EXPLANATION

TECTONIC ASSEMBLAGES

DISPLACED CONTINENTAL MARGIN
(Terranes displaced from Ancestral North America by transcurrent faulting):

CA

CASSIAR
UPPER PROTEROZOIC TO UPPER TRIASSIC PASSIVE CONTINENTAL MARGIN SEDIMENTS DISPLACED ALONG THE TINTINA AND NORTHERN ROCKY MOUNTAIN TRENCH FAULTS.

INTERMONTANE SUPERTERRANE
(Terranes amalgamated by latest Triassic time and accreted to Ancestral North America in the Jurassic):

SM

SLIDE MOUNTAIN
OCEANIC VOLCANICS AND SEDIMENTS OF DEVONIAN TO LATE TRIASSIC AGE.

QN

QUESNELLIA
UPPER TRIASSIC AND LOWER JURASSIC ISLAND ARC VOLCANICS, VOLCANICLASTICS AND COMAGMATIC INTRUSIVE ROCKS OVERLAIN BY JURASSIC ARC-DERIVED CLASTICS.

QNI

HARPER RANCH SUBTERRANE
UPPER DEVONIAN TO TRIASSIC ARC CLASTICS, VOLCANICS AND CARBONATE (BASEMENT TO QUESNELLIA).

CC

CACHE CREEK
MISSISSIPPIAN TO UPPER TRIASSIC OCEANIC VOLCANICS AND SEDIMENTS, AND UPPER TRIASSIC ISLAND ARC VOLCANICS, ALSO INCLUDES ALPINE-TYPE ULTRAMAFICS.

ST

STIKINIA
DEVONIAN TO PERMIAN ISLAND ARC VOLCANICS AND PLATFORM CARBONATES OVERLAIN BY TRIASSIC AND LOWER JURASSIC ISLAND ARC VOLCANICS, VOLCANICLASTICS AND ARC-DERIVED CLASTICS INTRUDED BY COMAGMATIC PLUTONIC ROCKS.

PLUTONIC SUITES

PRE-ACCRETIONARY INTRUSIONS

Hogam Batholith

Upper Triassic to Lower Jurassic diorite, monzonite, monzonite, quartz monzonite and granodiorite comagmatic with surrounding Table Group volcanics (Phase I)

POST-ACCRETIONARY INTRUSIONS

Hogam Batholith

Lower to Middle Jurassic syenite (includes Duckling Creek and Chuchi complexes, Phase II); Lower Cretaceous granite, quartz syenite and diorite (Phase III).

Germansen Batholith and Klawli Lake Stock
Upper Cretaceous granodiorite; pegmatite and apophite dykes.

Mitchell Batholith

Upper Jurassic to Lower Cretaceous granite with a border phase of diorite; surrounding stocks are granitic and diorite in composition.

Mount Milligan Stock
Upper Jurassic to Lower Cretaceous syenodiorite.

Jean Marie Stock
Cretaceous granodiorite and quartz diorite.

REGIONAL MAP UNIT

W

Wolverine Complex
Cambrian and earlier schist, quartzite, limestone and gneiss intruded by granodiorite and pegmatite.

SM

Slide Mountain Group
Upper Paleozoic to Lower Triassic mafic to intermediate volcanics, pyroclastics, argillite, sandstone, limestone and chert.

T

Takla Group
Upper Triassic and Lower Jurassic andesite and basaltic flows, tuffs and breccias; argillite, siltstone, sandstone, conglomerate and limestone.

HR

Harper Ranch Group
Middle to Upper Paleozoic mafic volcanics, sandstone, siltstone and limestone.

CC

Cache Creek Group
Paleozoic to Permian andesitic flows, tuffs and breccias; chert, argillite, pyroclastic, quartzite and limestone.

TR

Trembleur Ultramafics
Permian to Triassic harzburgite, dunite, pyroxenite and gabbro and their serpentinized and modified equivalents.

S

Sitlika Assemblage
Upper Triassic gneissite, basaltic, gabbro and rhyolite flows, tuffs and breccias; gneissite, siltstone, phyllite and argillite.

H

Hazleton Group
Jurassic andesite, rhyolite, trachyte and basaltic flows, tuffs and breccias; argillite, sandstone and limestone.

SYMBOLS

--- Fault trace (approximate, inferred)
--- Geological contacts and intrusive boundaries (approximate).

Geological information compiled from J.E. Armstrong (1936-1944), F. Ferri and D.M. Melville (1967-1968), J.A. Bennett (1971-1973), L.A. Peterson (1974), and J.O. Wheeler et al (1968).

NTS 93N	
TECTONIC FRAMEWORK AND REGIONAL GEOLOGY OF THE MANSON RIVER MAP SHEET	
SCALE -	DATE: FEBRUARY, 1990
COMPILED BY: J. B. TOOMEY	FIGURE 3
DRAWN BY: P. HAILLOT	

1.0 SUMMARY

The total field magnetic survey conducted over the Camp property has delineated various magnetic features, some of which may be important economic mineral exploration targets.

A magnetically active region, believed to be a near surface basic intrusion, occurs roughly in the middle of the grid within a relatively quiet magnetic environment. Interpreted magnetic lineaments are believed to reflect structure. A long lineament, "L1", appears to represent a major fault which may have formed the northeastern boundary of the basic intrusion. Various other lineaments in and around the intrusion may have partially controlled the intrusive activity.

Detailed contours of the northeast half of the grid reveal a number of subtle northwest trending lineaments interpreted as possible structure within the relatively non-magnetic country rock.

Magnetic model studies indicate different concentrations of magnetic minerals within separate magnetic (basic) rock units. Models also predict that the bodies are near surface with steeply dipping contacts. The major fault inferred by lineament "L1" appears to dip at about 65 to 70 degrees to the northeast.

Since pyrrhotite is reported to occur along with other sulphides containing high copper values the strong magnetic anomalies should be checked on the ground.

The following locations are recommended in order of geophysical priority for detailed investigations on the ground:

<u>Line #</u>	<u>Location</u>	<u>Feature</u>	<u>Comments</u>
5000 N	5400 - 5650 E	mag highs	cut by lineament "L2"
5300 N	5425 - 5625 E	mag highs	cut by lineament "L2"
5500 N	5325 - 5400 E	mag high	bounded by "L3" and an east west lineament
4900 N	5300 - 5400 E	mag saddle	intersection of lineament "L3" and an east-northeast unlabeled lineament
5800 N - 6000 N	6600 - 6800 E	mag highs	subtle mag highs and east west lineament offset by long northwest lineament.

2.0 INTRODUCTION

2.1 General

A total field magnetic survey was carried out on a single grid located in the Omineca Mining District, approximately 74 kilometers north-northwest of the community of Fort St. James, British Columbia.

2.2 Objectives

- to delineate structures such as faults, shears and contacts that may host copper and gold mineralization.
- to outline areas of interest for further exploration on the ground.

2.3 Physiography (from Ref. 1)

The property lies within the Nechako Plateau physiographic division which is characterized by broad flat-bottomed valleys and low rounded hills. The maximum relief on the property is 330 meters rising gently from an elevation of 920 meters at the shore of Witch Lake to 1250 meters at the highest crest in the center of the property.

The area was extensively glaciated during the Pleistocene. The Cordilleran ice sheet moved generally eastward across this portion of the Nechako Plateau (Armstrong, 1965). Drumlins and parallel groovings in the till plain indicate northeastward ice movement in the vicinity of the Camp property during the last episode of glaciation. The property is largely covered by a thick mantle of glacial and glacio-lacustrine overburden.

The claims are forested and have never been logged. Outcrops are sparse and occur mainly at the highest elevations near the center of the property.

2.4 Location and Access (from Ref. 1)

The Camp property lies at the southwest end of Witch Lake about 8 km. south of the center of Chuchi Lake. It is 35 km. west of the Mt. Milligan property (Continental Gold Corp. and B.P. Minerals Ltd.) and approximately 74 km. north-northwest of the community of Fort St. James.

The property is presently accessible only by float plane or helicopter. Logging activity in recent years has extended road access from Fort St. James (via the Leo Creek Forestry Road) to within 5 km. of the claims. A staging point for helicopter mobilization for this program was the end

of currently used logging roads about 6 km. south of the claims. Northern Mountain Helicopters, permanently based in Fort St. James, was used for transport into the area.

2.5 Claims

The property is located in the Omineca Mining Division and consists of the five Camp claims, comprising 62 units in total, that cover an area of 1550 hectares.

<u>Claim Name</u>	<u>Record Number</u>	<u>Units</u>	<u>Anniversary Date</u>
Camp 1	8628	20	July 31
Camp 2	10506	8	May 23
Camp 3	10507	18	May 24
Camp 4	10508	6	May 26
Camp 5	10509	10	May 25

2.6 1990 Work Program

The subject of this report is the ground magnetic phase of the 1990 work program wherein 39 km. of grid lines were surveyed on 17 survey lines. The magnetic survey was carried out by K. Chubb, a Silver Standard Resources Inc. employee, from November 28 to December 12, 1990. The work program is managed by Silver Standard Resources Inc. under contract from Mutual Resources Ltd. The interpretation and reporting was carried out by Interpretex Resources Ltd. in February, 1991.

2.7 Property Geology (from Ref. 1)

The property has not as yet been mapped during the 1990 work program. Previous mapping identified small outcrops of porphyritic andesite and basalt. In the area of trenching these volcanics have been strongly silicified and propylitically altered. Monzonite has been located about 2 km. to the southwest of the trenches.

Imperial Oil chip samples of the trenches assayed:

trench 1 - 22 feet grading	0.21% Cu
trench 2 - 4 feet grading	0.17% Cu
trench 3 - 5 feet grading	0.09% Cu
trench 4 - 80 feet grading	0.15% Cu

Higher copper values have been found in selected samples. Mineralization has been reported as pyrite, chalcopyrite, pyrrhotite and arsenopyrite in disseminations and fracture fillings and often in association with calcite. The 1971 drill core was only selectively sampled. Core assays ranged up to 0.62% Cu over 9 feet. ...4

3.0 SURVEY SPECIFICATIONS

3.1 Survey Parameters

- survey line separation - 100 meters
- data station spacing - 12.5 meters
- horizontal control - the survey grid was tied into topographic features thus allowing calculation and plotting of an actual grid location.

3.2 Equipment Parameters

- EDA Omni Plus magnetometer
- earth's total magnetic field measured in gammas (nanoteslas)
- magnetic variations controlled by the tie-back and linear correction method
- instrument accuracy +/- 0.1 gamma
- station repeatability better than +/- 3 gammas in low gradients

3.3 Equipment Specifications - see Appendix I

4.0 DATA

4.1 Calculations

Total Field Magnetic Survey

Total field magnetic readings were individually corrected for variations in the earth's magnetic field using magnetic base station values.

The formula used for magnetic corrections was;
$$CTFR = TFR + (DBL - BSR) \text{ (gammas)}$$

where: CTFR = Corrected Total Field Reading
TFR = Total Field Reading
DBL = Datum Base Level
BSR = Base Station Reading

4.2 Presentation

- Magnetic data are presented in profile form on Figure # 4 at a scale of 1:5000 and in contour form with postings on Figure # 5 at a scale of 1:5000

- Magnetic model studies are presented on Figures # 6.1, 6.2 and 6.3 at a scale of 1:5000
- The geophysical interpretation is presented along with magnetic contours at 50 and 500 nT. intervals on Figure # 7.1 at a scale of 1:5000
- The geophysical interpretation of the northeast half of the grid is presented along with magnetic contours at 10 and 50 nT. intervals on Figure # 7.2 at a scale of 1:5000
- Field readings are listed in Appendix III.

5.0 GEOPHYSICAL INTERPRETATION

5.1 Discussion of Results

The Camp property is characterized by a strong magnetic high anomalous region in the southeastern half of the survey grid. The magnetic high region contains magnetic field values of over 66,000 nanoteslas superimposed upon a background of the order of 57,800 nT. The regions of background magnetic values show little magnetic activity at the profile plotting scale and contour interval required to deal with the strong magnetic feature mentioned above. For this reason the northeast half of the grid, from 5650E to 6900E, was re-contoured at smaller contour intervals in order to observe any subtle variations of the magnetic field in the region of interesting geochemical activity.

Magnetic lineaments within the survey area have been delineated on the basis of offsets, terminations and disruptions in the magnetic contours. These lineaments are best defined within the strong magnetic high anomalous unit, since little magnetic relief is present within the remainder of the grid. The interpreted lineaments exhibit a predominantly northwest strike direction with a few shorter lineaments trending northerly.

5.2 Conclusions

Magnetic data display two distinct magnetic environments, one quiet and one active. The quiet magnetic environment is believed to represent a relatively homogeneous non-magnetic country rock such as acid plutonic or sedimentary material. The magnetically active region is obviously a more basic rock type, probably an intrusion, which, in the areas of highest magnetic gradient, should be found near or on surface.

The northeast half of the grid was contoured separately at smaller contour intervals and, although appearing somewhat noisy, seems to contain a number of subtle northwest trending magnetic lineaments. These subtle lineaments must be viewed with caution since some of the

magnetic field perturbations forming the trend may be due to noise. Under this cautionary note one can tentatively interpret the six unlabeled lineaments in this region as northwest structure within the relatively non-magnetic country rock.

Interpreted magnetic lineaments suggest a somewhat complex structural environment within and bounding the more basic rock type. Lineament "L1" appears to be a major fault which may have formed the northeastern boundary of the intrusion. Magnetic lineaments "L2", "L3" and "L4" are believed to be subparallel structures related to "L1" which have partially controlled the basic intrusion. Lineaments "L5" through "L8" plus two unlabeled west-southwest lineaments may be complementary structures also related to the intrusion of the basic rock type. Magnetic contours suggest that the basic intrusion continues across the entire grid, bounded by lineaments "L1", "L3" and "L5" through "L8", and continues to the northwest beyond the survey area. The contours also indicate that the basic material occurs at different depths below surface.

Rudimentary interactive model studies of total field magnetic values across the interpreted basic rocks confirm the differences in depth of burial and suggest that some portions of the basic rock contain different concentrations of magnetic minerals, specifically magnetite and pyrrhotite. Best fits were obtained when using susceptibility values for the basic rock material ranging from $k = .007$ (a rough average for gabbro, basalt and diorite according to Telford (3)) to a high of $.023$ Gaussian (CGS) units which indicates higher concentrations of magnetite and/or pyrrhotite within basic or ultrabasic rock. All modeling was carried out assuming that no remnant magnetism was present.

The magnetic models suggest that there are separate magnetic (basic) rock units within relatively non-magnetic country rock. They also show approximate widths, dips and the orders of magnitude of depth extent for some of the basic magnetic bodies. The models indicate that the boundaries of the magnetic material dip steeply and that the major fault inferred by lineament "L1" dips about 65 to 70 degrees to the northeast. The implications of differing magnetite concentrations within separate basic rock units may be different intrusive episodes, although further speculation is not within the scope of this report. When viewing magnetic model Figures #6.1, 6.2 and 6.3 the vertical exaggeration (V.E.) of $V.E. = 2.0$, with respect to horizontal distances, should be noted.

5.3 Recommendations

The magnetic survey has outlined a number of target areas which are recommended for additional exploration on the ground. Since pyrrhotite is reported to occur along with other sulphides containing high copper values the strong magnetic high anomalies should be checked on the ground. Additional detailed geological mapping is recommended in order to confirm a relationship between anomalous economic mineral content and magnetic high anomalies.

The following locations are recommended in order of geophysical priority for detailed investigations on the ground:

<u>Line #</u>	<u>Location</u>	<u>Feature</u>	<u>Comments</u>
5000 N	5400 - 5650 E	mag highs	cut by lineament "L2"
5300 N	5425 - 5625 E	mag highs	cut by lineament "L2"
5500 N	5325 - 5400 E	mag high	bounded by "L3" and an east west lineament
4900 N	5300 - 5400 E	mag saddle	intersection of lineament "L3" and an east-northeast unlabeled lineament
5800 N - 6000 N	6600 - 6800 E	mag highs	subtle mag highs and east west lineament offset by long northwest lineament.

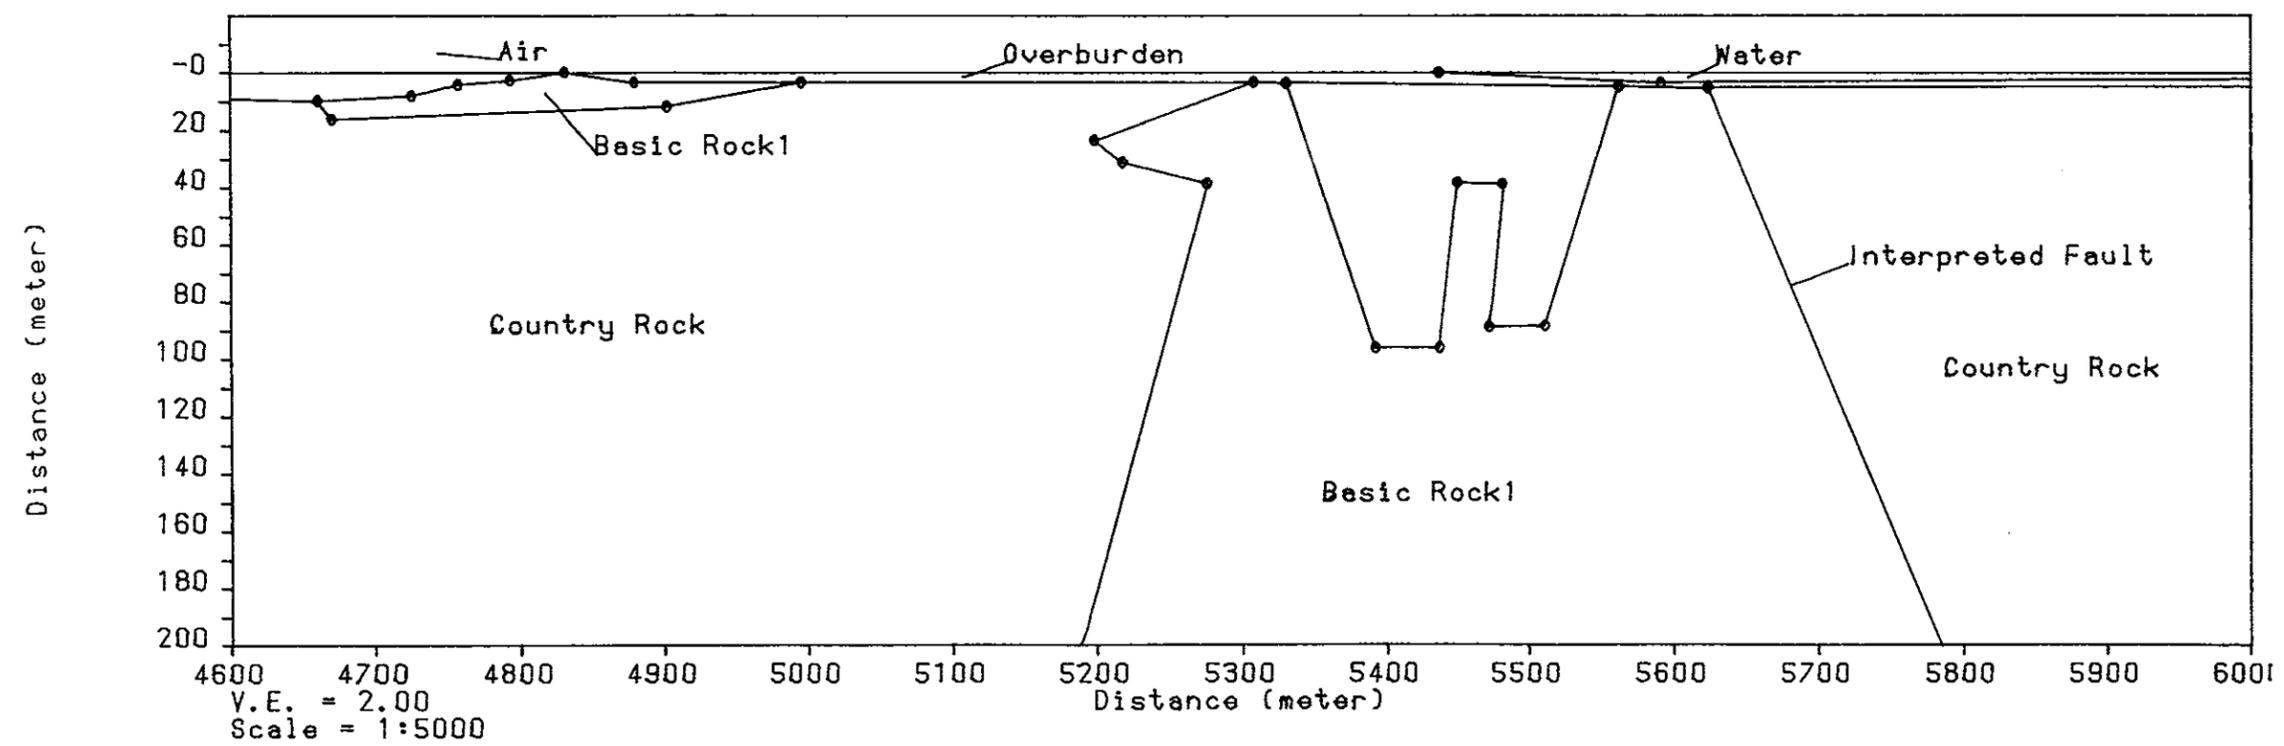

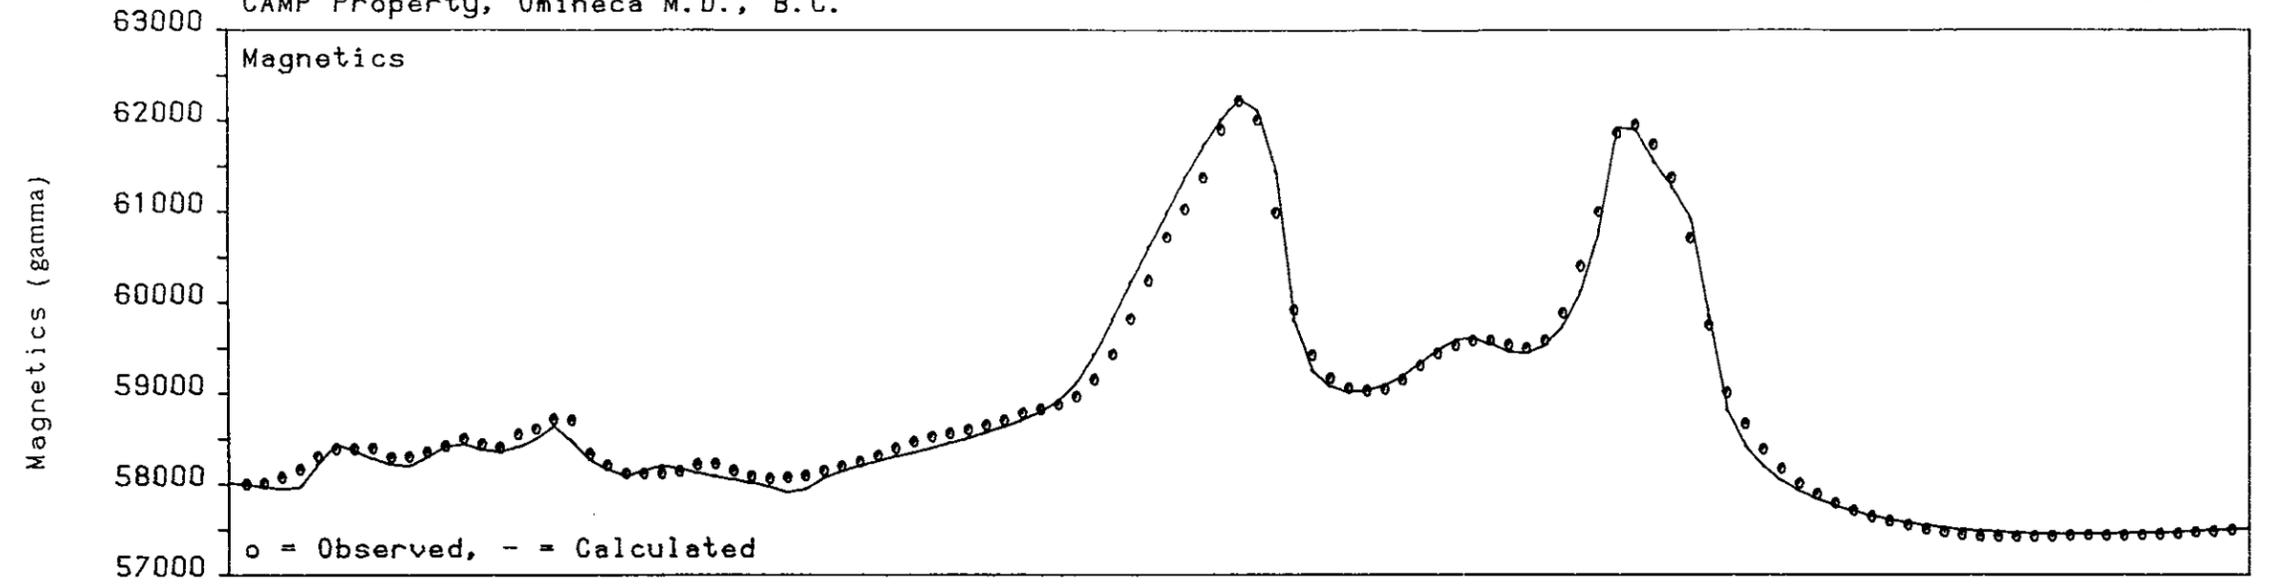

Favorable geological and/or geochemical information should be used to establish additional priorities for exploration of the remaining anomalous areas.

APPENDIX I

EQUIPMENT SPECIFICATIONS

OMNI PLUS VLF / Magnetometer System

Specifications*

Frequency Tuning Range	15 to 30 kHz, with bandwidth of 150 Hz; tuning range accommodates new Puerto Rico station at 28.5 kHz
Transmitting Stations Measured	Up to 3 stations can be automatically measured at any given grid location within frequency tuning range
Recorded VLF Magnetic Parameters	Total field strength, total dip, vertical quadrature (or alternately, horizontal amplitude)
Standard Memory Capacity	800 combined VLF magnetic and VLF electric measurements as well as gradiometer and magnetometer readings
Display	Custom designed, ruggedized liquid crystal display with built-in heater and an operating temperature range from -40°C to $+55^{\circ}\text{C}$. The display contains six numeric digits, decimal point, battery status monitor, signal strength status monitor and function descriptors.
RS232C Serial I/O Interface	2400 baud rate, 8 data bits, 2 stop bits, no parity
Test Mode	A. Diagnostic Testing (data and programmable memory) B. Self Test (hardware)
Sensor Head	Contains 3 orthogonally mounted coils with automatic tilt compensation
Operating Environmental Range	-40°C to $+55^{\circ}\text{C}$; 0 - 100% relative humidity; Weatherproof
Power Supply	Non-magnetic rechargeable sealed lead-acid 18V DC battery cartridge or belt; 18V DC disposable battery belt; 12V DC external power source for base station operation only.
Weights and Dimensions	
Instrument Console	2.8 kg, 128 x 150 x 250 mm
Sensor Head	2.1 kg, 130 dia. x 130 mm
VLF Electronics Module	1.1 kg, 40 x 150 x 250 mm
Lead Acid Battery Cartridge	1.8 kg, 235 x 105 x 90 mm
Lead Acid Battery Belt	1.8 kg, 540 x 100 x 40 mm
Disposable Battery Belt	1.2 kg, 540 x 100 x 40 mm
