni4 and a Scintrex MP3 magnetometer. Readings were taken on 12.5m. stations on 100m. line separations. L.50600N/50600 - 51567.5E has been level shifted since basestation data was missing during the time interval at which this line was surveyed.

The EM survey utilized a Scintrex SE-88 Genie EM system using a reference frequency of 112 Hz and 3 "energizing" frequencies of 337, 1012, and 3037 Hz. Coil spacing was 100m. with a station spacing of 25m. Readings were taken on L51000N, L51600N, and L51900N. No readings were taken on L51600N/51000E - 51175E due to terrain.

## INTERPRETATION

No significant conductors can be deduced from the EM profiles since the readings fall mainly within the survey's noise envelope. An especially noisy spike occurs at L.51000N/51225E. A narrow zone of slightly higher resistivity than background is indicated by elevated values centred at L.51600N/50525E.

The magnetic map shows an overall gradational trend to the south with elevated and active magnetics found in the southern third of the grid. A region of concentrated elevated values appears in the SE corner of the grid. A region of depressed magnetic values appears near the centre of the 2 southernmost lines. Judging from the sharpness of the magnetic profiles in this area, the sources are interpreted to be quite shallow and narrow. A rough magnetic boundary between the quiet and active magnetics can be visualized with the 56500nT contour. The geologic contact between rock units 5 (interbedded tuffs, medium tuffs, sediments) and 3 (chloritic tuffs) is not evident from the magnetics nor are

the mapped intrusives on Lines 51800N, 51900N/50700E - 51100E.

In the exceptionally quiet area of the grid a thin North-South magnetic lineament can be traced on the magnetic profiles and plan map. Several other North-South lineaments can be traced from the profiles and are shown on the magnetics map. These lineaments all appear quite shallow and may be associated with known North-South shear zones on the property.

### CONCLUSIONS

The identified lineaments should be examined in the field to determine their sources and association with the geology. A reconnaissance D.C. resistivity/I.P. survey may be attempted over known shear zones to determine the depth extent/resistivity (conductivity) expressions for these features.

Re: Wren Project, Whistler Area - July 9th - 24th

1.	Provision of geophysicist & helper, computer & printer July 10th - 24th = 14 days at \$410.00 per day	\$5,740.00
2.	Provision of two mag operators July 2nd - 15th 3 days during period at \$360.00 per day	1,080.00
3.	Truck - Red Hawk as attached \$1,235.00 - our 4x4 -Jul. 10th-15th 5 days at \$70.00 per day 350.00 tyre Red Hawk vehicle 143.40 gasoline 73.55, 52.04, 59.32, 38.92, 25.41, 40.00 20.00	2,937.64
4.	Greyhound - ship sensor up	5.25
5.	Levels Genie Tx	11.55
7.	Food & meals as attached (30 man days)	796.40

**APPENDIX 2**  
**ANALYTICAL METHOD**

## ANALYTICAL METHOD DESCRIPTIONS FOR GEOCHEMICAL ASSESSMENT REPORTS

The methods listed are presently applied to analyses geological materials by the Noranda Geochemical Laboratory at Vancouver.

### Preparation of Samples:

Sediments and soils are dried at approximately 80°C and sieved with a 80 mesh nylon screen. The -80 mesh (0.18 mm) fraction is used for geochemical analysis.

Rock specimens are pulverized to -120 mesh (0.13 mm). Heavy mineral fractions are analyzed in its entirety, when it is to be determined for gold without further sample preparation.

### Analysis of Samples:

ICP analyses for 28 elements is determined using a Leeman PS3000. For silts and soils a 0.2 g sample is digested with 3 ml of  $\text{HClO}_4/\text{HNO}_3$  at a ratio of 4:1. This digestion occurs for 4 hours at a temperature of 203°C. The resulting liquid is diluted to 11 ml with water. Pulps of rock or core are weighed out at 0.4 g, and chemical quantities are doubled relative to the above noted method for digestion. Otherwise the procedure remains the same.

Gold (Au) content is determined by atomic absorption (AA), not ICP. A 10 g sample is weighed and ashed at 590°C for 3 to 5 hours. After cooling, 35 mls of aqua regia ( $1\text{HNO}_3:3\text{HCl}$ ) is added and the samples are digested on a hot plate for 2 hours, or until 15 mls of aqueous solution is left. Dilute with water to 100 mls and add 5 mls MIBK. Addition of MIBK extracts and pre-concentrates the gold from the aqueous solution. Following this step the MIBK solution is analyzed on the AA.

Detection limits (D.L.) and low range sensitivities (L.R.S.)  
for ICP and AA (Au only) analyses (Noranda Vancouver Laboratory).

# NORANDA VANCOUVER LABORATORY

## Geochemical Analysis

Project Name & No.: WREN - 125

Geol.: L.E.

Date rec'd: JULY 12

LAB CODE: 9007-036

Material: 712 SOILS

Sheet: 1 of 17

Date compl: JULY 26

Remarks: \* Sample screened -35 MESH

Au - 10.0 g sample digested with aqua-regia and determined by A.A. (D.L. 5 PPB)

ICP - 0.2 g sample digested with 3 ml HClO<sub>4</sub>/HNO<sub>3</sub> (4:1) at 203 deg. C for 4 hours diluted to 11 ml with water. Leeman PS3000 ICP determined elemental contents.

N.B. The major oxide elements and Ba, Be, Ce, Ga, La, Li are rarely dissolved completely from geological materials with acid dissolution methods.

## NORANDA VANCOUVER LABORATORY

## Geochemical Analysis

Project Name &amp; No.: WREN - 125

Geol.: L.E.

Date rec'd: JUL. 20

LAB CODE: 9007-062

Material: 502 SOILS

Sheet: 1 of 12

Date compl: AUG. 02

Remarks: \* Sample screened -35 mesh

Au - 10.0 g sample digested with aqua-regia and determined by A.A. (D.L. 5 PPB)

ICP - 0.2 g sample digested with 3 ml HClO<sub>4</sub>/HNO<sub>3</sub> (4:1) at 203 deg. C for 4 hours diluted to 11 ml with water. Leeman PS3000 ICP determined elemental contents.

N.B. The major oxide elements and Ba, Be, Ce, Ga, La, Li are rarely dissolved completely from geological materials with acid dissolution methods.

## ROCK SAMPLE REPORT

SAMPLE NO.	LOCATION & DESCRIPTION	% Sulph.	TYPE	WIDTH (m)									SAMPLED BY
120902	L504+00N 509+75E. Medium grained tuff, medium green/grey, weakly siliceous, moderately-strongly chloritic - Pyrite 3-4% finely disseminated anhedral blebs.	Py 3-4%	Chip	1									R. Butler (92J/6)
120903	L504+00N 35 m north at N187 from 512+50E. - Medium grained, medium grey, strongly limonitic, strong silicification. - Pyrite 5-7% finely disseminated anhedral.	Py 5-7%	Chip	0.6									R. Butler (92J/7)
120904	L504+00N 514+40E. Medium grained, medium grey, tuff, strongly siliceous, strongly limonitic, pervasive "yellow-green" alteration. Pyrite 5-7% finely disseminated anhedral blebs & concentrated along fracture planes.	Py 5-7%	Chip	1									R. Butler (92J/7)

## ROCK SAMPLE REPORT

SAMPLE NO.	LOCATION & DESCRIPTION	% Sulph.	TYPE	WIDTH (m)								SAMPLED BY
120905	L504+00N 44m at N013 from 516+00E. - medium grain tuff, medium grey, strongly Si, strongly limonitic & "yellow-green" alteration. Pyrite 10% very fine grained disseminated.	Py 10%	Chip	1								R. Butler (92J/7)
120906	L505+00N 505+55E (15 m south) fine grained, dark grey, moderately siliceous, tuff. Pyrite 3-4% fine grained disseminated anhedral.	Py 3-4%	Chip	0.6								R. Butler (92J/6)
120907	L505+00N 502+85E (20m south) very fine grained, medium-dark grey, strongly siliceous tuff. Pyrite 3% as blebs to .5x1 cm, generally .5 mm clearly replacing mafics. Trace CPy in large blebs.	Py 3% CPy Tr.	Chip	0.6								R. Butler (92J/6)
120908	L507+00N 501+00E. Fine grained, medium grey/brown, moderately siliceous,	Py 3%	Chip	1								R. Butler (92J/6)

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCl-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.  
 THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM.  
 - SAMPLE TYPE: Rock      AU\* ANALYSIS BY ACID LEACH/AA FROM 10 GM SAMPLE.

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.  
 THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM.  
 - SAMPLE TYPE: Rock AU\* ANALYSIS BY ACID LEACH/AA FROM 10 GM. SAMPLE.

DATE RECEIVED: JUL 26 1990 DATE REPORT MAILED: Aug 2/90

SIGNED BY: C. L. T. D. TOYE, C. LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

**APPENDIX 5**  
**STATEMENT OF COSTS**

NORANDA EXPLORATION COMPANY, LIMITED  
STATEMENT OF COSTS

PROJECT: WREN

DATE: Sept. 7, 1990

TYPE OF REPORT: Geological, Geochemical, Geophysical

a) Wages:

No. of Days :	84 mandays		
Rate per Day :	L. Erdman	21 days @ \$170/day	\$3,570
	R. Butler	29 days @ \$120/day	\$3,600
	A. French	1 day @ \$120/day	\$ 120
	J. McCorquodale	1 day @ \$130/day	\$ 130
	C. Welton	25 days @ \$100/day	\$2,500
	S. Louden	7 days @ \$110/day	\$ 770
Dates from :	June 22 - July 25, 1990		
Total Wages :	\$10,690.00		

b) Food & Accommodation:

No. of Days :	84 mandays	
Rate per Day :	\$30.69	
Dates from :	June 22 - July 25, 1990	
Total Costs :	84 x \$30.69	\$2,578.80

c) Transportation:

No. of Days :	34 days	
Rate per Day :	\$35.86	
Dates From :	June 22 - July 25, 1990	
Total Costs :	34 x \$35.86	\$1,219.24

e)	Analysis:	\$20,176.61
	(see attached schedule)	
f)	Cost of Preparation of Report	
	Author: 3 days @ \$170.00	\$ 510.00
	Typing: 1 day @ \$120.00	\$ 120.00
g)	Other : Linecutting	
	No. of Days : 26 mandays	
	Rate per day : \$150.00	
	Dates from : June 22 - July 8, 1990	
	Total Wages : 26 x \$150.00	\$ 3,900.00
	Other : Geophysics (see Appendix 1)	\$11,322.99
	<b>TOTAL COST :</b>	<b><u>\$50,517.64</u></b>
h)	Unit Costs for: Geology	
	No. of Days : 39 mandays	
	No. of Units : 39	
	Unit Costs : \$226.34/manday	
	Total Cost : 39 x \$226.34	\$ 8,827.26
	Unit Costs for: Geochemistry	
	No. of Days : 45 mandays	
	No. of Units : 1289	
	Unit Costs : \$16.22/sample	
	Total Cost : 1289 x \$16.22	\$20,907.58

Unit Costs for Linecutting:

No. of Days : 26 mandays	
No. of Units : 43.00 km	
Unit Costs : \$220/km	
Total Cost : 43 x \$220.00	\$ 9,460.00

Unit Cost for Geophysics (Mag):

No. of Days : 20 mandays	
No. of Units : 33.3 km	
Unit Costs : \$266.81/km	
Total Cost : 33.3 x \$266.81	\$ 8,884.77

Unit Cost for Geophysics (EM)

No. of Days : 10 man days	
No. of Units : 3.8 km	
Unit Costs : \$641.63/km	
Total Cost : 3.8 x \$641.63	\$ 2,438.19

**TOTAL COST :** **\$50,517.80**

			<u>\$20,176.61</u>

**APPENDIX 6**  
**STATEMENT OF QUALIFICATIONS**

STATEMENT OF QUALIFICATIONS

\*\*\*\*\*

I, Linda R. Erdman of the City of Vancouver, Province of British Columbia, hereby certify that:

1. I am a resident of British Columbia, residing at 2-2291 West 1st. Avenue, Vancouver, B.C.
2. I am a graduate of the University of British Columbia, with a B.Sc. (Honours) in Geology (1978) and an M.Sc. in Geology (1985).
3. I am a Fellow of the Geological Association of Canada.
4. I have been engaged in mining exploration for 10 years.
5. I have been a temporary employee of Noranda Exploration Company, Limited (no personal liability) since May, 1986 and a permanent employee since November, 1987.

Linda Erdman

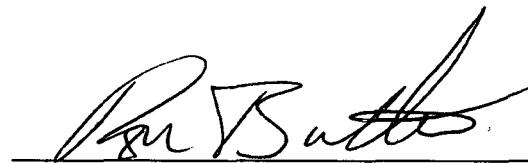

Linda R. Erdman, M.Sc.  
Project Geologist

STATEMENT OF QUALIFICATIONS

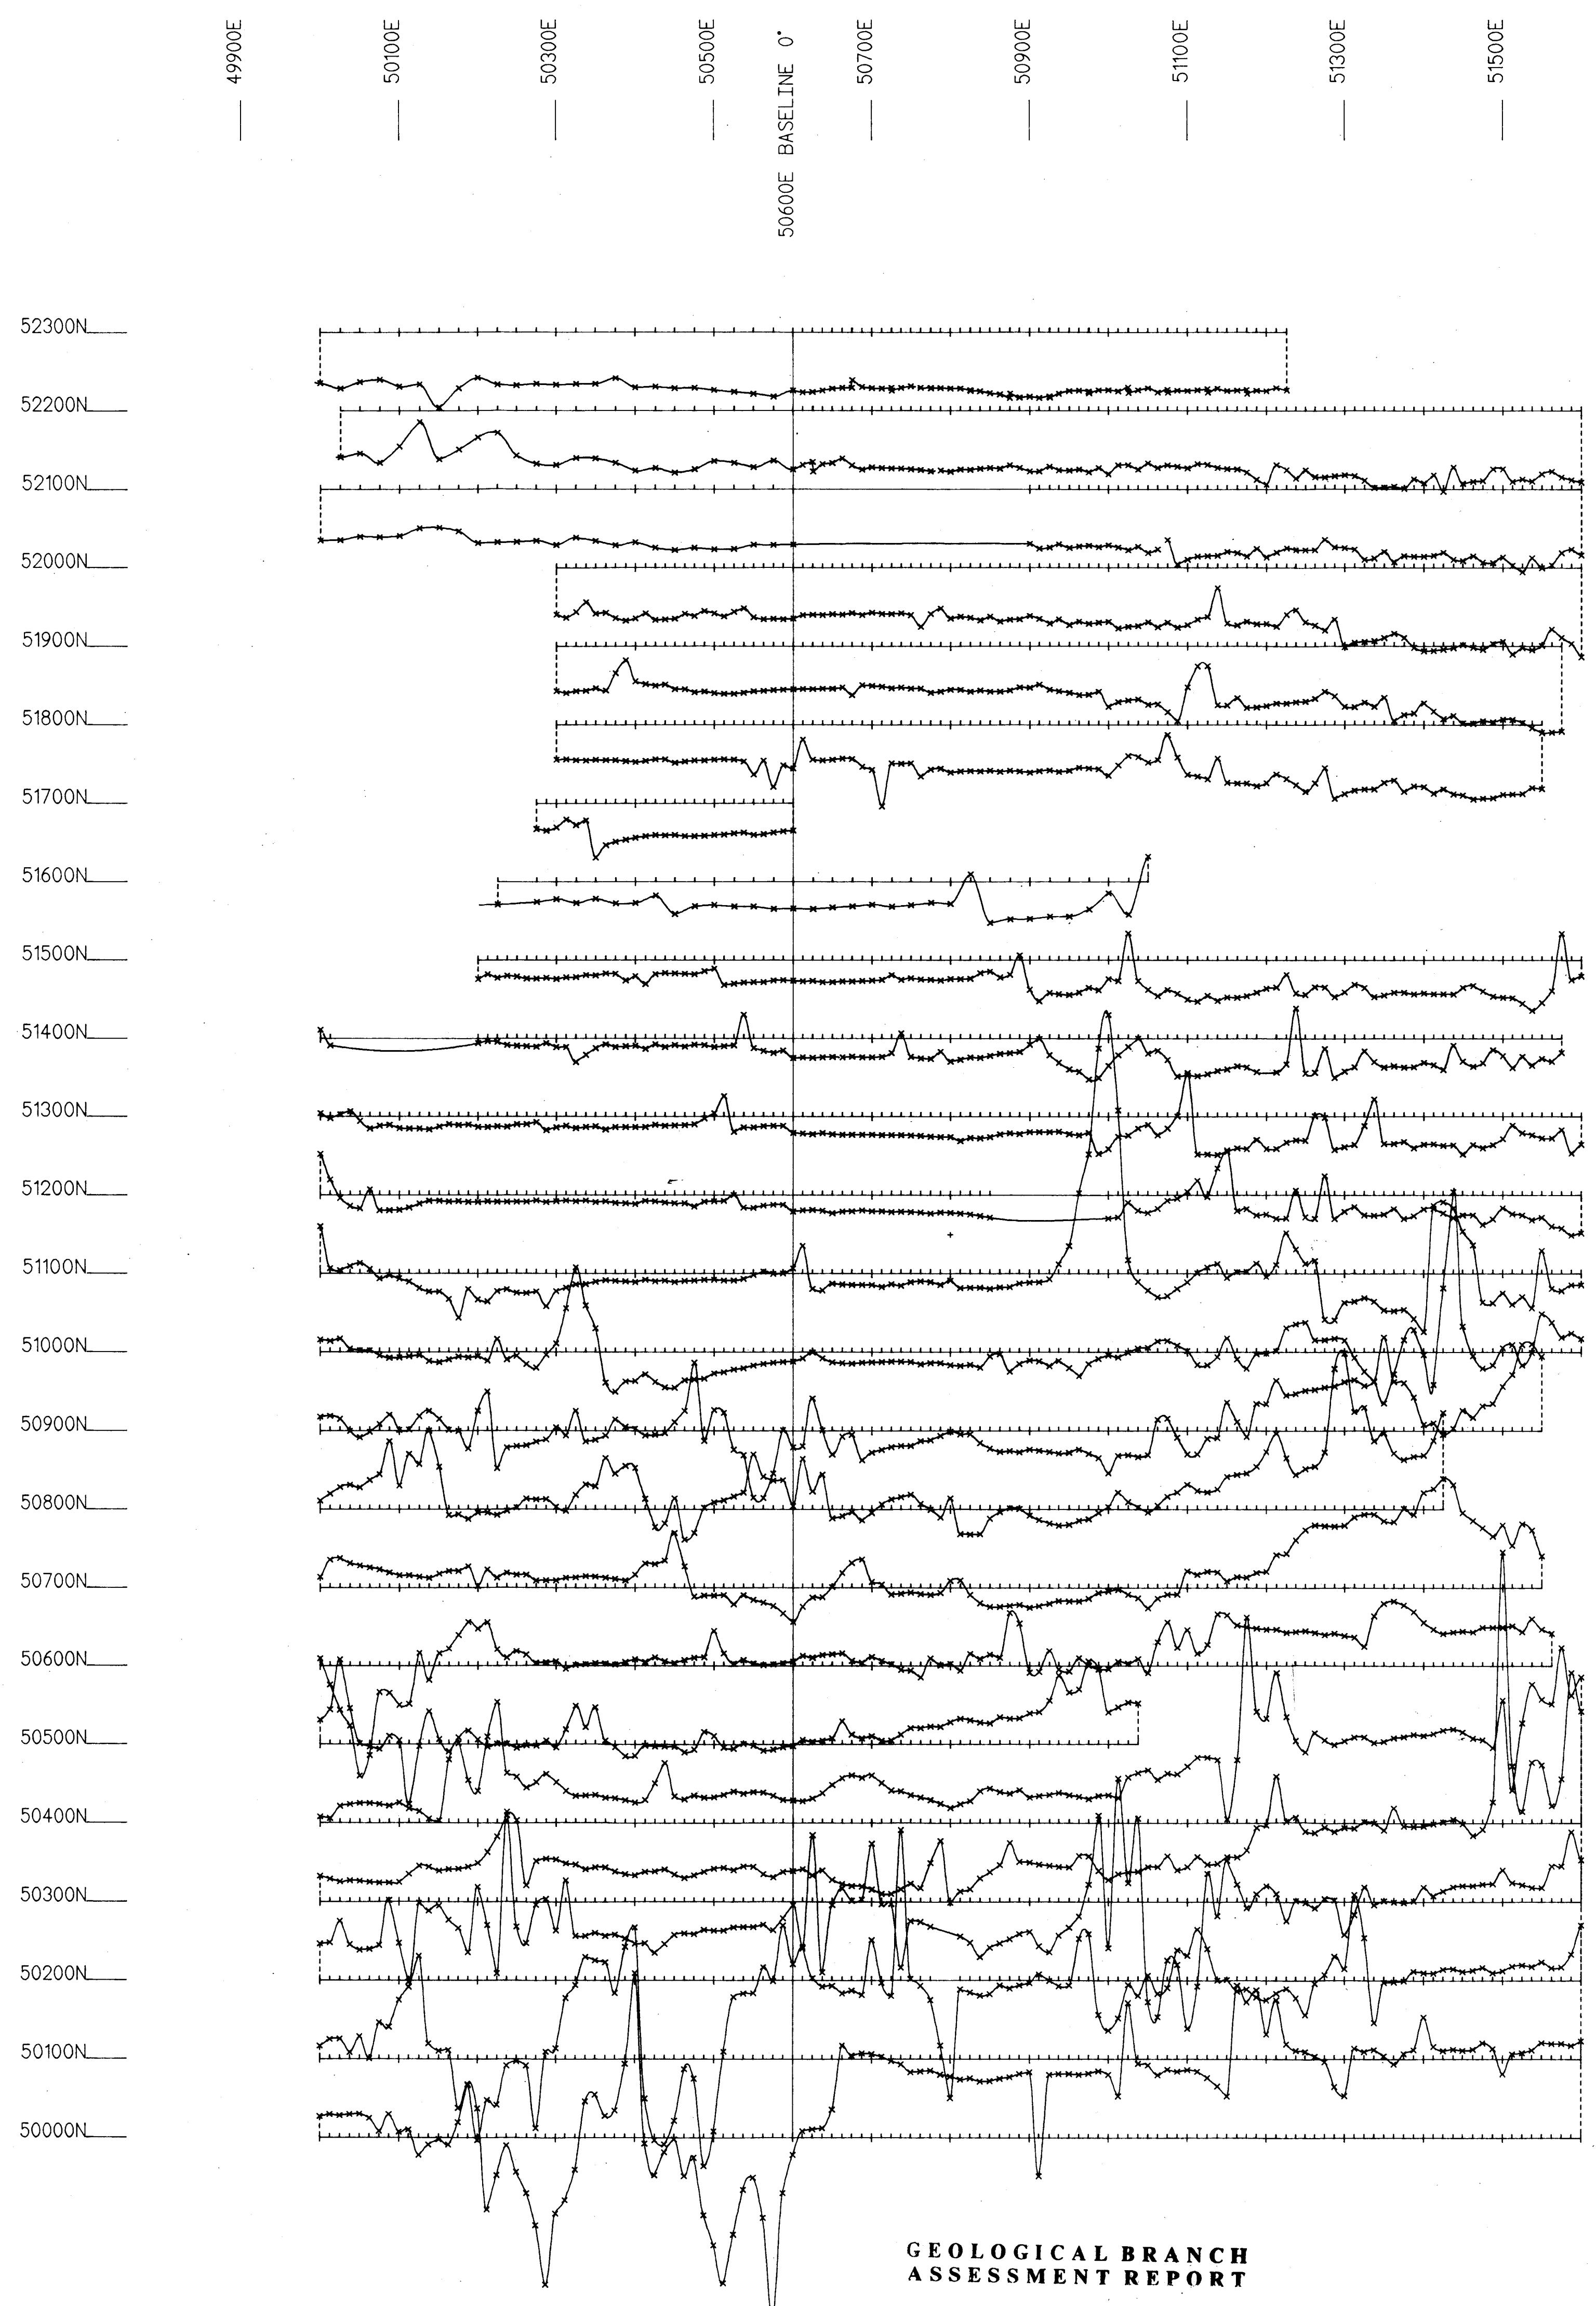

\*\*\*\*\*

I, Ron Butler of the city of Nelson, Province of British Columbia, hereby certify that:

1. I am a geologist residing in Nelson, B.C.
2. I have graduated from Dalhousie University in 1986 with a B.Sc. in geology.
3. I have been engaged in mining exploration for 4 years.
4. I have been a temporary employee of Noranda Exploration Company, Limited (no personal liability) since May, 1990

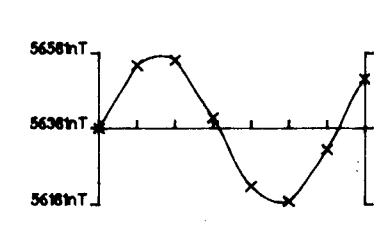

Ron Butler
