1.0 SUMMARY AND RECOMMENDATIONS

The BANDIT property is located fifteen kilometers south - southeast of the Golden Bear Mine in northwestern British Columbia. The property is currently being explored for gold by North American Metals Corp. and Chevron Minerals Ltd.

Diamond drilling in 1988 intersected anomalous gold values up to 2.57 grams/tonne over 2.5 meters from silicified and pyritized intermediate tuffs. The mineralized zones were also locally anomalous in antimony and tungsten although no stibnite, wolframite or scheelite were observed. Chalcopyrite was locally observed in trace amounts.

Mineralization can possibly be related to hydrothermal activity along the Ram Reef fault. The fault which trends across the Bandit X and Z claims may have been a conduit for fluids responsible for deposition of gold in structurally prepared zones.

Further work on the property should be focused on the strike extensions of both the Ram Reef fault and the silicified and pyritized tuff unit. Mapping, trenching, geophysics and soil surveying is recommended along their strike extension to the west where no previous work has been completed to define drill targets.

2.0 INTRODUCTION

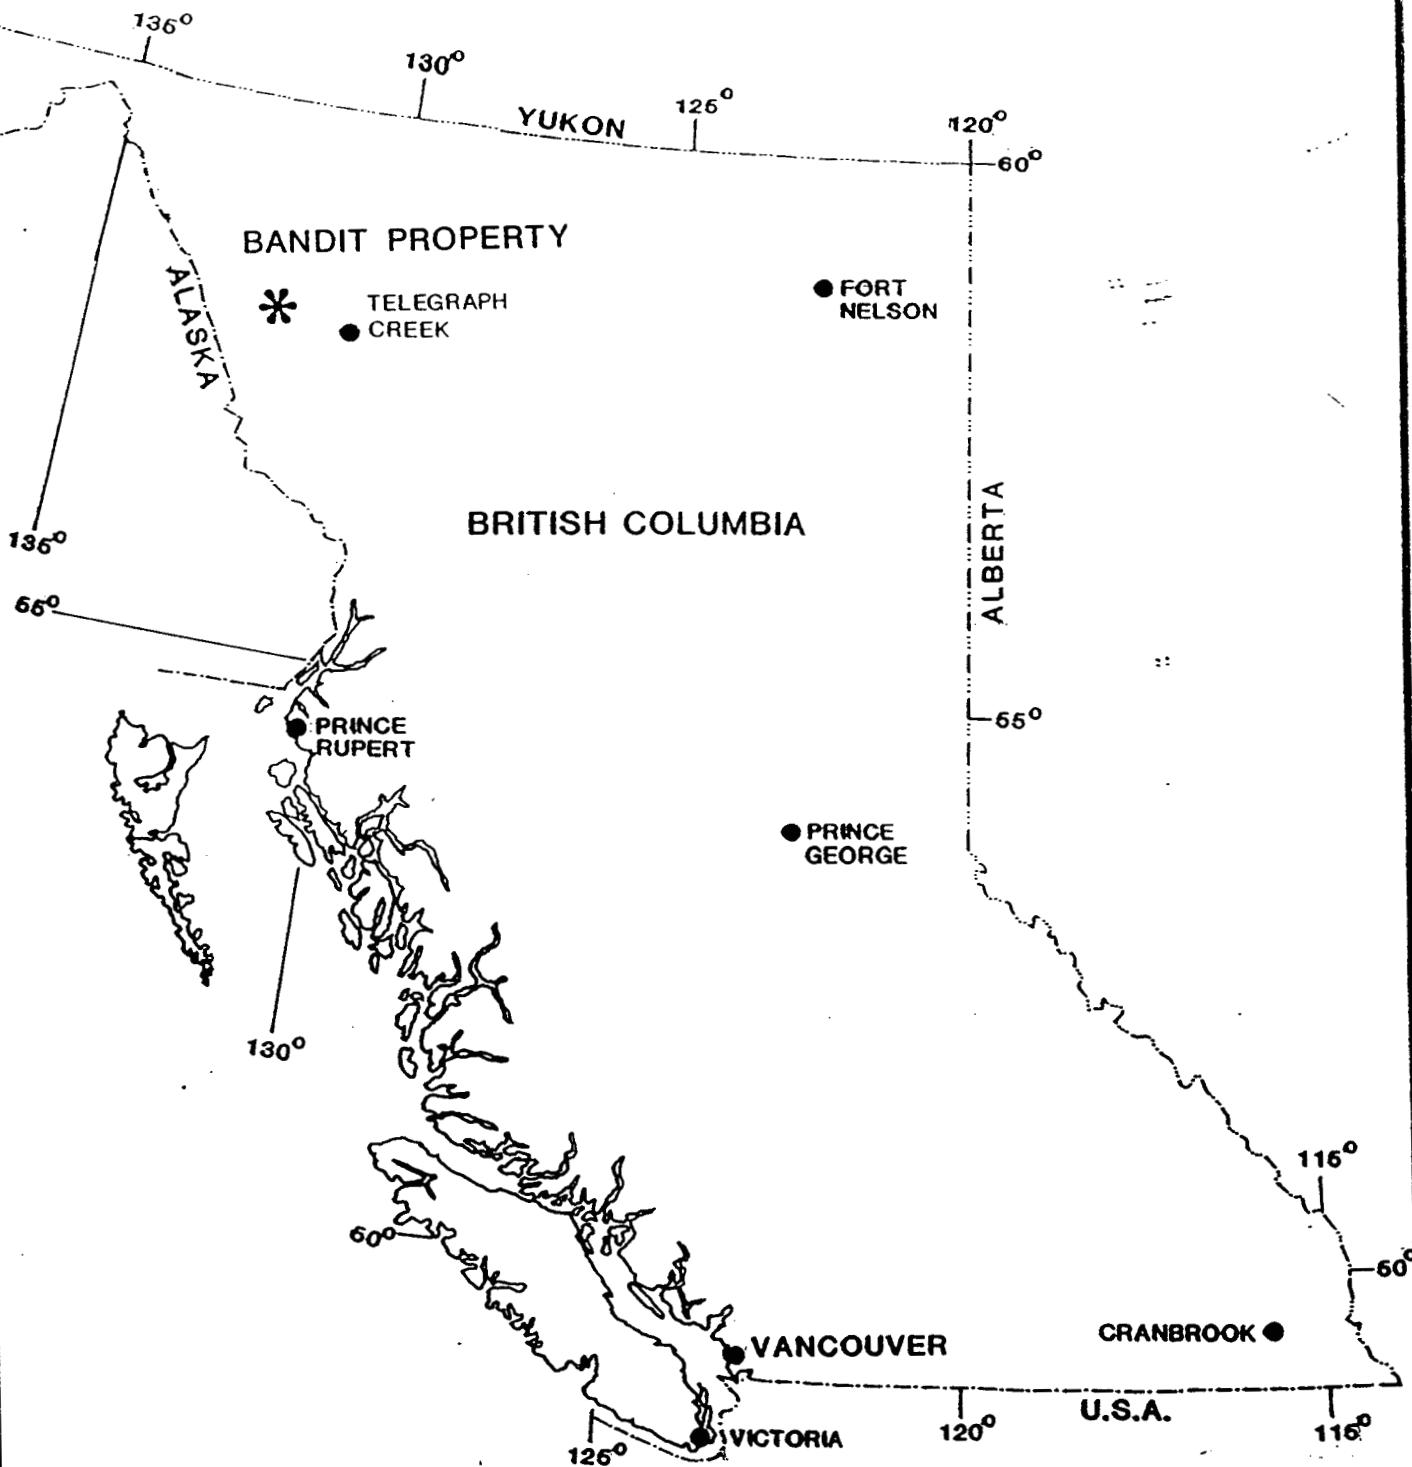

The BANDIT property consists of nine claims totalling one - hundred and twenty - nine units staked between 1983 and 1990 by Chevron Minerals Limited (Figure 1). The claims (Figure 2) are part of an option agreement between Chevron Minerals Limited and North American Metals Corp. North American Metals can earn a 50% interest in the property by completing \$2,000,000 in exploration expenditures. Homestake Mineral Development Company has been contracted by North American Metals Corp. to complete the work on the property.

2.1 SCOPE OF REPORT

Dia Met Minerals of Kelowna, B.C. drilled two diamond drill holes on the property in October of 1988. The program was terminated after the completion of hole B-88-2 as a result of adverse weather conditions, however the diamond drill was not removed from the property and the results of the drill program were never reported. This report serves to summarize the results of the 1988 drill program and apply assessment to the property with expenditures incurred while demobilizing the drill rig in July of 1990.

2.2 PROPERTY DEFINITION

The property is comprised of nine claims totalling one - hundred and twenty - nine units (3225 hectares). All of the claims are located in the Atlin Mining Division and are recorded as tabulated below:

* Assuming acceptance of this assessment report.

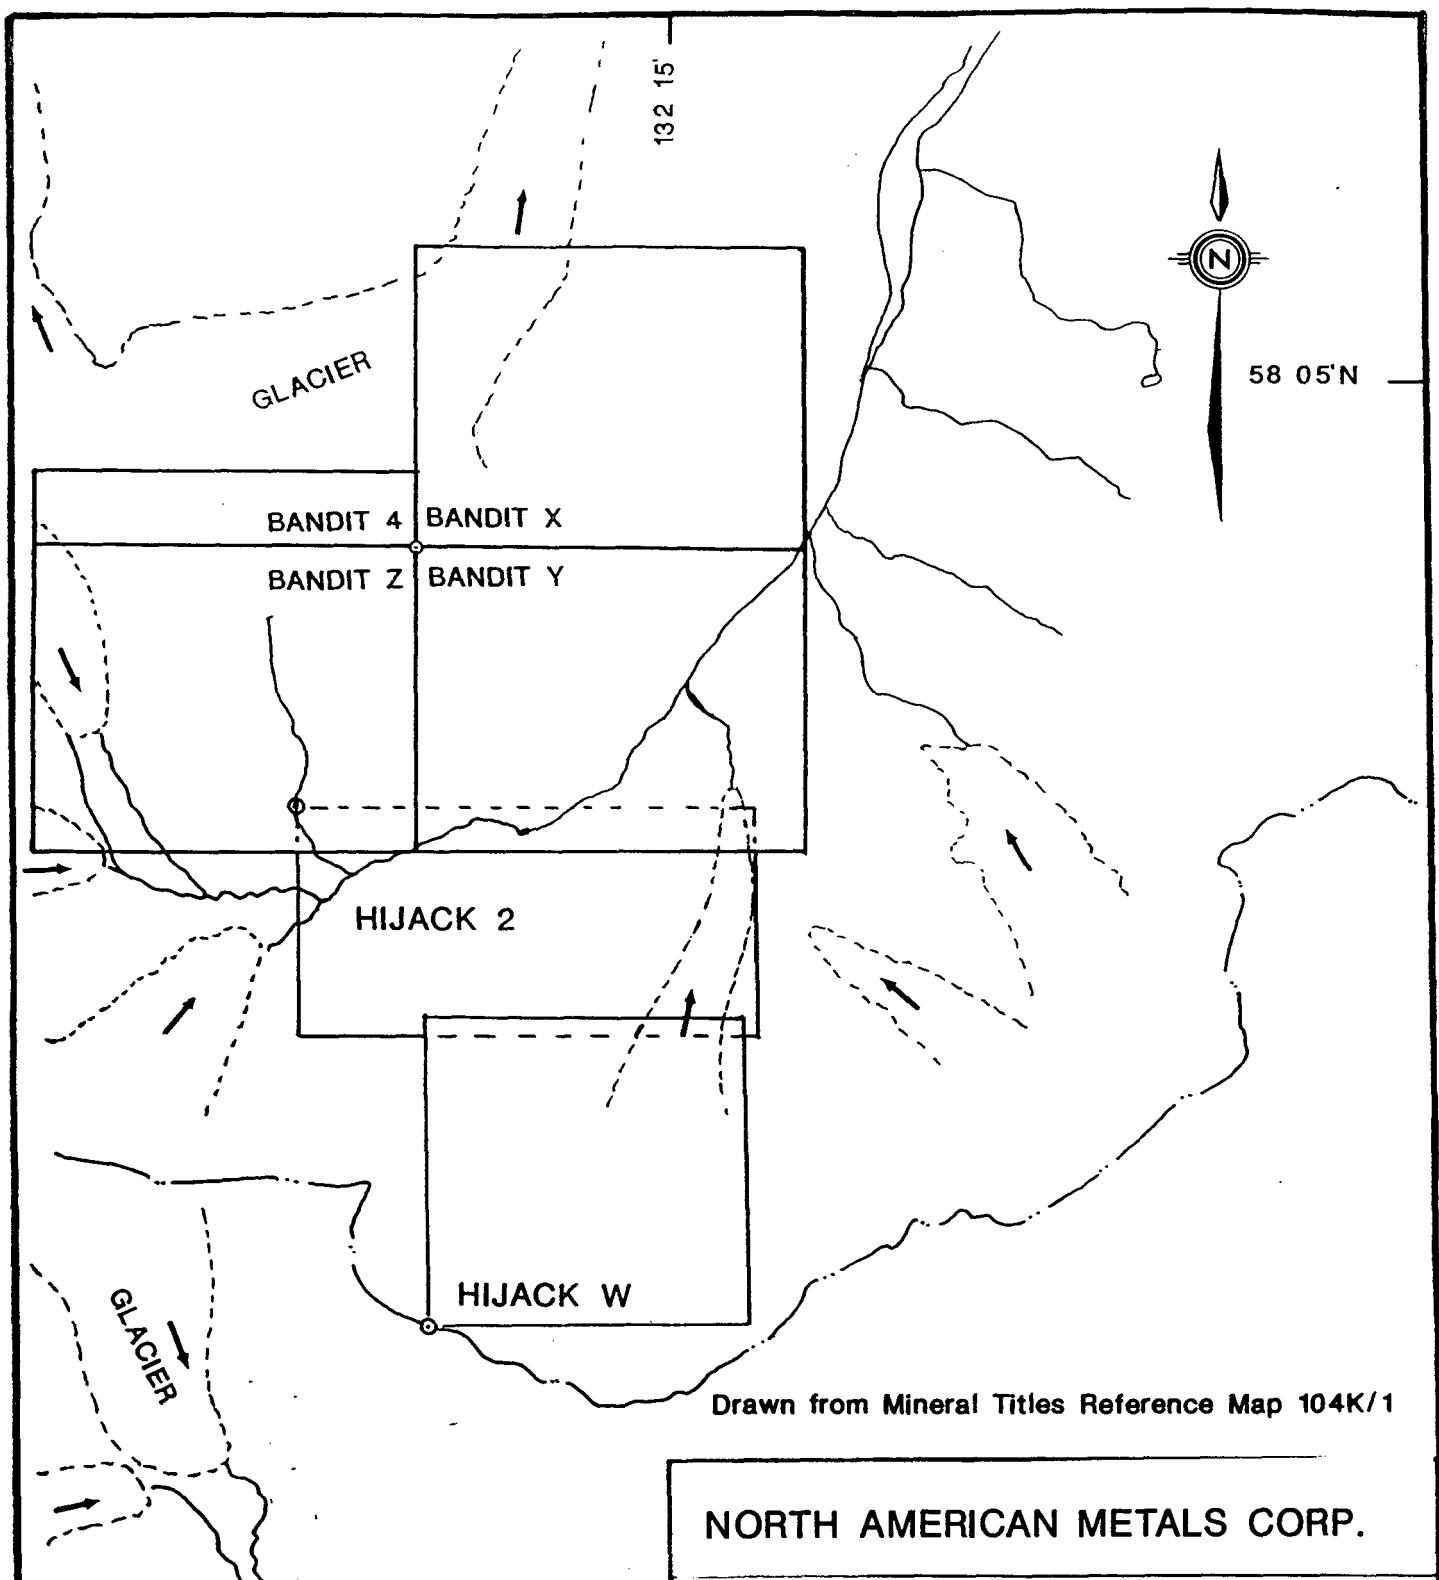

2.3 LOCATION, ACCESS AND PHYSIOGRAPHY

The BANDIT property is located at 132° 16'W and 58° 04'N on NTS map sheet 104 K 1, approximately fifteen kilometers south-southeast of the Golden Bear Mine and seventy - two kilometers northwest of Telegraph Creek, B.C. The Golden Bear Mine access road passes within eleven kilometers of the north end of the property but access is still only gained via helicopter out of the Golden Bear Mine or Telegraph Creek.

The property lies within moderately rugged terrain where elevations vary from 1100 meters in creek valleys to over 2200 meters in the northwest corner of the Bandit 4 claim. Most slopes are talus covered and the property is almost totally devoid of vegetation except in creek valleys where stunted spruce are common. Glaciers and permanent snow are abundant and account for approximately 15% the total surface area. A typical exploration season lasts from mid June to mid September.

2.4 EXPLORATION HISTORY

The BANDIT property was first staked in 1981 by Chevron Minerals Ltd as the Bandit 1 and 2 claims and expanded in 1983 with the location of the Bandit 3 and 4 and Hijack 1 and 2 claims. Chevron completed a program of mapping and rock and sampling on the property in 1982 (Shannon, 1982) and followed up with a more thorough program of detailed structural mapping, rock and soil sampling and trenching in 1983 (Shaw and Thicke, 1983) . In 1987, Chevron completed a program of heavy mineral talus fine sampling (Moffat and Walton, 1987) and optioned the property to Dia Met Minerals of Kelowna, B.C. Dia Met completed a program of heavy mineral talus fine sampling (Fipke, Schiller, 1988) and staked the Ban 1, 2 and 4 claims prior to completing the work discussed in this report. In 1989 the Bandit 1 and 2 claims were restaked as the Bandit X and Y claims and the Hijack 1 claim was restaked as Hijack W. The Bandit 3 claim was allowed to lapse in 1989 and was restaked in June of 1990 as the Bandit Z claim. Dia Met and Chevron terminated their option agreement in 1989. North American Metals Corp. has since entered into an option agreement with Chevron to earn a 50% interest in the property.

2.5 REGIONAL GEOLOGY

The BANDIT property lies within the Stikine terrane, a composite terrane comprised of Paleozoic, Triassic and Jurassic island arc rocks. The basement rocks of the Stikine terrane are known as the Stikine Assemblage and include Devonian to Permian limestones, argillites, cherts and a variety of volcanic and epiclastic arc rocks (Monger, 1977). The rocks are strongly deformed and stratigraphic relationships are not well understood. Rocks younger than Permian lack diagnostic faunal assemblages and as such can only be defined as pre-Upper Triassic in age. The Stikine Assemblage is overlain by Upper Triassic oceanic arc rocks of the Stuhini Group both of which are crosscut by Upper Triassic and Jurassic intrusive rocks of intermediate to felsic composition. Late Cretaceous to Early Tertiary intermediate to felsic subaerial volcanics and derived sediments of the Sloko Group locally rest unconformably on the underlying rocks. Sloko Group volcanics are commonly associated with felsic dyke and plugs of quartz monzonite (Souther, 1971). The youngest rocks in the area are basalt flows of the Late Tertiary Level Mountain Group and Hearts Peak Formation. The flows locally overlie glacial till and are in part, of Pleistocene age.

2.6 WORK COMPLETED

During the period October 1 to October 16, 1988, 2 diamond drill holes were completed for a total of 233 meters. All drilling was completed on the Bandit Y claim. All pertinent claim data is outlined below in Table 1.

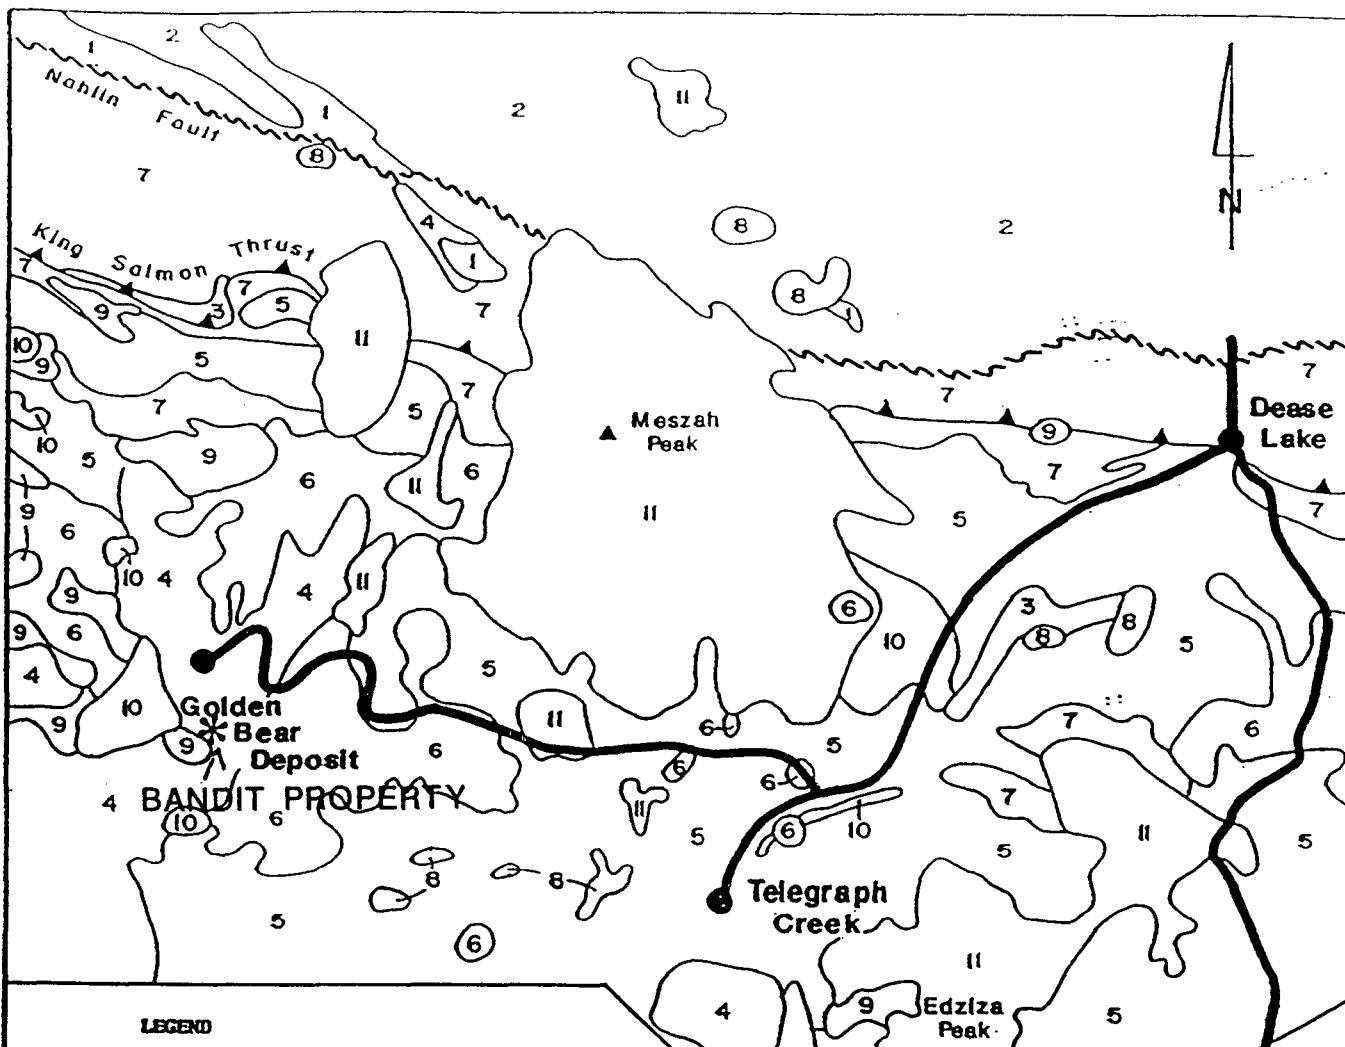

Table 1

HOLE NO	EAST	NORTH	AZIMUTH	DIP	START DATE	FINISH DATE	DEPTH

FIGURE 3

The holes were logged and then split and sampled over their entire lengths. Sample widths varied from less than one meter to 8.2 meters depending on lithology and mineralization. One half of the split core was forwarded to Bondar Clegg and Co. of Vancouver where it was geochemically analyzed for gold, silver and thirty-two other elements and fire assayed for gold and silver. The remainder of the core is stored in racks on the property at the base camp located two hundred meters east of the Bandit X and Y LCP.

3.2 DIAMOND DRILLING - GEOLOGY AND GEOCHEMISTRY

3.2.1 Lithologies

Six distinct lithologies were logged in drill core. A short description of each will be given here. More detailed descriptions can be found in the drill logs in Appendix I.

Sectional views of each drill hole are included as figures 4a.1 and 4b.1.

Unit Lt (Lapilli Tuff)

Lapilli tuff was noted in the top of both diamond drill holes. The rock is typically dark green to bluish green, fine to medium grained and moderately chloritized. Lapilli fragments range in size from 1 mm to 20 cm (bombs) in size.

Unit LCT (Limonite and Clay Altered Tuff)

This unit is an alteration of Lt and was only noted in hole B88-2. The majority of the rock is limonite with up to 10% white clay (kaolinite ?) locally. Silicification is common over widths of 0.5 to 3.0 meters.

Unit Ct (Crystal Tuff)

Crystal tuff was noted only in hole B88-1. The unit is described as a fine - grained chloritic tuff with abundant white feldspar crystals and locally, hornblende crystals.

Unit St (Silicified Tuff)

This unit was noted in the lower sections of both drill holes. The unit is described as a fine - grained to "ultra" fine - grained, dark gray rock containing numerous orange - brown mottled zones. The unit is pervasively

silicified and strongly fractured. In hole B88-2 St is interbedded with thin horizons of green tuffaceous rock.

Unit Si (Silicified Zone)

Unit Si was only logged in hole B88-1; it is a pervasively silicified tuffaceous rock.

Unit t (Tuff)

Tuff is a general designation given to rocks that are fine to medium - grained, dark green and moderately to strongly chloritized. Locally the unit is weakly silicified, mottled with limonite and occasionally crystal rich.

3.2.2 Structure

Both holes B88-1 and B88-2 intersected numerous structural gouge, fracture and breccia zones. The breccia and fracture zones have been rehealed by several stages of quartz and calcite.

The Ram Reef fault strikes across the property at 060° to 080° and was intersected in both drill holes. Core from the fault, was typically brown and strongly limonitic and displayed numerous episodes of brecciation and quartz and calcite cementation.

3.2.3 Mineralization

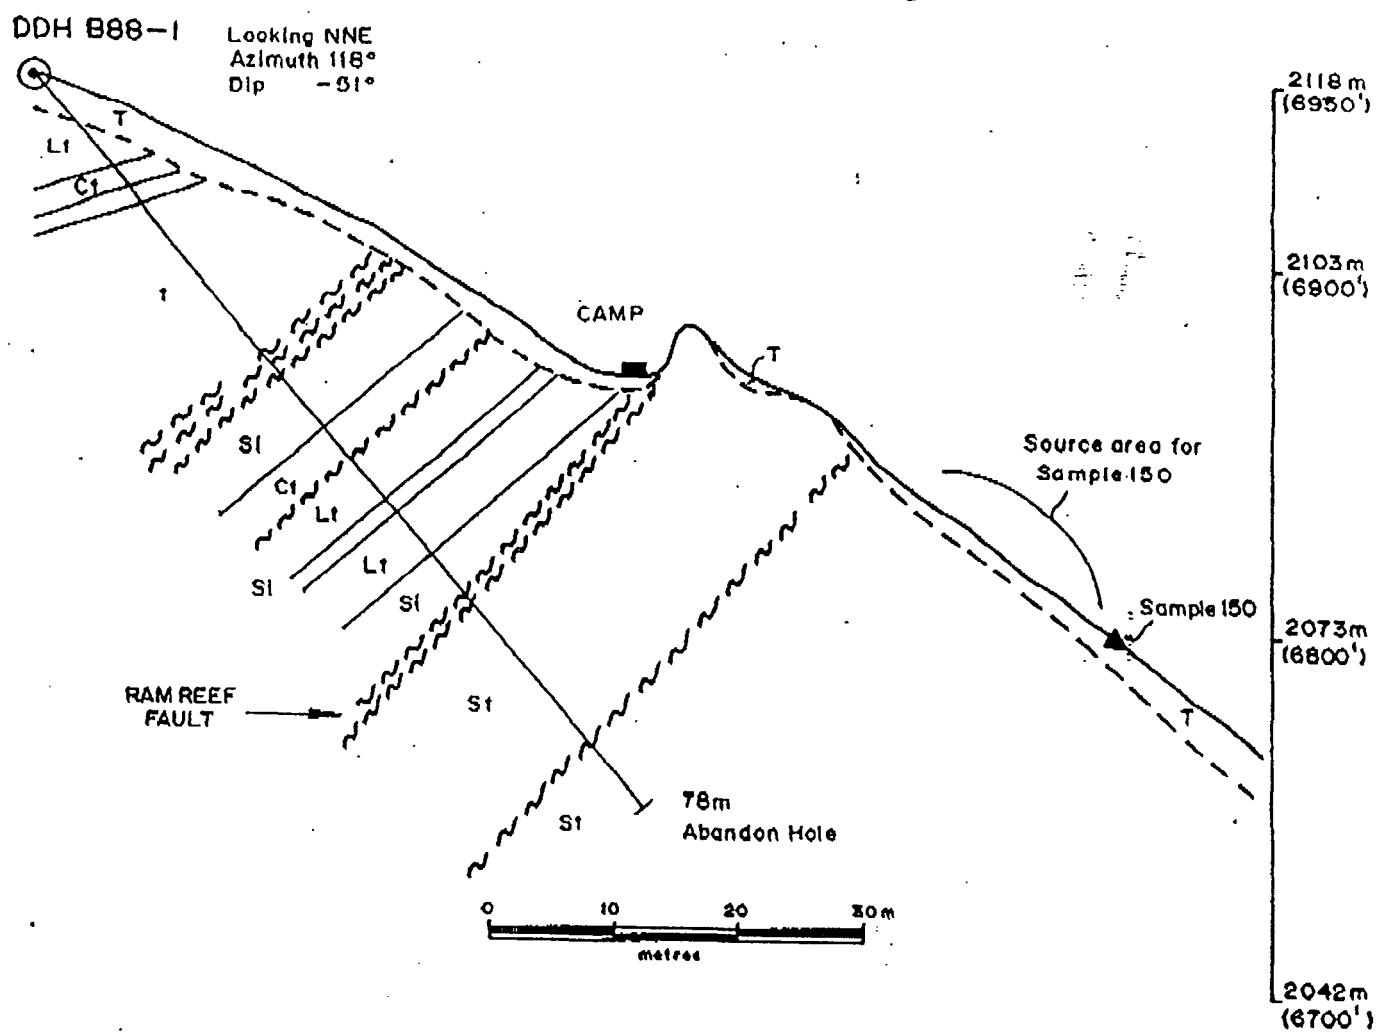

Mineralization on the BANDIT property is localized in silicified and pyritized tuff units which have been fractured and rehealed by several stages of quartz and calcite. Quartz veins and stringers are generally gray to black in color and rarely exceed two centimeters in width.

The most common sulfide mineral is pyrite. It is pervasive throughout most lithologies in trace amounts but in anomalous gold zones is present in quantities to 5%. Antimony is often noted geochemically in gold bearing zones but stibnite has not been noted. Chalcopyrite is rare.

Table 2 summarizes the best gold intersections from the drill program.

GEOLOGICAL DESCRIPTIONS			
LITHOLOGY	ALTERATION AND MINERALIZATION	STRUCTURE	
6.1 - 10.5 LAPILLI TUFF (LT)	Dark green to bluish green, locally fine-grained. Local minor microbrecciation along fractures. Lapilli fragments to 2.5 centimeter in diameter are of amygdaloidal volcanic composition. Rock is dominantly medium grained lapilli tuff. Hardness of rock is variable, scratches easily in some parts, hard in others. Lapilli frags. typically 1 to 2 mm in diameter and rounded.	Chlorite alteration plus calcite veining. Trace disseminated pyrite	Calcite veining and open spaces filled with calcite are cut by larger quartz-calcite veins (former usually 1mm wide, latter to 1cm). Quartz-calcite vein at 7 meters is 0.5mm wide and cuts core axis @ 30°. Calcite veining is ubiquitous 1-3%.
10.5 - 12.5 CRYSTAL TUFF (CT)	White feldspar and black hornblende crystal rich tuff. Dark green overall color. Possibly a feldspar-hornblende porphyry, however, looks tuffaceous.	Matrix hard to scratch but green color indicates propylitic alteration?	Hematite veining and calcite veining. Many fractures coated with hematite are slickensided.
12.5 - 13.7 DIORITE DYKE	Feldspar and dark green mineral making a pinkish and green mottled rock.		
13.7 - 29.3 TUFF	Dark green tuff, locally crystal rich.	Propylitic alteration (dark green color)	13.9 2 cm quartz vein, 60° to core axis. Hematite and calcite coating on many fracture surfaces. Rock is strongly fractured each surface having hematite and calcite.

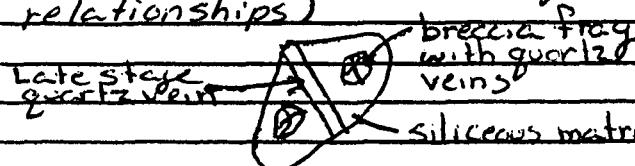

GEOLOGICAL DESCRIPTIONS

LITHOLOGY	ALTERATION AND MINERALIZATION	STRUCTURE
29.3 - 32.3 FAULT ZONE Bleached rock to tan color. Extremely fractured (gravel) with gravel containing sand sized particles (note lost core).		
32.3 - 37.2 SILICEROUS ROCK Altered tuff, to tan color mottled with pinks, greens and whites locally.	Bleached with ankerite? veining. Host between microfractures is sometimes clay, sometimes quartz (silica), more clay than quartz to 32.64 m then only Si to 37.2. Trace pyrite and pyrolusite dendrites.	Microbrecciation locally; carbonate veins offset hematite-calcite veins. Limonite on fracture surfaces. Black mineral rims quartz veins.
37.2 - 37.5 LOST CORE		
37.5 - 40.3 CRYSTAL TUFF Dark green with pale pink spots throughout (silica flooding)		Sporadic quartz veins cutting core axis @ 45-60°. Quartz vein at 39.7m cuts core axis @ 70° (1cm thick).
40.3 - 40.9 GRAVELEY GOUGE + QUARTZ VEIN Core is extremely broken up. Quartz vein is mottled white-grey-green.	Bleaching and silicification. Specks of specular hematite in quartz vein.	Quartz vein at least 25cm wide
40.9 - 44.5 LAPILLI TUFF Swirly textured with fragments of	Disseminated pyrite occurs	Sporadic veins of quartz plus

GEOLOGICAL DESCRIPTIONS

LITHOLOGY	ALTERATION AND MINERALIZATION	STRUCTURE
porphyritic and amygdaloidal rocks.	foliation planes (foliation defined by closely spaced fractures or flattened fragments) locally to 1-2%.	quartz as open-space fillings
44.5 - 46.7 SILICA ZONE Brown, looks to be a shear zone that has been invaded by silica and altered to clay. Anastomosing "stripes" of whitish quartz and gray clay with hematite coating the fractures that separate each stripe. Some host rock still visible.		2 to 5 cm gouge seams occurring sporadically between 44.5 and 46.7m. Note: There is 110% core between 45.8 and 48.8m but between 46 and 47m there is only ~46m of core, so some is lost and some mislabelled.
46.7 - 50.9 LAPILLI TUFF Dark green with sporadic quartz veins and open space filling.	Trace to 1% pyrite. Zones of larger quartz veins at 47.6m and at 47.9m (2.5cm) with specks of specularite.	Rock is moderately brecciated but not rotated. Fractures filled with white hairline quartz veinlets.
50.9 - 54.7 QUARTZ BRECCIA - SILICIFIED TUFF Brown to white rock consisting of white quartz chunks in a matrix of brown (hard) limonite altered rock, becoming a solid brown rock that is a mixture of silica and limonite. Foliated rock (silicified fault zone). Rock has a swirlly texture, possibly replaced pyroclastics (by Si)	Local disseminated pyrite ~1%. White narrow quartz veinlets cut the silica-limonite rocks.	Local gouge seams (2-3cm) between 50.9 and 52.2 m.

GEOLOGICAL DESCRIPTIONS

LITHOLOGY	ALTERATION AND MINERALIZATION	STRUCTURE
54.7 - 56.0 SILICIFIED FAULT ZONE Multiple silicified events, floating breccia fragments in a siliceous matrix.	$\leq 1.5\%$ disseminated pyrite and pyrite clots. Intense silicification.	At least 3 episodes of Si flooding seen in this rock (X-cutting relationships) 
56.0 - 78.4 SILICIFIED TUFF Dark gray, mottled with orange-brown. 5cm gouge at 56.0m then into this unit. The orange occurs along fractures like bleaching. The rock is very competent but has moderate to strong fracturing, the fractures are usually filled with hairline quartz veins along which limonite staining has occurred. Later stage narrow quartz veining then cuts across the fracture system. Starting at 69.8m, no longer dark gray and limonitic orange mottled, only the orange brown color. But still highly siliceous. Core is more broken up here than dark gray section. Fault gouge seams between 70.8 - 72.0m, with some lost core (50%). Slightly less siliceous than above as you can get minor scratching with a knife. Below 72m the rock is mottled orange-brown	Local intense fracturing results in nearly total bleaching of rock to pale tan to orange-brown color. $\leq 1\%$ py. Local zones (or bands) where multiple stages of brecciation have taken place. Black silica is the matrix in these bands with breccia fragments of white quartz + pink quartz. A black metallic mineral occurs (very tiny) and may be specular hematite ($\leq 1\%$). Very rare chalcopyrite blebs to 2 mm in size.	Late stage quartz veinlets at numerous angles to core axis, but commonly at 45° locally 0° to core axis. At least 3 silica events; intense fracturing and brecciation (with minor rotation), matrix being silica then gray and white narrow quartz veins cut that (<1mm), then white quartz veins (also narrow).

GEOLOGICAL DESCRIPTIONS

LITHOLOGY	ALTERATION AND MINERALIZATION	STRUCTURE
3.66-27.89m: LAPILLI TUFF Dark green, weak calcite and quartz veining. Weakly fractured. Large fragments (bombs) of ultra fine-grained tuff or massive flow rock to 20cm in size. Hematite appears along fractures at 11.28m. 18.9-20.73: epidote appears and disappears.	Pyrite as individual grains and along fractures. Rock is overall mildly propylitically altered.	1cm wide quartz vein c. 10.7m cuts core axis at 55°. 2cm wide quartz + calcite vein cutting core axis at 65° at 11.43m. 1cm wide quartz vein at 15.85m, at 65° to core axis. These quartz veins are banded alternating between pale green and white.
21.03-23.46: zone of a little more calcite (ankerite) + quartz veining. Interbeds of medium-grained tuff (no lapilli fragments larger than 1mm) occur in this unit.		21.03-23.46 veinlets are close to 90° to core axis. 1cm wide quartz veins at 26.2m and 27.1m >70° to core axis.
27.89-31.55m: OXIDIZED LIMONITIC SECTION 29.57m: 8.5cm complex quartz vein consisting of varying colors of quartz and minor hematite + mariposite(?) and brecciation. Silicified rock extends to 30.18m. Multiple quartz stages in vein.	27.89-31.55m no chlorite, only limonite. Patches of very pale green color which are relatively soft (argillite alteration). Can still see the lapilli texture and certain fragments are altered to green clay.	Quartz vein @ 29.57m cuts core axis at 45° Gouge at 31.34 - 31.39m.
31.55-32.31m: LAPILLI TUFF Fine-grained to medium grained, dark green.		
32.31-34.59m: TUFF Slightly paler green than above. Fine-		

GEOLOGICAL DESCRIPTIONS		
LITHOLOGY	ALTERATION AND MINERALIZATION	STRUCTURE
grained to medium-grained. Weak silic flooding - it is slightly harder than above unit. Oxidized along fractures.		
34.59-43.28m: OXIDIZED ZONE Limonite rich, appears to be mildly siliceous to 35.05m then scratches easily, siliceous again between 35.66-35.97; 37.34-37.64; 39.47-40.08; 40.23-40.54; 41.91-42.21m.	Complex quartz veins and silicification and minor brecciation between 39.62 - 40.08; 40.24 - 40.54m. Rock is cream to pale green with cross-cutting quartz veins and floating breccia fragments. Local Brecciation.	Gouge from 42.06 - 43.28m, shear or fault zone. Some breccia fragments in the gouge (some are totally silicified)
42.06-43.28 Fault zone, mainly gouge and fault breccia.	48.3-49.5 Zone of no black hematite: rock is pale tan colored. Local clots of disseminated pyrite. Possibly an introduced quartz vein after hematite/quartz alteration?	
43.28 - 100.13 SILICIFIED TUFF Dark gray and orange brown, mottled silicified tuff. Orange brown along fractures.		Rock is very competent, although moderately to highly fractured (fractures filled with quartz veins) Multiple veining
81.53-81.69: Non silicified, limonite and chlorite alteration (limonite with chlorite blobs)	54.56-54.86 Slightly less siliceous, some chlorite: original tuffaceous texture.	
83.06 - 84.28: weakly silicified, ultra fine-grained rock mottled orange-brown, cream, black + medium green. Hematite (black) filling multiple fractures that cut core axis at 35°. Is this a flow that isn't silica flooded	55.78 Minor malachite on fractures haven't seen any chalcopyrite.	
	59.74 Trace chalcopyrite (2 specs)	
	62.48-63.09 Less siliceous, more	

GEOLOGICAL DESCRIPTIONS

LITHOLOGY	ALTERATION AND MINERALIZATION	STRUCTURE
99.06-100.13 Another ultra fine-grained - medium - grained zone that is only weakly silicified. Sharp contact with underlying dark green tuff. Probably a flow. Black silicification occurs as patches in this very fine-grained unit, along fractures.	chlorite again. 90.52 Trace chalcopyrite (probably trace bits all through unit)	
100.13 - 108.81 TUFF Dark green, fine to medium-grained. Non silicified.	99.97 Unusual white mineral (0.1-0.3mm) occurring abundantly in black silicified patches, many have a square outline, appear to be harder than a knife.	
108.81 - 109.42 TUFF Black, silicified with orange-brown mottled limonitic-siliceous tuff.	Quartz and calcite veining (5-10% of rock) mainly calcite 105.76 - 108.81 mixed dark green tuff and black silicification	Gravelley material between 104.5 - 104.9m and 106.7 - 107.3m.
109.42 - 111.86 TUFF Weakly silicified, limonitic, black and orange to orange-brown with green chlorite spots.	Minor quartz veining and weak silicification	110.95 - 111.25 Gravel, lost core.
111.86 - 115.06 CHLORITIC TUFF Mostly limonite + chlorite with local concentrations of quartz brecciation. Go in and out of		

GEOLOGICAL DESCRIPTIONS		
LITHOLOGY	ALTERATION AND MINERALIZATION	STRUCTURE
limonite rich + chlorite rich zones in a tuffaceous material that is spotted with chlorite blebs (amygdules). Weakly to non-silicified.		
115.06 - 116.43 SILICIFIED ZONE Mostly above unit, black-orange mottled but also a mottled green, limonitic, red hematitic fine-grained rock that is very hard.		
116.43 - 126.19 TUFF? Ultra fine-grained rock, moderate green + limonite mottled (99.1-100.3m). Local fractures filled with white or black quartz veins. Local silicification around quartz veins. 122.83 - 123.14 Pink color	Chlorite steps at 120.7m, only limonite after that. 124.51 - 125.27 silica flooding minor associated pyrite in fractures	Still get abundant fracturing in this rock, the fractures usually filled with quartz.
126.19 - 140.05 TUFF Fine to medium grained. Limonite altered to 128m, then is dark green and chloritic. Local bands of silicification in fractured areas. Bands of ultra fine-grained tuff/flow/dyke occur in this unit	Trace pyrite 126.19 - 126.80 zone of fracturing and silica flooding.	This tuffaceous unit has a foliation to it that is nearly 90° to core axis. Foliation is local. Narrow shear zone at 135.64 - 135.79m (broken core)
140.05 - 145.08 SILICEOUS Rock Black and orange mottled siliceous rock. A small zone of silicification

APPENDIX IV

STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Darcy Edward Marud, of 2205 Graveley Street, Vancouver, British Columbia, Canada, hereby certify that:

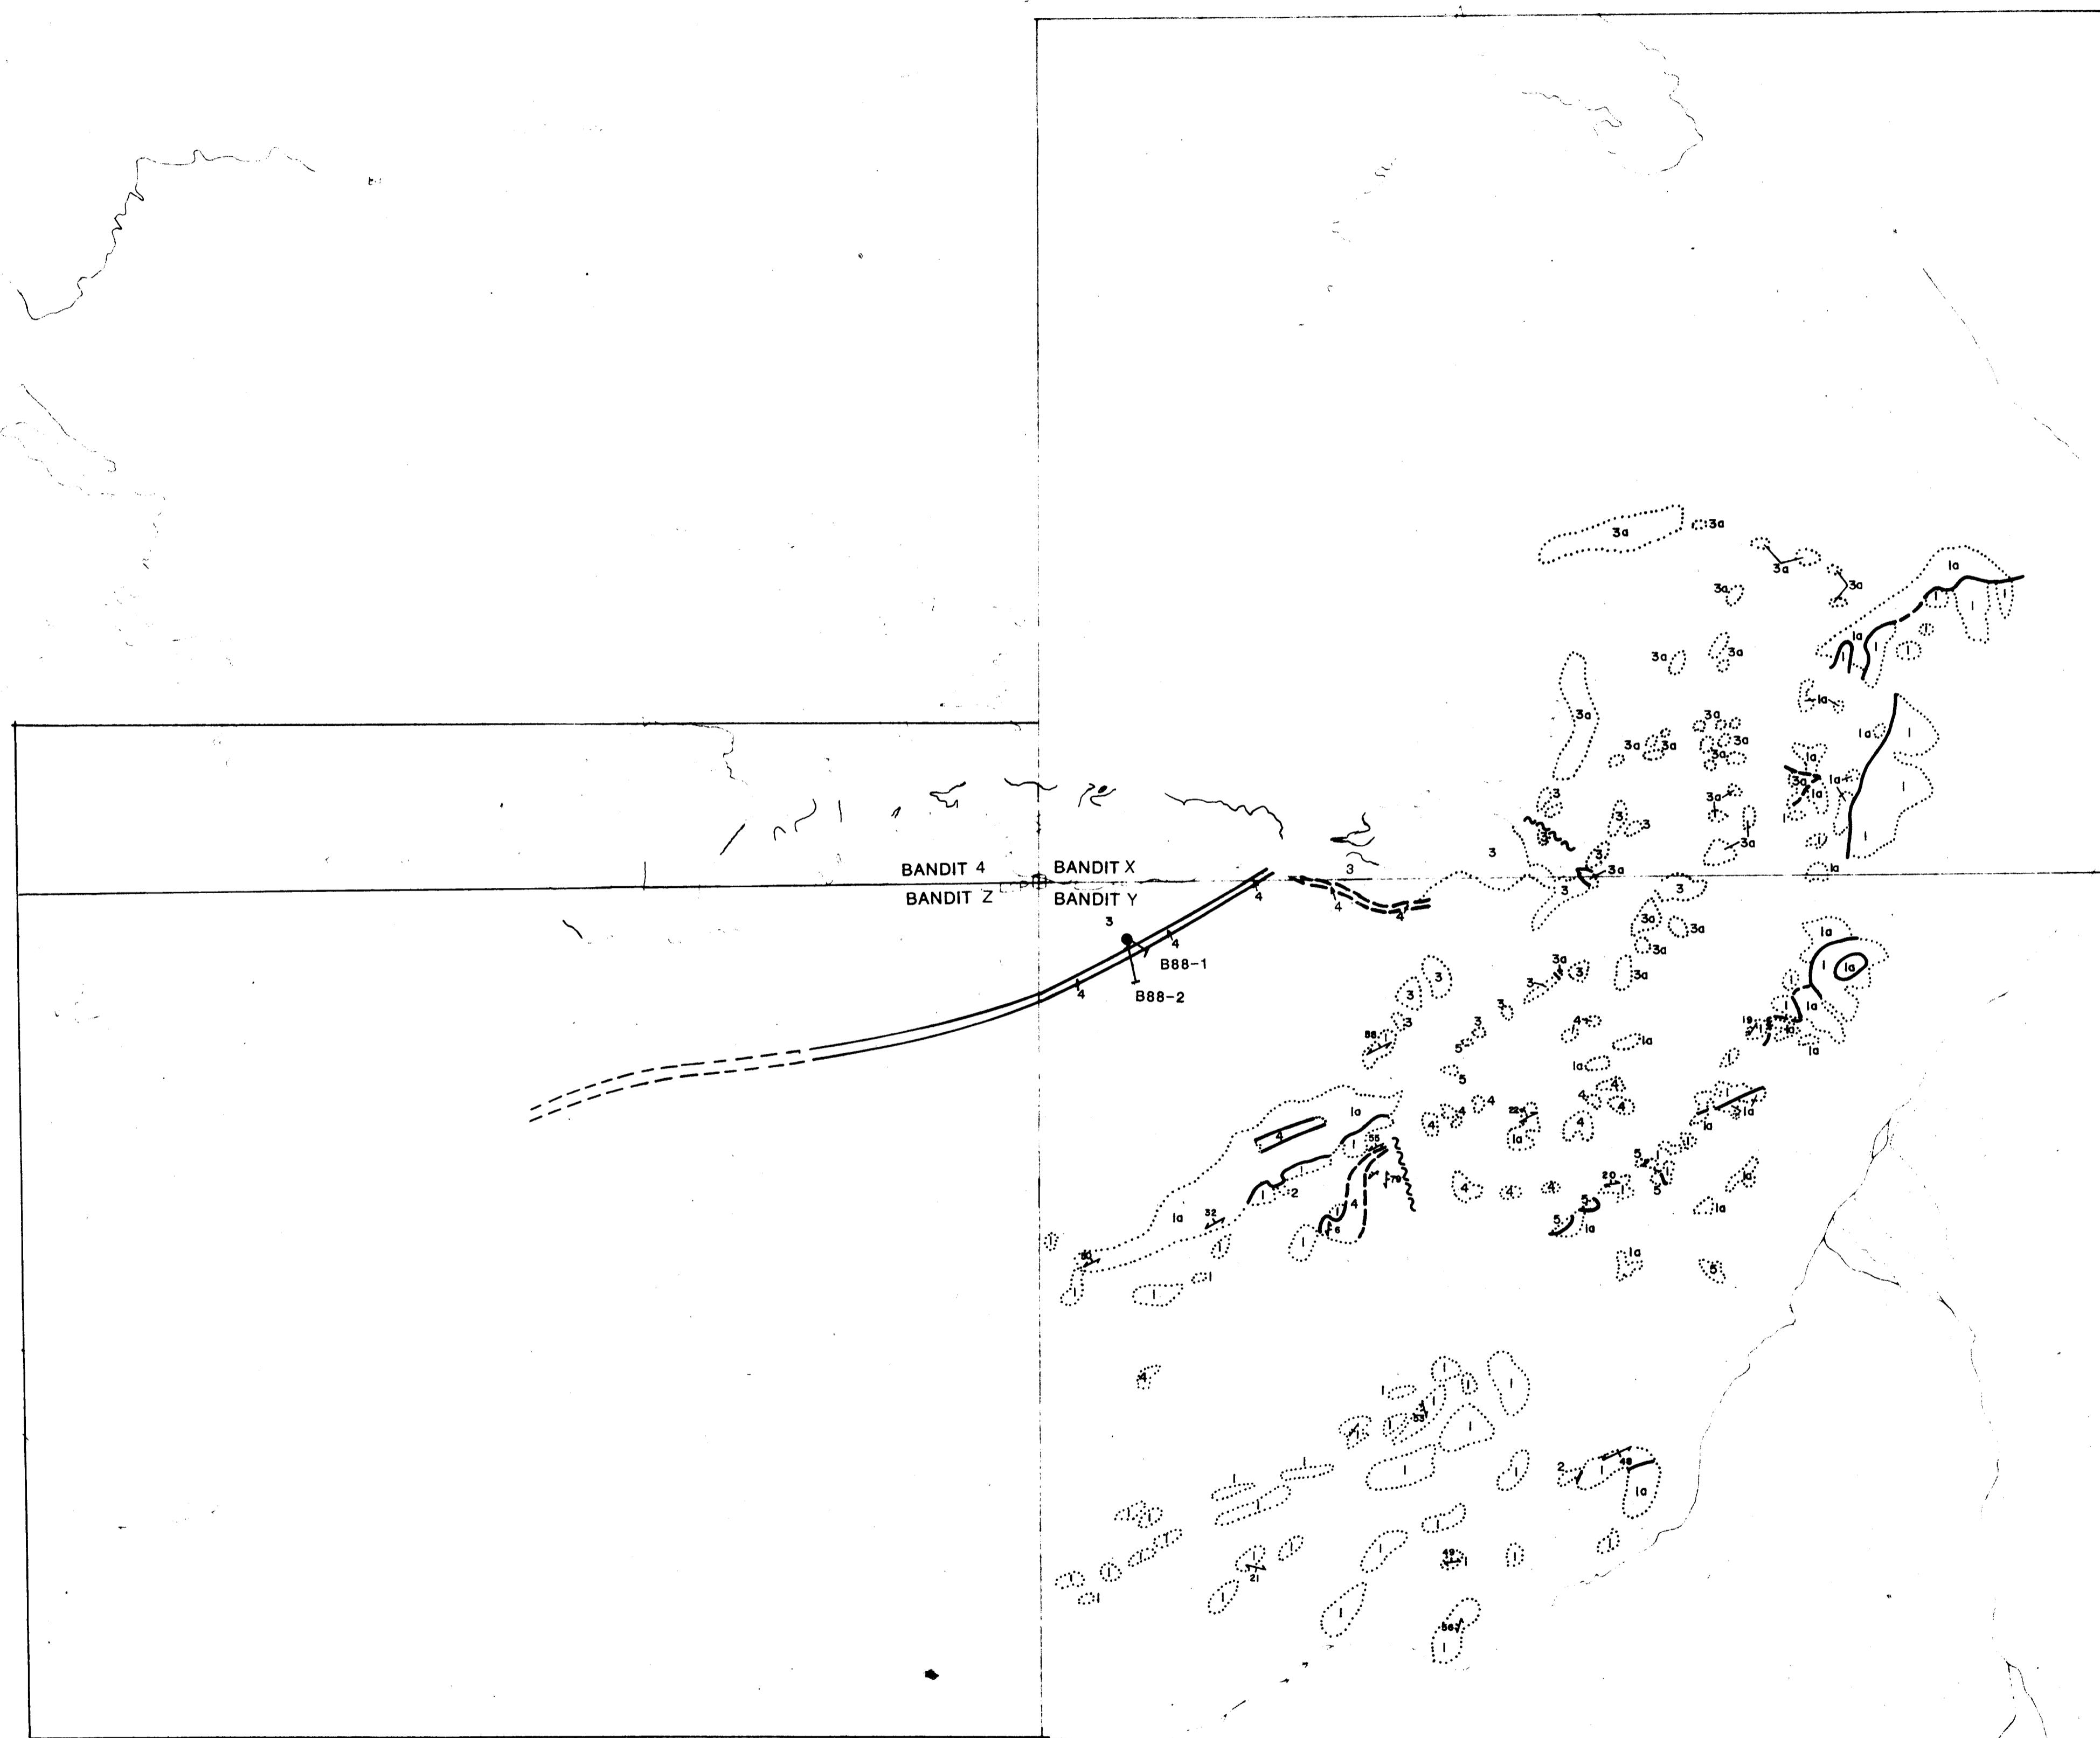

1. I am a graduate of the University of Saskatchewan, having been granted the degree of Bachelor of Sciences - Honours degree in Geology in 1985.
2. I have practiced my profession as a geologist in mineral exploration since 1985.
3. I am presently employed as a geologist with Homestake Mineral Development Company of #1000 - 700 West Pender Street, Vancouver, British Columbia.
4. The accompanying report was written by myself with information supplied to me by Chevron Minerals Ltd. of Vancouver, B.C. and Dia Met Minerals Ltd. of Kelowna, B.C.
5. I have spent three days on the BANDIT property and have briefly examined the drill core described in this report.
6. I have no direct or indirect financial interest in any companies known by me to have an interest in the mineral properties described by this report, nor do I expect to receive any such interest.

Dated at Vancouver, B.C. this ^{17th} Day of December, 1990

Respectfully submitted,

Darcy E. Marud
