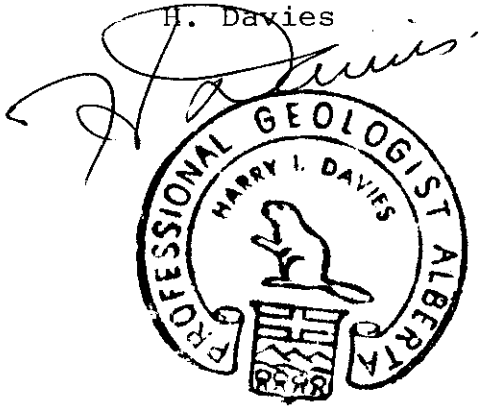
BUCK CLAIM

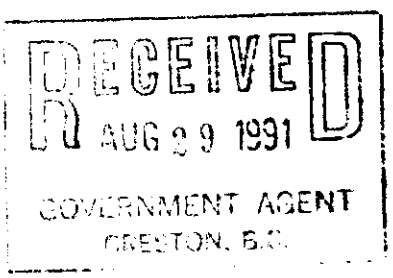
Work performed May 1991

Latitude 49 14' N Longitude 116 7' W

Claim Group Buck #1 - 25
Record No.'s 6242 - 6262
6334 - 6337

Prepared by
H. Davies





21,611

TABLE OF CONTENTS

INTRODUCTION

The writer Mr. Harry Davies (P. Geol) was retained by Mr. Dave Wiklund of Creston, B.C. to carry out a geochemical survey over a portion of the Buck Claims, which are located in the Nelson Mining District.

The collection of samples was carried out in May 1991.

The collected samples were analyzed by Acme Laboratories of Vancouver, B.C.

One of the objects of this work was to earn credits as outlined in the Mineral Act Regulations of B.C.

LOCATION

The Buck group of claims which consists of 1 - 16 unit 4 post claim and 24 two post claims are located about 40 Kilometers by road North-East of Creston, B.C.

Access is via the Kidd Creek logging road which exits from the No. 3 highway 25 Km East of Creston. The greater portion of the claim block is located on the East side of Kidd Creek about 15 Km from the highway.

TOPOGRAPHY

The Claim block which trends North-South is located on the West facing slope of the Kidd Creek valley. The East fork of Kidd Creek transects the Claim block.

The area has been extensively logged over the years. Numerous logging roads are available for easy access to most areas of the block. Elevations range from 1100 meters to 1500 meters.

OBJECTIVE

The soil geochemistry was undertaken to help evaluate an area known to be underlain by favorable geology. The presence of a few large quartz veins which exhibited weathered sulphide mineralization, together with evidence of albitization and tourmaline float, marked this area as being favorable for further examination. It was hoped that a Geochemical survey would define anomalous areas which could be considered drilling targets.

SAMPLING PROCEDURE

The geochemical sampling program was carried out over a portion of the claim area. Ten Kilometers of line was sampled, made up of 10 lines each 1 Km in length. A total of 211 samples were collected.

All sample stations were 50 meters apart where possible and each line was spaced at 250 meters. This effectively sampled an area of 1000 by 2500 meters.

Each sample point was flagged on the ground, and was tied into a North-South base line.

In each case a "B" type soil sample was collected put into paper bags with the sample location noted. The samples were forwarded to Acme Laboratories of Vancouver, B.C. for 30 element I.C.P. analysis.

LABORATORY PROCEDURE

The samples were first dried at 105 degrees for 12 hours. They were then sieved through an 80 mesh screen, with the minus 80 fraction retained for analysis. A 0.5 gram sample was put into a test tube, along with 2 ml of water, 3 ml conc. HCL and 1 ml Hno_3. The sample was digested in a water bath at 100 degrees. Water was then added to bring the volume up to 10 ml. The sample was then analyzed using the Inductively Coupled Plasma spectroscopy. A read out for 30 elements was acquired. The results accompany this report under "Assays".

CONCLUSIONS

A large portion of the area surveyed was underlain by Middle Aldridge quartzites are argillites, which had a strike of North East and shallow dip to the West. One noticeably large quartz vein trending North-East occurs at about 750W on line #7. A large Gabbro intrusive is located on the Eastern part of Lines #1 and #2.

The most noticeable geochemical feature is the North-East trending Ag. anomalies. There is a moderate correlation

between the Ag. and Cu. anomalies which suggest that a Cu.-Ag. sulphide such as tetrahedrite may account for the anomalous readings.

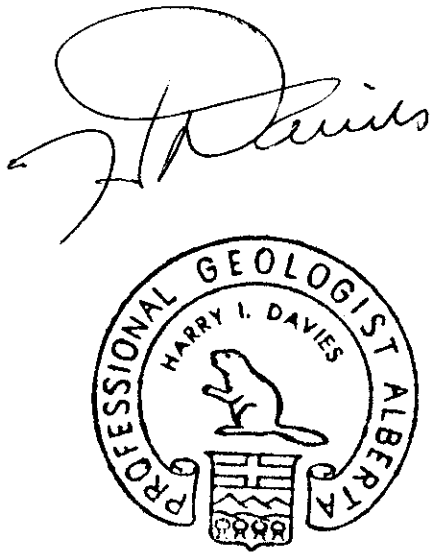
As a large part of the staked area has not been tested, further geochemical investigation is warrented.

SUMMARY GEOLOGY (lithology, age, structure, alteration, mineralization, size, and attitude):

THE BUCK CLAIMS ARE UNDERLAIN BY SHALLOW DIPPING WEST FACING PRECAMBRIAN MIDDLE ALDRIDGE SEDIMENTS. THE SEDIMENTS ARE DOMINENTLY INTERBEDDED QUARTZITES AND SHALES. ALBITIZATION OCCURS LOCALLY. A LARGE NORTH EAST TRENDING QUARTZ VEIN IS PRESENT ON THE BUCK #1 GABBRO STOCKS AND DYKES OCCUR THROUGHOUT THE AREA. THE STRIKE IS NORTH-SOUTH. NORTH-SOUTH TRENDING FAULTS OCCUR ON THE PROPERTY.

STATEMENT OF QUALIFICATIONS

NAME:	Harry I. Davies
ADDRESS:	Box 12 Boswell, B.C. V0B 1A0
EDUCATION:	University of Manitoba, BSc (H) Geology, 1950
EMPLOYMENT:	Manitoba Department of Mines, field work of Pre-Cambrian (Three field seasons) Mobil Oil of Canada Ltd, Ten years, with two years field work in structural mapping. Thirty years consulting practice with roughly 60% in oil geology and 40% in mineral exploration.
ASSOCIATIONS:	Professional Engineers of Alberta (Geologist) Member for 30 years.



STATEMENT OF EXPENDITURES

Cost related to 2250 M. of base line, soil sampling lines and collecting 211 soil samples on the Buck Claims, Kitchener area, Nelson Mining Division, British Columbia.

Base line and soil sampling - May 1991.

SALARIES:

H. Davies (Supervision)	3 days	$ 900.00
Labour (soil sampling)	8 days	800.00
Base line		500.00

TRANSPORTATION:

4WD (gas, oil incl.)	6 days @ $60/day	360.00

ASSAYS:

Acme Laboratories	1241.74
Shipping samples	26.05

SUPPLIES:

Ribbon, thread, sample bags, etc.	85.00

REPORT PREPARATION:

Map construction, writing report	450.00
Drafting, typing, photocopying, etc.	150.00

TOTAL EXPENDITURES **$4512.79**

Submitted by H.I. Davies (P. Geol)
