INTRODUCTION

- i) The AURUM RULER Group of Placer Claims is comprised of the GOLDELUXE Rec. #42 (12) and AURUM RULER Rec. #72 (1) Placer Claims, which are located along the Fraser River below the township of Lillooet, B.C. in Lillooet Mining Division. The group covers 1450 meters of Fraser River frontage in length and includes both banks of the river.

While access to the eastern bank is limited to two 4-wheel drive roads, access to the western side of the river is gained by several routes down to the waters edge.

- ii) The claim group is owned and operated by John P. La Rue of Lillooet, BC. Numerous archive records and Minister of Mines Annual Reports attest to a local history of gold mining along the Fraser River and its' benches. The author is not aware of any mining activity occurring within the claim boundaries in comparatively recent times, other than of a casual nature.

In other locations along the Fraser River, both upstream and downstream, small successful placer operations have been established which effectively mine only the top 10" - 12" of the gravels on the Fraser River floodplains and river benches, harvesting the same ground year after year. It is the author's intention to set up a similar operation on the low riverside benches within the claim group boundaries.

- iii) A summary of work completed on the claim group for Assessment purposes is comprised wholly of prospecting/sampling on both banks of the Fraser River, on both claims, as indicated on accompanying maps.
- iv) The majority of the work completed thus far to date, has been on both banks of the Fraser River, particularly within the boundaries of the AURUM RULER Claim.

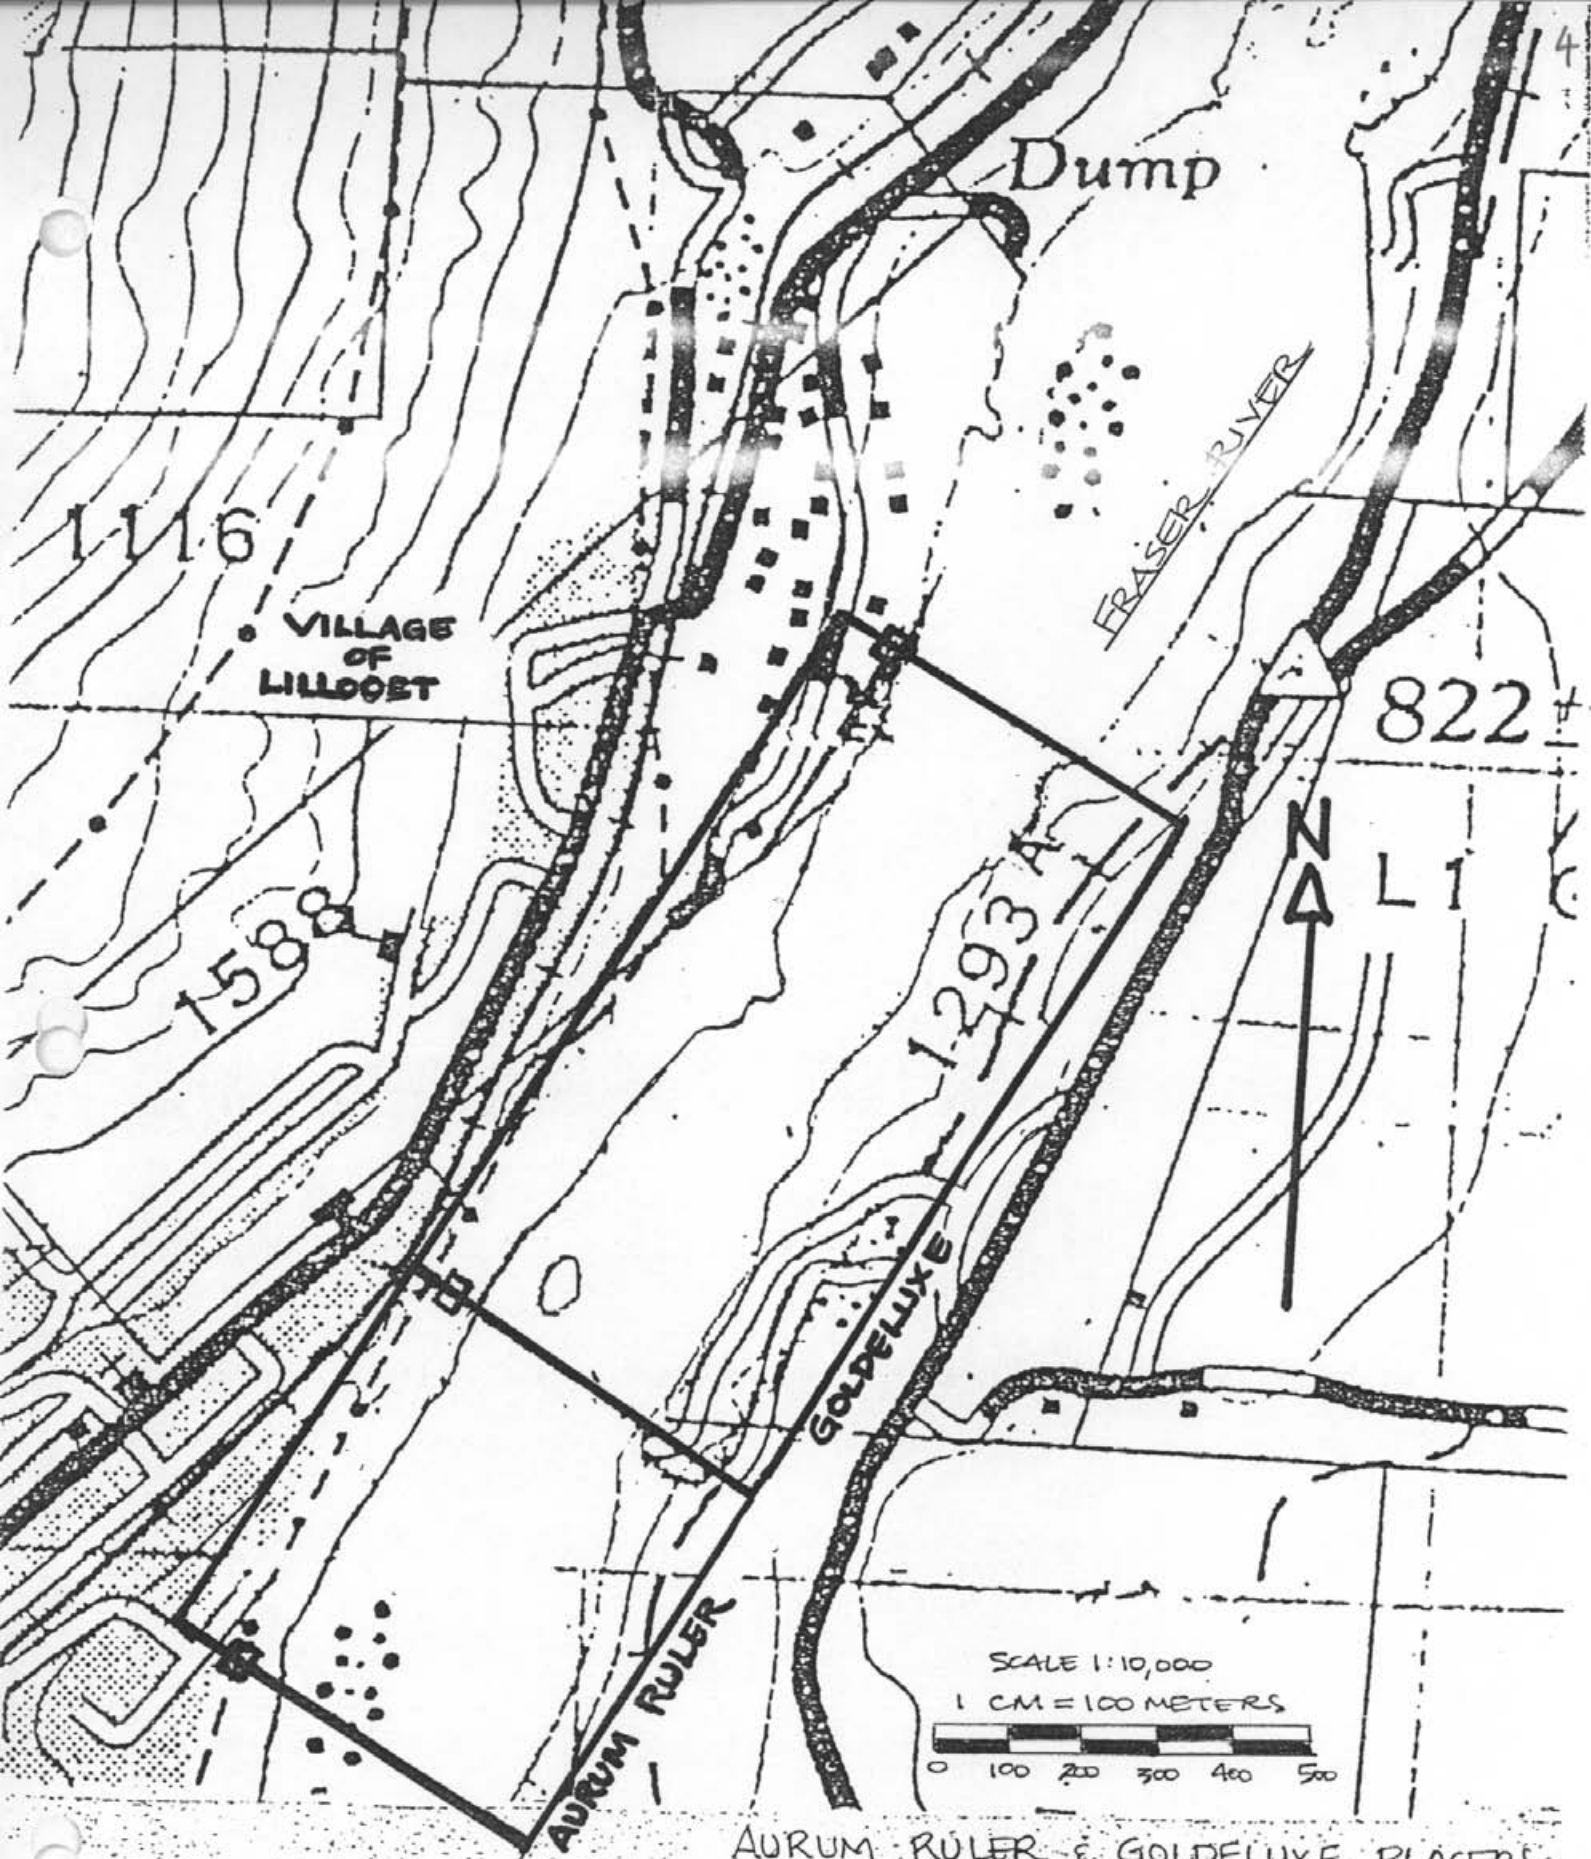

DETAILED TECHNICAL DATA AND INTERPRETATION

Work for assessment purposes, during the 1990 exploration season, has consisted wholly of sampling and processing gravels within the claim boundaries; a total of eight days work were performed by John and Tammy La Rue, over the past 10 month period. Approximate sample locations are indicated on the enclosed maps.

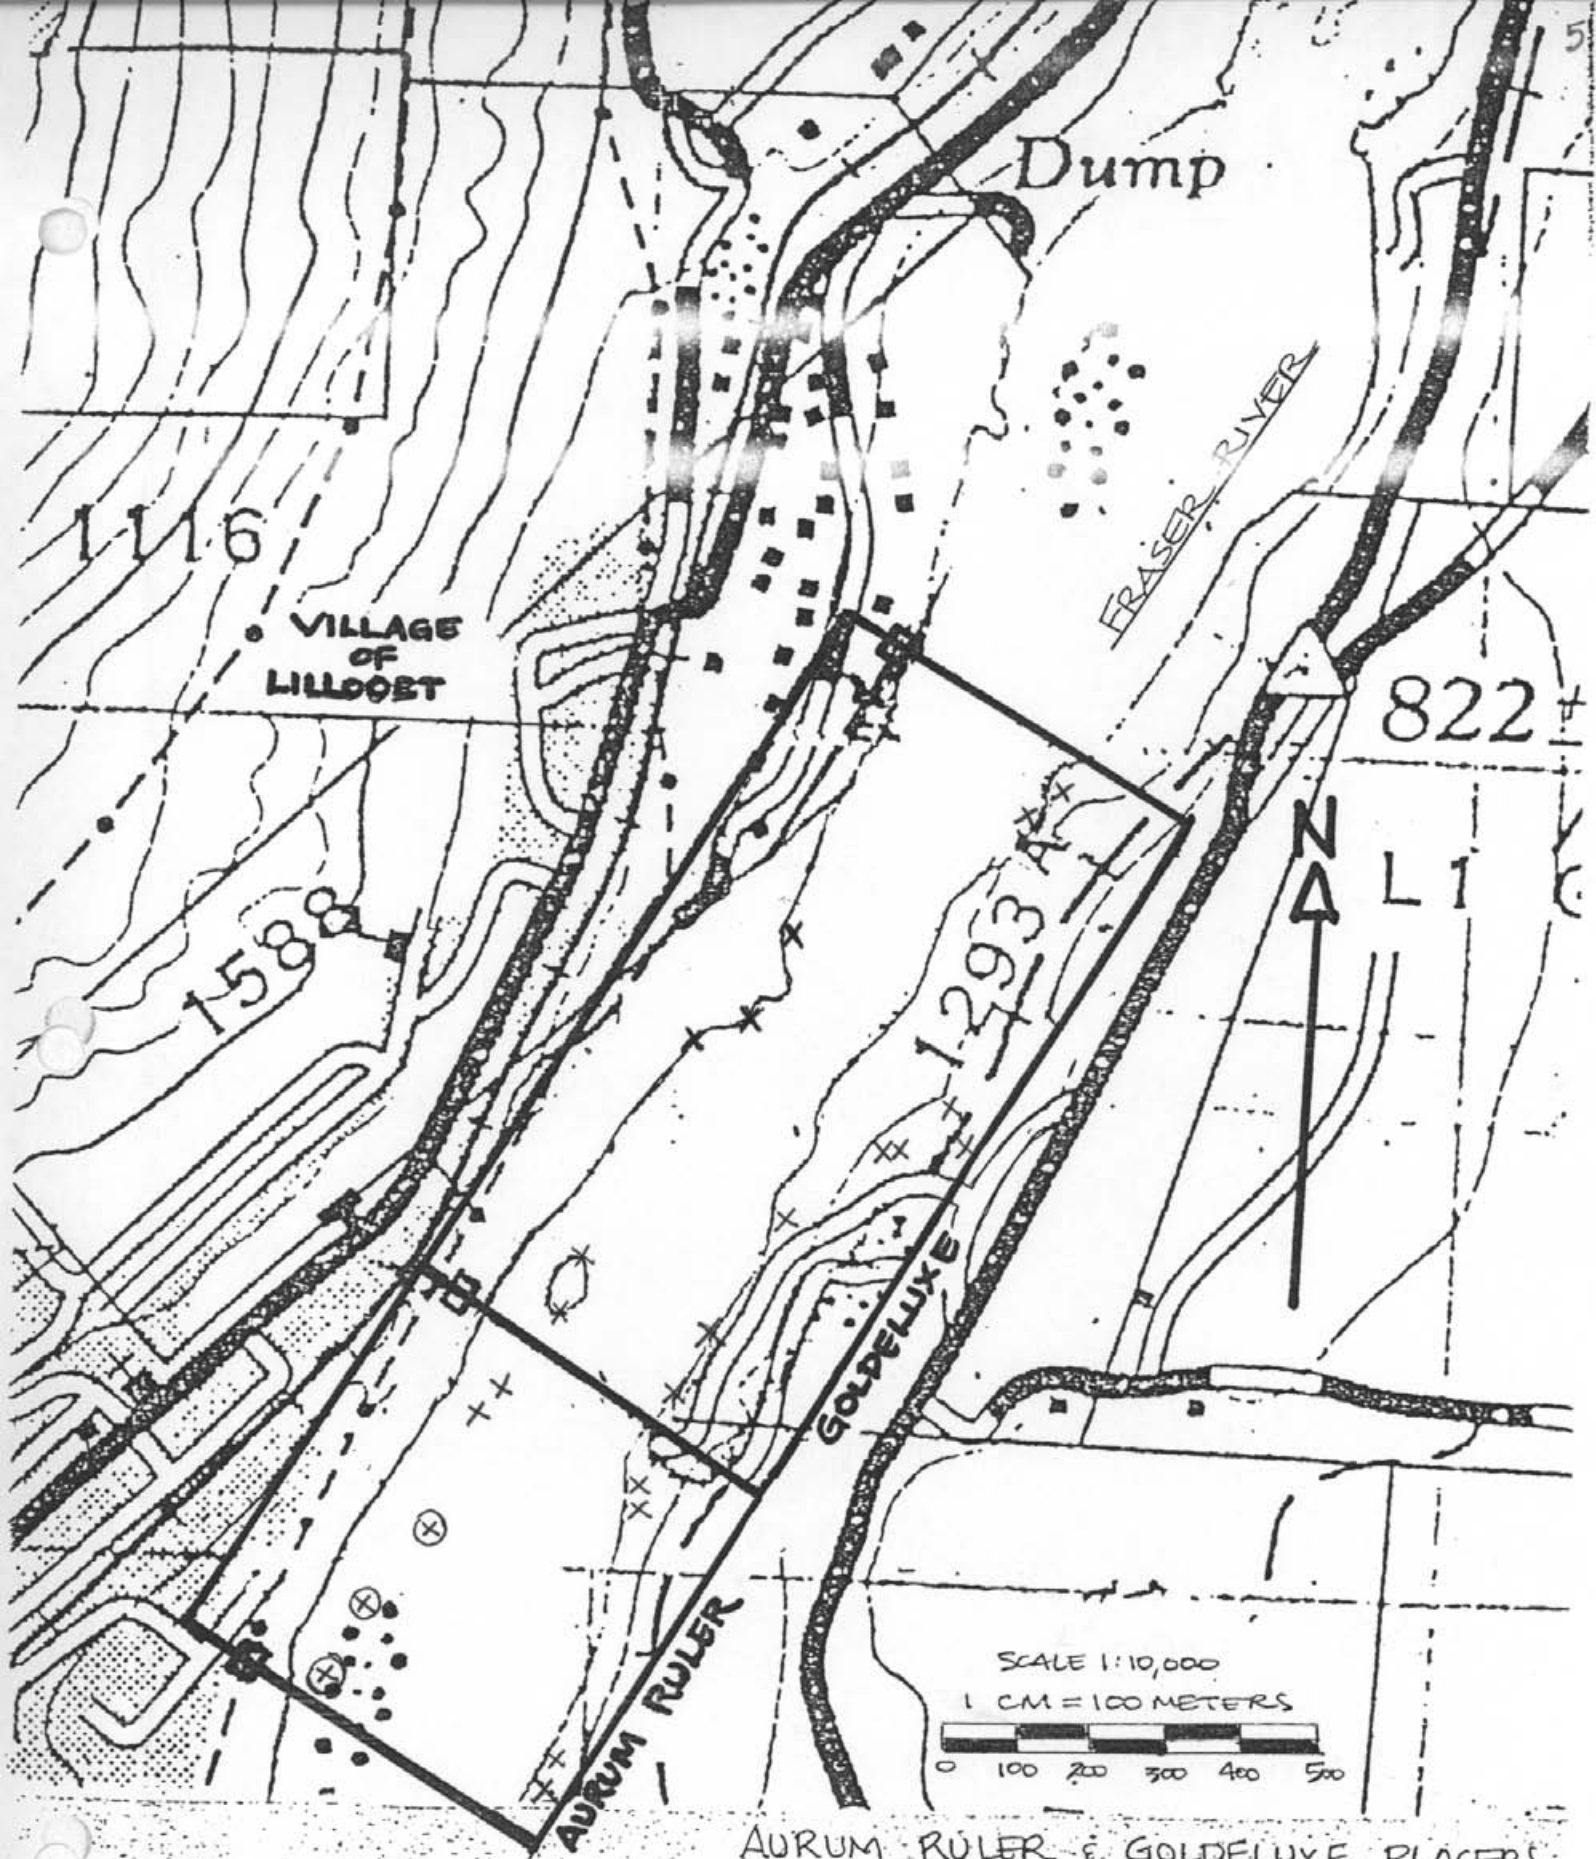

Work completed consisted of hand panning, and/or shovelling into a 5 foot long sluice set in the Fraser's current. Gravels sampled were primarily within the top 10" - 12" of the floodplain, with the exception of sampling the three locations of past "magnetometer highs", where holes were excavated to depths varying between 2' to 4.5' in an attempt to disclose the causitive source of the magnetic anomaly. A greater emphasis was placed on sampling the gravels of the east bank of the Fraser River this year, which has many areas of shallow bedrock.

Limited follow-up to last season's magnetometer survey was completed by sluicing the gravels in three locations showing the highest magnetometer readings (Line 00 + 60E; Line 40NE + 50E; and Line 100NE + 60E). No evident correlation could be established between the high magnetometer readings and the hoped for higher concentrations of black sand and greater concentrations of gold.

A total of 15+ grams of fine gold and approximately 25 lbs. of concentrate were the accumulated results of this year's sampling. Those areas sampled on the east bank of the Fraser, in areas of shallow bedrock, yielded by far the majority of the gold gathered.

ECONOMIC VIABILITY

While fine "flour" gold can be found in virtually every sample pan, the true economic viability of mining these claims might only be determined through a program of bulk sampling. Due to the extremely fine nature of the floodplain placer gold on the bars within the claim, it is not possible to "count colors". Rather, visual observation is the only reference possible in determining areas that show promise and would be suitable targets for future testing.

As may be seen from the accompanying economic viability map, the areas thus far sampled, using only limited hand sampling methods, would indicate those areas showing the greatest concentrations of gold, are the least favourable areas for commercial mining. These are areas with open shallow bedrock, and would prove difficult to mine other than by hand "sniping". Limited area on the east bank of the Fraser River would also present logistical problems in setting up settling ponds of adequate size without compromising working room.

Those areas I consider viable for a commercial operation, would be limited to the expanse of bars on the west bank of the Fraser River where there is adequate room for a settling system. These areas are characterized by generally lower gold values (visible reference), but in terms of possible tonnage/yardage, represent the areas with the greatest actual mining potential.

Explorations to date have all focused on surface (Max. 4.5' depth) gravels. Deeper excavations are planned for future sampling surveys.

ECONOMIC VIABILITY
