## **I. SUMMARY**

Tchentlo Lake property is an east-west trending, 7 km by 13 km claim block located 190 km northwest of Prince George, B.C., and 40 km due west of the Mt. Milligan deposit. The property was initially staked in Dec., 1988, and expanded in 1989 and 1990. It was acquired for its potential to host Mt. Milligan style alkaline porphyry Au-Cu deposits.

Tchentlo Lake is situated at the southwestern tip of the Hogem Batholith, and overlies Takla Group volcanic rocks which are intruded by favourable coeval Hogem Batholith Basic Suite rocks (mainly monzonite and monzodiorite).

In the late 1960's and early 1970's approximately 75% of the area now overlain by the property was tested by wide spaced Cu soil geochemical sampling by Borondra/West Coast. The sampling defined large areas of  $\geq 100$  ppm Cu values (many values  $\geq 500$  ppm Cu) in numerous locations. Gold was not analyzed for. Subsequent rock geochemical sampling in 1988 by U. Schmidt established the presence of relatively weak Au values (up to 670 ppb Au) associated with Cu values of 2-3% in narrow shear zones near the western property boundary. In 1989 Westmin conducted an airborne geophysical survey over the property (Magnetics, HEM, VLF), which defined a number of very interesting magnetics and weight percent magnetite anomalies, that possibly relate to alkaline porphyry Au-Cu mineralization. In addition, four pronounced parallel, 300 m - 800 m long HEM conductors were defined in the southwestern corner of the property.

Eight follow-up soil geochemical grids were established on the property in 1990 (in addition to eight grids in 1989) to test: (1) areas of  $\geq 100$  ppm Cu soil geochemical response defined by Borondra/West Coast; and (2) areas of anomalous geophysical response defined by the 1989 survey. Samples were analyzed for Au, Ag, Cu, Zn, Co, Fe, Mn, Mo, Ni, Pb. Several Cu±Au anomalies were identified. The highest rated anomaly measures 400 x 600 metres and is open. It warrants backhoe trenching in 1991. Stream silt anomalies were identified on Wolverine and Lone Wolf Creeks.

Two backhoe trenches were dug across the four strong HEM conductors in the southwest corner of the property. One trench exposed pyritic and carbonaceous black argillite, which appears to explain the geophysical response, but conductive rocks were not exposed in the second trench.

## **II. INTRODUCTION**

### **A. Location, Access, Topography**

The Tchentlo Lake property is located in the Nation Lakes area, approximately 190 km northwest of Prince George, B.C., and 40 km due west of Mt. Milligan. It lies immediately south of the Tchentlo Lake/Chuchi Lake junction, (figures 1 and 3).

Vehicle access is via an all-weather gravel road extending north from Fort St. James for approx. 100 kms, then by logging roads west for approximately 25 kms to the

north shore of Chuchi Lake, and finally, by boat or barge for 2 kms to the property boundary. A system of jeep roads were established on the property in the 1960's. Alternatively, access is via float plane from Vanderhoof (150 kms) or Ft. St. James (90 kms).

Topography is usually gently rolling but in places is moderately steep. Elevations range from 3000' (914m) to 5000' (1524m). The property is densely tree covered (fir, spruce and alder), and outcrop is poor to good locally. Glacial till covers most of the property. It varies from 1 m to a few tens of meters thick, and is estimated to average 5-25 m thick. Low areas are commonly swampy.

## **B. Claims**

Tchentlo Lake property is comprised of 22 contiguous four-post claim blocks (Lake-1 to Lake-22) totalling 341 units, shown in Figure 4, which are wholly owned by Westmin Resources Limited.

<u>Claim Name</u>	<u>Record Number</u>	<u>Units</u>	<u>Expiry Date</u>
Lake-1	10034	15	Dec. 16, 1994
Lake-2	10035	8	Dec. 15, 1994

### C. Option Agreement

Byron Resources Inc., a Vancouver, B.C. registered company listed on the Vancouver Stock Exchange, acquired an option from Westmin Mines Limited, on July 14, 1989, to earn a 45% interest in the Tchentlo Lake and Kwanika Creek properties. Byron is to make the following cumulative expenditures by Dec. 31, 1993:

<u>Date</u>	<u>Amount</u>	<u>Cumulative Amount</u>
Dec. 31, 1989	\$150,000	\$150,000
Dec. 31, 1990	250,000	400,000
Dec. 31, 1991	250,000	650,000
Dec. 31, 1992	250,000	900,000
Dec. 31, 1993	300,000	1,200,000

In addition, on the closing date of the agreement Byron issued Westmin 200,000 common shares without par value.

### D. History

- 1961 Government regional airborne magnetics survey (flight lines spaced 0.5 miles apart).
- 1966-1972 West Coast Mining and Exploration (Jemmet and Veerman, 1966; Mouritsen, 1967; Veerman, 1968); and Borondra Exploration Corporation Ltd. (Goudie and Hallof, 1970; McFall and Sawyer, 1971). Assessment reports indicate extensive exploration for porphyry Cu deposits in an area covering 75% of the present Tchentlo Lake property. Work undertaken consisted of geological mapping, geochemical surveys (Cu soil and stream sediment), and geophysical surveys (VLF-EM, magnetics, and a limited amount of I.P.)
- 1983 Regional Stream Sediment and Water Geochemical Survey, Joint Canada/British Columbia Program.
- 1989 Westmin Mines staked LAKE claims; Aerodat conducted detailed airborne Mag-VLF-HEM survey, grid soil sampling by Westmin.

### E. Exploration Target

Primary exploration target is large tonnage low grade alkaline porphyry Au-Cu deposits similar to the Mt. Milligan deposit.

Secondary exploration target is moderate tonnage high grade Au-Cu-Zn sulphide deposits replacing fracture zones adjacent to or cross-cutting Au-Cu porphyry mineralization.

### III. REGIONAL GEOLOGY

Tchentlo Lake is situated within the central portion of the Quesnel Trough, a 30 to 60 km wide by 1300+ km long depositional basin, which extends northwestward from the southern B.C. border (49th parallel) to the Stikine River in northern B.C. (Figures 2 and 3). The boundaries of the trough are regional faults in some areas. The Trough contains an assemblage of alkalic and calc-alkalic volcanic and sedimentary rocks of Upper Triassic to Jurassic age (Rosstand, Nicola, Takla and Stuhini Groups), which are intruded by comagmatic plutons. The potential for porphyry Au-Cu deposits in this environment is considered quite good, especially in areas of well developed structural control.

### IV. PROPERTY GEOLOGY

Tchentlo Lake property is mainly covered by thin to thick glacial till, which ranges from well drained to boggy. Outcrop or subcrop exposure averages about 3-5%. The best exposures are in the western, southwestern and northeastern corners of the property. The underlying geology is mapped and/or interpreted to consist of 20% alkaline (to calc-alkaline) Takla Group volcanic and sedimentary rocks and 80% comagmatic intrusive rocks of the Hogem Batholith. The Hogem rocks appear comprised of relatively large elongate shaped plutons in the west, and a mixture of small to medium sized elongate shaped plutons in the east. The plutons are clearly aligned in a northwest direction, parallel to regional scale structure in the area. The property is also cut by strong north and northeast trending structures which appear to control alteration/mineralization but largely post-date initial plutonism. Weak to strong propylitic alteration is common on the property. Potassic and pyrite rich phyllic alteration also occurs in the easternmost portion of the property.

### V. GEOCHEMISTRY

#### A. Stream Sediment Geochemistry

Detailed stream sediment sampling was undertaken on several creeks. Considerable effort was expended to collect high quality silt samples, consisting wherever possible, of fine silt containing a minor amount of grit, and representative of several depositional cycles. The number of silt samples reported herein is 38.

Samples were analyzed by Chemex Labs of Vancouver, B.C. for Au (fire assay with A.A. finish), and for an additional 10 elements (As, Ag, Co, Cu, Fe, Mn, Mo, Ni, Pb, Zn) by the ICP-AES method. Refer to Appendix A. Results for gold were plotted on figures 5a and 6a, and for copper on figures 5b and 6b. Values for the remaining elements are available in Appendix B.

Each sample was analyzed twice for gold for a total analyzed weight of 60 grams (two 30 gram samples), whenever sufficient sample weight was available. The duplicate analyses were undertaken to deal with the nugget effect of gold. The quality of data and the ability to confidently outline areas of anomalous gold on a map is vastly improved using a weighted average value from two 30 gram analyses, as opposed to

using a single value from a 30 gram sample. An additional advantage of running two or more analyses is that the variability of results for an anomalous sample gives an indication of the amount and grain size of gold particles in the sample, and hence an estimation of the reliability of the anomalous value. When the gold grains are very small and abundant the results are often more uniform and representative.

## Results

Anomaly thresholds were established by visual inspection of the silt and soil copper and gold values and set at 20 ppb gold and 100 ppm copper for both silt and soil data. Gold and copper values are plotted for Lone Wolf Creek, Wolverine Creek (plus its tributary White Moose Creek) and an unnamed stream on LAKE 21 claim.

Wolverine Creek results include two isolated very anomalous gold values (446 ppb, 260 ppb) in the main drainage. Nearby tributaries produced background gold values. The significance of these two anomalies should be investigated by small soil grids. Highly anomalous gold (800 ppb) and copper values (400 pm) at adjacent sites on White Moose Creek appear to correlate with a copper soil anomaly on the TL-12 grid (discussed below). If valid, this correlation is interesting because there are very few anomalous gold values in the soil anomaly.

Silts on Lone Wolf Creek contain background values in copper and gold except for a gold anomaly near the headwater. This anomaly warrants follow-up. The few duplicate analyses of Lone Wolf Creek samples is indicative of low silt deposition in the stream.

The stream on LAKE 21 yielded background values except for an isolated gold anomaly of unknown significance.

## **B. Soil Geochemistry**

Grid soil geochemical sampling was undertaken on eight grids in 1990 (TL-9 extension, TL-11 to 17) in addition to soil geochemical grids established in 1989 (TL-1, 3, 5 to 10). Soil grid areas were selected on the basis of airborne geophysical anomalies (magnetics, resistivity), prior soil survey anomalies and favourable geology/alteration. Most grid samples were spaced at 50 metre intervals on lines spaced 200 metres apart. A total of 20.4 km of grid was cut. Compass-controlled cross lines on TL-9 grid show significant deviation due to strong magnetics. Tree planting shovels were used to take samples 15-45 cm below surface.

Initially, samples were collected from A and B soil horizons but A horizon sampling was suspended when it was determined that B horizon samples yielded more consistent results for gold and copper. At some locations the B soil horizon is too poorly developed to provide a sample in which case an A horizon sample was taken. A and B horizon samples are identified in Appendix B.

The number of grid soil samples collected is:

TL-9	1782
TL-11	158
TL-12	288
TL-13	60
TL-14	52
TL-15	52
TL-16	52
TL-17	<u>52</u>
	2496

Soil samples were analyzed by Chemex Labs of Vancouver for Au (30 gram sample, fire assay with A.A. finish) and an additional 9 elements (Ag, Co, Cu, Fe, Mn, Mo, Ni, Pb, Zn) by the ICP-AES method. Refer to Appendix A. Grid locations and results for gold are plotted on figures 5A and 6A, and for copper on figures 5B and 6B. Values for the other elements are listed in Appendix B.

### Results

Soil sampling defined one area of anomalous gold values on the TL-9 grid which warrants trenching and several other areas on the TL-9 and TL-12 grids which warrant follow-up work that may include trenching. No sizeable anomalous areas were found on TL-11, 13, 14, 15, 16 and 17 grids.

#### Soil Anomaly A (Au) on TL-9 Grid

- centred at about 900E, 1200S at the edge of the grid
- 600 metres by 400 metres open to the SE
- Au values to 755 ppb, though most are less than 100 ppb
- poor correlation with Cu
- occurs near the contact between rocks of the Hogem Batholith with the Takla Group

#### Soil Anomaly B (Cu) on TL-9 Grid

- centred at 1600W, 3400S
- approximately 100 m by 200 m
- Cu values to 3720 ppm

#### Soil Anomaly C (Cu) on TL-9 Grid

- centred at 2400 to 2800S along the 00E/W baseline
- weak cluster of Cu values ranging up to 762 ppm.

Anomalous gold and copper values are widespread on the TL-9 grid but generally only a few anomalous values are grouped together. Aside from Anomaly A, anomalous gold values are most prevalent in a broad area southeast of Hoe Lake, for example along line 3200S, but anomalous values show poor line to line correlation. The maximum gold value on the grid is 855 ppb on line 3400S and occurs in this general area. Till is thick over the western portion of the grid and glacial dispersion may be responsible for poor resolution of anomalies.

#### Anomaly D (Cu±Au) on TL-12 grid

- extends from 3200W to 4000W, centred at 6700S.
- 800 metres long by 100-200 metres wide.
- open to grid east, ends at White Moose Creek to the west (fault truncation?).
- Cu to 611 ppm, contains few elevated gold values.
- appears to correlate with silt Cu-Au anomaly on White Moose Creek.
- area is underlain by Hogen granodiorite.

## **VI. TRENCHING ON TL-7 GRID**

Soil sampling and ground VLF-EM on the TL-7 grid conducted in 1989 (refer to assessment report dated Dec. 13, 1989) defined anomalies which were followed-up by trenching in 1990. The ground survey corroborated the position of airborne EM conductors located by the Aerodat survey. The TL-7 grid is located south of Wolverine Creek and west of White Moose Creek in the southwest portion of the Tchentio Lake property. The two 1990 trenches are shown on figure 5a.

A four-wheel drive road was constructed to the TL-7 grid. Road work consisted of clearing 15 km of old road and constructing 2.5 km of new road. Two parallel trenches 200 and 250 metres long, spaced 300 metres apart were dug with a John Deere 590 excavator. Both trenches were backfilled and levelled following completion of work in compliance with environmental regulations. Geology and rock geochemistry of the trenches is shown in figures 7 and 8.

Trench 1 exposes basaltic tuff to the NE that is structurally overlain by black cherty argillite to the SW. Glacial till was found to be 0.5 to 4 metres thick. Bedding in the argillite strikes NNE and dips steeply NW. The very fine grained argillite is highly pyritic (and gossanous), carbonaceous and carbonate-rich. The volcanic rocks are also pyritic and contain abundant carbonate veins. They have been subjected to pervasive propylitic alteration and pervasive carbonatization, alteration intensity decreases northward, away from the argillite. A feldspar porphyry of intermediate composition intrudes the black argillite. It is 10 metres wide where exposed in Trench 1. Two narrow andesite dikes, both pyritic, also cut the argillite. One of these dikes is anomalous in copper and gold, refer to following table.

Trench 2 is on a southerly slope. Glacial till deepened from 0.3 metres at the north end of the trench to more than 5 metres at the south. The trench exposed mainly basalt and

andesite, and minor rhyolite. The mafic volcanic rocks are altered only slightly to carbonate and pyrite is rare. Minor shear zones show stronger carbonate and pyrite development than the adjacent rock. There are two feldspar porphyritic "rhyolite" or aplite dikes(?) exposed in the trench. The rock is composed essentially of quartz, feldspar and minor biotite. Contacts are irregular.

### TRENCH ROCK GEOCHEMISTRY

<u>Sample Number</u>	<u>Au (ppb)</u>	<u>Cu (ppm)</u>	<u>Sample Description</u>
486895	5	74	Argillite, 7-10% pyrite
486896	1	12	Dolomite/calcite veins
486897	1	68	Intermediate dyke, 10-15% pyrite
486898	1	64	Feldspar porphyry
486899	75	435	Intermediate dyke, 7-10% pyrite, tr. cpy.
486900	1	71	Argillite, carbonate rich, pyrite
486901	1	119	Recrystallized basalt, 35% pyrite
486902	1	84	Carbonatized basalt, 5-7% pyrite
486904	1	45	Limonitic basalt, 10-15% Py, trace Po
486905	1	4	Feldspar porphyritic rhyolite
486906	1	78	Carbonate rich sheared basalt, 2-4% Py.

Results of the trenching program are disappointing. The strong VLF and airborne EM conductors appear likely caused by graphite (and pyrite) in trench 1 but are not readily explained by the rocks exposed in trench 2. The sporadic soil anomalies appear to be derived by pyrite-induced acid leaching of black argillites which are moderately enriched in metals.

### **VII. CONCLUSIONS AND RECOMMENDATIONS**

1. Silt anomalies on Wolverine and Lone Wolf Creek should be investigated by soil surveys. More silt sampling is recommended.
2. Soil anomalies on the TL-9 and TL-12 grids should be followed up with trenching.
3. Trenching of a geophysical and weak geochemical anomaly on TL-7 exposed carbonaceous black argillite.
4. No significant soil anomalies were found on the TL-11, 13, 14, 15, 16 and 17 grids.

## VIII. EXPENDITURES

### A. Physical Work

Cat work: clearing road and building road. Excavator work: building road and 450 metres of trenching \$22,000

Linecutting, 20.4 km 11,500

Barge Access 2,500  
\$36,000

### B. Geochemical Surveys

Salaries and wages, temporary personnel \$20,300

Mobilization/demob 1,500

Camp support 3,000

Charter flying - fixed wing 4,700  
- helicopter 8,600

Chemical analyses; soils, silts, rocks 27,500

Vehicle rental 1,400

Drafting, base map preparation 12,000  
\$ 79,000

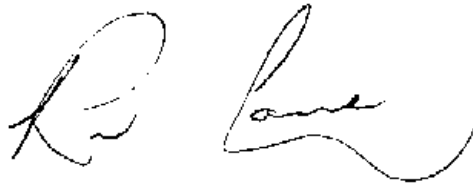

Total \$115,000

## IX. STATEMENT OF QUALIFICATIONS

I, Ron W. Lane, of 7673 Sutton Place, North Delta, B.C., graduated in 1971 from the University of Alberta, Edmonton, Alberta, with a Bachelor of Science - majoring in Geology.

Since graduation, I have worked on a continuous basis as an exploration geologist, first for Cominco Resources and Cominco International (12 years), and then for Westmin Resources ( 8 years). Work was undertaken in British Columbia, Alberta, Yukon Territory, Northwest Territories, Idaho, Southern Africa, and Italy.

I personally planned and supervised the work undertaken on the Tchentlo Lake property, which is described in this report.

A handwritten signature in black ink, appearing to read "Ron W. Lane". The signature is fluid and cursive, with a large initial "R" and a long, sweeping underline.

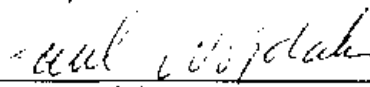

Ron W. Lane  
Project Geologist  
WESTMIN RESOURCES LIMITED

## STATEMENT OF QUALIFICATIONS

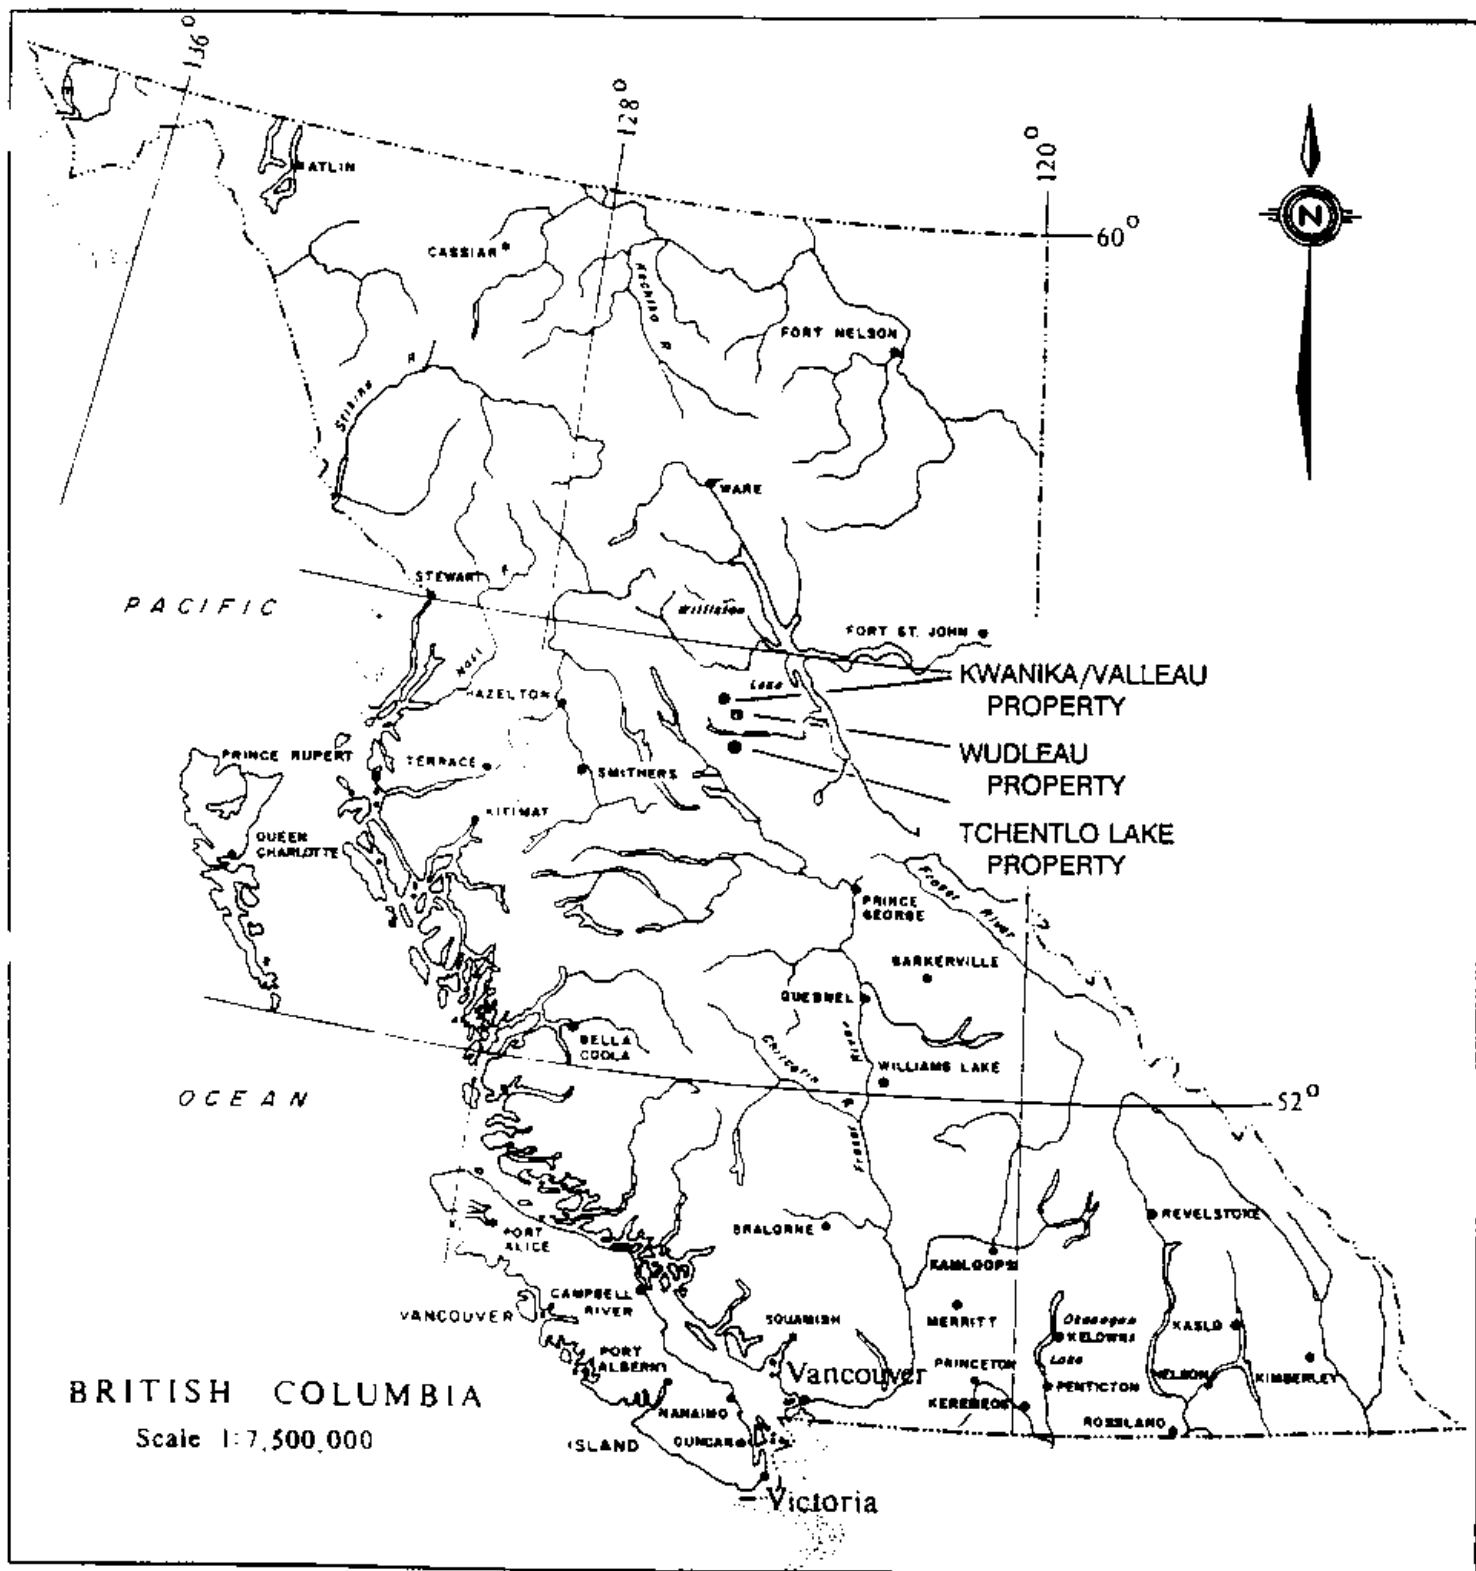

I, Paul J. Wojdak, of the City of Vancouver, Province of British Columbia, hereby certify:

1. That I am a geologist residing at 7952 Limewood Place, Vancouver, British Columbia with a business address at Suite 904, 1055 Dunsmuir Street, P.O. Box 49066, The Bentall Centre, Vancouver, British Columbia V7X 1C4.
2. That I graduated with a B.Sc. (Honours) in Geology and Chemistry from McMaster University, Hamilton, Ontario in 1971 and with a M.Sc. in Geology from the University of British Columbia in 1974.
3. That I am a member of the Geological Association of Canada.
4. That I have practised geology with Cominco Limited and Westmin Resources Limited from 1974 to 1990.

Excavator trail →  
Exposures of massive  
unaltered basalt, trace  
pyrite  
Hematized-limonitic  
basalt, well jointed

thick accumulations of glacial  
fill, bright orange sand,  
blocks of basalt, andite  
and dacite, Fe rich dolomite

Basalt  
thick overburden, blocks  
of basalt, andite, dacite  
carbonate

UTM North is 1°25' west of  
true north

Dark grey, massive  
basalt with trace pyrite,  
"fresh" in appearance

massive basalt,  
tuffs and flows

Hematized, carbonized  
Basalt

Weakly siliceous, carbonized  
basalt with 5-7% disseminated  
pyrite and fracture coating pyrite  
(486902 H)

Abundant carbonate veinlets,  
pyrite as fracture coatings and  
stringers, deeply jointed argillites

black argillite and  
interlayered carbonate,  
limonitic staining  
carbonate

pyrite pseudomorphs  
after amphibole phenocrysts  
contains up to 55% pyrite (486901 H)  
Well jointed  
argillites

dense black basalt

Abundant pyrite as  
fracture coatings,  
abundant carbonate  
stringers (486900 H)

black cherty argillite,  
carbon rich

shardalite

intermediate (andesitic) dyke

7-10% pyrite, trace chlorite  
(486899 H)  
435

argillite

486898 H  
64

Feldspar porphyritic  
dacite to andite

Intermediate dyke with 10-15% pyrite  
(486897 H)

4 veins/blocks of  
dolomite/calcite, 30cm - 75cm thickness  
(486896 H)  
12

dark black cherty argillite

486895 H  
74

7-10% disseminated pyrite
