SUMMARY

This assessment report describes CH90-125, CH90-126, CH90-129 and CH90-130 drilled between May 12, 1990 and November 27, 1990 on the BRENT 1, HOLYOAK 2 and HOLYOAK 3 claims.

These holes tested favourable stratigraphy within the McLaughlin Ridge Formation. Best results are from CH90-126 and CH90-130.

A 5.64 metre intersection of a chlorite-chalcopyrite- pyrite stringer zone in hole CH90-126 is probably part of the Sharon mineralized trend.

In hole CH90-130 a narrow pyrite, sphalerite, and chalcopyrite-bearing band in felsic tuff may be correlative with the Silver Creek showing 500m to the east suggesting that this may be a persistent mineralized horizon.

Our exploration target is a volcanogenic massive sulphide deposit with significant tonnage. Base metal grades with significant precious metal credits are expected for such a deposit based on the grade of the small lenses found to date within the Cowichan and Buttle Lake Uplifts.

SUMMARY OF SIGNIFICANT RESULTS

Hole #	Purpose	From	To	Length	Cu	Zn	Ag	Au	Pb	Remarks
CH90-125	S,R	210.95	211.15	0.20m	120	85	2.1	3	1912	Ga,Cpy in stringers

LOCATION, ACCESS AND PHYSIOGRAPHY

The Chemainus Project is located on southeast Vancouver Island about 10 to 25km west of Chemainus or 70km north of Victoria (Figure 1). On June 23,1989, Esso Resources share of the joint venture was purchased. The project is now wholly owned by Falconbridge Limited.

The project occurs in two separate claim groups totalling 20 claims. The 16 CHIP claims are to the west and the 4 BRENT-HOLYOAK claims are to the east. CHIP 1 to 8 and CHIP 11 to 18 comprise 119 units and 4 fractions covering 2638.3 hectares. The BRENT-HOLYOAK claims comprise 46 units (1103.8 hectares) in the BRENT 1 and HOLYOAK 1 to 3 claims (Figure 2). These two claim groups cover a 15 km strike length of Sicker Group stratigraphy and are separated by a 2.5 km wide property presently held under a Minnova Inc./Laramide Resources joint venture. This latter claim group hosts the Coronation deposits (Bailes et al, 1987).

Access to the property is along dirt roads and abandoned railway grades which are part of the Mt. Brenton Forest Service Road network, the B.C. Hydro access road and logging road networks maintained by Canadian Pacific Forest Products Limited and MacMillan Bloedel Limited. These interlocking roads can be reached from MacMillan Bloedel Limited's Copper Canyon Mainline haulage road by the Mile 10 access road, the Mile 12 access road and by the C-7 access road which intersects the Copper Canyon Mainline 5km west of the gate at MacMillan Bloedel's Copper Canyon Camp.(Figure 2). Road use is subject to annual permits and/or notice with BC Hydro, the forestry companies and the Ministry of Forests. Timber and surface rights for the claims are held by the Crown, Canadian Pacific Forest Products Limited and MacMillan Bloedel Limited.

Annual notification of programs and ongoing contact throughout the year is maintained with the landowners. Compensation for damages to surface and timber rights are made annually following field inspections.

Topography is relatively gentle overall with many local steep sections along deeply incised stream valleys and on hillsides in the northern parts of CHIP 1 to 4, the western part of HOLYOAK 3 and eastern part of BRENT 1. Elevations range from between 500 and 1100 metres, with higher elevations encountered along the northern margin of the property.

The climate is quite mild with winter temperatures in the -5 to +5 degree range and summer temperatures in the 15 to 25 degree range. A few predictable extremes that can affect programs are dry, sunny conditions that cause bush closures in mid-June to late-September and difficult ice and snow conditions above 700m between January and April. Periods of persistent showers and rain in the fall through spring may turn access roads into badly rutted mud tracks. Optimum periods for heavy equipment programs are in April-June and October-November. Heavy rains in November produce flash flooding conditions and the opportunity for washouts of culverts and small bridges. At present, all the property's roads are accessible in spite of 3 major storms in November, 1990.

CLAIM STATUS

There are 20 claims comprising 165 units and 4 fractions covering 3724.9 hectares. Claims are well located, without internal missing fractions. Upon acceptance of three assessment reports on 1990 programs, the claims will be in good standing until at least February 27, 2000. All claims are wholly owned by Falconbridge Limited.

Claim data is summarized below.

CLAIM	RECORD #	UNITS	AREA	STAKING DATE	EXPIRY DATE
CHIP 1	720	20	500.0h	Nov. 11,1982	Dec. 7,2000
CHIP 2	721	20	500.0h	Nov. 13,1982	Dec. 7,2000

This assessment report is for claim group CHEM-90B which is composed of the BRENT 1, HOLYOAK 1, HOLYOAK 2 and HOLYOAK 3 claims.

EXPLORATION HISTORY

Early property history was described by Everett and Cooper (1984) as follows:

" *The CHIP claims have seen sporadic periods of exploration activity since the early 1900's. The oldest recorded work was in 1915 with the sinking of a 50 foot shaft on a weak chalcopyrite-bearing pyrrhotite vein (part of the Anita Showing). Interest in the Sicker Group schists intensified in 1944 with the development of the Twin J massive sulphide-precious metal deposit, 15km to the southeast. The volcanic belt has undergone several periods of staking and prospecting.*

In recent years, development of Westmin's deposit at Buttle Lake has renewed exploration interest in the Chemainus area. An induced polarization survey was completed by Cominco in the vicinity of the CHIP 4 claim in 1966 and a soil survey was completed by UMEX in the vicinity of the CHIP 1 claim in 1978."

Early property history on the BRENT-HOLYOAK claims has been described by Britten (1984):

" *The BRENT 1 mineral claim overlies what is believed to have been the PAUPER C.G. claim (L31G) crown granted in 1903. The BCDM Annual reports for 1924 and 1927 report underground development of a pyritized schist belt 60 feet wide. An updated map by Sharon Copper Mines Limited shows three parallel adits.*

In 1966 and 1967 Cominco Ltd. carried out geological mapping, a geochemical soils survey and an induced polarization (Tikkanen, 1966) on the TOT and RUM claims, for which the base metal rights were optioned from Canadian Pacific Oil and Gas Limited, who at that time controlled the E&N Railway Land grant.

Imperial Oil Limited staked the MONS 4 mineral claim in 1976 and upon surrender of the E&N mineral rights to the Crown in 1978 this claim was abandoned and restaked as the BRENT 1 Claim. The OAK 1, 2 and 3 claims were staked at the same time to cover anomalies outlined by a Scintrex airborne EM and magnetic survey. Imperial Oil carried out minor geological mapping, a self potential survey and drilled four holes on this block of claims now known as the OAK Group. Traces of copper in pyritic quartz-sericite schists were noted on the BRENT claim (Somerville, 1979)."

In 1983, Esso conducted a field program on the CHIP claim group. Their work included 2500 scale geologic mapping, soil and stream sampling, line cutting, HLEM and magnetometer surveys of the CHIP1 and 2 and part of the CHIP 3 claims. Part of the favourable felsic volcanic lithology was defined by mapping and several weak, copper-zinc soil anomalies and two weak conductors were identified on the CHIP 1 claim. Several whole

rock analyses suggest the presence of Na2O depletion on the CHIP 1 claim. Esso conducted geological mapping in 1984 on the Oak Group and applied this work for assessment.

Kidd Creek Mines Ltd. entered into an option agreement for a joint-venture with Esso Minerals in August 1984. The entire Chemainus property (BRENT-HOLYOAK and CHIP claims) was flown with Questor's Mark VI helicopter INPUT system in September 1984.

In 1985 the OAK 1,2 and 3 claims were abandoned and restaked as the HOLYOAK 1,2 and 3 claims. Ground follow-up of selected airborne anomalies was started using time domain IP (Schlumberger array), VLF and magnetometer surveys. Geological mapping lithogeochem sampling and soil sampling along grid lines was focused on the BRENT 1 and HOLYOAK 1, 2 and 3 claims and culminated with a 7 hole drill program totalling 1534.5 metres. Two holes intersected significant sulphides. Geophysical surveys also covered selected parts of the CHIP claims.

In 1986, exploration focused on the CHIP claims. Work included 5,000 scale mapping of most of the claims and expansion of the grid to cover the entire CHIP claim block on a 200 metre line spacing with IP, VLF and magnetometer surveys. Selected areas were covered with a deep penetrating gradient array IP survey, results of which guided the late fall drilling program. A total of 1845.4 metres were drilled in six widely spaced holes, four of which intersected significant sulphides. The Anita shaft area was trenched with an excavator, mapped in detail and the exposed pyrrhotite lens was chip sampled. Falconbridge Limited continued exploration on the BRENT-HOLYOAK claims with geological mapping, soil geochemistry and induced polarization, magnetic and VLF surveys.

In 1987, an 18 hole drill program for 6753.7 metres traced a pyritic felsic tuff unit across the CHIP 1 claim. Hole CH87-37 discovered a significant pyritic felsic tuff intersection containing 2.37% Cu, 2.74% Zn, 0.73% Pb 41.8g/t Ag, 0.7g/t Au and 0.95% Ba over 2.5 metres. All holes were tested with the Crone Pulse EM system. Further gradient array IP

surveys were completed over the CHIP claims and additional magnetic, IP and VLF surveys were carried out on the BRENT-HOLYOAK claims.

In 1988 a comprehensive exploration program was carried out. Forty-six holes were completed for 13,578.1 metres. The property was remapped and resampled geologically at 5,000 scale (Figures 3a to 3i). Bedrock trenching totalling 2270 linear metres was completed in four areas. IP, VLF and magnetometer surveys totalling 112km completed coverage of the felsic volcanics to a 100 metre line spacing. Other geophysical surveys included 65km of gradient IP, a Max-Min orientation survey over the Anita mineralization and frequency domain REMI EM borehole surveys down 34 drill holes. The property's baselines, drill holes and legal corner posts were surveyed to provide accurate locations for the geological and geophysical data which was compiled onto 5,000 scale orthophoto-controlled contoured base maps.

The 1989 exploration program focused on testing chargeability anomalies in altered McLaughlin Ridge Formation felsic volcanics. Secondary targets were chargeability anomalies in the Fourth Lake Formation or near its transition with the McLaughlin Ridge Formation. Thirty-one diamond drill holes (10853.7m) were completed on broadly spaced sections across the entire property. Borehole EM surveys were completed on 29 holes to extend the effective range of the drill holes. Sulphidic sections were test by multi-element analysis (1947 samples) and a further 341 samples were tested by whole rock analysis.

In 1990, emphasis was placed upon evaluating untested primary and secondary targets and extending previously drill tested mineralization. This evaluation was accomplished through diamond drilling (23 holes, 7201.8m), borehole EM (19 holes), 5 grid extensions (32.2 km), geological mapping and geophysical surveys (MAXMIN-MAG-VLF: 53.4 km; PROTEM 37: 10.8 km). Sulphidic sections were tested by multi-element analysis (1159 samples) and a further 252 samples were tested by whole rock analysis.

REGIONAL GEOLOGY

On a regional scale, the area underlain by the Chemainus Project is included in government maps and reports by Muller (1980), Massey and Friday (1988) and Massey et al (1988).

Vancouver Island is underlain by a diverse assemblage of lithologies, which, with the exception of the extreme southern tip of the island, belong to Wrangellia, an allochthonous terrain that was accreted to the continental margin of North America during the Cretaceous (eg. Muller, 1977; Jones et al, 1977). Paleozoic Sicker Group volcanics and sediments are the oldest rocks within Wrangellia. They occur in several structural culminations, the largest of which are the Cowichan-Horne Lake, Buttle Lake, Tofino and Nanoose uplifts (Figure 4). The Chemainus Project occupies a portion of the southeast part of the Cowichan-Horne Lake uplift (Figure 4).

Most of our understanding of the Sicker Group derives from recent geological studies within the Buttle Lake (Juras, 1987) and Cowichan-Horne Lake (Massey and Friday, 1987, 1988; Sutherland Brown et al, 1986; Muller, 1980) uplifts. While there are striking geological similarities between the two uplifts, there has been no concentrated effort on correlating units. Each uplift has its own set of formational names.

A tentative correlation of lithologies between the two uplifts is presented in Table 1. Of prime importance in this correlation is the presence of volcanic-hosted massive and semi-massive sulphide deposits within the McLaughlin Ridge Formation in the Cowichan-Horne Lake Uplift (Twin J, Coronation, Anita, 900 Zone) and the Myra Formation of the Buttle Lake uplift (Lynx, Myra, Price, H-W). Caution is required in embracing this correlation due to several factors that include the facies changes which characterize volcanic stratigraphy and environments, the great distances over which these correlations are made, and the rather poor age constraints on lithologies of the two uplifts.

Figure: **4**

Stratigraphy for the Cowichan-Horne Lake Uplift

Within the Cowichan-Horne Lake uplift the Sicker Group has been subdivided into three formations (Table 1) which overlain by the Buttle Lake Group comprised of two sedimentary formations that prior to 1990 were assigned to the Sicker Group. From oldest to youngest these are the Duck Lake, Nitinat, McLaughlin Ridge Formations of the Sicker Group and the Fourth Lake and Mount Mark Formations of the Buttle Lake Group.

The Duck Lake Formation is exposed in the northwest part of the Cowichan-Horne Lake uplift, near Port Alberni. This formation comprises a monotonous sequence of variolitic pillowed and massive basalts (Massey, 1989). The Duck Lake Formation is overlain by the Nitinat Formation, a fairly homogeneous sequence of mafic clinopyroxene +/- plagioclase-phyric flows and pyroclastics of calcalkalic to alkalic (shoshonitic) affinity. Flows and individual clasts are typically highly vesicular. The Nitinat Formation is overlain by the McLaughlin Ridge Formation, a heterolithic sequence of calcalkalic to alkalic (shoshonitic) felsic, intermediate and mafic volcanics, and derived sediments. Felsic volcanics are quartz +/- plagioclase-phyric pyroclastics, flows and subvolcanic intrusions. The Saltspring Intrusion, centred in southern Saltspring Island, may represent an intrusive phase (volcanic centre?) related to McLaughlin Ridge felsic volcanism. Intermediate and mafic volcanics are aphyric to clinopyroxene +/- plagioclase phyric pyroclastics, flows and subvolcanic intrusions, texturally and geochemically similar to lithologies within the Nitinat Formation. The McLaughlin Ridge Formation is overlain, apparently conformably, by the Buttle Lake Group's Fourth Lake Formation, a dominately epiclastic and chemical sedimentary package composed of thinly bedded cherts, argillites, siltstones and wackes. The uppermost formation within the former Sicker Group of the Cowichan-Horne Lake uplift is the Buttle Lake Group's Mount Mark Formation. This formation, not exposed in the Chemainus Project, is composed of massive and laminated crinoidal calcarenites and argillites (Massey and Friday, 1987).

The Sicker Group has been intruded by gabbro and diorite sills and dykes which fed Karmutsen Formation volcanics of the overlying Vancouver Group, in response to Late Triassic crustal dilation (Massey and Friday, 1988). In the Chemainus Project area, the Sicker Group and Karmutsen intrusions are overlain unconformably by clastic sediments of the Late Cretaceous Nanaimo Group.

Available age constraints on various formations within the Sicker Group are summarized in Brandon *et al* (1986) and Juras (1987). The best estimate for the age of the Saltspring Intrusion is a U-Pb zircon date of 393Ma (estimated error is +25Ma to -10Ma; Early Devonian). A U-Pb zircon age of 370Ma (estimated error is +18Ma to -6Ma; pre-Late Devonian) is the best estimate for the age of the Myra Formation at Buttle Lake. Faunal data indicate that the Fourth Lake Formation is Early to early Late Mississippian. The Mount Mark (Cowichan-Horne Lake uplift) and Buttle Lake (Buttle Lake uplift) Formations contain early Middle Pennsylvanian through Early Permian conodonts.

Table 1. Stratigraphic Comparison between the Cowichan-Horne Lake and Buttle Lake Uplifts.

PROPERTY GEOLOGY

Property-scale geological mapping of the Chemainus claim group was by Britten (1984), Everett and Cooper (1984), Enns and Hendrickson (1986), Mallalieu et al (1987) and Morrice (1989). Surveys prior to 1988 focused on specific regions of the property. Dr. M.G. Morrice reviewed the previous mapping in 1988 and completed the first property wide geological compilation and interpretation. The following geological discussions are taken with minor revisions from Morrice (1989)

The geological interpretation of the CHIP claims and the BRENT-HOLYOAK claims is shown on 1:5,000 maps revised to reflect results from the 1989 drill programs (Figures 3a to 3i). The Chemainus Project is underlain by about 57% McLaughlin Ridge Formation (units 2,3 and 4), 23% Fourth Lake Formation (unit 5), 17% Karmutsen gabbro and diorite (units 7 and 8), and 3% Nanaimo Group (unit 11). Nitinat Formation lithologies are not exposed within the confines of the Chemainus Project but outcrop immediately east of the property.

Lithologies within the Chemainus Project trend west-northwest. Bedding attitudes are difficult to discern for most of the property. Those that were observed have dips which vary from 20 degrees to vertical. Virtually all lithologies are characterized by a steeply dipping, variably intense schistosity. Mineral and stretch lineations are shallow plunging within the plane of schistosity.

Devonian

Nitinat Formation

The following discussion is based on observations of Nitinat lithologies east and south of the property (Massey et al, 1987).

Lithologies within the Nitinat Formation are mafic flows, pyroclastics and subvolcanic intrusions, characterized by the presence of up to 50% large (0.25-1.5 cm) calcic clinopyroxene phenocrysts. Lesser (0-15%) plagioclase phenocrysts are present locally. Flows are massive or pillowed; pillow breccia is present on Panorama Ridge, 2 km northwest of

Chemainus. Pyroclastics, which dominate the Nitinat Formation, comprise monolithic tuff breccia, lapilli tuff and lesser tuff. Clasts are invariably vesicular, with up to 65% calcite, quartz or chlorite-filled amygdules. The monolithic nature of the pyroclastics and their high vesicularity are consistent with near-vent deposition in a shallow marine to subaerial environment, perhaps in tuff or cinder cones.

McLaughlin Ridge Formation

The McLaughlin Ridge Formation is the lithologic package of exploration interest, hosting massive and semi-massive sulphide deposits in the Cowichan-Horne Lake uplift and being remarkably similar to the massive sulphide-hosting Myra Formation in the Buttle Lake uplift. The McLaughlin Ridge Formation occurs, uninterrupted, along the entire length of the claim group with an average exposed width of 2 km. The McLaughlin Ridge Formation is composed of varying proportions of felsic, intermediate and mafic volcanics and subvolcanic intrusions and lesser clastic and chemical sediments. Felsic volcanics dominate the central part of the claims, decreasing in abundance, at the expense of mafic and intermediate volcanics, to the northwest and southeast.

Classification in the field is based on colour index (CI) (% mafic minerals); mafic volcanics have CI>35, intermediate volcanics 15-35 and felsic volcanics <15. The quartz-phyric nature of felsic volcanics distinguishes them from the more felsic intermediate volcanics. These colour indices correspond approximately with SiO2 contents of 53%, 53-70% and >70%, respectively.

Mafic, and lesser ultramafic volcanics (Units 1 and 2) are the main lithologies in the western, eastern and northern parts of the property. The distinction between mafic and ultramafic volcanics is not readily made in the field, but is based on geochemical criteria with ultramafic volcanics containing <53% SiO2 and >10% MgO. Thus defined, only a small proportion of ultramafic compositions and no mappable units of ultramafic volcanics occur on the property. In the central part of the property, mafic volcanics occur as thin, continuous units interbedded with felsic volcanics.

Intermediate volcanics (Unit 3) occur throughout the property intimately associated with mafic volcanics. They attain their greatest abundance towards the east end of the property on HOLYOAK 2 and BRENT 1. In addition, a distinct suite of intermediate volcanics are sandwiched between the mafic volcanics of the McLaughlin Ridge Formation and Fourth Lake cherts along the northern part of the property, from CHIP 1 to CHIP 4.

Felsic volcanics (Unit 4) are the dominant lithology of the McLaughlin Ridge Formation on the Chemainus Project. They are the main lithology in the central part of the claims, decreasing in abundance both east and west at the expense of mafic and intermediate volcanics.

Within the McLaughlin Ridge Formation, sediments (Unit 5) are a minor component, occurring as thin (<10 m thick) units of argillite, siliceous argillite, and chert.

The general stratigraphic picture that has emerged is of a basal member dominated by felsic volcanics which is overlain by a mafic and intermediate volcanic-dominated sequence which is subsequently overlain, apparently conformably, by sediments of the Fourth Lake Formation. The mafic Nitinat Formation is not exposed on the claim group but is inferred to underlie the McLaughlin Ridge Formation. The basal felsic volcanic member is estimated to be a maximum of 600 metres thick based on the maximum exposed width, in the central part of the belt, assuming a simple anticline with axial fold trace bisecting the belt. This member is composed dominately of felsic pyroclastic flows which are variably quartz +/- plagioclase-phyric. Alteration within the felsic member, manifest as sericite +/- pyrite mineral assemblages, occurs throughout the member, but appears to be especially prominent near its upper contact with the mafic member. Thin interbeds of mafic volcanics interrupt the otherwise monotonous felsic succession. These mafic units may represent "background" volcanism which accumulated during lulls in the outpouring of the felsic pyroclastic flows. Alternatively these thin mafic units may be infolded or infaulted portions of the upper mafic member. The mafic volcanic-dominated member that overlies the felsic member is estimated to be <400 metres thick. These upper mafic volcanics are texturally

and compositionally similar to the thin mafic interbeds in the felsic member and to the mafic units in the Nitinat Formation. Alteration, in the form of hematitization, is prevalent near the top of the mafic member. Thin jasper units are associated with these hematitically altered mafic volcanics. The mafic member is overlain directly by Fourth Lake Formation sediments on most of the property. However, along the north margin of the McLaughlin Ridge Formation, in the CHIP claims, a unit of plagioclase-phyric intermediate volcanics occurs between hematitized mafic volcanics and Fourth Lake Formation sediments.

Mississippian

Fourth Lake Formation, Buttle Lake Group

The Fourth Lake Formation is defined by the presence of thick accumulations of sedimentary rocks (Unit 5) which bound the McLaughlin Ridge Formation along its northern and southern margins. On the Chemainus Project, the Fourth Lake Formation is composed mainly of cherts with lesser, but significant, siltstones and wackes. Bedding is well developed, ranging in thickness from 0.1-5 cm. Grading is locally present.

Triassic

Karmutsen Formation

Mafic intrusive rocks (Unit 7) related to Late Triassic Karmutsen volcanism, are ubiquitous throughout the property. Individual intrusions vary from several cm to 400 m wide and have been traced along strike for up to 6.5 km. In a gross sense most mafic intrusions are sill-like, appearing to have intruded along lithologic contacts in many instances. Cross-cutting relationships are present locally. Attitudes range from vertical to near-horizontal.

Intermediate intrusive rocks (Unit 8) are restricted to one sill-like diorite exposed at the east end of the property. This very magnetic diorite is medium-grained equigranular with a CI of 20-30.

Post-Triassic Intrusive Rocks

Late, post-metamorphic and post-deformational intrusive rocks (Unit 10) are a very minor component of the Chemainus claim group. All clearly crosscut prexisting schistosity and are themselves nonfoliated. All are thin (<2 m wide) equigranular intermediate dykes. Colour indices average about 35-40.

Cretaceous

Nanaimo Group (Comox Formation, Haslam Formation)

Clastic sediments of the Nanaimo Group (Unit 11) unconformably overlie or are in fault contact with older volcanic, sedimentary and intrusive rocks. In the Chemainus Project area the fining upward sequence comprises basal conglomerates and sandstones of the Comox Formation overlain by rusty weathering argillite and siltstone of the Haslam Formation (Muller and Jeletzky, 1970). Conglomerates include non-transported lithified regolith, little transported lithified talus and well transported boulder and cobble conglomerates. Clast types exhibit reasonably close correlation to underlying lithologies. Conglomerate matrix and overlying sandstone units are dominately composed of immature wacke.

Nanaimo Group sediments unconformably overlie older lithologies along the south margin of the property. A sliver of Nanaimo sediments, encountered in drill core in the Anita area, is in fault contact to the north with McLaughlin Ridge volcanics. Its southern contact, again with McLaughlin Ridge volcanics, is unconformable in places and a fault in places (Money et al., 1988).

Metamorphism

With the exception of Late Intrusive rocks (Unit 10) and Nanaimo sediments (Unit 11), all lithologies have been metamorphosed. The presence of abundant calcite, actinolitic amphibole and chlorite in mafic volcanics indicate that peak metamorphic conditions reached greenschist facies. The presence of hornblende in mafic volcanics in the Watson Creek area indicates slighter higher metamorphic conditions have developed locally.

1990 EXPLORATION PROGRAM

The portion of the 1990 exploration program covered by this report consisted of diamond drilling. Reclamation of all 1990 drill sites was completed except for the sowing of grass seed.

All work in this program was permitted with certain specific conditions under Annual Work Approval Number NAN 90-208-140 from the Ministry of Energy, Mines and Petroleum Resources. Timber use/road access permits were obtained from MacMillan Bloedel, Canadian Pacific Forest Products Ltd., B.C. Hydro and the Ministry of Forests. Plans for new roads and off-road machinery access were reviewed by the Ministry of Environment . A water permit was not required since all water sources used are unscheduled.

Diamond drilling site preparation and reclamation was completed by Ellison Excavating Limited using a John Deere 490 excavator. All damaged timber from site preparation and road building was either buried into the construction, properly stacked for removal or taken under permit for firewood. Roads, sumps, drill pads and trenches were recontoured and revegetated with particular attention to minimizing erosion through the use of water bars, culverts cross drains and ditches.

The drill holes were completed under contract by Burwash Contract Drilling of Cobble Hill, B.C. between May 12, 1990 and November 27, 1990 on the BRENT 1 claim and from November 1, 1990 to November 27, 1990 on the HOLYOAK claims. A unitized Longyear Super 38 drill equipped with air cooled diesel engines was used to drill the NQ-sized core. Drill core was placed in wooden trays marked by metric/imperial tags. Sperry-Sun orientation tests were taken by the drill crew at approximately 100 metre intervals. Core was delivered at the end of each shift to the Falconbridge field office in Chemainus. Drill core was logged by hand. Data was subsequently transferred into Progigraph Inc.'s PRGLOG 1G drill log system on a Toshiba 3200 computer and plotted using TRALOG, AUTOCAD and hand drafting.

Significantly mineralized core was split or sawn in intervals generally less than 1.5m long and sent to Bondar-Clegg And Company Ltd. in North Vancouver. Samples were digested with hot aqua regia (HNO3-Hcl) and then analyzed for 29 elements using ICP. Gold was determined using a 10 gram fire assay with an AA finish. Complete barium results were obtained using an XRF analysis. Automatic assaying was triggered for Cu, Pb or Zn values greater than 3000ppm, Au values greater than 1000ppb or Ag values greater than 30ppm. Complete results were generally available within 6 to 10 days by modem access to their computer. Geochemical results at or above the following thresholds were considered to be anomalous.

Elements of Primary Interest			
Cu > 500ppm	Zn > 1000ppm	Ag > 2.0ppm	Au > 100ppb
Pb > 35ppm	As > 50ppm	Co > 20ppm	Mn > 400ppm
Ni > 45ppm	Ba(XRF)> 2000ppm	Ba(ICP)> 300ppm	Sc > 10ppm

Elements of Secondary Interest			
Cr > 150ppm	Ga > 100ppm	Be > 20ppm	Li > 20ppm
Nb > 30ppm	Rb > 500ppm	Sb > 50ppm	V > 100ppm
Bi > 40ppm	Cd > 30ppm	Ce > 30ppm	La > 30ppm
Mo > 30ppm	Sn > 50ppm	Sr > 50ppm	Ta > 50ppm
Te > 50ppm	Y > 30ppm	Zr > 20ppm	

Samples for whole rock analyses (16 element whole rock, and copper, zinc and nickel package; Cominco Exploration Research Laboratory, Vancouver) were collected as 30cm composites from intervals up to 3m long with a spacing of less than 30m. Whole rock analyses were done in an attempt to identify zones of alteration which typically occur near volcanogenic massive sulphide deposits. Samples with less than 1.2% Na_2O are considered to be possibly altered.

Drill hole locations are shown on Figures 3 and 5. Results for each area are discussed below. Drill hole summaries are given in Appendix A, section by section descriptions in Appendix B, and complete drill logs with analytical results in Appendix C.

All drill core from 1985 to 1990 Chemainus Project programs is stored at the Falconbridge Limited's Chemainus field office, 9382 Trans Canada Highway, Chemainus, British Columbia.

CH90-130	35+50W	445.32	Includes costs from November 1 to 6, 1990.
		1166.15m	

The Sharon horizon occurs as a chlorite-pyrite-chalcopyrite stringer zone intersected in hole CH90-126 (section 11+50W) and is exposed on surface roughly 1.3km to the east. It is hosted in predominantly mafic tuffs approximately 10m north of a large distinct unit of quartz phyric felsic tuff (coarse quartz eye sericite schist). This part of the stratigraphy has been poorly tested. Prior to the 1990 Phase II program, CH90-126 was the only hole to penetrate the horizon along a strike length of roughly 2.6km. Hole CH90-125 was drilled northeast of CH90-126 to test stratigraphy north of the Sharon horizon.

Hole CH90-129 drilled through 170m (130m vertical) of overburden into gabbro indicating that the Sharon gabbro extends farther north than was previously believed. Because of the expense of deep overburden drilling and the proximity of the large gabbro body in the area, additional drilling adjacent to CH90-129 was cancelled.

Hole CH90-130 apparently penetrated the target Sharon stratigraphy having collared in intermediate to mafic tuffs and extending well into a large felsic unit. Nothing significant was noted in the stratigraphic position of the Sharon horizon. Well into the felsic tuffs, however, a 1.5cm foliation-parallel band contained 0.69% lead and 2.12% zinc across 0.1m. This could be correlative with the Silver creek horizon.

Summary Drill Logs

SUMMARY LOG AND DESCRIPTION
CH90-125 (PROPOSED HOLE E5)

LOCATION: 7+47W, 3+15S, 958m asl.; Holyoak 1/Brent 1
AZIMUTH: 182° **DIP:** -56°
TOTAL DEPTH: 513.59m **PROPOSED DEPTH:** 420m
STARTED: May 29, 1990 **COMPLETED:** June 7, 1990
REVISED: August 7, 1990
LOGGED BY: G. Allen

PURPOSE:

Due to deep overburden, this area appeared to be geophysically blind. INPUT TREND B-8 which lies at 4+00S was not located by the PROTEM or MAXMIN III surveys carried out earlier this month. The hole was designed to test volcanic stratigraphy north of and below the south-dipping Sharon gabbro.

RESULTS:

Bouldery till in the CH90-125 area has a vertical thickness of approximately 95m.

The hole intersected a sequence of predominantly felsic, intermediate, and mafic tuffs with mineralization consisting predominantly of sparse sporadic disseminated pyrite in narrow zones. From 118.87 to 402.47m the rocks are well foliated and steeply north-dipping with stratigraphic tops tentatively up. Between 402.47 and 434.50m foliation is contorted or steeply south-dipping suggesting that a major fold hinge may occur in this area. A strongly foliated contorted zone between 422.77 and 434.50m could be a ductile shear zone (R.D.S.). From 460 to 513.59m (E.O.H.) the rock is unfoliated.

Between 118.87 and 193.8m a sequence of intercalated felsic tuff, intermediate tuff, mafic tuff and argillite is generally sodium depleted, sporadically mineralized with narrow zones of disseminated pyrite, and may be correlative with the Randy/Powerline/Anderson Creek sericitic felsic volcanics (R.D.S.). From 125.16 to 125.76m 20% pyrite occurs in bands up to 1cm wide in felsic tuff and sediment(?). An analysis of this material indicates that no base metals are associated. Input trend B-8 is coincident with the zone but with such deep overburden this may not be a valid correlation.

A 1.5cm quartz stringer at 211.04m contains 5% fine-grained galena and traces of chalcopyrite.

At 409.0m a 3cm quartz stringer adjacent to a quartz -flooded fault zone contains 5% pyrite and 2-3% sphalerite. Samples from this area outlined a 0.53m wide zone with weakly anomalous zinc values.

Between 439.28 and 513.59m (E.O.H.) the hole intersected weakly foliated to massive mafic lapilli tuff with traces of pyrrhotite and chalcopyrite throughout. The sulphides commonly replace amygdules (primary filling?) and mineralization is thought to be immediately post depositional. From 445.90 to 450.68m 5-8% pyrite and 5% pyrrhotite occur in lenses up to 5mm by 3cm parallel to foliation. From 503.0 to 504.1m 3-5% pyrrhotite, 1-2% pyrite and <1% chalcopyrite occur as fillings in a weak breccia zone, disseminated, and replacing amygdules. Geochemical analyses of samples from this unit are weakly sporadically anomalous in copper and barium. The rock is sodium depleted in the 485m area.

Information gained from this hole indicates that the felsic volcanics hosting the weakly base metal mineralized Randy trend are probably more persistent than previous mapping shows. It is also apparent that the Sharon gabbro is not as extensive a body as previously believed.

DIRECT DRILLING COSTS: $39,892 or $77.67/m

CH90-125 PEM BOREHOLE EM RESULTS
HOLE DEPTH: 513.6m SURVEYED INTERVAL: 120-510m

No apparent EM targets were detected.

SUMMARY LOG AND DESCRIPTION
CH90-126 (PROPOSED HOLE E6)

LOCATION: 11+43W, 5+20S, 930m asl.; Holyoak 1, Brent 1
AZIMUTH: 184° **DIP:** -58°
TOTAL DEPTH: 600.46m **PROPOSED DEPTH:** 500m(+)
STARTED: June 7, 1990 **COMPLETED:** June 18, 1990
REVISED: August 7, 1990
LOGGED BY: G. Allen

PURPOSE:

This stratigraphic hole was designed to continue testing the Silver Creek-Sharon volcanic stratigraphy on a staggered section 400m west of CH90-125.

RESULTS:

Hole CH90-126 intersected 124m (95-100m vertical) of bouldery till. Because of the deep overburden it appears that there is a 40-50m gap in the stratigraphy tested between CH90-125 and CH90-126.

The upper part of CH90-126 between 124 and 370m was predominantly in intermediate to mafic tuffs, with weak sporadic disseminated pyrite and chalcopyrite mineralization between 151 and 180m. From 370 to 476.8m intercalated felsic, intermediate, and mafic tuffs occur. The last part of the hole from 476.8 to 600.46m (E.O.H.) intersected a fairly homogeneous quartz-feldspar phyric felsic tuff.

Between 370 and the end of the hole the rocks are sporadically mineralized with disseminated and stringer (+/-chlorite)-related pyrite and chalcopyrite. A continuous zone between 438 and 465m (13m approximate true width) contains weakly to highly anomalous amounts of copper and sporadic weakly to moderately anomalous amounts of silver. From 453.8 to 457.5m a chloritic felsic tuff cut by chlorite stringers contains an average of 10-15% pyrite and 3-5% chalcopyrite (453.13-458.77m: 2.17% Cu, 5.20g/T Ag across 5.64m or 2.38m approximate true width). This mineralization may be part of the Sharon trend, a chlorite-chalcopyrite stringer showing exposed on surface approximately 1.2km along strike to the east. It also appears to be in roughly the same stratigraphic horizon as the mineralization in the Silver Creek area, giving this mineralized trend a possible strike length of over 3km. CH90-126 is the only hole which has intersected this stratigraphic horizon along a strike length of over 2.5km.

CH90-126 PEM BOREHOLE EM RESULTS
HOLE DEPTH: 600.5m SURVEYED INTERVAL: 130-590m

No apparent EM targets were detected.

SUMMARY LOG AND DESCRIPTION
CH90-129 (PROPOSED HOLE F1)

LOCATION: 7+50W, 7+08S, 917m asl.; Brent 1
AZIMUTH: 182° **DIP:** -56°
TOTAL DEPTH: 242.32m **PROPOSED DEPTH:** 500m
STARTED: Oct. 11, 1990 **COMPLETED:** Oct. 18, 1990
REVISED: November 30, 1990
LOGGED BY: G. Allen

PURPOSE:

Hole CH90-129 was designed to test the Sharon horizon on section 7+50W, south of CH90-125. The northern limit of the Sharon gabbro was thought to be well south of the proposed drill target. Overburden depth in this area was estimated to be 75m (roughly 90m of overburden drilling) and it appeared that geophysical surveys were unable to penetrate to bedrock. An intersection of the Sharon horizon was expected at approximately 375m, roughly 300m below surface.

RESULTS:

Bouldery till in the CH90-129 area has a vertical thickness of approximately 130m.

The hole intersected medium-grained massive gabbro. Textures of this gabbro suggest that it is a relatively large intrusive body and is probably the Sharon gabbro. Grain size did not change with depth and it was felt that the contact was not close, possibly paralleling the hole. Even if the hole had drilled through the gabbro and intersected the Sharon horizon, it was felt that significant accessible (near surface) tonnage would be minimal and the hole was terminated.

DIRECT DRILLING COSTS: $25,182 or $103.93 /m

SUMMARY LOG AND DESCRIPTION
CH90-130 (PROPOSED HOLE F-8)

LOCATION: 35+56W, 1+15N, 765m asl.; Brent 2, Brent 3
AZIMUTH: 174° **DIP:** -57°
TOTAL DEPTH: 445.32m **PROPOSED DEPTH:** 500m
STARTED: Oct. 29, 1990 **COMPLETED:** Nov. 6, 1990
REVISED: November 30, 1990
LOGGED BY: G. Allen

PURPOSE:

Hole CH90-130 lies on section 35+50W, west of a postulated kink in the stratigraphy. The hole tested both the postulated stratigraphic position and a linear projection of the Sharon horizon. Depths to these targets were 165m and 365m respectively. No significant geophysical targets occurred in the area.

RESULTS:

Hole CH90-130 intersected intermediate to mafic tuff with a sedimentary component in the upper part of the hole and passed into a broad sequence of felsic volcanics below 150m. This transition is probably in the same stratigraphic position as the mafic to intermediate/felsic contact near the Sharon trend. The postulated kink in the stratigraphy, therefor, probably exists and the targets were tested.

At 232.1m a pinkish-brown 1.5cm wide foliation-parallel band in a quartz phyric felsic tuff contained 15% fine-grained pyrite, and 2% each of fine-grained chalcopyrite and sphalerite. An analysis of this material indicates that it contained 1250ppm copper, 6359ppm lead, and 16030ppm zinc (see VB00899 in table below). This mineralization may be in approximately the same stratigraphic position as the Silver Creek showing which lies roughly 500m to the east.

DIRECT DRILLING COSTS: $32,167 or $72.24/m

SILVER CREEK AREA
SECTION 35+50W

OBJECTIVE/TARGET: CH90-130 - To test the Silver Creek and Sharon trends.

HOLE #	LOCATION	AZIMUTH	DIP	LENGTH
CH90-130	35+56W, 1+15N	174°	-57°	445.3m

RESULTS:

Section 35+50W cuts an intercalated sequence of steeply north-dipping mafic to felsic volcaniclastics and gabbroic intrusives.

The primary target of hole CH90-130 was the sharon horizon which to the east is a pyrite-chalcopyrite-chlorite stringer zone hosted within mafic tuffs and situated 10-15m north of a large distinct quartz phyric sericite schist unit known as the Sharon felsic tuff. It appears that this stratigraphic horizon was penetrated in CH90-130. No significant mineralization was noted and it is probable that the Sharon mineralized trend does not extend this far to the west.

At 232.1m, well within a quartz phyric felsic unit which is probably stratigraphically equivalent to the Sharon felsic tuff, a 1.5cm wide foliation-parallel band contained 15% pyrite and 1250ppm copper, 0.69% lead, 2.12% zinc, 5.4g/T silver and 217ppb gold across 0.10m. This mineralization appears to be in the same stratigraphic position as the Silver Creek showing which lie roughly 500m to the east.

SILVER CREEK - SHARON AREA
SECTION 11+50W

OBJECTIVE/TARGET: CH90-126 - Stratigraphic hole, Sharon trend

HOLE #	LOCATION	AZIMUTH	DIP	LENGTH
CH90-126	11+43W, 5+20S	184°	-58°	600.46m

RESULTS:

Hole CH90-126 intersected 124m (95-100m vertical) of bouldery till. Because of the deep overburden it appears that there is a 40-50m gap in the stratigraphy tested between CH90-125 and CH90-126.

The upper part of CH90-126 between 124 and 370m was predominantly in intermediate to mafic tuffs, with weak sporadic disseminated pyrite and chalcopyrite mineralization between 151 and 180m. From 370 to 476.8m intercalated felsic, intermediate, and mafic tuffs occur. The last part of the hole from 476.8 to 600.46m (E.O.H.) intersected a fairly homogeneous quartz-feldspar phyric felsic tuff.

Between 370 and the end of the hole the rocks are sporadically mineralized with disseminated and stringer (+/- chlorite)-related pyrite and chalcopyrite. A continuous zone between 438 and 465m (13m approximate true width) contains weakly to highly anomalous amounts of copper and sporadic weakly to moderately anomalous amounts of silver. From 453.8 to 457.5m a chloritic felsic tuff cut by chlorite stringers contains an average of 10-15% pyrite and 3-5% chalcopyrite (453.13-458.77m: 2.17% Cu, 5.20g/T Ag across 5.64m or 2.38m approximate true width). This mineralization may be part of the Sharon trend, a chlorite-chalcopyrite stringer showing exposed on surface approximately 1.2km along strike to the east. It also appears to be in roughly the same stratigraphic horizon as the mineralization in the Silver Creek area, giving this mineralized trend a possible strike length of over 3km. CH90-126 is the only hole which has intersected this stratigraphic horizon along a strike length of over 2.5km.

SILVER CREEK - SHARON AREA
SECTION 7+50W

OBJECTIVE/TARGET: CH90-125 - Stratigraphic hole, Randy trend

HOLE #	LOCATION	AZIMUTH	DIP	LENGTH
CH90-125	7+47W, 3+15S	182°	-56°	513.59m

RESULTS:

Bouldery till in the CH90-125 area has a vertical thickness of approximately 95m.

The hole intersected a sequence of predominantly felsic, intermediate, and mafic tuffs with mineralization consisting predominantly of sparse sporadic disseminated pyrite in narrow zones. From 118.87 to 402.47m the rocks are well foliated and steeply north-dipping with stratigraphic tops tentatively up. Between 402.47 and 434.50m foliation is contorted or steeply south-dipping suggesting that a major fold hinge may occur in this area. A strongly foliated contorted zone between 422.77 and 434.50m could be a ductile shear zone (R.D.S.). From 460 to 513.59m (E.O.H.) the rock is unfoliated.

Between 118.87 and 193.8m a sequence of intercalated felsic tuff, intermediate tuff, mafic tuff and argillite is generally sodium depleted, sporadically mineralized with narrow zones of disseminated pyrite, and may be correlative with the Randy/Powerline/Anderson Creek sericitic felsic volcanics (R.D.S.). From 125.16 to 125.76m 20% pyrite occurs in bands up to 1cm wide in felsic tuff and sediment(?). An analysis of this material indicates that no base metals are associated. Input trend B-8 is coincident with the zone but with such deep overburden this may not be a valid correlation.

A 1.5cm quartz stringer at 211.04m contains 5% fine-grained galena and traces of chalcopyrite.

At 409.0m a 3cm quartz stringer adjacent to a quartz - flooded fault zone contains 5% pyrite and 2-3% sphalerite. Samples from this area outlined a 0.53m wide zone with weakly anomalous zinc values.

Between 439.28 and 513.59m (E.O.H.) the hole intersected weakly foliated to massive mafic lapilli tuff with traces of pyrrhotite and chalcopyrite throughout. The sulphides commonly replace amygdules (primary filling?) and mineralization is thought to be immediately post depositional. From 445.90 to 450.68m 5-8% pyrite and 5% pyrrhotite occur in lenses up to 5mm by 3cm parallel to foliation. From 503.0 to 504.1m 3-5% pyrrhotite, 1-2% pyrite and <1% chalcopyrite occur as fillings in a weak breccia zone, disseminated, and replacing amygdules. Geochemical analyses of samples from this unit are weakly sporadically anomalous in copper and barium. The rock is sodium depleted in the 485m area.

Information gained from this hole indicates that the felsic volcanics hosting the weakly base metal mineralized Randy trend are probably more persistent than previous mapping shows. It is also apparent that the Sharon gabbro is not as extensive a body as previously believed.

SILVER CREEK-SHARON AREA
SECTION 7+50W

OBJECTIVE/TARGET: CH90-129 - To test the Sharon trend.

HOLE #	LOCATION	AZIMUTH	DIP	LENGTH
CH90-125	7+47W, 3+21S	180°	-55°	513.6m
CH90-129	7+50W, 7+33S	180°	-61°	242.3m

RESULTS:

Section 7+50W cuts an intercalated sequence of steeply dipping mafic to felsic tuff and gabbroic intrusives north of the south-dipping Sharon gabbro and covers the sodium depleted Randy felsic volcanic unit. Overburden in this area is up to 130m thick (vertical).

The target of CH90-129 was the Sharon horizon, intersected in CH90-126 on section 11+50W. This mineralized horizon is a pyrite-chalcopyrite-chlorite stringer zone hosted within mafic tuffs and situated 10-15m north of a large distinct quartz phyric sericite schist unit known as the Sharon felsic tuff. Hole CH90-129 passed through 169.4m of bouldery till into medium-grained massive gabbro indicating that the Sharon gabbro extends farther north than previously believed and that near the bedrock surface the Sharon horizon has been dyked out on this section.

0.00 TO 118.87	CASING «┤ob├»	Bouldery till. Till recovered from 50 m weakly conductive.				
118.87 TO 125.16	MAFIC TUFF «2a»	Medium brownish to greenish-grey fine-grained sericitic well foliated tuff with sporadic <5% quartz eyes up to 5 mm (average 1-2 mm). The unit is cut by 10% irregular discontinuous <5 mm calcite stringers parallel to and crosscutting foliation. Sporadic 5% boudinaged quartz stringers. Several <5cm medium brownish-grey fine-grained quartz (10%, <1mm, rounded) - mafic (10%, <1 mm chloritic clots) phyric well foliated sericitic felsic dyklets cut the unit parallel to foliation. 123.5 - 124.0 Cherty tuff with 5% bright green to yellow-brown fine-grained talc developed in groundmass. STRUCTURE FOLIATION: 65° to core axis.			1-2% fine-grained disseminated pyrite.	The unit was originally thought to be felsic, but whole rock data indicate a mafic composition.
125.16 TO 125.76	PYRITIC ZONE «4a,SUL.ZN»	20% fine-grained pyrite (predominantly concentrated along bands up to 1 cm wide with up to 40% pyrite) in intercalated dark grey felsic tuff and medium brownish-grey fine-grained soft sediment (?) STRUCTURE FOLIATION: 57° to core axis.			20% pyrite.	
125.76 TO 126.30	FELSIC TUFF - SEDIMENT TRANSITION «4a-5»	Medium brownish-grey to dark grey fine-grained massive to thinly banded tuff and sediment (?) STRUCTURE 126.0 - 126.1 Carbonate vein brecciated and flooded with 20% quartz. Fault zone?				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
126.30 TO 132.95	ARGILLITE «5ik»	Dark grey to black fine-grained thinly bedded (1 mm to 1 cm) argillite and siltstone. 127.85 - Possible graded bedding indicating tops up hole. 128.08 - 127.7 Interbedded felsic tuff, felsic lapilli tuff and argillite. 128.7 - 129.1 Medium yellowish-brown fine-grained sericitic dyke with 20% <1-2 mm dark grey calcite +/-quartz eyes flattened out along foliation. Amygdules? STRUCTURE Broken core over interval FAULT: 126.7 - 2 cm gouge zone parallel to bedding at 70° CA. BEDDING/FOLIATION: 65-70° CA.			126.3 - 128.08 3-5% pyrite as narrow lenses parallel to foliation.	
132.95 TO 139.55	FELSIC TUFF «4a»	Light grey to medium greenish-grey fine-grained sericitic well foliated felsic tuff with rare <1 mm quartz eyes. 137.5 - 137.58 Thinly laminated (<1 mm) ash tuff with a cherty appearance. Actually relatively soft. 138.7 - 138.95 Quartz vein. Sheared along upper contact at 25° to core axis. 138.95 - 139.05 Yellowish-brown fine-grained dyklet. STRUCTURE FOLIATION: 60° to core axis.			1-2% fine-grained disseminated pyrite.	
139.55 TO 140.20	PYRITIC CHERTY FELSIC TUFF «4ap»	Medium to dark blue-grey fine-grained massive to poorly bedded sericitic to cherty tuff.			7% fine-grained pyrite (disseminated and concentrated along <1 mm bands parallel to foliation.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
140.20 TO 142.60	ARGILLITE «5ik»	Medium to dark grey to black fine-grained well bedded argillite, cherty argillite and siltstone. Cut by irregular quartz stringers and veins up to 10 cm wide, generally parallel to foliation. 142.25 - Shear at 40° CA cutting bedding at 60°. Weakly conductive gouge. (graphitic ?) Sharp lower contact. STRUCTURE BEDDING: 55-60° CA.			2% fine-grained pyrite in laminae up to 2 mm parallel to bedding and in irregular lenses up to 5 mm in diameter.	
142.60 TO 152.10	QUARTZ PHYRIC FELSIC LAPILLI (?) TUFF «4ba»	Mottled light blue-grey to medium greenish-grey fine-grained quartz phyric (15-20%, <1-5 mm [average 2-3 mm], rounded) sericitic foliated felsic tuff. The medium greenish irregular lenses may be talc altered matrix of lapilli fragments. Light grey lithic fragments (?) up to 2 cm wide flattened out in the plane of the foliation. 146.64 - 147.0 Mafic dyke. Dark green fine-grained chloritic mafic intrusive. Contacts parallel foliation. Cut by 15% irregular white calcite stringers and lenses up to 1 cm in diameter. Fault along lower contact. STRUCTURE FOLIATION: 60° to core axis.			1-2% fine-grained disseminated pyrite.	
152.10 TO 157.40	MAFIC LAPILLI TUFF «2b»	Medium to dark greenish-grey fine-grained chloritic groundmass with up to 50% dark green to medium brownish-grey amygdaloidal (15-20%, calcite <1 mm) lithic fragments up to 1 cm wide flattened parallel to foliation. STRUCTURE FOLIATION: 50-60° CA.				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		FAULT: 152.1 - 1 cm gouge and broken core. 152.3 - 152.5 Gouge, pulverized rock. Shearing parallel to foliation.				
157.40 TO 162.90	INTER- MEDIATE TUFF «3a»	Dark green to greenish-grey fine-grained foliated chloritic groundmass with sporadic 5% <1-2 mm calcite 'eyes' which could be amygdules in obscure lithic fragments. STRUCTURE FOLIATION: 40-60° to core axis. FAULT: 158.0 - 158.1 Gouge, pulverized rock. Shearing at 45° to core axis cutting foliation at 10°.				
162.90 TO 164.90	FELSIC LAPILLI TUFF «4b»	Light grey to medium greenish-grey fine-grained sericitic foliated felsic tuff with up to 40% greenish-grey fine-grained lithic fragments up to 1 cm wide flattened parallel to foliation. Contacts sharp, conformable. STRUCTURE FOLIATION: 55-60° CA.			1% fine-grained disseminated pyrite.	
164.90 TO 168.10	MAFIC TUFF «2a»	Dark greenish-grey fine-grained chloritic foliated mafic tuff. STRUCTURE FOLIATION: 60° CA. Some kinking forming open 'Z'-type folds.				
168.10 TO 170.50	CHLORITIC FELSIC TUFF «4al»	Mottled light to medium greenish-grey fine-grained sericitic +/-chloritic foliated felsic tuff. Inhomogeneous texture with some light-coloured lenses which could be boudinaged layers or flattened lithic fragments. Barren.				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		STRUCTURE FOLIATION: 60° CA.				
170.50 TO 170.85	MAFIC DYKE «7r»	Dark grey fine-grained massive dyke. Sharp contacts parallel to foliation in host.				
170.85 TO 175.70	INTER- MEDIATE TUFF «3a»	Medium greenish-grey fine-grained chloritic-sericitic foliated tuff, with rare, sporadic 1 mm quartz eyes and light-coloured fine-grained feldspar crystal fragments (?) STRUCTURE FOLIATION: 50-60° CA.			170.85 - 174.25 Sporadic 1% pyrite in irregular masses up to 2 mm wide and in lenses and thin bands up to 1 mm wide. 174.17 - Irregular 1-10 mm quartz vein with 10% Chalcopyrite. Stringer parallels foliation. 174.25 - 175.7 2-3% fine-grained pyrite, disseminated and concentrated along 1-2 mm bands parallel to foliation.	
175.70 TO 179.60	QUARTZ PORPHYRY «9ra»	Light grey fine-grained sericitic, sporadically siliceous (about 50%) groundmass with 15-20%, 1-5 mm rounded quartz eyes. Massive to weakly foliated. Probably SALTSPRING INTRUSION. Sharp contacts with host. UPPER CONTACT: 40° CA LOWER CONTACT: 45° CA STRUCTURE FOLIATION: 60° CA				
179.60 TO 181.20	INTER- MEDIATE TUFF «3a»	As 170.85 - 175.7				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
181.20 TO 183.00	QUARTZ PHYRIC FELSIC LAPILLI TUFF «4ba»	Mottled light grey to medium greenish-grey fine-grained sericitic groundmass with 5-15% rounded quartz eyes up to 3 mm. Some distinct fragments up to 2 cm thick flattened in plane of foliation. 182.15 - 182.37 Dark green fine-grained mafic dyke with an amygdaloidal core. STRUCTURE FOLIATION: 55-60° CA			2-3% fine-grained pyrite as discontinuous thin lenses and stringers (?) parallel to foliation.	
183.00 TO 189.60	MAFIC LAPILLI TUFF «2b»	Mottled medium to dark greenish-grey fine-grained chloritic foliated groundmass with some distinct brownish-grey fine-grained lithic fragments flattened along plane of foliation. STRUCTURE FOLIATION: 50° CA FAULT: 188.96 - 189.35 Sheared parallel to foliation. Gouge zones up to 1 cm wide.				
189.60 TO 191.50	QUARTZ PHYRIC FELSIC TUFF «4aa»	Light grey to light greenish-grey fine-grained sericitic foliated groundmass with 15% 1-5 mm rounded quartz eyes.			190.25 - 191.5 5-5% fine-grained pyrite; disseminatd and concentrated along bands up to 1 cm wide parallel to foliation.	
191.50 TO 193.80	CHLORITIC FELSIC (?) TUFF «4al»	Medium to dark greenish-grey fine-grained chloritic-sericitic strongly foliated felsic (?) tuff. Gradational contact with unit below. STRUCTURE FOLIATION: 50° CA			193.25 - 193.78 7-8% pyrite concentrated along <3 mm bands parallel to foliation.	
193.80 TO 207.87	MAFIC LAPILLI TUFF «2bf»	Dark green fine-grained chloritic foliated groundmass with sporadic zones from <1 cm to 10 cm wide with 5-15%, 1-4 mm rounded calcite +/-quartz amygdules. Amygdaloidal zones commonly have indistinct boundaries but are probably lithic			<1% pyrite in isolated crystals generally in calcite amygdules. Traces of Chalcopyrite.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		fragments. The unit is strongly foliated and cut by 10-15% irregular, discontinuous quartz-calcite stringers parallel to and crosscutting foliation. 206.68 - 1 cm fine-grained band? bed (?) parallel to foliation. STRUCTURE FOLIATION: 50-60° CA FAULT: 207.87 - 3 cm gouge zone. Subparallel foliation (slightly crosscutting).				
207.87 TO 262.85	MAFIC TUFF «2ak»	Medium to dark greenish-grey fine-grained massive to thinly bedded (<1 mm - >10 cm) weakly foliated mafic tuff. The unit is very fine-grained, quite homogeneous and may be more of a volcanic sandstone. 260.4 - 260.8 Thinly bedded brecciatd tuff. <1-2 cm blocks fractured and offset a few millimetres. Could be soft sediment deformation. Fine-grained chlorite infilling. STRUCTURE BEDDING/FOLIATION: 55° CA 240.0 - Kinked foliation. Open 'Z'-fold (foliation oriented from top left to bottom right).			211.04 - 1.5 cm wide quartz vein with 5% fine-grained Galena and traces of Chalcopyrite. Vein appears to parallel foliation. 238.46 - 238.87 5-7% fine-grained pyrite concentrated along <1 mm bands or stringers parallel to foliation.	
262.85 TO 264.71	GABBRO «7r»	Dark greenish-grey fine-grained feldspar phyric (15%, <1 mm) mafic dyke. Some parts look like typical Karmutsen gabbro. Up to 15% white leucoxene. STRUCTURE Upper contact parallels foliation.				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
264.71 TO 265.50	MAFIC TUFF «2a»	As above dyke.				
265.50 TO 266.45	GABBRO «7rb»	As 262.85 - 264.71				
266.45 TO 271.00	MAFIC TUFF «2ak»	Dark green fine-grained chloritic massive to thinly bedded weakly to moderately foliated homogeneous mafic tuff. Fault along lower contact. STRUCTURE BEDDING/FOLIATION: 60° CA				
271.00 TO 288.27	QUARTZ EYE CALCAREOUS MAFIC TUFF (?) (FLOW?) «2a?,2df?»	Dark green fine-grained chloritic massive to moderately foliated mafic tuff with 3-5% rounded <1-8 mm rounded elipsoidal quartz eyes. The unit is slightly more foliated than the unit above. 5-10% calcite in <1 mm discontinuous hairline stringers (?) parallel to foliation. Quartz eyes could be amygdules in a flow. Thin section at 272.9 m. STRUCTURE FAULT: 271.0 - 5 cm broken core and gouge at contact. Parallel to foliation. FOLIATION: 55-60° CA 275.2 - 275.85 Broken core. Fault? Fractured subparallel to CA. 282. 0 - 284.7 Several open 'S' folds (foliation oriented top left to bottom right). Hinge up hole?			<1% pyrite in coarse-grained cubes up to 3 mm.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
288.27 TO 289.35	QUARTZ-FELDSPAR PHYRIC CHLORIC FELSIC TUFF «4acl»	Medium greenish-grey fine-grained foliated sericitic groundmass with 10-15% each of rounded <1-3 mm grey quartz and greenish-grey stubby feldspar crystals. 288.27 - 288.85 50% white quartz veins and stringers up to 15 cm wide generally parallel to foliation. Fault zone?				
289.35 TO 293.14	MAFIC TUFF (FLOW ?) «2a?2df?»	Dark greenish-grey fine-grained chloritic massive to weakly foliated homogeneous mafic tuff. Rare quartz eyes up to 2 mm could be amygdules. 5% calcite as discontinuous <1 mm hairline stringers parallel to foliation. Shear along lower contact. STRUCTURE FOLIATION: 55° CA.				
293.14 TO 298.87	QUARTZ-FELDSPAR PHYRIC FELSIC TUFF «4ac»	Medium to light greenish-grey fine-grained foliated sericitic groundmass with 10-15% @ <1-3 mm rounded grey quartz and greenish-grey feldspar crystals. Finer-grained parts are poorly banded parallel to foliation (bedding ?). STRUCTURE FOLIATION: 55-60° CA BANDING: 296.3 - 60° to core axis, parallel to foliation.				
298.87 TO 299.72	FAULT ZONE «FZ»	Pulverized rock, gouge zones up to 30 cm wide. Shearing appears to parallel foliation on the uphole side of the fault and to cut foliation at 30° on the downhole side.				Drillers report that the hole is 'squeezing' at this fault.

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
299.72 TO 301.64	FELDSPAR PHYRIC FELSIC TUFF «4ab»	Medium grey fine-grained sericitic weakly foliated groundmass with 15% <1-3 mm vague grey rounded feldspar (+quartz ?) eyes. Distinctly different from unit above fault. STRUCTURE FOLIATION: 50-55° CA. Some open 'S' folds (foliation oriented top left to bottom right).				
301.64 TO 302.02	MAFIC DYKE (?) (TUFF?) «7r?,2a?»	Dark green fine-grained feldspar phyric(5%, <1 mm, stubby, evenly distributed) chloritic moderately foliated mafic dyke (?). Sharp upper contact parallel to foliation. Lower contact along a shear parallel to foliation.				
302.02 TO 307.50	QUARTZ-FELDSPAR PHYRIC FELSIC TUFF «4ac»	Medium greenish-grey fine-grained sericitic foliated groundmass with 15% @ rounded <1-3 mm grey quartz and light greenish-grey feldspar crystals. Some fine-grained bands may be beds or perhaps flattened lithic fragments. 307.0 - 307.5 30% <1-5 cm fine-grained mafic beds (?) (or possibly dyklets ?) at 40-50° to core axis. One bed has a cherty appearance. STRUCTURE FOLIATION: 302.02 - 303.0 55-60° CA 303.0 - 307.5 40-50° CA				
307.50 TO 309.60	MAFIC TUFF «2a»	Dark green fine-grained massive to well foliated and thinly banded chloritic mafic tuff. 307.5 - 307.7 Mixing of feldspar phyric unit above and mafic tuff. Some brecciation of mafic tuff could be soft sediment deformation. 1 cm jasper band/bed developed on or near the contact possibly along an erosional surface. The deformed mafics plus the jasper suggest stratigraphic tops are up hole.			307.6 - 2-3% pyrite associated with 1 cm jasper bed.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
309.60 TO 312.22	QUARTZ-FELDSPAR PHYRIC FELSIC TUFF «4ac»	As 302.2 - 307.5 STUCTURE FOLIATION: 60° to core axis. 'S' folds at 309.8 (Foliatiion oriented top left to bottom right).				
312.22 TO 314.77	INTER-BEDDED MAFIC TUFF AND HEMATITIC ARGILLITE (MYLONITE?) «2a,5i?»	Interbedded dark green to greenish-grey fine-grained mafic material and dark purplish-grey to maroon hematitic argillite (?). Colour bands range from <1 mm to 1 cm and are somewhat contorted. Between 312.22 and 330.0 light and dark green bands actually cross, suggesting that shearing may be causing the banding. Possibly a mylonite zone. Sharp upper and lower contacts. STRUCTURE FAULT: 313.03 - 5 cm (+) hematitic gouge, parallel to foliation 35-40° to core axis. FOLIATION: Contorted, averaging 60° CA.				
314.77 TO 343.70	QUARTZ-FELDSPAR PHYRIC FELSIC TUFF (+LAPILLI TUFF) «4ac,4bc»	Medium greenish-grey sericitic foliated groundmass with 15% @ quartz and feldspar crystals up to 3 mm. As previous intervals. 318.85 - 320.16 Fine-grained sericitic quartz-feldspar phyric interval. Quartz and feldspar crystals <1 mm. 312.6 - 322.3 As above. 329.4 - 329.68 Medium to dark grey fine-grained feldspar phyric (15-20% <0.5 mm) intermediate dyke. Contacts sharp, parallel to foliation. 335.40 - Distinct 1 cm * 2 cm quartz phyric lithic fragment suggesting that the unit or parts of it may be lapilli tuff.				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		139.0 - 140.5 Several <1-2 cm wide light grey quartz phyric 'bands' parallel to foliation are probably flattened lithic fragments. STRUCTURE FOLIATION: 314.77 - 316.0 60° CA. One 'Z' fold. 316.0 - 318.85 CONTORTED 318.85 - 320.0 Weakly foliated 60° CA. 320.0 - 321.6 Contorted. 321.6 - 335.0 60° CA. 335.0 - 343.7 40-50° CA. FAULTS: 322.4 - 2 cm gouge zone 45° to core axis, cutting foliation at about 60° 333.76 - 334.14 Sheared, gougy. 60° to core axis parallel to foliation.			330.0 - 330.25 Quartz vein parallel to foliation. Trace Chalcopyrite. 330.30 - 330.62 4-5% fine-grained pyrite, disseminated and in 1-2 mm stringers associated with quartz stringers adjacent to a fine-grained mafic dyke.	
343.70 TO 345.00	FAULT ZONE «FZ»	Sheared, pulverized rock with 1-2 cm gouge zones at 30° to core axis.				
345.00 TO 359.66	QUARTZ-FELDSPAR PHYRIC FELSIC TUFF «4ac»	As above fault zone. 345.0 - 346.2 Fine-grained tuff with quartz and feldspar crystals <1 mm. 349.65 - 350.13 Dark green fine-grained feldspar phyric mafic dyke cut by quartz veins and strongly epidotized. 355.43 - 3 cm grey brown mafic phyric foliated dyklet. 358.30 - Distinct quartz feldspar phyric lithic fragments up to 1 cm * 2 cm flattened in the plane of foliation. 358.5 - 359.66 20% white quartz stringers up to 2 cm parallel foliation. STRUCTURE			349.65 - 350.13 2-3% pyrite in quartz stringers.

		FOLIATION: 45-50° CA.				
359.66 TO 362.78	FELDSPAR PHYRIC MAFIC DYKE «7r»	Dark green fine-grained massive to strongly foliated +/-feldspar phyric (0-15%, <1-2 mm) mafic dyke. Chill along upper contact at 35° CA, parallel to foliation in host tuff. 362.42 - 362.78 20% 1-3 mm stubby anhedral feldspar phenocrysts.				
362.78 TO 373.27	QUARTZ-FELDSPAR PHYRIC FELSIC TUFF «4ac»	Medium blueish to greenish-grey fine-grained sericitic foliated groundmass with 10-15% @ rounded <1-3 mm grey quartz and light grey feldspar. As previous intervals. Homogeneous, barren. STRUCTURE FOLIATION: 45° CA. FAULT: 371.37 - 371.44 Gouge zone. 60° CA.				
373.27 TO 382.18	MAFIC TUFF (?) (DYKE?) «2a?,7r?»	Dark green to greenish-grey fine-grained chloritic mafic tuff with several dark green bands up to 5 mm (beds ?) parallel to foliation. Rare <0.5 mm quartz eys. 379.3 - 379.63 Medium to dark blue-grey quartz feldspar phyric sericitic foliated felsic tuff. Sharp contacts parallel to foliation. Possible dyke? STRUCTURE FOLIATION: 45-60°, average 50-55° CA.				
382.18 TO 384.32	QUARTZ-FELDSPAR PHYRIC FELSIC TUFF «4ac»	Medium to dark grey to greenish-grey fine-grained sericitic groundmass with 25% 1-3 mm rounded grey to white feldspar and quartz eyes. STRUCTURE				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		FOLIATION: 70° CA. Minor contorted zone 383.4 - 383.6				
384.32 TO 391.45	MAFIC TUFF (?) (DYKE?) «2a?,7r?»	As 373.27 - 382.18 384.4 - 384.9 Relatively massive fine-grained feldspar phyric (15-20% <0.5 mm). 10% quartz stringers up to 2 cm wide parallel to foliation. 390.60 - 390.98 Medium greenish-grey fine-grained sericitic intermediate tuff (?) Fault along lower contact. STRUCTURE FOLIATION: 55-60° CA. FAULTS: 384.9 - 385.2 Mylonitic well-banded material. 385.1 - 385.2 Gouge. Upper contact at 80° CA, cuts foliation at 60°. Lower contact parallel foliation. 390.6 - 390.7 Gouge at 25° CA. 391.45 - 5 mm gouge along lower contact at 18° CA.				
391.45 TO 394.13	MAFIC TUFF «2a»	Medium greenish to brownish-grey fine-grained sericitic +/-chloritic foliated tuff. 15% calcite in discontinuous lenses and bands up to 3 mm parallel to foliation. STRUCTURE FOLIATION: 50-60° CA.			<1% fine-grained disseminated pyrite.	The unit was originally thought to have an intermediate to felsic composition but whole rock data indicate a mafic chemistry.
394.13 TO 398.90	FELDSPAR PHYRIC MAFIC DYKE (?) (TUFF?) «7rb?,2ab?»	Dark green fine-grained chlorite-sericite foliated groundmass with 10% sporadically distributed <1-3 mm stubby anhedral epidotized feldspar phenocrysts. The sporadic distribution of the phenocrysts may be as a result of shearing and				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		development of the foliation or it may be a remnant texture of a lapilli tuff. Sheared with 5 mm calcite veins along lower contact 30° and 90° to CA. STRUCTURE FOLIATION: 45-50° CA.				
398.90 TO 400.30	MAFIC TUFF (?) «2a»	Dark green fine-grained chloritic foliated mafic tuff (?) with sporadic zones up to 1 cm wide with 10% <0.5 mm stubby light green feldspar crystals.				
400.30 TO 402.47	INTER-MEDIATE TUFF «3a»	Medium greenish-grey fine-grained sericitic + chloritic foliated tuff with 5% sporadically distributed epidotized feldspar crystals up to 3 mm. 401.46 - 401.60 Light grey to sericitic tuff with 15-20% fine-grained pyrite. Shear along lower contact at 45° to core axis. Foliation above and below shear at 70° to each other. STRUCTURE FOLIATION: 60° CA.			401.46 - 401.60 15-20% fine-grained pyrite in 1-2 mm bands parallel to foliation.	
402.47 TO 404.30	(+/- FELDS-PAR PHYRIC) FELSIC TUFF «4ab»	Medium to light blueish-grey fine-grained feldspar phyric (10%, average 1 mm, white, stubby, anhedral) foliated sericitic felsic tuff. 403.15 - 404.30 Medium greenish-grey fine-grained sericitic well foliated felsic tuff. Contorted. STRUCTURE FOLIATION: 402.47 - 402.88 10° CA. 402.88 - 403.15 Contorted 35-45° CA. 403.15 - 404.3 Contorted, subparallel to core axis. FAULTS:			402.47 - 402.88 2-3% fine-grained disseminated pyrite. Pyrite also in rare 1 mm wide foliation - parallel bands. 402.88 - 403.15 15% fine-grained pyrite; disseminated and concentrated along <1-3 mm bands parallel to foliation. Fault-bounded top and bottom.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		402.5 - Minor shear at 35° CA. 402.88 - 1 cm gouge zone at 35° to core axis. Truncates foliation. 403.07 - 403.15 5 cm gouge zone at 40° CA.				
404.30 TO 410.82	MAFIC TUFF «2ak»	Medium to dark greenish-grey fine-grained poorly thinly bedded to massive weakly foliated mafic tuff. 5% calcite in irregular cross-cutting and bedding parallel calcite stringers up to 1 mm wide. STRUCTURE BEDDING/FOLIATION: 40-50° CA. FAULT ZONE/QUARTZ VEIN: 408.40 - 408.62 Quartz flooded fault/gouge zone.			408.40 - 408.62 15% pyrite and traces of Chalcopyrite along 1-2 mm stringers in a quartz flooded fault zone at 50° to core axis. 408.98 - 409.02 3 cm quartz stringer at 45° CA. 5% pyrite and 2-3% fine-grained re-brown Sphalerite.	Unit was originally thought to have an intermediate composition but whole rock data indicate a mafic chemistry.
410.82 TO 411.30	FAULT ZONE «FZ»	Crushed, pulverized rock. Gouge. Margins at 40° to core axis.			3-4% fine-grained disseminated pyrite in gougy parts.	
411.30 TO 417.32	MAFIC TUFF «2ak»	As 404.30 - 410.82 STRUCTURE FOLIATION/BEDDING: 40-50° CA. 417.0 - 417.28 Contorted foliation 'M' folds.			417.0 - 417.28 4-5% disseminated pyrite.	
417.32 TO 422.70	MAFIC TUFF «2a»	Dark green fine-grained chloritic foliated and thinly banded mafic tuff with some zones up to 40 cm wide with 15% <1 mm stubby white feldspar crystals. STRUCTURE FOLIATION: 40-20° CA across unit. 419.2 - 419.3 'S' fold (foliation oriented top left to bottom right).				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
422.77 TO 431.20	MAFIC TUFF(?) (DUCTILE SHEAR ZONE ?) «2aq»	Medium grey-brown fine-grained strongly foliated sericitic tuff with 15% calcite in 1-5 mm discontinuous lenses and bands parallel to foliation. The unit is contorted and may be a ductile shear zone (R.D.S.) 422.77 - 423.63 Zone with 25% white quartz-carbonate stringers and irregular lenses up to 5 cm wide. Shear along upper contact. 427.0 - 428.15 Strongly contorted, breccia zone. 428.15 - 428.83 Brecciated schist with gouge matrix. STRUCTURE FOLIATION: 423.63 - 427.0 Undulating 15-20° CA. 427.0 - 428.15 Strongly contorted into tight 'S' folds. Brecciated. 428.15 - 431.20 Contorted, with 'S' folds. Average 30° CA. FAULT ZONE: 428.15 - 428.83 Brecciated. 50% gouge matrix. Shears 30° and 50° CA.				Possibly a decollement zone.
431.20 TO 434.50	FELDSPAR PHYRIC MAFIC DYKE (GABBRO?) (CONTIN-UATION OF DUCTILE SHEAR ZONE) «7rbq»	Dark green fine-grained chloritic foliated groundmass with 15% 1-3 mm stubby light green feldspar phenocrysts. 30% of unit sheared into 1 cm wide fine-grained chlorite zones with irregular lenses and bands of white calcite averaging 10-15% overall. STRUCTURE FOLIATION: Contorted,averaging 10-15° CA. 434.0 - 434.50 40° CA.				
434.50 TO 436.64	QUARTZ PHYRIC FELSIC ASH TUFF «4aa»	Light greenish to blueish-grey fine-grained quartz phyric (5%, 1 mm) sericitic foliated felsic ash tuff. 436.4 - 436.64 Feldspar phyric.			2-4% fine-grained disseminated pyrite.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		STRUCTURE FOLIATION: 40° CA. One small 'S' fold or kink at 434.9				
436.64 TO 439.28	FELDSPAR PHYRIC FELSIC TO INTER-MEDIATE TUFF «4ab-3ab»	Mottled medium to dark greenish-grey fine-grained feldspar phyric (sporadic, 0-15%, <1-2 mm rounded epidotized) felsic to intermediate tuff. STRUCTURE FOLIATION: 35-40° CA.			436.64 - 439.0 1-2% disseminated pyrite. 439.0 - 439.28 2-3% @ pyrite and pyrrhotite concentrated along <1 mm bands parallel to foliation.	
439.28 TO 513.59	FELDSPAR-MAFIC PHYRIC AMYGDAL-OIDAL MAFIC LAPILLI TUFF «2bef»	Mafic lapilli tuff with a predominantly medium to dark greenish-grey fine-grained chloritic epidotic calcareous +/-feldspar phyric groundmass and up to 60% <1-20 cm (+) medium grained feldspar (1-3 mm, euhedral commonly altered to epidote) +mafic (pyroxene ?) phyric +amygdaloidal rounded to angular lithic fragments. Some fragments have been altered to a pale greenish-grey to white groundmass. Some 2-3 m zones are siliceous and have a fine-grained biotite-rich groundmass. 444.70 - 450.68 Medium greenish-grey fine-grained feldspar-phyric (15%, <1 mm) chlorite-calcite-epidote altered mafic tuff with a few vague mafic-feldspar phyric lithic fragments up to 1 cm. 448.42 - 448.56 Thinly (2 mm - 1 cm) bedded cherty tuff. 457.14 - 457.38 Fine-grained medium grey mafic to intermediate dyke (?) (possibly a sandy tuff bed ?) with sharp contacts at 45° to core axis. 468.3 - 470.8 Siliceous-biotitic zone. Distinct increase in pyrrhotite content compared to surrounding chloritic-calcareous-epidotic material.		It appear that an original silica-biotite alteration is being overprinted by a calcite-epidote-chlorite alteration. 491 - 496, 500 - 503 Moderate carbonate chlorite alteration gives the rock a pseudobreccia texture. 493.4 - 493.8 Strong biotite-chlorite alteration of groundmass. 510.2 - 511.4 Moderate pervasive fine-grained biotite, chlorite and epidote.	Ubiquitous traces of pyrrhotite and lesser amounts of Chalcopyrite commonly replacing or partially replacing amygdules. 445.90 - 450.68 5-8% pyrite and 5% pyrrhotite in lenses up to 5 mm * 3 cm parallel to foliation. 468.3 - 470.8 2-3% fine grained disseminated pyrrhotite. Traces of Chalcopyrite. 480.80 - 1 cm calcite vein at 80° CA with 30% pyrrhotite. 486.7 - 490.5 1-3% pyrrhotite; disseminated and along 1-2 mm wide stringers with calcite. Traces of Chalcopyrite. 503.0 - 504.1 3-4% pyrrhotite, 1-2% pyrite and traces of Chalcopyrite in weak breccia zones and partially replacing amygdules. 504.1 - 505.0 Weakly sheared zone (40-50° CA) with sporadic silicification and quartz	This unit is relatively (unfoliated) and may be a 'basement' to an overlying foliated dicollement.

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		486.7 - 490.5 As above. STRUCTURE 439.28 - 445.90 Massive to weakly foliated at 40° CA. 445.90 - 452.4 Moderately foliated 30-45° to core axis (average 40° CA). 452.4 - 460.2 Massive to weakly foliated 40-45° CA. 460.2 - 513.59 Massive, unfoliated. 455.58 Irregular 5 cm wide quartz calcite chlorite vein at 15° CA with a trace of chalcopyrite. 513.59 m E.O.H.			stringers up to 1 cm wide. 3-4% @ pyrite and pyrrhotite, <1% Chalcopyrite along hairline quartz stringers. 505.0 - 505.7 4-5% disseminated pyrrhotite and <1% Chalcopyrite.

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 124.06	CASING «┤ob├»					
124.06 TO 135.33	QUARTZ-FELDSPAR PHYRIC FELSIC INTRUSIVE (SALTSPRING INTRUSION) «9sc»	Light grey to white medium to coarse-grained quartz (15-20%, 2-4 mm, anhedral to euhedral feldspar (15-20%, 2-5 mm anhedral to subhedral prisms) phyric massive felsic intrusive. Broken blocky core over entire interval. Fractured subparallel to 90° to core axis. Minor limonetic weathering on fracture surfaces. STRUCTURE FAULT: 135.20 - 135.33 Pulverized rock and gouge. Angle unclear, but possibly 40-50° CA.				
135.33 TO 139.90	FELSIC TUFF «4a»	Light grey to greenish-grey fine-grained sericitic weakly to moderately foliated felsic tuff. 138.38 - 139.90 Sporadically quartz-feldspar phyric. Vague clastic texture; possibly a lapilli tuff. Broken core along lower contact. Fault? STRUCTURE FOLIATION: 55-60° to core axis. FAULT: 138.38 - 5 cm (+?) wide gouge zone parallel to foliation.			137.45 - 137.58, 138.23 - 138.38 Zones with 7-8% fine-grained pyrite in discontinuous 1-2 mm wide bands parallel to foliation.	
139.90 TO 143.14	FELDSPAR PHYRIC MAFIC TUFF «2ab»	Medium to dark greenish-grey fine-grained feldspar phyric (sporadic 0-15%, <1 mm, dark green to epidotic) massive to poorly banded mafic tuff. 141.20 - 142.34 Medium greenish-grey feldspar (10% <1 mm) phyric intermediate dyke. STRUCTURE BANDING/FOLIATION: 55° CA			Sporadic <1-3% disseminated pyrite.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
143.14 TO 144.26	QUARTZ-FELDSPAR PHYRIC FELSIC TUFF «4ac»	143.14 - 143.56 Medium greenish-grey fine-grained massive sericitic groundmass with 10% @ rounded grey 2-3 mm quartz and feldspar crystals. 143.56 - 144.26 Medium to light grey fine-grained quartz-feldspar phyric (sporadic 0-5% of each, <1 mm) sericitic strongly foliated felsic tuff. STRUCTURE FOLIATION: 45-50° CA.				
144.26 TO 146.02	MAFIC LAPILLI TUFF «2b»	Mottled medium to dark greenish-grey fine-grained epidotic-chloritic mafic tuff with vague lithic clasts up to 1 cm. Some irregular zones (clasts?) up to 5 cm wide with <1 mm feldspar phenocrysts.			145.18 - 145.28 2 cm wide zone with 7-8% pyrrhotite adjacent calcite stringer at 30° to core axis.	
146.02 TO 149.21	MAFIC TUFF «2a»	Dark greenish-grey fine-grained mafic tuff weakly brecciated and flooded with 15-20% calcite +/-quartz in irregular discontinuous lenses and stringers up to 3 cm wide parallel to foliation. 146.75 - 147.42 Mafic lapilli tuff as 144.26 - 146.02 STRUCTURE FOLIATION: 40-60° CA.			147.14 - 147.32 4-5% @ of pyrite and pyrrhotite, disseminated and in irregular masses up to 5 mm wide.	
149.21 TO 159.04	MAFIC LAPILLI TUFF «2b»	Mottled medium to dark greenish-grey fine-grained massive mafic lapilli tuff with dark green rounded fine-grained +/-feldspar phyric +/-amygdaloidal mafic lithic fragments up to 2 cm in diameter.			<1% pyrite, traces Chalcopyrite.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
159.04 TO 175.87	FELDSPAR PHYRIC INTER-MEDIATE TUFF «3ab»	Dark greenish to brownish-grey fine-grained feldspar phyric (sporadic 5-15%, <1-2 mm [average 1 mm] epidotized) weakly foliated and poorly banded to massive mafic tuff. Rare epidotized clasts upto 2 cm are probably lithic fragments. Lower contact gradational. STRUCTURE BANDING/FOLIATION: 159.04 - 160.60 58° CA 160.60 - 166.00 70° CA 166.00 - 169.00 65° CA 169.00 - 175.80 60° CA		Sporadic brown colour could be due to fine-grained biotite.	175.40 - 1 cm wide quartz stringer at 60° CA parallel to foliation. 5-8% @ pyrite and pyrrhotite. Traces Chalcopyrite. Generally <1% pyrite along hairline fracture.	
175.87 TO 250.46	MASSIVE FELDSPAR PHYRIC INTER-MEDIATE TO MAFIC TUFF «3ab-2ab»	Medium greenish-grey fine-grained feldspar phyric (sporadic 5-15% generally <1 mm, epidotic massive to weakly foliated intermediate to mafic tuff. Sporadic (<5%) generally <5 cm epidotic masses could be altered lithic fragments. The unit is probably a sandy volcaniclastic. Contact with the unit above is gradational over 1 m, and is based on a slight shift in colour and a change to a more massive texture. Chemically the two units may be similar. STUCTURE 208.30 - 210.00 Broken core. Fractured subparallel to core axis. 216.50 - 219.00 Broken blocky core. FAULTS: 228.80 - 229.05 Broken core. Minor gouge. 30° CA 230.48 - 230.74 Broken core. Minor gouge. 30° CA		249.90 - 250.15 Groundmass bleached white adjacent quartz stringer.	<1% disseminated and fracture-controlled pyrite. 175.87 - 176.83 4-5% pyrite along hairline fractures parallel to and crosscutting foliation. 205.05 - 205.26 Quartz-calcite flooded shear zone at 20-40° CA. 5% fracture related pyrite. Minor gouge.	
250.46 TO 279.15	MAFIC LAPILLI TUFF «2b»	Mottled medium brownish-grey to greenish-grey to dark greenish-grey fine-grained feldspar phyric (?) (15% sporadic <0.5 mm light-coloured specs) massive intermediate to mafic lapilli tuff. The rock has a vaguely clastic texture with dark			Sporadic <1% disseminated Chalcopyrite and pyrite throughout. 253.60 - 254.00 2% Chalcopyrite in	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		green chloritic patches up to 5 cm in diameter. 251.28 - 251.80 Medium grey feldspar phyric (15-20% euhedral <0.5 mm) intermediate dyke with 20% white +/-1 mm siliceous spherules (amygdules ?). Spherules not prominent in 5 cm chill margins. Sharp lower contact at 60° to core axis. STRUCTURE FAULT: 278.85 - 279.15 Broken, gougy core sheared 20-30° CA.			irregular masses up to 2 mm * 5 mm along hairline fractures.	
279.15 TO 288.34	FELDSPAR-MAFIC PHYRIC SPHERULITIC MAFIC INTRUSIVE «7reg»	Medium greenish-grey fine-grained feldspar (15%, <1 mm euhedral to subhedral) mafic (5-10%, 1-2 mm, stubby chloritic pyroxene?) phyric massive intermediate intrusive with 15-20% +1 mm spherical white masses commonly enveloping phenocrysts. 279.15 - 281.52 Mottled light to dark grey silicified equivalent of unit described above. 15% white quartz-carbonate stringers up to 1 cm wide 50° to subparallel to core axis. Fault along upper contact. 288.34 - Sharp contact at 50° CA.				
288.34 TO 304.30	MAFIC LAPILLI TUFF «2b»	As 250.46 - 279.15. Fault along lower contact. STRUCTURE 296.30 - 297.80 Fractured subparallel to core axis. FAULT: 303.90 - 304.30 Broken blocky core. Sheared 15-40° to core axis. Minor gouge.			Traces (<<1%) disseminated Chalcopyrite 294.14 - 294.50 5% Chalcopyrite in masses up to 5 mm * 1 cm along hairline fractures and calcite stringers, 70° - subparallel to core axis. Zone adjacent a weak shear zone at 30° to core axis.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
304.30 TO 306.66	FELDSPAR +/-MAFIC PHYRIC SPHERULITIC MAFIC INTRUSIVE «7reg»	As 281.52 - 288.34 Sharp lower contact. Broken core. Angle to core axis unclear.				
306.66 TO 313.87	MAFIC-LAPILLI TUFF «2b»	As 250.46 - 279.15 A few distinct feldspar phyric fragments. 307.70- 308.25 Fine-grained spherulitic dyke. 312.80 - 313.40 50% distinct <1-2 cm fine-grained feldspar phyric lithic fragments. STRUCTURE FAULT: 309.00 - 310.50 Blocky broken core. Minor gouge. Shearing at 30° to subparallel to core axis.				
313.87 TO 316.40	SPHERULITIC MAFIC INTRUSIVE (?) «7rg»	Medium greenish to brownish-grey fine-grained aphanitic massive intrusive (?) with sporadic 0-20% <1 mm white spherules. STRUCTURE 314.00 - 314.56 Broken core. Fractured 20° to subparallel to core axis.				
316.40 TO 317.46	MAFIC LAPILLI TUFF «2bbf»	As previous intervals. Some distinct feldspar +/- amygdaloidal clasts up to 2 cm.				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
317.46 TO 318.58	MAFIC TUFF «2a»	Medium to dark green fine-grained massive tuff. Conformable. STRUCTURE BEDDING/CONTACT: 317.46 - 43° CA				
318.58 TO 319.85	INTERBEDDED FELSIC VOLCANIC-LASTIC AND CHERT «4a,5m»	Light greenish-grey fine to medium-grained sandy felsic volcaniclastic interbedded with 30% <1-2 cm light grey chert beds at 30° to core axis. 319.80 - Possible graded bedding and scouring indicate tops down hole. STRUCTURE BEDDING: 30° CA				
319.85 TO 324.50	FELSIC MEDIUM TO COARSE-GRAINED VOLCANIC-LASTIC «4br»	Light greenish-grey medium to coarse-grained massive volcanic sandstone (?) (lapilli tuff?) with 10% subrounded to rounded fine-grained light to medium grey lithic fragments up to 2 cm in diameter.				
324.50 TO 325.60	MAFIC TUFF «2a»	Medium to dark greenish-grey fine-grained chloritic epidotic massive tuff.				
325.60 TO 328.80	FELDSPAR-MAFIC PHYRIC SPHERULITIC MAFIC INTRUSIVE «7reg»	Medium greenish-grey fine-grained feldspar (15-20% light to dark green <1 mm euhedral to anhedral) mafic (5-15%, 1-2 mm, stubby pyroxene?) phyric silicified massive mafic intrusive. Contacts indistinct. Sporadic 0-20% <1 mm white spherules.		Ubiquitous silicification.		

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
328.80 TO 331.14	FELSIC TUFF «4a»	Mottled medium greenish to brownish-grey fine-grained siliceous weakly foliated felsic tuff. STRUCTURE FOLIATION: 20° to core axis.		Moderate ubiquitous silicification.		
331.14 TO 333.80	FELDSPAR (+/-MAFIC) PHYRIC SPHERULITIC MAFIC INTRUSIVE «7reg»	As 325.60 - 328.80				
333.80 TO 340.37	FELDSPAR PHYRIC INTER-MEDIATE LAPILLI TUFF «3b»	Mottled light to medium greenish-grey fine-grained feldspar phyric massive siliceous tuffaceous groundmass with light to medium greenish-grey fine-grained +/-feldspar phyric subangular to rounded lithic fragments up to 2 cm.		Pervasive moderate silicification.		
340.37 TO 344.12	FELDSPAR-MAFIC PHYRIC MAFIC INTRUSIVE «7reg»	Light to medium greenish-grey fine-grained feldspar (15%, <1 mm) mafic (5-10%, 1-2 mm, stubby chloritic pyroxene?) phyric moderately siliceous massive intermediate intrusive.		Pervasive moderate silicification.		
344.12 TO 359.40	FELDSPAR PHYRIC INTER-MEDIATE TUFF «3ab»	Mottled medium to dark greenish-grey fine-grained feldspar phyric (5-20%, <1 mm) massive sporadically silicified mafic tuff. 350.00 - 351.00 20% rounded feldspar phyric lithic fragments up to 5 cm in diameter. 353.00 - 359.40 Less silicified, darker greenish-grey than above. Unclear whether darker colour is due to a more mafic original		Sporadic moderate silicification.		

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		composition or less severe silicification. 358.30 - 359.40 Lapilli tuff? White to medium greenish-grey fine-grained feldspar phyric subrounded to subangular lithic fragments up to 3 cm. Banding (bedding ?) at 50° to core axis. STRUCTURE 358.90 - 359.4 Banded (bedded?) 50° to core axis.				
359.40 TO 362.27	FELDSPAR-MAFIC PHYRIC MAFIC INTRUSIVE «7re»	Medium to light greenish-grey fine-grained feldspar (15% epidotic chloritic subhedral prisms up to 2 mm) mafic (5-10%, 2-4 mm stubby pyroxene) phyric massive mafic intrusive. Indistinct margins.		361.70 - 362.27 Strong silicification. Bleached to a light greenish-grey.		
362.27 TO 370.03	INTER-MEDIATE LAPILLI TUFF «3bb»	Mottled light to dark greenish-grey fine-grained massive siliceous groundmass with 10-50% subangular light grey fine-grained +/-feldspar phyric +/-amygdaloidal lithic fragments up to 5 cm. 369.80 - 370.03 Light to medium grey felsic cherty ash tuff bed. STRUCTURE BEDDING/FOLIATION: 369.80 42° CA		362.27 -370.03 Strong pervasive silicification.	369.67 - 369.80 1-2% fine-grained disseminated Chalcopyrite, traces pyrite.	
370.03 TO 384.60	INTER-MEDIATE TUFF «3a»	Mottled light to dark greenish-grey fine-grained chloritic-epidotic massive to weakly foliated intermediate tuff. STRUCTURE FAULT: 370.56 - 370.60 Weak shear/gouge zone at 80° CA. FOLIATION: 35° CA.		Sporadically weakly silicified. Sporadic moderate epidotization.	370.03 - 371.22 1% disseminated and fracture-related pyrite. Traces of Chalcopyrite. 371.22 - 371.74 1-2% pyrite and 4-5% Chalcopyrite disseminated and along hairline fractures in masses up to 2 mm * 5 mm. 371.74 -372.00 Traces Chalcopyrite. 382.11 - 382.65 5-6% disseminated	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
					pyrite in an epidotized zone. 384.12 - 384.60 5% disseminated medium-grained pyrite.	
384.60 TO 399.10	FELDSPAR PHYRIC INTER-MEDIATE TUFF «3ab»	Mottled light to medium greenish-grey fine-grained feldspar-phyric (sporadic 5-15%, <1 mm) sericitic foliated tuff. 387.00 - 393.70 Quartz phyric (<5%, <1-2mm). Rare quartz phyric lithic fragments up to 2 cm * 10 cm. 393.70 - 397.10 Sheared, pulverized rock. Shearing subparallel to core axis. Minor gouge. 20% quartz stringers. STRUCTURE FOLIATION: 384.60 - 393.70 25-40° CA 393.70 - 397.10 Contorted, generally subparallel CA. 'S' Folds (foliation oriented top left to bottom right). 397.10 - 398.30 25-30° CA 398.30 - 399.10 50-60° CA			1-2% disseminated pyrite.	This unit was originally thought to be felsic, but whole rock data indicate an intermediate composition.
399.10 TO 403.32	CHLORITIC INTER-MEDIATE LAPILLI TUFF «3bl»	Medium to dark greenish-grey chloritic sericitic groundmass with 25% light grey fine-grained siliceous lithic fragments up to 1 cm * 3 cm flattened along the plane of foliation. A few fragments are feldspar phyric. Several angular dark maroonish-grey fragments may be mudstone suggesting a more sedimentary nature to unit. STRUCTURE FOLIATION: 25-35° CA			2% pyrite and traces Chalcopyrite throughout. 399.80 - 400.35 5-7% fine-grained pyrite concentrated along 1-2 mm wide discontinuous bands parallel to foliation. Traces of Chalcopyrite. A few felsic fragments with 15% fine-grained red-brown sphalerite (?).	
403.32 TO 408.00	FELSIC TUFF «4a»	Light to medium greenish-grey fine-grained sericitic +/-chloritic foliated felsic tuff with rare fine-grained aphanitic felsic lithic fragments up to 2 cm and vague feldspar phyric possible lithic fragments up to 2cm * 4 cm				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		flattened in the plane of foliation. The unit could be a lapilli tuff. STRUCTURE FOLIATION: 45-50° CA				
408.00 TO 409.38	QUARTZ PHYRIC FELSIC TUFF «4aa»	Light greenish-grey to white fine-grained quartz phyric (5-10%, 1-3 mm, rounded) sericitic foliated felsic tuff. STRUCTURE FOLIATION: 45° CA.				
409.36 TO 415.42	MAFIC LAPILLI TUFF «2b»	Mottled medium to dark green fine-grained chloritic weakly foliated mafic tuff with 20% epidotic +/-feldspar phyric +/-amygdaloidal lithic fragments up to 1 cm. 413.45 - 414.44 Weakly to strongly magnetic. Hematite on fracture surfaces. Up to 20% fine-grained magnetite across 20 cm. STRUCTURE FOLIATION: 50° CA.				
415.42 TO 415.98	FELSIC TUFF «4a»	Medium greenish-grey fine-grained moderately siliceous massive felsic tuff.				
415.98 TO 418.30	MAFIC TUFF «2a»	Dark greenish-grey fine-grained chloritic calcareous strongly foliated mafic tuff. STRUCTURE FOLIATION: 35-40° CA.				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
418.30 TO 421.86	ARGILLITE ? /CHLORITE-CALCITE STRINGER ZONE «5i,STR.Z.»	Black fine-grained massive argillite (?) (mafic tuff?) cut by 15-20% fine grained chlorite stringers up to 7 cm wide and 20% irregular white calcite lenses and discontinuous stringers up to 2 cm wide 60° to subparallel to core axis. STRUCTURE SHEAR: 418.55 - 20° CA. Minor gouge.			418.3 - 1 cm calcite vein at 30° to core axis with 40% Chalcopyrite in masses up to 1 cm • 2 cm commonly rimmed by pyrite. 1% pyrite and traces of Chalcopyrite throughout unit.	The zone is possibly a mylonite with subsequent fracturing and veining.
421.86 TO 430.50	MAFIC TUFF/ LAPILLI TUFF «2a,2b»	Mottled medium to dark greenish-grey fine-grained chloritic massive mafic tuff with up to 10% indistinct feldspar phyric lithic fragments up to 2 cm. 427.94 - 428.94 Medium greenish-grey fine-grained well foliated felsic tuff. STRUCTURE FAULT: 421.86 -422.80 Sheared, pulverized gougy. Sheared 20° to core axis. VEINS: 422.80 - 426.10 5% widely spaced white quartz, calcite, chlorite veins up to 5 cm wide 60-70° CA. FOLIATION: 427.94 - 430.00 25° CA. FAULT: 430.30 - 430.50 2 cm zone of pulverized rock and gouge at 20° CA.			<1% pyrite and traces Chalcopyrite throughout. Chalcopyrite disseminated and associated with quartz-calcite-chlorite stringers. 423.84 - 426.87 4-5% disseminated pyrite and traces of Chalcopyrite.	This unit was originally thought to be an intermediate tuff, but whole rock data indicate a mafic composition.
430.50 TO 451.52	MAFIC LAPILLI TUFF «2b»	Mottled dark to medium green chloritic massive mafic tuff with epidotic patches up to 5 cm in diameter (probably altered lithic fragments). Rare clear feldspar phyric lithic fragments up to 2 cm. STRUCTURE VEIN:			Sporadic +/-1% disseminated pyrite and traces Chalcopyrite throughout. 435.60 - 441.05 Sporadic 2-4% fine-grained pyrite concentrated in irregular lenses, patches and bands up to 5 mm wide.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		451.03 - 451.52 Chlorite carbonate epidote vein at 25-30° CA. 15% pyrite.			441.05 - 441.40 Chloritic zone (vein?) adjacent shear at 441.40 at 35° to core axis. 10-15% medium-grained pyrite and <1% Chalcopyrite. 441.40 - 447.50 1-2% disseminated pyrite. 447.50 - 450.30 2-3% disseminated pyrite. 450.30 - 451.03 5% disseminated pyrite 451.03 - 451.52 15% fine to medium-grained pyrite and traces Chalcopyrite.	
451.52 TO 457.33	CHLORITIC FELSIC LAPILLI TUFF/ CHLORITE-SULPHIDE STRINGER ZONE «4bl,SULPH. Z.»	Mottled medium to dark green chloritic sericitic weakly foliated sporadically silicified felsic tuff with indistinct amygdaloidal lithic fragments up to 5 cm in diameter. CHLORITIC ZONES/CHLORITE VEINS: 451.03 - 451.52 Fine-grained chlorite matrix with 30% angular epidote-calcite fragments and zones. 25-30° to core axis. 453.13 - 456.20 Predominantly fine-grained chlorite, epidote and sulphides.		Spotty to pervasive chloritic +/-epidotic alteration. Chlorite 'veins' or 'stringers' may be simply intense chlorite alteration.	451.03 - 451.52 15-20% fine to medium grained pyrite. 451.52 - 451.90 15% disseminated pyrite and 1-2% Chalcopyrite in masses up to 2 mm * 4 mm. 451.90 - 453.13 5% sporadic disseminated pyrite and traces Chalcopyrite. 453.13 - 453.80 3-4% each of pyrite and Chalcopyrite, disseminated and in irregular masses up to 2 mm * 4 mm. 453.80 - 454.40 10% each of pyrite and Chalcopyrite. 454.75 - 456.20 10-12% pyrite and 3-5% Chalcopyrite 456.20 - 457.33 7-8% each of pyrite and Chalcopyrite; disseminated, along stringers up to 1 cm and in irregular masses up to 2 cm in diameter.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
457.33 TO 461.80	MAFIC TUFF «2a»	Dark green fine-grained chloritic massive mafic tuff with 10-15% epidotic patches up to 3 cm in diameter, some of which are clearly feldspar phyric lithic fragments.		Pervasive strong chloritic +/-epidotic alteration.	Sporadic 5-7% fine to medium-grained disseminated pyrite and traces to 1% Chalcopyrite. 457.33 - 457.53 Chloritic vein/ alteration zone with 7-8% each of pyrite and Chalcopyrite in masses up to 1 cm * 5 mm.	R.D.S. feels that this unit could be a strongly chloritically altered felsic tuff.
461.80 TO 464.33	FELDSPAR PHYRIC CHLORITIC FELSIC LAPILLI TUFF «4bbl»	Medium to dark greenish-grey fine-grained feldspar phyric (5-15%, <1mm, dark green, vague) chloritic +/-sericitic felsic(?) tuff with distinct amygdaloidal zones (fragments with indistinct margins) up to 5 cm wide. STRUCTURE FOLIATION: 25-30° CA.		Moderate chloritic alteration.		
464.33 TO 476.80	MAFIC LAPILLI TUFF «2b»	Mottled dark to medium green fine-grained chloritic-epidotic massive to weakly foliated mafic tuff with 10% rounded and irregular epidotic patches up to 5 cm wide. Some epidotic patches are clearly amygdaloidal lithic fragments. Sporadically weakly magnetic throughout. 470.00 - 472.50 Moderately to strongly magnetic. 476.27 - 476.80 Sheared mafic dyke. STRUCTURE FOLIATION: 30-35° CA. BANDING/BEDDING: 472.35 - 472.55 22° CA. FAULT: 474.63 - 474.94 Chloritized shear zone at 30° to core axis.			Sporadic 3-6% fine-grained disseminated pyrite. 464.33 - 464.90 10% fine to medium-grained disseminated pyrite and 1-2% Chalcopyrite in a chlorite epidote calcite vein/shear zone at 30° CA. 470.60 - 470.70 Chlorite vein/ chloritized zone at 30° CA with 15% Chalcopyrite and 10% pyrite. 470.90 - 2 cm wide band at 20° CA with 25% medium-grained pyrite 472.35 - 472.55 15% medium-grained pyrite concentrated along bands at 22° CA.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
476.80 TO 600.46	QUARTZ-FELDSPAR PHYRIC FELSIC TUFF «4ac»	Medium to light greenish to blueish-grey fine-grained sericitic moderately foliated groundmass with 5-20% <1 mm stubby anhedral to subhedral light to dark grey feldspar crystals and 10-20% <1-5 mm (average 2-3 mm) rounded grey quartz eyes. Homogeneous. 518.90 - 519.85 20-30% fine-grained <1 cm chlorite-rich bands. 524.35 - 524.90 Medium to dark greenish-grey fine-grained chloritic calcareous foliated mafic dyke. Contacts parallel foliation. 549.38 - 550.35 Dark greenish-grey fine-grained chloritic calcareous, foliated mafic dyke. 3-4% disseminated pyrite. Contacts parallel foliation. 575.00 - 580.20 Gradational contacts. Medium blueish to greenish-grey quartz feldspar phyric chloritic felsic tuff. Much as unit above but darker colour. Slightly less homogeneous texture. Lapilli tuff? 580.95 - 581.58 Dark green fine-grained mafic dyke. Upper contact complicated by 30 cm offset along fracture subparallel to core axis. Lower contact sharp at 70° CA. 583.5 - 584.04 Dark green fine-grained mafic dyke. Contacts sharp at 50° CA. Minor chalcopyrite along upper contact. 584.04 - 585.00 Distinct feldspar phyric lithic fragments up to 2 cm. Lapilli tuff. 584.04 - 600.46 Mottled inhomogeneous texture suggests a lapilli protolith. STRUCTURE FOLIATION: 495.00 - 548.00 25-30° CA 548.00 - 556.00 45° CA		Sporadic weak to moderate silicification. 584.04 - 600.46 Moderate sporadic silicification.	476.80 - 479.15 5% disseminated pyrite and <1% Chalcopyrite most of which occurs within 5 cm of the 476.80 contact. 484.13 - 484.30 6-7% pyrite and <1% Chalcopyrite in host adjacent quartz stringers. 489.60 - 494.92 Sporadic 1-4% (average 2%) disseminated pyrite. 494.92 - 495.45 5% disseminated and fracture-related pyrite, and traces Chalcopyrite. Traces dark blue-black metallic mineral. 495.45 - 508.11 Sporadic 1-2% disseminated pyrite. 508.11 - 511.16 2-4% disseminated pyrite, 1-2% Chalcopyrite adjacent quartz vein. 511.16 - 519.85 <1% fine-grained disseminated pyrite. 519.45 - 519.85 2% fine-grained disseminated pyrite and 1% Chalcopyrite disseminated and in a 1 mm * 3 cm discontinuous band parallel to foliation. 519.45 - 527.93 Generally barren (<<1% pyrite). 527.93 - 528.10 Irregular quartz-chlorite vein with 5% pyrite and 10% Chalcopyrite in irregular masses up to 2 cm * 5 mm. 528.45 - 1 cm * 2 cm mass of Chalcopyrite associated with 1 cm wide irregular discontinuous	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		556.00 - 558.00 30° CA 558.00 - 600.46 40° CA VEINS 485.90 - 486.30 White quartz vein. Irregular contacts approximately 45° CA. 508.45 - 508.85 Quartz-chlorite vein 20° CA. BANDING/FOLIATION: 518.90 - 519.85 30° CA FAULTS: 526.14 - 529.82 Broken core. Minor gouge, pulverized rock. Fractured 20° to subparallel to core axis. 1-2 mm vuggy calcite stringers. Irregular quartz veins up to 10 cm wide. 529.13 - Slickensided shear at 30° to core axis. Projection of slickensides about 15° CA. 545.14 - 545.57 Shearing 15° CA. 558.05 - 558.20 Gouge, pulverized rock at 30° CA. Cuts foliation at about 30°. 580.42 - 580.60 Crushed, pulverized zone at 40° CA. 591.20 - 592.10 Fractured core. Rubble. Fractures at 20° to subparallel to core axis. 593.50 - 594.40 Rubble, minor gouge. Sheared 10° to core axis.			chlorite stringer. 528.10 - 529.82 3-4% disseminated pyrite. 529.82 - 534.00 Generally <1% pyrite. 534.00 - 545.14 1-2% pyrite. 545.14 - 545.57 5-8% disseminated pyrite. 545.43 - 4 mm * 2 cm lens (stringer ?) of chlorite and Chalcopyrite. 545.57 - 549.38 <1% fine-grained disseminated pyrite. 549.38 - 550.35 3-4% fine-grained disseminated pyrite. 550.35 - 553.55 <1% pyrite. 553.55 - 554 .34 2-4% fine-grained disseminated pyrite. 554.02 - 554.17 White-chlorite stringer zone subparallel to crosscutting foliation. 7-8% @ pyrite and Chalcopyrite. 554.60 - 1-2 mm calcite-chlorite Chalcopyrite stringer crosscutting foliation 50° CA. 554.34 - 556.57 1% disseminated pyrite. 556.57 - 560.90 2-4% disseminated pyrite. 556.75 3-5 mm chlorite calcite pyrite Chalcopyrite stringer parallel to foliation. 560.90 - 563.90 1% disseminated	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
					pyrite. Traces Chalcopyrite. 563.90 - 564.40 5% disseminated pyrite. 564.40 - 564.73 7-8% pyrite (disseminated and concentrated along 1-5 mm bands parallel to foliation) and <1% dissemianted Chalcopyrite. 564.73 - 574.94 Sporadic 2-4% disseminated pyrite and traces of Chalcopyrite. 571.00 - 571.30 7-8% pyrite disseminated and concentrated along bands parallel to foliation. 573.57 - 573.95 5% pyrite, as seen above. 574.77 - 574.94 5-7% pyrite, as above. 574.94 - 583.09 Sporadic 1-3% pyrite. 583.09 - 594.82 <1% pyrite. 594.82 - 600.46 2-3% disseminated pyrite and traces of Chalcopyrite concentrated along widely spaced (0.5 - 1 m) 1-3 mm chloritic stringers parallel to foliation. 598.30 - Masses of Chalcopyrite up to 5 mm * 5 mm in a chlorite stringer parallel to foliation.

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
0.00 TO 31.60	OVERBURDEN «overburden»					
31.60 TO 36.00	INTERMEDIATE TUFF «3a»	Medium bluish to greenish-grey fine-grained chloritic sericitic schistose intermediate to felsic tuff with a vague granular texture. Homogeneous. FOLIATION: 45 - 55° CA.				
36.00 TO 38.71	FAULT ZONE «FZ,3a»	Broken core (tuff as above), gouge, sand. Fractures: Parallel to foliation and subparallel to core axis.				
38.71 TO 41.76	NO RECOVERY «FZ»	Triconed. Fault 'squeezing'.				
41.76 TO 42.10	FAULT ZONE «FZ,3a»	Broken core. Intermediate tuff.				
42.10 TO 42.67	INTERMEDIATE TUFF «3a»	As 31.6 - 36.0. Possibly a chloritic felsic tuff. Rare fine-grained (<1 mm) quartz eyes.				
42.67 TO 43.59	FAULT ZONE «FZ,3a»	Broken core (intermediate tuff), gouge, 'sand'.				
43.59 TO 51.82	NO RECOVERY «FZ?»	Triconed. Fault zone (?).				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
51.82 TO 82.09	INTER-MEDIATE TUFF «3a»	Light to dark greenish-grey to blue-grey fine-grained moderately foliated chloritic sericitic tuff. Varied textures: - massive, sandy - thinly bedded - fine-grained schistose - lapilli (minor) 57.17 - 57.5 - Fine-grained thinly bedded sediment or ash tuff. 63.0 - 63.6 - Vague feldspar - phyric lithic fragments up to 1 cm 65.8 - 70 - Feldspar phyric (15%, < 1-2 mm, stubby, subhedral banded intermediate tuff with vague lithic fragments up to 2 cm. 70 - 82.09 - Fine-grained chloritic-sericitic schist. Homogeneous. Poorly banded. FOLIATION/BEDDING: 51.82 - 74.7 - 40 - 55° CA. 74.7 - 76.2 - 30° CA. 76.2 - 82.09 - 40 - 55° CA.			52.90 - 53.00 - 5% fine-grained pyrite concentrated along 1 - 2 mm bands parallel to foliation 53.40 - 53.54 - as above 57.27 - 1 cm wide light purplish-grey bed at 53° CA. 10% fine-grained disseminated pyrite. Exhalite?	
82.09 TO 83.26	MAFIC DYKE? (TUFF?) «7r(2a?)»	Dark green fine-grained massive crystalline aggregate of chlorite and vague feldspar crystals. The unit is cut by 15% irregular discontinuous calcite stringers up to 1 mm wide. 82.86 - 83.26 - Fine-grained medium to dark green thinly banded chloritic, epidotic schist. Chill margin? Sharp lower contact.			82.86 - 83.26 - 3-4% fine-grained disseminated pyrite.	Dyke may occupy a fault.
83.26 TO 86.70	QUARTZ-FELDSPAR PHYRIC FELSIC TUFF (LAPILLI TUFF?) AND CHERT «4ac,5m»	Light bluish to greenish-grey fine-grained sericite schist with 0 - 10% <1 mm rounded quartz eyes, 5% vague feldspar crystals, and vague cherty fragments up to 1 cm. 83.8 - 84.43 - Light blue-grey cherty tuff or chert. Intercalated chert and sericite schist. 83.8 - 83.85 - Chert pebbles up to 1 cm. FOLIATION: 35 - 40° CA. FAULT: 84.8 - 86.7 - Sheared parallel to foliation. Broken core. Gouge.			83.26 - 83.8 - 2-3% fine-grained disseminated pyrite. 83.60 - 2 subrounded fine-grained sulphide (pyrite) fragments or possibly deformed coarse-grained crystals up to 1 cm in diameter. 83.8 - 84.43 - 2-3% each of pyrite and pyrrhotite in irregular masses up to 2 mm wide along fractures	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
86.70 TO 93.60	MAFIC TUFF «2a»	Medium to dark greenish-grey fine-grained thinly banded foliated chloritic mafic tuff or possibly a mafic dyke. 15% 1-2 mm irregular bands and lenses. FOLIATION: 50 - 55° CA. FAULT ZONES: 88.09 - 89.8 - Shearing 65° to subparallel to core axis. Broken core, gouge, pulverized rock. 95.82 - 95.96 - Gouge zone. 60° CA.				
93.60 TO 102.05	QUARTZ PHYRIC FELSIC TUFF «4aa»	Light greenish to bluish-grey fine to medium-grained sericitic schist with 15% <1 - 5 mm rounded quartz eyes. FOLIATION: 35 - 40° CA. FAULT: 95.82 - 95.96 - gouge zone. 60° CA.				
102.05 TO 114.10	MAFIC TUFF TO TUFFACEOUS SEDIMENT AND CHERT «2ak,2qk, 5mk»	Medium grey to brownish-grey very fine-grained thinly banded/bedded sericitic tuff or tuffaceous sediment with 5% blue-grey cherty beds up to 1 cm thick. 102.5 - 105 - Blue-grey cherty pebbles or possibly chert fragments from boudinaged chert beds. 108.8 - 109.4 - Coarse-grained clastic with flattened chert pebbles up to 1 cm long. FOLIATION/BEDDING: 40 - 45° CA. 102.05 - 104 - Contorted bedding/foliation.			102.05 - 102.2 - 5-8% fine-grained pyrite in 1 - 2 mm bands or beds contorted along with foliation.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
114.10 TO 115.70	INTERBEDDED INTER-MEDIATE TUFFACEOUS SEDIMENT AND ARGILLITE «3qk,5ik»	Interbedded (<1 mm - 1 cm) medium grey fine-grained sericitic tuffaceous (?) sediment and black argillaceous sediment. FOLIATION/BEDDING: 35 - 40° CA.				
115.70 TO 116.60	INTERBEDDED FELSIC TO INTER-MEDIATE TUFFACEOUS SEDIMENT AND CHERT «4qk-3qk, 5mk»	Medium to light grey fine-grained sericitic foliated tuffaceous sediment and 15-20% light blue-grey cherty beds up to 1.5 cm wide. FOLIATION/BEDDING: 50° CA.			3 - 5% fine-grained pyrite concentrated along 1-2 mm bands parallel to foliation.	
116.60 TO 119.70	INTER-MEDIATE TUFF «3ak»	Medium brownish to greenish-grey fine-grained thinly banded/bedded intermediate tuff or tuffaceous sediment. FOLIATION/BEDDING: 40 - 50° CA. FAULT: 119.18 - 5 cm fault gouge parallel to foliation.				
119.70 TO 119.90	FAULT «FZ»	Gouge and pulverized rock. Shearing 50 - 60° CA.				
119.90 TO 121.31	INTERBEDDED ARGILLITE AND INTER-MEDIATE TUFFACEOUS SEDIMENT «5i,3qk»	Thinly (1 mm - 1 cm) interbedded medium greenish-grey fine-grained sediment and black argillite. FOLIATION/BEDDING: 45 - 50°				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
121.31 TO 121.62	FAULT ZONE «FZ»	Gouge and pulverized rock. Shearing parallel to foliation at 45° CA.				
121.62 TO 125.80	MAFIC TUFF «2a»	Medium to dark greenish-grey fine-grained sericitic chloritic schistose mafic tuff. FOLIATION: 45 - 50° CA.				
125.80 TO 149.28	CHLORITIC FELSIC TUFF «4akl»	Medium greenish-grey fine-grained chloritic sericitic foliated felsic tuff. Weak banding/ bedding parallel to foliation. Abundant 5-10 cm crush/gouge zones parallel to foliation. FOLIATION/BEDDING: 50 - 60° CA. 143.3 - 'z' type minor fold (foliation bottom left to top right)				
149.28 TO 153.70	QUARTZ PHYRIC FELSIC TUFF «4aa»	Medium greenish to bluish-grey fine-grained sericitic schist with 15% 1-3 mm rounded grey quartz eyes. FOLIATION: 45 - 50° CA.				
153.70 TO 168.70	QUARTZ-FELDSPAR PHYRIC CHLORITIC FELSIC TUFF «4acl»	Medium to light greenish-grey fine-grained quartz (15%, 1-3 mm) - feldspar (15 - 20%, vague, stubby </=2 mm) phyric sericitic chloritic foliated felsi tuff. FOLIATION: 50 - 60° CA. SHEAR: 161.3 - 161.85 - shear zone 15 - 20° CA. Minor gouge.				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
168.70 TO 170.80	FELDSPAR PHYRIC MAFIC DYKE(?) (TUFF?) «7rb(2a?)»	Medium to dark green fine-grained foliated chloritic groundmass with 15% very fine-grained stubby subhedral feldspar crystals - 15-20% irregular discontinuous bands and lenses of blue-grey calcite. Could be an altered dyke or a mafic tuff. FOLIATION: 65° CA.		Pervasive patchy carbonate alteration.		
170.80 TO 173.80	QUARTZ-FELDSPAR PHYRIC CHLORITIC FELSIC TUFF «4acl»	As 153.7 - 168.7 171.82 - 172.2 - Quartz-chlorite vein. Barren. FOLIATION/BANDING: 55 - 60° CA.				
173.80 TO 176.65	FELDSPAR PHYRIC MAFIC DYKE? (TUFF?) «7rb(2a?)»	As 168.7 - 170.8. FOLIATION: 55° CA.				
176.65 TO 180.15	QUARTZ-FELDSPAR PHYRIC CHLORITIC FELSIC TUFF «4acl»	As 153.7 - 168.7. 176.75 - 177.1 - Fine-grained cherty interval.			176.75 - 177.1 - 3-5% fine-grained disseminated pyrite.	
180.15 TO 220.70	CHLORITIC FELSIC TUFF (+/-QUARTZ PHYRIC) «4a(+/-a)l»	Medium to light greenish-grey fine-grained sporadically quartz phyric sericite-chlorite foliated felsic tuff. Indistinct contact with unit above. FOLIATION: 180.15 - 185.02 - 55-70° CA. 185.02 - 191 - contorted 55° - subparallel CA 190.4 - 'z' fold 190.5 - 's' fold 191 - 197.9 - 35-55° (Av - 45°) 197.9 - 204.1 - 60° - subparallel CA. Contorted. Fold axis?			181.57 - 1 cm x 5 cm mass of coarse-	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		204.1 - 208.1 - 40-50° CA. 208.1 - 219.07 - subparallel CA. Contorted. 219.07 - 220.7 - 50° CA. FAULTS: 185.02 - 186.6 - sheared, pulverized rock. Gouge. Shearing subparallel to 45° to core axis. 188 - 191 - Broken core. Sheared parallel to foliation. 40° - subparallel to core axis. 1-2 cm gouge zones. Quartz veins to 10 cm. 211.07 - 213.06 - Broken core. Gouge zones up to 10 cm wide.			grained pyrite associated with 5 cm wide quartz vein. 182.15 - 182.2 - 20% fine-grained pyrite concentrated along foliation - parallel bands up to 5 mm wide. 189.6 - 189.65 - 7% fine-grained disseminated pyrite adjacent a 3 cm quartz vein. 207.27 - 220.7 - sporadic 1-4% pyrite, disseminated, along 1-2 mm bands and as irregular masses along fractures parallel to foliation. Trace CHALCOPYRITE at 215.50.	
220.70 TO 225.50	MAFIC DYKE? (TUFF?) «7r(2a?)»	As 168.7 - 170.8. 15% quartz veins up to 40 cm wide. FOLIATION: 30° CA.				
225.50 TO 240.15	QUARTZ PHYRIC FELSIC TUFF «4aa»	Medium to light greenish-grey sericite +/- chlorite schist with sporadic 5-15% 1-5 mm rounded quartz eyes. FOLIATION: 25 - 35° CA. FAULTS: 227.6 - 228.7 - Sheared 10° to subparallel to core axis. Gouge at 228.6 - 228.9 (+/-) 229.92 - 229.99 - Gouge zone at 80° CA. 229.92 - 233 - Broken core. Shearing predominantly along foliation. 235 - 240.15 - Broken, 'blocky' core.			225.5 - 240.15 - 2-3% fine-grained disseminated pyrite. Traces CHALCOPYRITE. 232.1 - 232.2 - 1.5 cm wide band parallel to foliation with pinkish-brown colour and: 15% fine-grained pyrite 2% CHALCOPYRITE 2% fine-grained dark brown to black metallic mineral. SPHALERITE?	
240.15 TO 277.03	FELDSPAR GLOMERO-PHYRIC GABBRO «7rb»	240.15 - 264.5 - Dark greenish-grey fine-grained equigranular crystalline aggregate of feldspar and chlorite with 20% <1 - 5 mm clusters of white stubby feldspar phenocrysts. Broken core along upper contact. 264.5 - 277.03 - Fine-grained gabbro with few phenocrysts. Chill margin. 10% quartz veins up to 20 cm wide at 60 - 70° CA. Broken, blocky core. Broken core along lower contact. Angle				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
		to core axis unclear. Minor gouge. Sheared 30° to subparallel CA.				
277.03 TO 305.40	QUARTZ-FELDSPAR PHYRIC RHYOLITE «4ac(4dc?)»	Light to medium blue-grey fine-grained sericitic groundmass with 10-15% <1 - 5 mm rounded quartz eyes and 10-15% vague stubby <1 mm feldspar phenocrysts. The rock is quite homogeneous and could be a flow or tuff. (Intrusive?) 305.4 - Mottled texture. Possible lithic fragments up to 2 cm in diameter. FOLIATION: 15 - 20° CA. FAULTS: 282.9 - 283.0 - 3 cm gouge zone at 30° CA, crosscutting foliation at 45°. 304.8 - 305.4 - sheared 15° CA. 309.07 - 309.4 - Crushed, gougy zone. 30° CA.		280 - 343.5 - Weak pervasive silicification.	Fine-grained disseminated and fracture controlled pyrite and CHALCOPYRITE (<1% of each) throughout with local concentrations. 279.52 - 279.91 - 5% CHALCOPYRITE in irregular masses up to 0.5 cm x 3cm along fractures parallel to foliation and at 90° to CA. 282.10 - 282.55 - 2-3% pyrite and 1-2% CHALCOPYRITE in masses up to 3 mm x 1 cm along a quartz stringer and a 1 cm band parallel to foliation. 284.88 - 5 mm - 1 cm wide calcite stringer at 30° CA with 25% pyrite, 5% CHALCOPYRITE, and traces of GALENA?	
305.40 TO 343.50	QUARTZ-FELDSPAR PHYRIC RHYOLITE LAPILLI TUFF «4bc»	Medium blue-grey weakly siliceous sericitic weakly foliated quartz (10 - 15%, 2-6 mm, rounded) - feldspar (10 - 15%, </= 1mm stubby, white, vague) phyric groundmass with 20 - 25% rounded light grey fine-grained feldspar phyric lithic fragments up to 1 cm x 2 cm. Massive. Homogeneous. 322.3 - 325 - 15% white quartz stringers up to 3 cm wide at 10° CA. FOLIATION: 15 - 20° CA. FAULT: 334.1 - 334.2 - 5 cm gouge zone at 20° CA. 342.2 - 342.9 - Crushed zone.		Pervasive weak to moderate silicification.	Traces sporadically distributed CHALCOPYRITE. Some pyrite along fractures at 70° CA associated with calcite and chlorite stringers.	
343.50 TO 345.70	MAFIC DYKE «7r»	Dark greenish-grey very fine-grained aphanitic mafic dyke with interval banding at 40° CA.			5% fine-grained disseminated and fracture-related pyrite.	

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
345.70 TO 369.07	QUARTZ-FELDSPAR PHYRIC RHYOLITE TUFF/ LAPILLI TUFF «4ac,4bc»	345.7 - 357 - As 305.4 - 343.5 with fewer obvious lithic fragments. 357 - 369.0 - Mottled texture. Probably lapilli tuff. FOLIATION: Weak. 20° CA. FAULTS: Narrow gouge, shear and crush zones at 30-70° CA. 350.2 - 350.45 352.15 - 352.25 352.95 - 353.0 354.5 - 354.7 355.6 - 355.7 356.1 - 357.3 363.9 - 364.6 364.8 - 364.9			Sporadic disseminated pyrite. <1% overall. 350 - 352.5 - 2-4% disseminated pyrite.	
369.07 TO 388.68	CHLORITIC QUARTZ-FELDSPAR PORPHYRY INTER-MEDIATE DYKE «8rc»	Dark green fine-grained hard weakly chloritic intermediate to felsic groundmass hosting 5-10% rounded oval quartz eyes (1-5 mm) and 10-15% 1-2 mm epidotized subhedral feldspar phenocrysts. 369.07 - 376 - Chill margin. Foliated 20° CA. 376 - Feldspar phenocrysts more obvious and larger than above. Massive. Non-foliated. The entire unit is cut by 5% <1 cm - 30 cm quartz veins 10° - 70° CA. Upper contact: Broken core. Possibly parallel to foliation at 25° CA. 386 - 388.68 - Chill margin. Feldspar phenocrysts not obvious. Lower contact at 30° parallel to foliation. STRUCTURE: 375.0 - 375.33 - white quartz vein 45° CA. Hematitic coated fractures on downhole side. 384.85 - 385.2 - Quartz vein at 90° CA. 386.95 - 387.96 - 20% quartz veins up to 10 cm wide at 70 - 90° CA.			369.07 - 371 - 3% disseminated pyrite. 373.52 - 5 mm quartz stringer with 10% CHALCOPYRITE. 374.17 - 374.25 - 15% medium-grained pyrite in a chloritic zone. 378 - 379.5 - 3-5% fine-grained disseminated pyrite. 379.6 - 379.7 - 3-4 cm quartz-carbonate vein at 35° CA with 5% CHALCOPYRITE. 386.90 - 387.71 - sporadic <1% CHALCOPYRITE in masses up to 2 mm x 5 mm in quartz stringers.	Whole rock data indicate an intermediate composition.

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
388.68 TO 403.00	QUARTZ-FELDSPAR PHYRIC RHYOLITE TUFF «4ac»	Medium blue-grey fine-grained sericitic foliated groundmass hosting 10-15% <1 - 5 mm rounded quartz eyes and 10% (?) vague stubby <1 mm feldspar crystal fragments. Some vague lighter-coloured patches may be lithic fragments. FOLIATION: 388.75 - 399.5 - 40-50° CA. 399.5 - 403 - 60° CA. Poorly foliated. FAULT: 392.8 - 393.7 - Gouge. Crushed zone parallel to foliation.		399.5 - 403 - Weakly silicious.		
403.00 TO 407.41	CHLORITIC FELDSPAR PHYRIC MAFIC TO INTER-MEDIATE DYKE «7rb,8rb»	Dark green to medium brownish-grey fine-grained feldspar phyric (sporadic 0-10%, vague, dark green to light grey, <1 mm) mafic to intermediate dyke. 5-10% 1-3 mm wide irregular discontinuous calcite stringers parallel to foliation. 406.6 - 407.2 - Rounded epidotized fragments.		Sporadic strong chloritization.	7-8% fine to medium-grained disseminated and fracture related pyrite. 406.95 - 407.02 - 5% disseminated CHALCOPYRITE.	
407.41 TO 408.90	QUARTZ-FELDSPAR PHYRIC RHYOLITE «4ac»	As above dyke. Could be a xenolith, lower contact parallels core axis 408.4 - 408.90.				
408.90 TO 410.70	CHLORITIC MAFIC DYKE «7r»	Dark green fine-grained aggregate of chlorite feldspar and calcite. Homogeneous. Weakly foliated. Sharp irregular lower contact, roughly 30° CA, crosscutting foliation. FOLIATION: 30° CA.				
410.70 TO 416.57	QUARTZ-FELDSPAR PHYRIC RHYOLITE FLOW OR TUFF	Medium blue-grey fine-grained sericitic foliated groundmass hosting 10% 1-2 mm rounded quartz eyes and 10-15% </=1 mm stubby subhedral white feldspar phenocrysts. Homogeneous. FOLIATION:				

FROM TO	ROCK TYPE	TEXTURE AND STRUCTURE	ANGLE TO CA	ALTERATION	MINERALIZATION	REMARKS
	«4dc(4ac?)»	20° to subparallel CA.				
416.57 TO 417.68	CHLORITIC MAFIC DYKE «7r»	Dark green fine-grained chloritic dyke with 20% irregular lenses of white calcite. Upper contact parallel to foliation at 35° CA. Lower contact subparallel CA. FOLIATION: 35 - 40° CA.				
417.68 TO 428.04	QUARTZ-FELDSPAR PHYRIC RHYOLITE LAPILLI(?) TUFF «4ac(4bc?)»	Mottled medium to light blue-grey fine-grained moderately foliated sericitic +/- chloritic groundmass hosting 10% 1-5 mm rounded quartz eyes and 15% vague dark green </=1 mm feldspar crystal fragments. Light grey patches could be lithic fragments up to 1 cm in diameter. 417.96 - 418.05 - chloritic calcareous mafic dyke. 420.66 - 420.80 - as above. 50° CA parallel to foliation. FOLIATION: 35 - 50° CA. FAULT: 425.98 - 427.3 - Broken core. Gouge. Sheared 20° to subparallel to core axis.				
428.04 TO 428.86	CHLORITIC MAFIC DYKE «7r»	Dark green fine-grained chloritic mafic dyke. 10 cm interval quartz-feldspar phyric. LOWER CONTACT: Sharp at 35° CA.				
428.86 TO 445.32	QUARTZ-FELDSPAR PHYRIC RHYOLITE FLOW OR TUFF «4dc(4ac?)»	Mottled medium to light blue-grey fine-grained weakly siliceous sericitic poorly foliated (50 - 60° CA) groundmass hosting 5% <1 - 2 mm rounded quartz eyes and 15 - 20% <1 - 2 mm chloritic feldspar phenocrysts. The rock is quite homogeneous. In some places the feldspar phenocrysts are evenly distributed suggesting a flow protolith. FOLIATION: 50 - 60° CA.

APPENDIX E

Statement of Costs

STATEMENT OF COSTS

Drilling Costs			
Burwash Contract Drilling			$ 98,377.46
Site Reclamation			
Ellison Excavating			$ 1,920.00
Analytical			
Bondar Clegg			$ 3,944.00
Cominco			$ 1,113.00
Personnel			
R. Stewart	Project Geologist	4 days	$ 1,000.00
G. Allen	Geologist	18 days	$ 3,600.00
R. Barrick	Technician	13 days	$ 1,170.00
B. Cochrane	Technician	3 days	$ 330.00
Vehicle			
3/4 ton truck	25 days		$ 1,125.00
Office Overhead			
Rent, utilities, report costs			$ 2,420.54
TOTAL:			**$115,000.00**

APPENDIX F

Statements of Qualifications

STATEMENT OF QUALIFICATIONS

I, Robert D. Stewart, an employee of Falconbridge Limited, with offices at 202 - 856 Homer Street, Vancouver, British Columbia, V6B 2W2, do hereby certify that:

1. I hold a B.Sc. (Hon.) in Geology from Mount Allison University, Sackville, New Brunswick, having graduated in 1975 and a M.Sc. in Geology from Carleton University, having graduated in 1979.

2. I reside at 2621 Bruce Road, R.R. #7, Duncan, B.C., V9L 4W4.

3. I have been continuously engaged as a geologist since 1979 with Newmont Exploration of Canada Limited (1979-1980) and Texasgulf/Kidd Creek Mines/Falconbridge (1980 to present).

4. I am a Fellow in the Geological Association of Canada.

5. I am the project geologist for the Chemainus Project and that the work was completed under my direction.

Dated at Chemainus, B.C.

Robert Stewart
Senior Project Geologist

STATEMENT OF QUALIFICATIONS

I, Gordon J. Allen, an employee of Falconbridge Limited, with offices at 202 - 856 Homer Street, Vancouver, British Columbia, V6B 2W2, do hereby certify that:

1. I hold a B.Sc. (Hon.) in Geology from the University Of British Columbia, having graduated in 1975.

2. I reside at 2475 Jackson Valley Road, R.R.1, Duncan, B.C., V9L 1M3.

3. I have practised as a geologist in mineral exploration for fifteen years.

4. I am a member in good standing of the Association of Professional Engineers, Geologists and Geophysicists of Alberta.

Gordon J. Allen

Gordon J. Allen, P. Geol.

Chemainus, B.C.

LEGEND

MAJOR ROCK UNITS

11	Nanaimo Sediments
10	Late Mafic Intrusions
9	Felsic Intrusive Rocks
8	Intermediate Intrusive Rocks
7	Mafic Intrusive Rocks
6	Ultramafic Intrusive Rocks
5	Sedimentary Rocks
4	Felsic Volcanic Rocks
3	Intermediate Volcanic Rocks
2	Mafic Volcanic Rocks
1	Ultramafic Volcanic Rocks

ROCK UNIT LETTER QUALIFIERS

The second letter indicates the type of rock; if omitted a dash should be inserted if a third letter is used.

a	Tuff	k	Wacke
b	Lapilli Tuff	l	Conglomerate
c	Tuff Breccia	m	Chert
d	Massive Flow	n	Iron Formation
e	Pillowed Flow	o	Limestone
f	Flow Breccia	p	Exhalite/Sulphides
g	Pillow Breccia	q	Tuffaceous Sediments
h	Intrusive	r	Fine Grained
i	Argillite	s	Medium Grained
j	Siltstone	t	Coarse Grained
		u	Chlorite Schist

The third and fourth letters are placed in alphabetical order; they are optional and further define the rock.

a	Quartz Phyric	j	Melanocratic
b	Feldspar Phyric	k	Bedded
c	Quartz-Felspar Phyric	l	Chloritic
d	Mafic Phyric	m	Graphitic
e	Mafic-Feldspar Phyric	n	Calcareous
f	Amygdaloidal	o	Argillaceous
g	Spherulitic	p	Siliceous/Cherty
h	Variolitic	q	Sheared
i	Leucocratic	r	Massive
		s	Lithic

SYMBOLS

- Small bedrock outcrop
- Area of bedrock outcrop
- Bedding, top unknown; (inclined, vertical)
- Bedding, top(arrow); (inclined, overturned)
- Schistosity; (inclined, vertical)
- Shear zone, fault; (inclined, vertical)
- Geological boundary, observed
- Geological boundary, position interpreted
- Geological boundary, fault contact
- Drag fold with plunge (S-fold, Z-fold)
- Mineral/stretch lineation
- Anticline, syncline with plunge
- Mineral occurrence
- Adit
- A – A' Location of cross-section
- Base metal mineralized zone

ABBREVIATIONS

py	pyrite
po	pyrrhotite
sph	sphalerite
jasp	jasper
cpy	chalcopyrite
mt	magnetite
ep	epidotized
carb	carbonatized
sil	silicified
ser	sericitized
chl	chloritized
hem	hematitized
Fe-carb	iron carbonate alteration
QV	quartz vein
mag	magnetic
mag'c	magnetic

MAJOR ROCK UNITS

- 11 Nanaimo Group Sediments
- 10 Late Mafic Intrusions
- 9 Felsic Intrusions
- 8 Intermediate Intrusions
- 7 Mafic Intrusions
- 6 Ultramafic Intrusions
- 5 Sediments
- 4 Felsic Volcanics
- 3 Intermediate Volcanics
- 2 Mafic Volcanics
- 1 Ultramafic Volcanics

ROCK UNIT LETTER QUALIFIERS

The second letter indicates the type of rock; if omitted a dash should be inserted if a third letter is used.

- A Tuff
- B Lapilli Tuff
- C Tuff Breccia
- D Massive Flow
- E Pillowed Flow
- F Flow Breccia
- G Pillow Breccia
- H Intrusive
- I Argillite
- J Siltstone
- K Wacke
- L Conglomerate
- M Chert
- N Iron Formation
- O Limestone
- P Exhalite/Sulphides
- Q Tuffaceous Sediments
- R Fine Grained
- S Medium Grained
- T Coarse Grained

The third and fourth letters are placed in alphabetical order; they are optional and further define the rock.

- A Quartz Phyric
- B Feldspar Phyric
- C Quartz-Felspar Phyric
- D Mafic Phyric
- E Mafic-Feldspar Phyric
- F Amygdaloidal
- G Spherulitic
- H Variolitic
- I Leucocratic
- J Melanocratic
- K Bedded
- L Chloritic
- M Graphitic
- N Calcareous
- O Argillaceous
- P Siliceous/Cherty
- Q Sheared
- R Massive
- S Lithic

SYMBOLS

- Overburden
