SUMMARY

The Knipple Lake Property comprises the KL-1, KL-2, KL-3 and TREATY-12 mineral claims in the Skeena Mining Division, approximately 60 kilometres north of Stewart, B.C. The KL claims were staked by Noranda in 1988 and the TREATY-12 claim by Ross Resources in 1989. The TREATY-12 claim was optioned by Noranda in 1990. The geological and geochemical surveys undertaken in 1990 were designed to locate the source of mineralized float boulders of quartz-calcite-sulphide vein and breccia material discovered in 1989 from which assays up to 17.9 gm/t Au, 17.1 gm/t Ag, 0.14% Cu, 3.03% Pb, and 9.02% Zn were obtained.

The property is underlain by volcanic rocks of the Jurassic Hazleton Group. Two packages of volcanics are present, an extensive sequence of interbedded andesitic flows and agglomerates (Betty Creek Formation) and a less dominant unit of felsic tuffs and flows (Mt. Dilworth Formation). Alteration is not extensive but includes silicification of felsic rocks, chloritization of andesitic rocks, and quartz-sericite-pyrite alteration of felsic porphyritic intrusive rocks found immediately southeast of the KL-3 claim.

Quartz-calcite vein and breccia material containing variable amounts of coarse sphalerite, galena, chalcopyrite and pyrite has been found in subrounded to subangular boulders up to 100 centimetres in diameter scattered over a 100 by 400 metre area at the northwest corner of the KL-3 claim. Economic gold values have been detected in a significant number of these boulders. The source has yet to be located, but is believed to be upslope and/or up ice within the grid surveyed area.

The soil geochemical survey of the grid has detected at least three anomalies that may reflect buried mineralization. Anomaly 1 contains coincident Au, Pb and As values up to 50 ppb, 233 ppm, and 196 ppm respectively as well as more scattered Ag, Cu and Zn values (up to 12 ppm, 166 ppm, and 334 ppm respectively). Anomaly 2 contains a linear cluster of gold values up to 230 ppb over a 175 by 1000 metre long zone with Pb values up to 251 ppm restricted to the up slope side. Anomaly 3 is a 150 by 800 metre long zone and consists of patchy Au, Ag, Cu, Pb, Zn, and As values up to 250 ppb, 11.6 ppm, 112 ppm, 229 ppm, 440 ppm, and 122 ppm respectively. All three anomalies are possible source areas of the float mineralization.

November, 1990

Page 2

The favourable host rocks, evidence of widespread hydrothermal activity, economic gold values in sulphide rich float and the large aerial extent of Au, Ag, Cu, Pb, Zn and As soil geochemical anomalies suggest this essentially untested property has good potential to host economic mineralization. Further exploration is warranted.

It is recommended that an airborne EM and Mag survey of the entire property be undertaken, followed by detailed ground magnetic and induced polarized surveys and subsequent trenching. The most attractive targets should then be drilled.

INTRODUCTION

The Knipple Lake Property comprises the KL-1, KL-2, KL-3 and the Treaty-12 mineral claims in the Skeena Mining Division in the Bowser River area, north of Stewart, B.C. The KL claims were staked by Noranda Exploration in 1988 to secure attractive gossans believed to be associated with pyritic felsic pyroclastics. The Treaty-12 claim was staked for Ross Resources in 1989 and was subsequently optioned to Noranda Exploration in 1990. This report describes a geological and geochemical survey undertaken by Noranda in July and August of 1990 to evaluate the economic potential of the claims. A statement of costs is included for each group, however for sake of completeness and convenience the work has been compiled into a single report. All work was performed by employees of Noranda Exploration.

LOCATION AND ACCESS

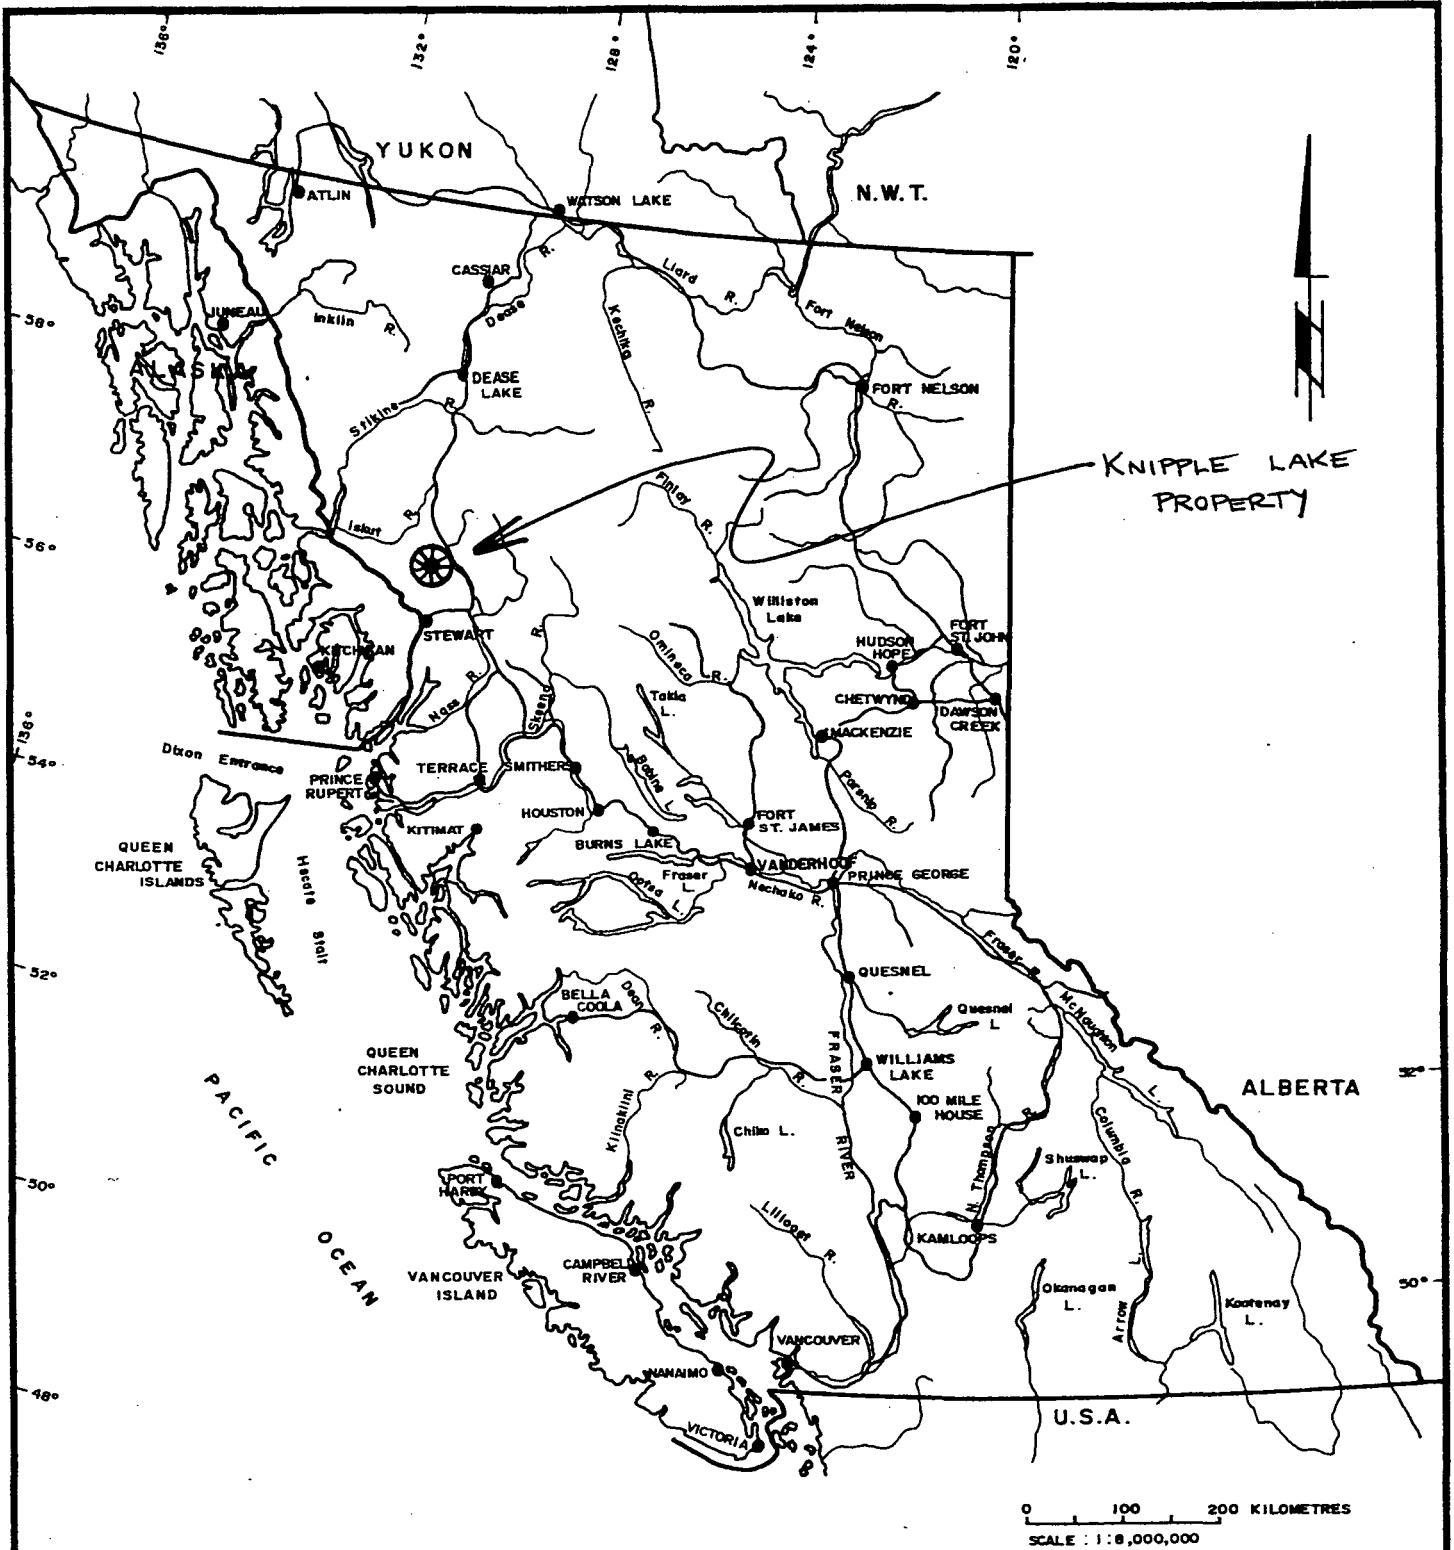

The Knipple Lake Property is located approximately 60 kilometres north of Stewart, B.C. and 25 kilometres southwest of the Stewart-Cassiar Highway (figure 1). At present, the property is accessible only by helicopter. A gravel airstrip connected by a road-barge link to the Stewart Cassiar Highway lies just 1 kilometre south of the property.

A Hughes 500D helicopter chartered from Vancouver Island Helicopters at Stewart was utilized for this program. Camp facilities were provided by Noranda's previously established tent camp on the Todd Creek property, approximately 15 kilometres to the southeast.

PHYSIOGRAPHY AND VEGETATION

The property is contained within the Boundary Ranges of the rugged Coast Mountains. Elevations range from about 450 metres in the Bowser River Valley at the south end of the property to over 1890 metres on the northwest trending ridge on the north end of the property. The east, north, and west sides of the property are bounded by thick, crevassed glaciers.

About 90% of the claims can be easily traversed. The remainder consists of steep cliffs and glaciers. Treeline lies at about 1500 metres, however receding glaciers have left large treeless areas as low as 1000 metres. Alpine areas are covered with grasses and brush typical of a cool, wet coastal alpine environment. Below treeline mature stands of spruce, fir and hemlock dominate.

CLAIM DATA

The property is comprised of the following modified grid claims. Upon acceptance of this report, they will be in good standing until the indicated date. A plan of the claims is provided in figure 2.

Table 1. Claim Data

Name	Units	Record #	Record Date	Expiry Date
KL-1	18	6934	10/25/88	10/25/92
KL-2	18	6935	10/25/88	10/25/92
KL-3	18	6936	10/25/88	10/25/92
TREATY-12	20	7824	08/26/89	08/26/92

PREVIOUS WORK

The property lies within the Stewart-Iskut belt of mineralization which has seen considerable exploration activity in recent years. The area of the claims has been staked several times by different interests previous to Noranda, however, there is no record of work in the public domain and no evidence of any serious exploration was observed during the 1990 program.

The results of Noranda's preliminary surveys conducted in 1989 are reported in "Geochemical Report on the KL-1, 2, 3 Mineral Claims" by M. Savell, submitted for assessment requirements. The highlight of this program was the discovery of numerous boulders of quartz-carbonate vein, stringer and breccia material mineralized with abundant coarse sphalerite, galena, chalcopyrite, and pyrite on the northwest corner of the KL-3 claim. Values up to 0.521 oz/t Au, 0.50 oz/t Ag, 0.14% Cu, 3.03% Pb, and 9.02% Zn were obtained. The source area was presumed to be up slope on either the KL-3 or TREATY-12 claim.

REGIONAL GEOLOGY

The area lies near the western edge of the Intermontane Belt of the Canadian Cordillera, where it straddles the Coast Plutonic Complex. Recent work by both the Geological Survey of Canada and the Geological Services Branch of British Columbia provides a useful framework of the complex geology of this rugged area. The area includes four, unconformity bounded, tectonostratigraphic assemblages: 1) Paleozoic Stikine Assemblage; 2) Triassic-

November, 1990

Page 5

Jurassic volcano-plutonic complexes of Stikinia; 3) Middle and Upper Jurassic Bowser overlap assemblage; and 4) Tertiary Coast Plutonic Complex.(Anderson, 1989) This section of the Intermontane Belt forms the west limb of the "Stikine Arch," a roughly horseshoe shaped area of Upper Triassic to Jurassic stratigraphy that hosts most of the significant mineral deposits in northwest B.C. and also the Toodoggone gold camp.

Paleozoic Stikine Assemblage

This is the oldest assemblage and contains three distinct, mainly volcanic-carbonate mappable divisions: Early Devonian limestones and intermediate to felsic volcanics, Mississippian bioclastic limestones, and Permian fragmental volcanics and limestone. These rocks are generally highly metamorphosed and deformed.

Triassic-Jurassic volcano-plutonic complexes (Stewart Complex)

This comprises both the Triassic Stuhini Group and the Jurassic Hazleton Group. The Stuhini Group consist of limestones and bimodal to mafic volcanics deposited in island arc environments. These rocks host the Snip and Johnny Mountain deposits. Hazleton Group rocks comprise andesitic breccias and lavas, felsic tuffs and breccias, maroon-green volcanic siltstone, greywacke, conglomerate, calcareous siltstone, and black shale also with island arc affinities. These rocks host the Eskay Creek deposits.

Middle and Upper Jurassic Bowser Overlap Assemblage

These are predominantly turbidite black clastics deposited in the Bowser Basin, a result of uplift to the west due to emplacement of the Coast Range Intrusives.

Tertiary Coast Plutonic Complex

Tertiary, post-tectonic, felsic plutons characterize the Coast Plutonic Complex. Eastward younging of strata from west to east and local zones of high strain attest to intrusion and uplift of the complex.

Locally Tertiary to Recent subaerial volcanics cover mainly low lying areas of the above strata.

November, 1990

Page 6

Sub-volcanic intrusions accompany most of the volcanic centres of the Mesozoic island arc complexes. These range from Alaskan type ultramafics to felsic dykes. Distinctive porphyritic dykes link Upper Triassic and Lower Jurassic volcanics with their plutonic equivalents. Many of the significant mineral deposits in the Stewart Complex are found to have a close association with volcanic centres.

PROPERTY GEOLOGY

Geological mapping was concentrated in the area thought to be the most likely source area of the mineralization found in float described above. A 1:2500 scale geological plan of this area is presented on figure 4. Figure 3 shows this area relative to the entire claim block. Topographical control was provided by the survey grid described in the next section.

Surficial Geology

Most of the bedrock exposures are found along the top and west sides of the north to northwest trending ridge that dominates the Treaty-12 and KL-3 claim. North and northeast of this ridge the slope abruptly drops forming inaccessible cliffs that end at glacial ice. The mapped area forms a relatively consistent west facing slope averaging about 30 degrees that ends at a wide south flowing receding glacier. The slope is covered with a thin to moderately thick apron of fine talus, minor moraine outwash and poorly developed, slumping alpine soil. Vegetation has stabilized most of the area at lower elevations. The glacier to the west of this slope has receded approximately 50 metres vertically from its maximum size and has left a 100 to 200 metre wide strip underlain with a semi-consolidated basal till which is in places covered with coarse and loose lateral and medial moraine and talus that is still unvegetated. The edge of this strip is indicated on figure 4. The east-west trending 600 to 700 metre wide zone shown in the south grid area is dominated by more recent coarse moraine and outwash from the small receding icefields at the southeast corner of the map.

Bedrock Lithologies

The mapped area is underlain by two packages of volcanic rocks: an extensive sequence of interbedded andesitic flows (Unit # 2) and agglomerates (Unit # 3) and a less dominant unit of felsic tuffs and flows (Unit # 1).

November, 1990

Page 7

Unit 1 consists of dark brown, maroon, grey and green vaguely layered, subrounded to subangular clasts of andesitic rocks of unit 2 in a darker very fine matrix. In areas of sufficient outcrop mappable beds in the order of 25 to 100 metres thick can be traced over several hundred metres.

Unit 2 has been subdivided into four mappable divisions:

- 2a) Massive, dark varicoloured, feldspar porphyritic flows.
- 2b) Vaguely layered, fine lithic tuff +/- feldspar phenocrysts.
- 2c) Massive, dark amygdaloidal feldspar porphyritic flows.
- 2d) Massive, dark greenish brown chloritic flows.

Unit 3 has been subdivided into two mappable divisions:

- 3a) Massive to vaguely layered, pale grey to brown, feldspar porphyritic lapilli tuff.
- 3b) Massive pale grey to buff, aphyric siliceous rhyolite.

These rocks are interpreted to have been rapidly deposited in dominantly submarine environment proximal to a volcanic centre. The felsic volcanics may indicate the youngest eruptive event. They are considered part of the Lower Jurassic Hazleton Group. Units 1 and 2 may correlate with the Betty Creek Formation and unit 3 with the Mt. Dilworth Formation.

Structure

Where layering is discernable two general attitudes were measured. In the central east portion of the mapped area, attitudes are found to trend from about 060 to 090 degrees and dip moderately to steeply southward. Several hundred metres south of this area the dominant trend is found to be around 180 degrees with a variable westward dip.

Two 070 degree trending faults are interpreted to cross the gridded area as shown on figure 4. The interpretation is based on strong contrasts in magnetic relief indicated from a ground magnetic survey completed later in the program and on the presence of strongly foliated and brecciated rocks in the vicinity of Line 10100 N, 10350 W.

Alteration

In situ alteration is limited to unit 3a which is often observed to be variably silicified and laced with a pervasive network of white quartz stingers and veinlets. Disseminated pyrite is common. Weakly chloritized andesitic rocks are found scattered throughout the east-central grid area. In the moraine

November, 1990

Page 8

fields on the grid south area numerous boulders of strongly quartz-sericite-pyrite altered felsic porphyritic intrusive are derived from exposures on the main ridge immediately east of the KL-3 claim. This intrusive is believed to be the source of the hydrothermal system that produced the observed alteration.

Mineralization

A boulder field at the southwest grid corner from 11000W, 8700N to 11150W, 9100N contains over one hundred boulders of quartz-calcite breccia and vein material containing coarse sphalerite, galena, pyrite, and chalcopyrite (figure 3 and 4). There are often recrystallized and silicified wall rock material within and adjacent to the quartz-calcite-sulphide mineralization. The boulders are subrounded to subangular and range in size from about 10 to 100 centimetres in diameter. Of forty-eight samples analyzed, all have anomalous gold values, and 18 have values greater than 4 gm/t Au and 8 greater than 8.5 gm/t Au. Base metal values average 0.18% Cu, 0.89% Pb, and 3.14% Zn; silver averages 9.3 gm/t. Intense prospecting failed to locate the source of the boulders on the largely overburden covered slopes above, however the presence of minor sulphide bearing clots and quartz veins with anomalous gold values (up to 1260 ppb) suggests the source is within the grid area.

GEOCHEMISTRY

Soil Geochemistry

A total of 825 soil samples were collected and analyzed for Au and the I.C.P. suite of elements. Samples were collected from the "B" soil horizon where possible, however due to local poor soil development and slumping, the material collected is more likely a "C" horizon at many sites. At many sites the material available was very coarse "C" horizon, such that less than 10 grams of minus 80 mesh material was available for gold analyses. These stations are indicated with an asterisk on the lab reports. They were obtained by digging a small hole averaging about 40 centimetres deep with a grubhoe. The soil was placed in a Kraft paper envelope and shipped to the geochem lab of Noranda Exploration at 1050 Davie Street, Vancouver, B.C. Details of the analytical procedure is given in Appendix IV, and lab reports are listed in Appendix V. Figures 5 through 10 are grid plots of results with selected contour intervals for Au, Ag, Cu, Pb, Zn, and As.

November, 1990

Page 9

Samples were collected at 25 metre intervals along lines spaced 100 metres apart and assigned a grid coordinate. The grid was surveyed with compass and hipchain and stations marked with 0.5 metre high wooden pickets. A line azimuth of 290 degrees was chosen as this is perpendicular to the average strike of vein, gossan, and bedding attitudes.

Au : Values range from 5 ppb (the detectable limit) to 300 ppb (L8800N, 10250E). Values over 20 ppb are considered anomalous, over 100 ppb strongly anomalous. Numerous, widely scattered values in the south grid area are attributed to dispersion by glacial and outwash processes, however the high result at L8800N, 10250E still warrants closer investigation. Three other more extensive anomalous areas also warrant closer scrutiny : Anomaly 1, from L9400N, 11000W to L9900N, 11400W; Anomaly 2, from L9700N, 10850W; and Anomaly 3, from L9300N, 10000W to L10100N, 10375W. These areas are coincident with significant Ag, Cu, Pb, Zn and As.

Ag : Values range from 0.2 to 12.0 ppm, with those over 2 ppm considered anomalous. The anomalous values are restricted to small zones within anomalies 1 and 3, except for a few scattered values in the moraine and outwash covered area on the south quarter of the grid.

Cu : Values range from about 15 to 166 ppm, with those over 50 ppm considered anomalous. Significant values are restricted to anomalies 1 and 3.

Pb : Values range from about 2 to 251 ppm, with those over 50 ppm considered anomalous. Significant values are restricted to anomalies 1 and 2. Pb values in anomaly 2 are clustered up slope of most of the Au values. There are also a few scattered high Pb results within anomaly 3.

Zn : Values range from about 40 to 440 ppm, with those over 150 ppm considered anomalous. Significant values are restricted to the central zones of anomaly 1 and 3, and a few isolated scattered stations throughout the grid especially the southeast corner.

As : Values range from about 5 ppm to 196 ppm, with those over 60 ppm considered anomalous. Significant values are restricted to anomaly 1 and 3, and again a few scattered results over the south grid area.

November, 1990

Page 10

Anomaly 1 occurs at the base of the main west facing slope. The 30 ppm As contour defines an area about 150 metres wide by 600 metres long trending at 170 degrees. Coincident Au and Pb values are found within these limits, and to a lesser extent Ag, Cu, and Zn. Follow up prospecting failed to locate significant mineralization within this largely overburden covered area, however as it lies up slope and up ice from the mineralization found in float, it must be considered a possible source area.

Anomaly 2 occurs at mid-slope in a largely overburden covered area over a roughly 175 metre wide by 1000 metre long zone trending about 170 degrees. It consists of a linear cluster of gold anomalies with lead values restricted to a 100 metre wide strip on the up slope side. This anomaly does not have the same geochemical signature as the mineralized boulders, however this may be due to more complete dispersal of mobile elements such as Zn, Cu and As.

Anomaly 3 occurs near the top of the main slope in an area of thin overburden and significant area of outcrop. It is almost directly upslope of the mineralized boulders at a distance of about 1300 metres and should also be considered as a possible source area of the mineralization.

Lithochemistry

A total of 117 rock samples were collected and analyzed by the multielement I.C.P. method as well as A.A. for gold. This was done primarily as a quick and cheap assay for samples collected during mapping and prospecting traverses. Sample locations and significant results are plotted on figures 3 and 4, descriptions are listed in Appendix VI and Certificates of Analysis provided in Appendix VII.

The only economically significant results were obtained from the previously described mineralized boulders found in the southwest grid area. There is a strong correlation between Au, Ag, Cu, Pb, Zn, As, and Cd values. In samples with significant gold values As concentrations range between about 100 and 900 ppm and Cd between 200 and 800 ppm. Unmineralized samples collected elsewhere on the property found to contain anomalous Au values (100 to 1260 ppb) also contain elevated Cu, Pb, and Zn levels suggesting a common origin thus a widespread mineralizing system.

November, 1990

Page 11

Stream Sediment Geochemistry

An additional 23 silt samples were collected during the 1990 surveys. These were collected from active stream channels, placed in Kraft paper envelopes and shipped to the geochem lab of Noranda Exploration at 1050 Davie Street, Vancouver B.C. Here they were dried and analyzed by the multielement I.C.P. method and A.A. method for Au. Sample locations and results are shown on figure 3 and 4, and Certificates of Analysis in Appendix VIII.

Inspection of results indicates several moderately anomalous Au values collected from small streams in the immediate vicinity of the mineralized boulders previously described (eg. #109633 - 65 ppb Au, # 128468 - 60 ppb Au). There are no significant accompanying Ag or base metal values.

Eight additional heavy mineral concentrates from the KL-1 and 2 claims were collected and analyzed. These were sieved and panned in the field from 20 litre stream gravel samples, and analyzed by A.A. methods. Sample locations and results are presented on figure 3. No significant results were obtained.

CONCLUSIONS

The Knipple Lake Property is underlain by volcanic rocks of the Jurassic Hazleton Group. Two packages of volcanics are present, an extensive sequence of interbedded andesitic flows and agglomerates (Betty Creek Formation) and a less dominant unit of felsic tuffs and flows (Mt. Dilworth Formation). Alteration is not extensive but includes silicification of felsic rocks, chloritization of andesitic rocks, and quartz-sericite-pyrite alteration of felsic porphyritic intrusive rocks found immediately southeast of the KL-3 claim.

Quartz-calcite vein and breccia material containing variable amounts of coarse sphalerite, galena, chalcopyrite and pyrite has been found in subrounded to subangular boulders up to 100 centimetres in diameter scattered over a 100 by 400 metre area at the northwest corner of the KL-3 claim. Economic gold values have been detected in a significant number of these boulders. The source has yet to be located, but is believed to be up slope and/or up ice within the grid surveyed area. Chip samples of similar vein material without sulphides found in outcrop returned anomalous gold and base metal values.

November, 1990

Page 12

The soil geochemical survey of the grid has detected at least three anomalies that may reflect buried mineralization. Anomaly 1 is 400 metres north of the mineralized boulders and contains coincident Au, Pb and As values up to 50 ppb, 233 ppm, and 196 ppm respectively as well as more scattered Ag, Cu and Zn values (up to 12 ppm, 166 ppm, and 334 ppm respectively). Anomaly 2 is 1100 metres north-northeast of the mineralized boulders and contains a linear cluster of gold values up to 230 ppb over a 175 by 1000 metre long zone with Pb values up to 251 ppm restricted to the up slope side. Both anomaly 1 and 2 occur in a largely overburden covered area. Anomaly 3 occurs 1300 metres east-northeast of the boulders almost directly up slope. This 150 by 800 metre long zone consists of patchy Au, Ag, Cu, Pb, Zn, and As values up to 250 ppb, 11.6 ppm, 112 ppm, 229 ppm, 440 ppm, and 122 ppm respectively. This anomaly is located near the top of the slope in an area of thin overburden and abundant outcrop and talus. All three anomalies are possible source areas of the float mineralization.

The favourable lithologies, setting and age of the host rocks, widespread hydrothermal activity as evidenced by alteration and veining, economic gold values in sulphide rich float and the large aerial extent of Au, Ag, Cu, Pb, Zn and As soil geochemical anomalies suggest this essentially untested property has good potential to host economic mineralization. Further exploration is warranted.

RECOMMENDATIONS

The following exploration program is recommended:

- 1) An airborne EM and MAG survey should be flown over the gridded area and the remainder of the property to assist in geological interpretation and target selection.
- 2) Further target definition utilizing ground magnetics and induced polarization surveys.
- 3) Testing of selected targets with blast and/or excavator trenching using a small helicopter transportable machine.
- 4) A minimum of 1000 metres of diamond drilling to test the most promising targets.

APPENDIX III
STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Michael J. Savell of the City of Prince George, Province of British Columbia, do certify that:

1. I am a geologist residing at 3507 Rosia Road, Prince George, British Columbia.
2. I am a graduate of Dalhousie University with a Bachelor of Science (Honors) in Geology.
3. I am a member in good standing of the Geological Association of Canada, Canadian Institute of Mining, Prospector's and Developer's Association and the B.C.-Yukon Chamber of Mines.
4. I presently hold the position of Project Geologist with Noranda Exploration Company, Limited and have been in their employ since 1980.

Michael J. Savell
Geologist
Noranda Exploration Company, Limited
(No Personal Liability)

November, 1990

Page 16

APPENDIX IV
ANALYTICAL PROCEDURE

Soils, Silts, Rocks

The samples are dried and screened to -80 mesh. Rock samples are pulverized to -120 mesh. A 0.2 gram sample is digested with 3 ml of $\text{HClO}_4/\text{HNO}_3$ (4 to 1 ratio) at 203° C for four hours, and diluted to 11 ml with water. A Leeman PS 3000 is used to determine elemental contents by I.C.P. Note that the major oxide elements and Ba, Be, Ce, Ga, La and Li are rarely dissolved completely from geological materials with this acid dissolution method.

For Au analyses, a 10.0 gram sample of -80 mesh material is digested with aqua regia and determination made by A.A.

Heavy Mineral Concentrates

The entire concentrate is digested in aqua regia solution, and elemental concentrations of Au, Ag, Cu, Pb, and Zn are determined by A.A.

GEOLOGICAL, GEOCHEMICAL REPORT ON THE
KNIPPLE LAKE PROPERTY
(KL 1 to 3, Treaty 12 Claims)

November, 1990

APPENDIX V

CERTIFICATES OF ANALYSIS - SOILS

293
Results

NORANDA VANCOUVER LABORATORY
Geochemical Analysis

Project Name & No.: KNIPPLE LK. - 293

Material: 117 SOILS & 15 SILTS

Remarks: • Sample screened @ -35 mesh

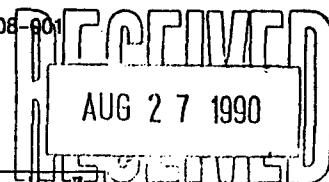

Geol M.S.

Sheet 1 of 4

Date rec'd: JUL. 28

Date compl: AUG. 21

LAB CODE: 9006-001

Au - 10.0 g sample digested with aqua-regia and determined by A.A. (D.L. 5 PPB)

ICP - 0.2 g sample digested with 3 ml HClO4/HNO3 (4:1) at 203 °C for 4 hours diluted to 11 ml with water. Leeman PS3000 ICP determined elemental contents.

N.B. The major oxide elements and Ba, Be, Ce, Ga, La, Li are rarely dissolved completely from geological materials with acid dissolution methods.

293

Copy to Mike

Project Name & No.: KNIPPLE LK - 293 Geol.: B.F.
 Material: 115 SOILS Sheet: 1 of 3
 Remarks: * Sample screened @ -35 mesh.

Date rec'd: JUL. 30
 Date compl: AUG. 21

LAB CODE: 900820091

Au - 10.0 g sample digested with aqua-regia and determined by A.A. (D.L. 5 PPB)
 ICP - 0.2 g sample digested with 3 ml HClO₄/HNO₃ (4:1) at 203 °C for 4 hours diluted to 11 ml with water. Leeman P83000 ICP determined elemental contents.
 N.B. The major oxide elements and Ba, Be, Ce, Ga, La, Li are rarely dissolved completely from geological materials with acid dissolution methods.

NORANDA VANCOUVER LABORATORY
Geochemical Analysis

Project Name & No.: KNIEPELKA 109

Geol.: B.F.

Date rec'd: AUGUST 03

LAB CODE: 69008-018

Material: 219 SOILS

Sheet: 1 of 6

Date compl: AUGUST 21

Remarks:

Au - 10.0 g sample digested with aqua-regia and determined by A.A. (D.L. 6 PPB)

ICP - 0.2 g sample digested with 3 ml HClO4/HNO3 (4:1) at 203 °C for 4 hours diluted to 11 ml with water. Leeman PS3000 ICP determined elemental contents.

N.B. The major oxide elements and Ba, Be, Ca, Ga, La, Li are rarely dissolved completely from geological materials with acid dissolution methods.

Copy to Mike

Kniffle Results

NORANDA VANCOUVER LABORATORY
Geochemical Analysis

Project Name & No.: **10000-10000**
Material: **54 SOILS**
Remarks:

Geol.: **B.F.**
Sheet: 1 of 2

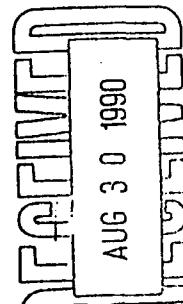

Date rec'd: **AUGUST 03**
Date compl: **AUGUST 22**

LAB CODE: **10000-1023**

Au - 10.0 g sample digested with aqua-regia and determined by A.A. (D.L. 6 PPB)
ICP - 0.2 g sample digested with 3 ml HClO4/HNO3 (4:1) at 203 °C for 4 hours diluted to 11 ml with water. Leeman P83000 ICP determined elemental contents.
N.B. The major oxide elements and Ba, Be, Ce, Ga, La, Li are rarely dissolved completely from geological materials with acid dissolution methods.

(field + office)*

Project Name & No.: KNIPPLE LK - 293 Geol.: M.S.
Material: 199 SOILS & 6 SILTS Sheet: 1 of 5
Remarks:

Date rec'd: AUGUST 08 LAB CODE: 9008-039
Date compl: AUGUST 27

Au - 10.0 g sample digested with aqua-regia and determined by A.A. (D.L. 5 PPB)

ICP - 0.2 g sample digested with 3 ml HClO4/HNO3 (4:1) at 203 °C for 4 hours diluted to 11 ml with water. Leeman FS3000 ICP determined elemental contents.

N.B. The major oxide elements and Ba, Be, Ce, Ga, La, Li are rarely dissolved completely from geological materials with acid dissolution methods.

NORANDA VANCOUVER LABORATORY
Geochemical Analysis

Project Name & No.: KNIPPLE LAKE - 293 Geol.: M.S.

Material: 2 SILTS & 121 SOILS

Sheet: 1 of 3

Date rec'd: AUG. 13

LAB CODE: 9008-045

Date compl: SEP. 04

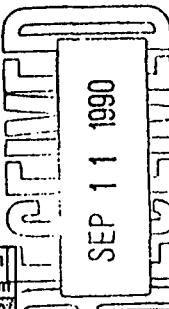

Remarks:

Au - 10.0 g sample digested with aqua-regia and determined by A.A. (D.L. 5 PPB)

ICP - 0.2 g sample digested with 3 ml HClO4/HNO3 (4:1) at 203 °C for 4 hours diluted to 11 ml with water. Leeman P93000 ICP determined elemental contents.

N.B. The major oxide elements and Ba, Be, Ce, Ga, La, Li are rarely dissolved completely from geological materials with acid dissolution methods.

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR Mn Fe Sr Ca P La Cr Mg Ba Ti B W AND LIMITED FOR Na K AND Al. AU DETECTION LIMIT BY ICP IS 3 PPM.

- SAMPLE TYPE: Rock AU* ANALYSIS BY ACID LEACH/AA FROM 10 GM SAMPLE.

DATE RECEIVED: JUL 26 1990 DATE REPORT MAILED:

Aug 2/90

SIGNED BY: C. Henry

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: ROCK AU* ANALYSIS BY ACID LEACH/AA FROM 10 GM SAMPLE.

DATE RECEIVED: SEP 21 1990 DATE REPORT MAILED: Sept 28/90 SIGNED BY...: D.TOE, C.LEONG, J.WANG; CERTIFIED B.C. ASSAYERS

APPENDIX VIII

CERTIFICATES OF ANALYSIS - STREAM SEDIMENTS

NORANDA VANCOUVER LABORATORY
Geochemical Analysis

Copy to Mike +2.

Project Name & No.: KNIPPLE LAKE - 293 Geol.: M.S.
 Material: 2 SILTS & 121 SOILS Sheet: 1 of 3
 Remarks:

Date rec'd: AUG. 13 LAB CODE: 9008-045
 Date compl: SEP. 04

Au - 10.0 g sample digested with aqua-regia and determined by A.A. (D.L. 5 PPB)
 ICP - 0.2 g sample digested with 3 ml HClO₄/HNO₃ (4:1) at 203 °C for 4 hours diluted to 11 ml with water. Leeman PB3000 ICP determined elemental contents.
 N.B. The major oxide elements and Ba, Be, Ce, Ga, La, Li are rarely dissolved completely from geological materials with acid dissolution methods.

NORANDA VANCOUVER LABORATORY

PROPERTY/LOCATION: KNIPPLE LAKE

CODE : 9008-045

Project No. : 293
 Material : 2 PANS
 Remarks :

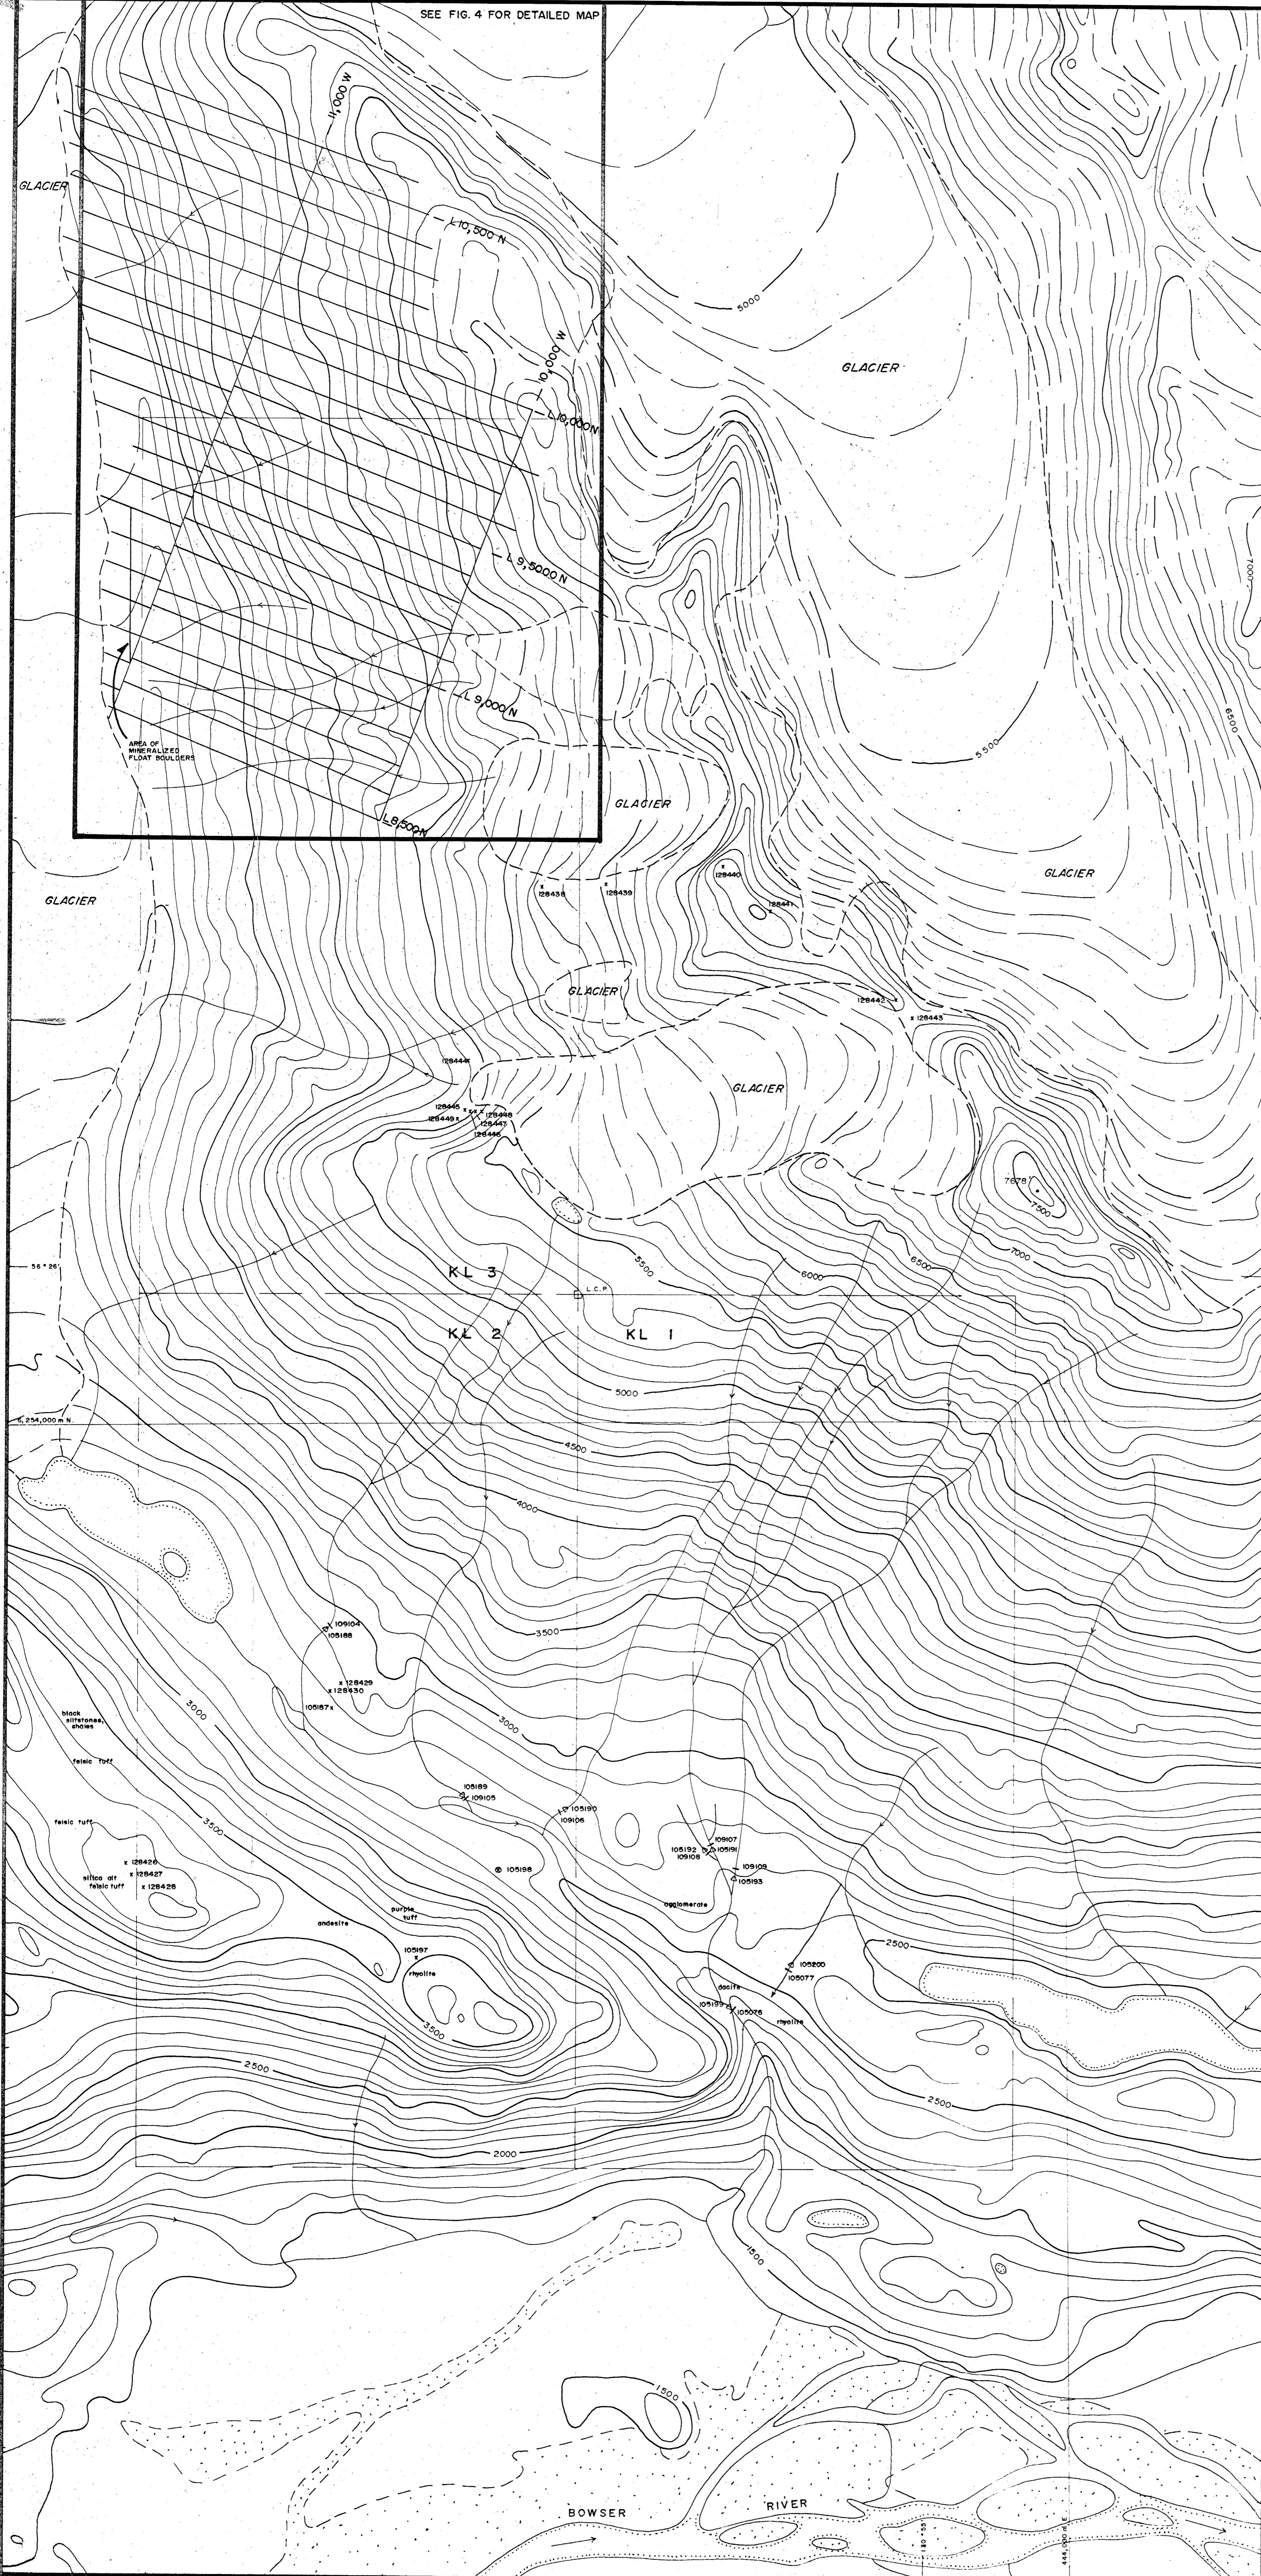

Sheet: 1 of 1
 Geol.: M.S.

Date rec'd: AUG 13
 Date compl: AUG 22

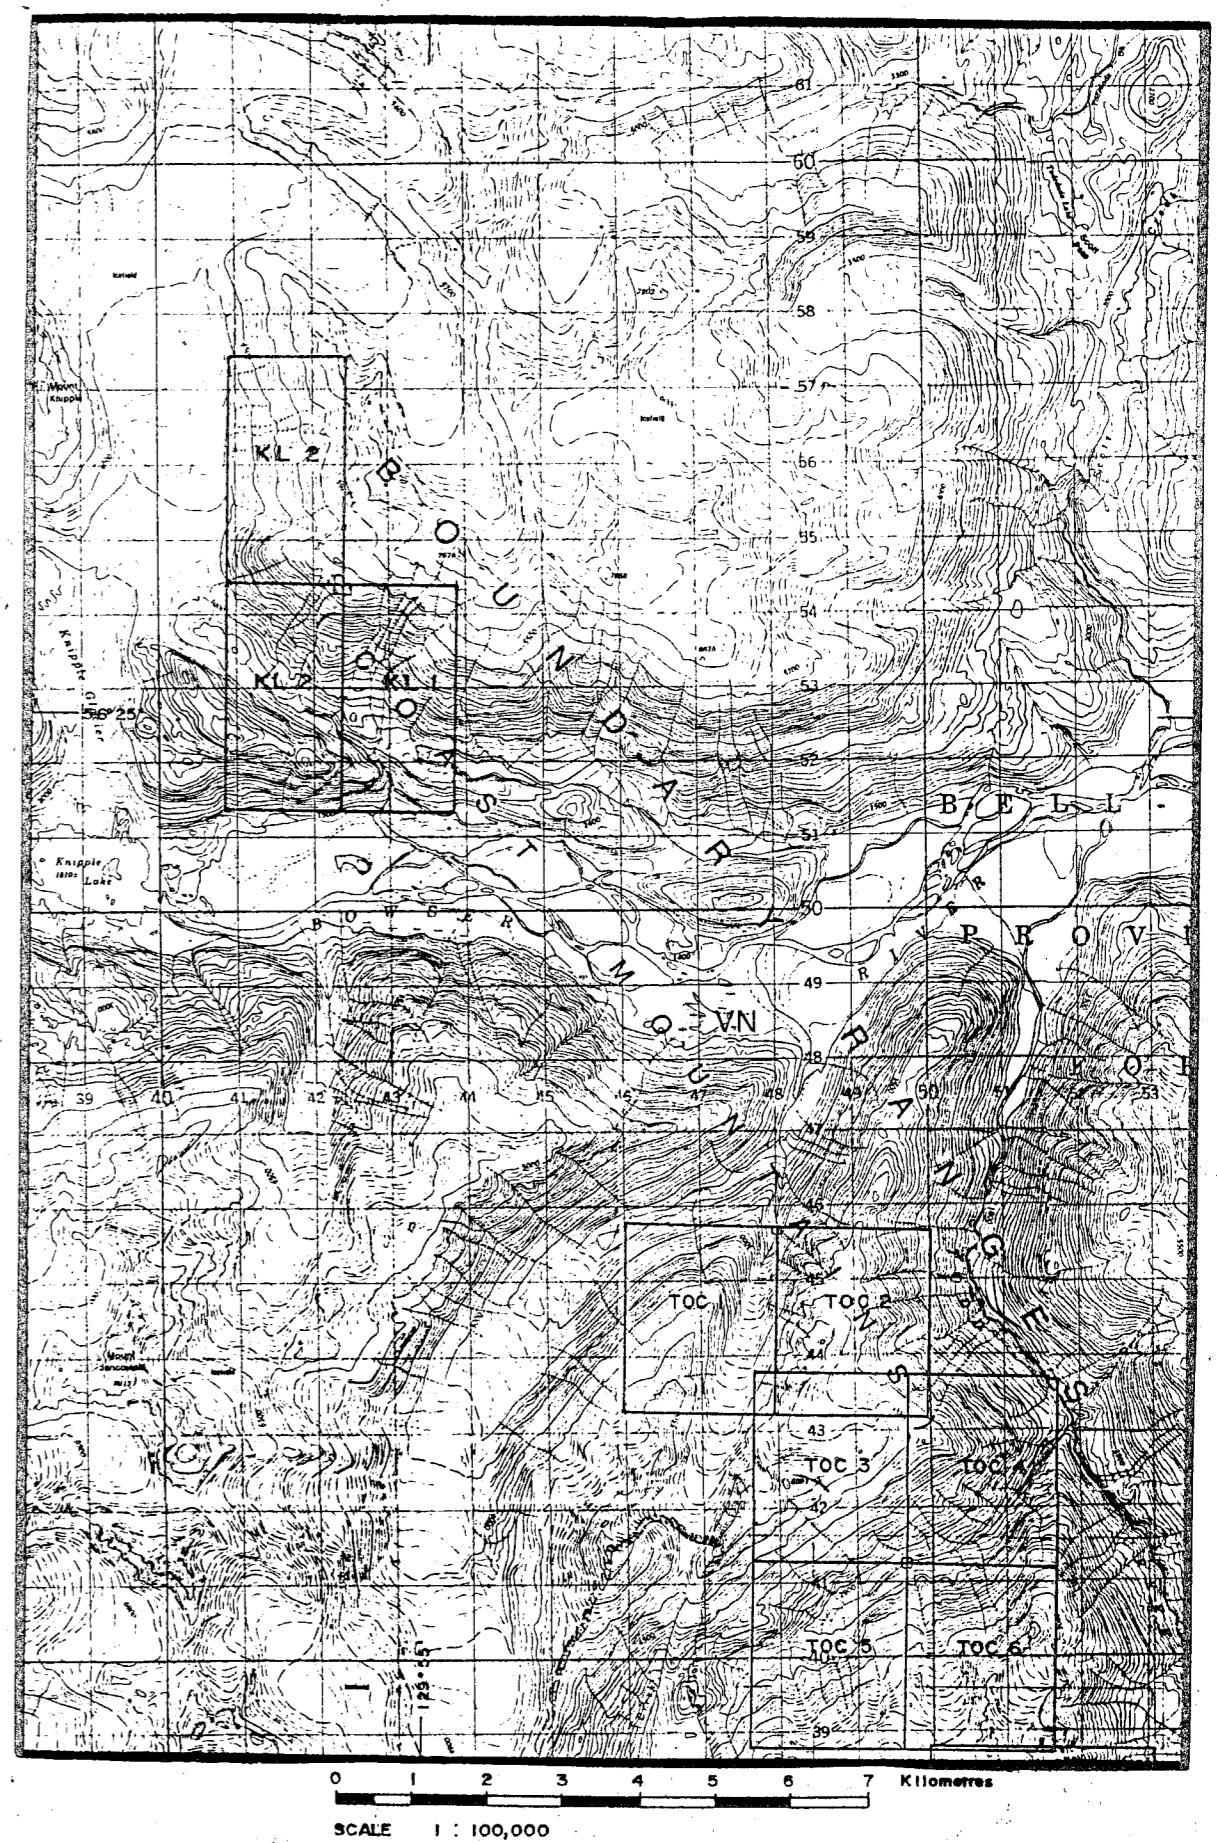

Values in PPM, except where noted.
