GEOCHEMICAL ANALYSIS CERTIFICATE

STATEMENT OF WORK recorded July 22, 1991

STATISTICAL DATA

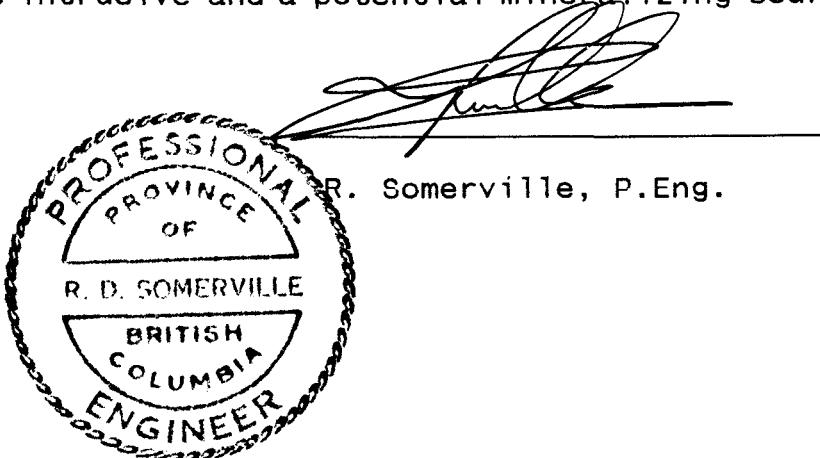

c:\rsgmwp51\1kgchem

RSGM R. Somerville Geological & Mining Engineering Ltd.

Ste. 103 - 255 West 1st Street • North Vancouver, B.C., Canada V7M 3G8 • (604) 986-5766 Fax (604) 986-8701

CONCLUSIONS

1. It is apparent from an examination of the maps that two areas on the property are moderately anomalous:
 - (a) a large area on the south border of Lake #1 claim (Area A)
 - (b) a small area near the junction of BL 550 N and L 550 W in the centre of Lake #1 (Area B)(See Map #2A). These areas are outlined on the north and middle maps.
2. It is apparent that there is a strong correlation between Ba and Sr, and between Cu and Ag. There is also a moderate correlation or overlapping of the anomalous areas of these two element pairs. As is weakly correlative with Sr.
3. The element Co is weakly anomalous in and around the anomalous areas A and B.
4. The element Pb also shows a moderate to strong anomaly in both of the designated areas A and B.
5. Area B (see Map #2A) appears to be located immediately west and adjacent to an airborne aeromagnetic high which probably represents a diorite intrusive and a potential mineralizing source.

LOCATION AND ACCESS

The claims lie about 3 km. south of Witch Lake and about 65 km. by air northwest of Fort St. James, British Columbia, NTS 93 N/2E.

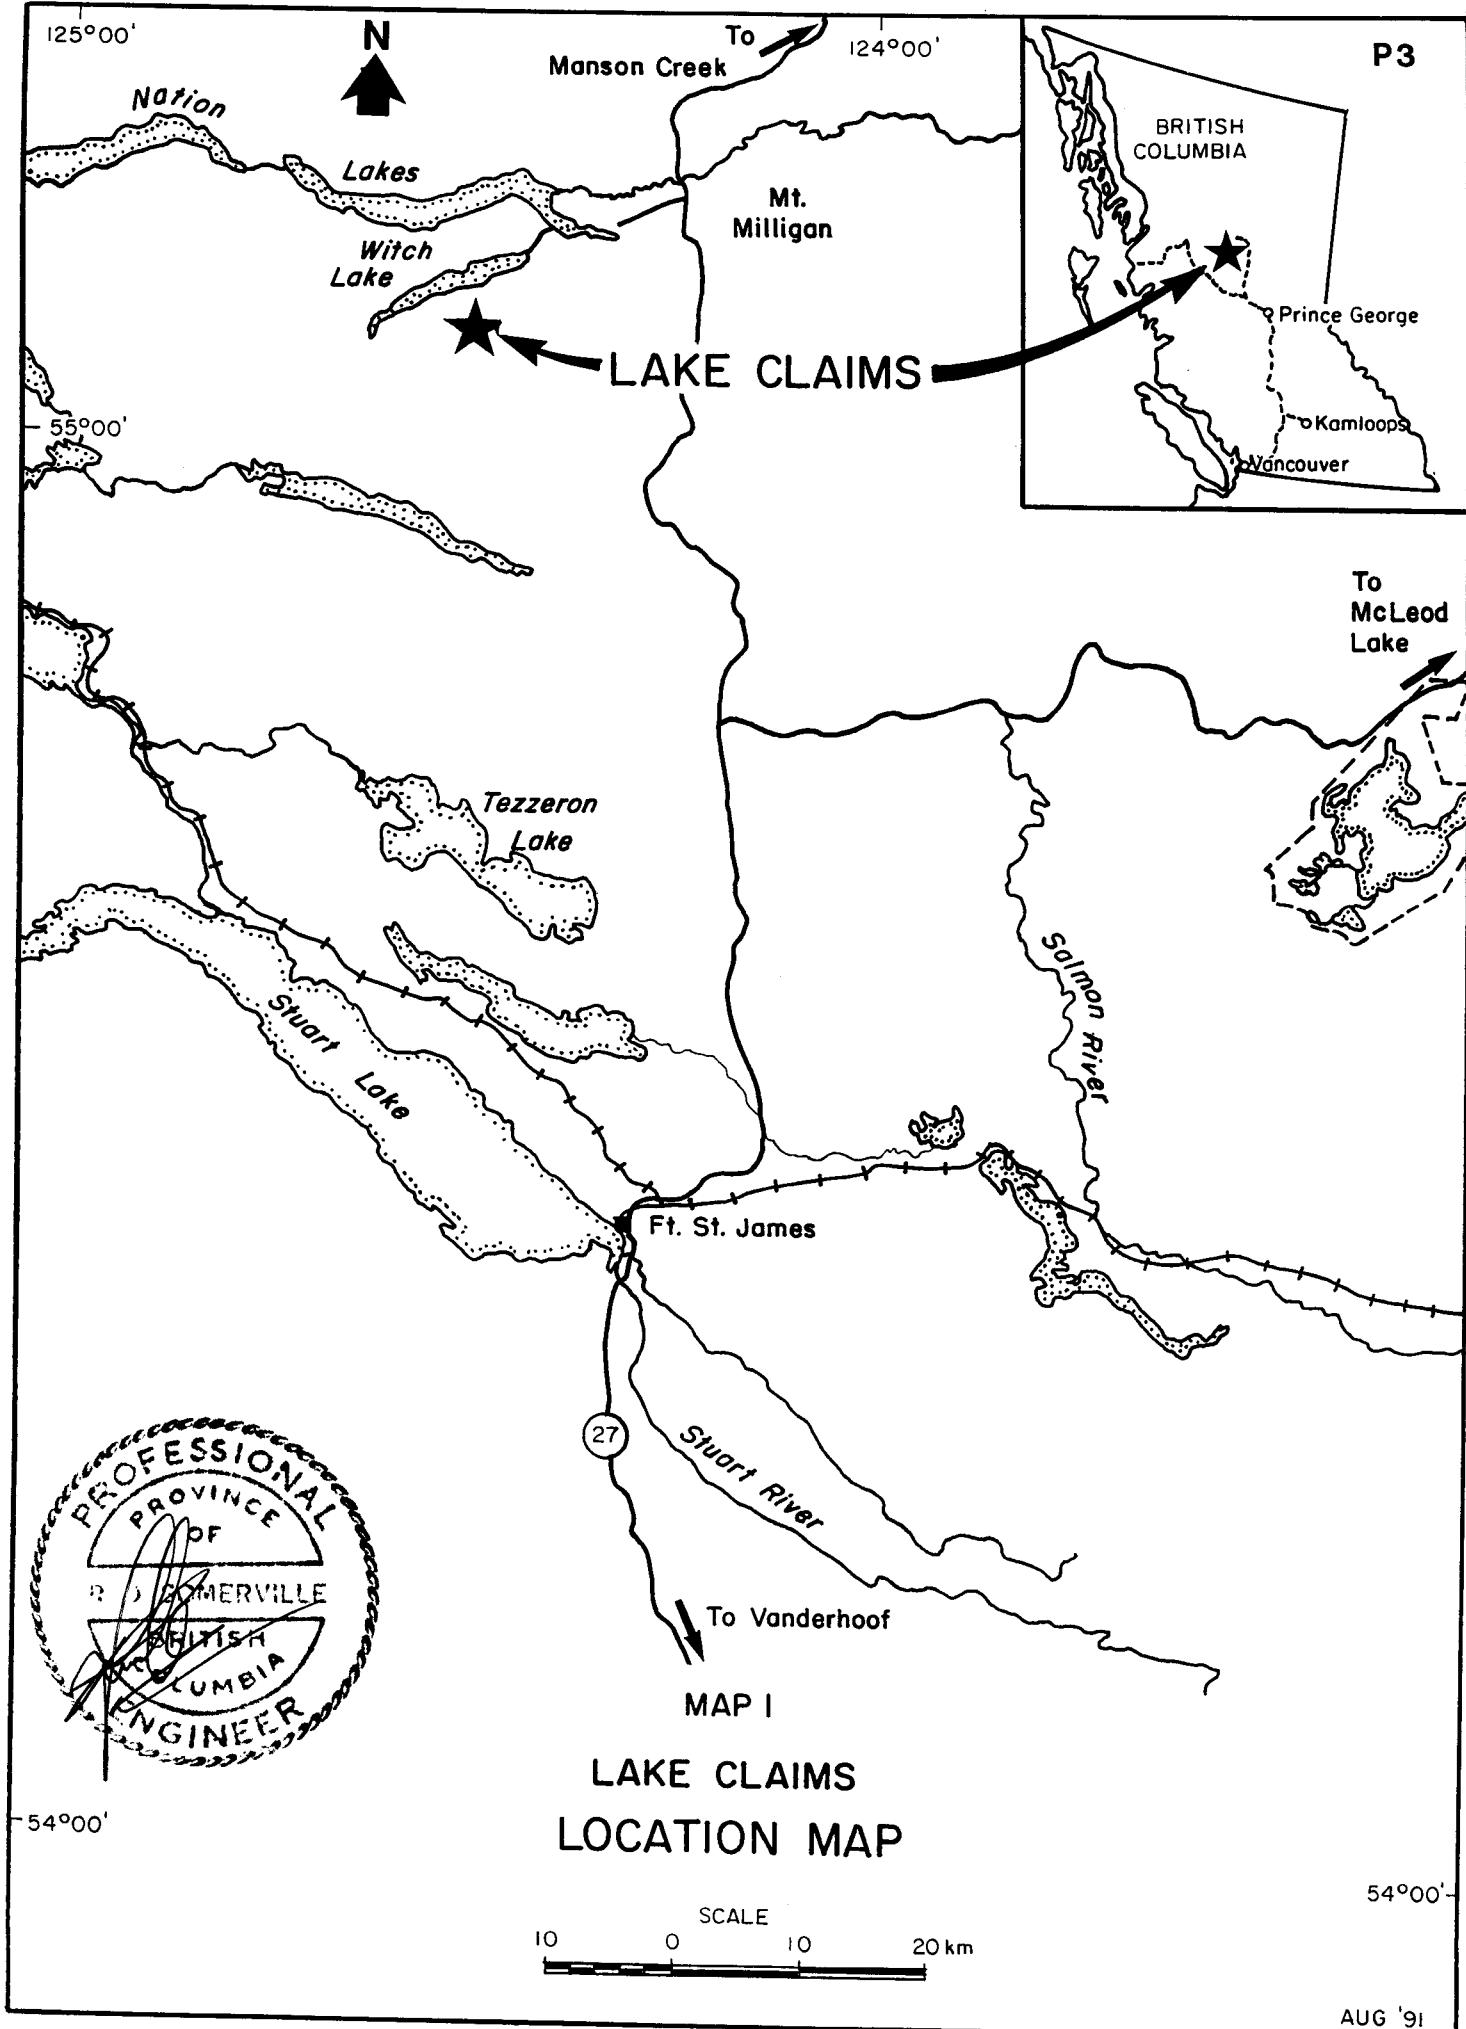

The property can be accessed by helicopter from a logging road system called the Leo-Inzana Forest Service road which lies about 15 km. west of the property. After travelling about 40 km. from Fort St. James on the road which passes through the native village of Pinchi, you reach the Leo Creek F S road. At mile point 48 on the Leo Creek FS road, the Leo-Inzana system branches off on the right hand side (north side) of the Leo Creek FS road. Several locations in this area are suitable for helicopter operations (see Maps #1 and #2).

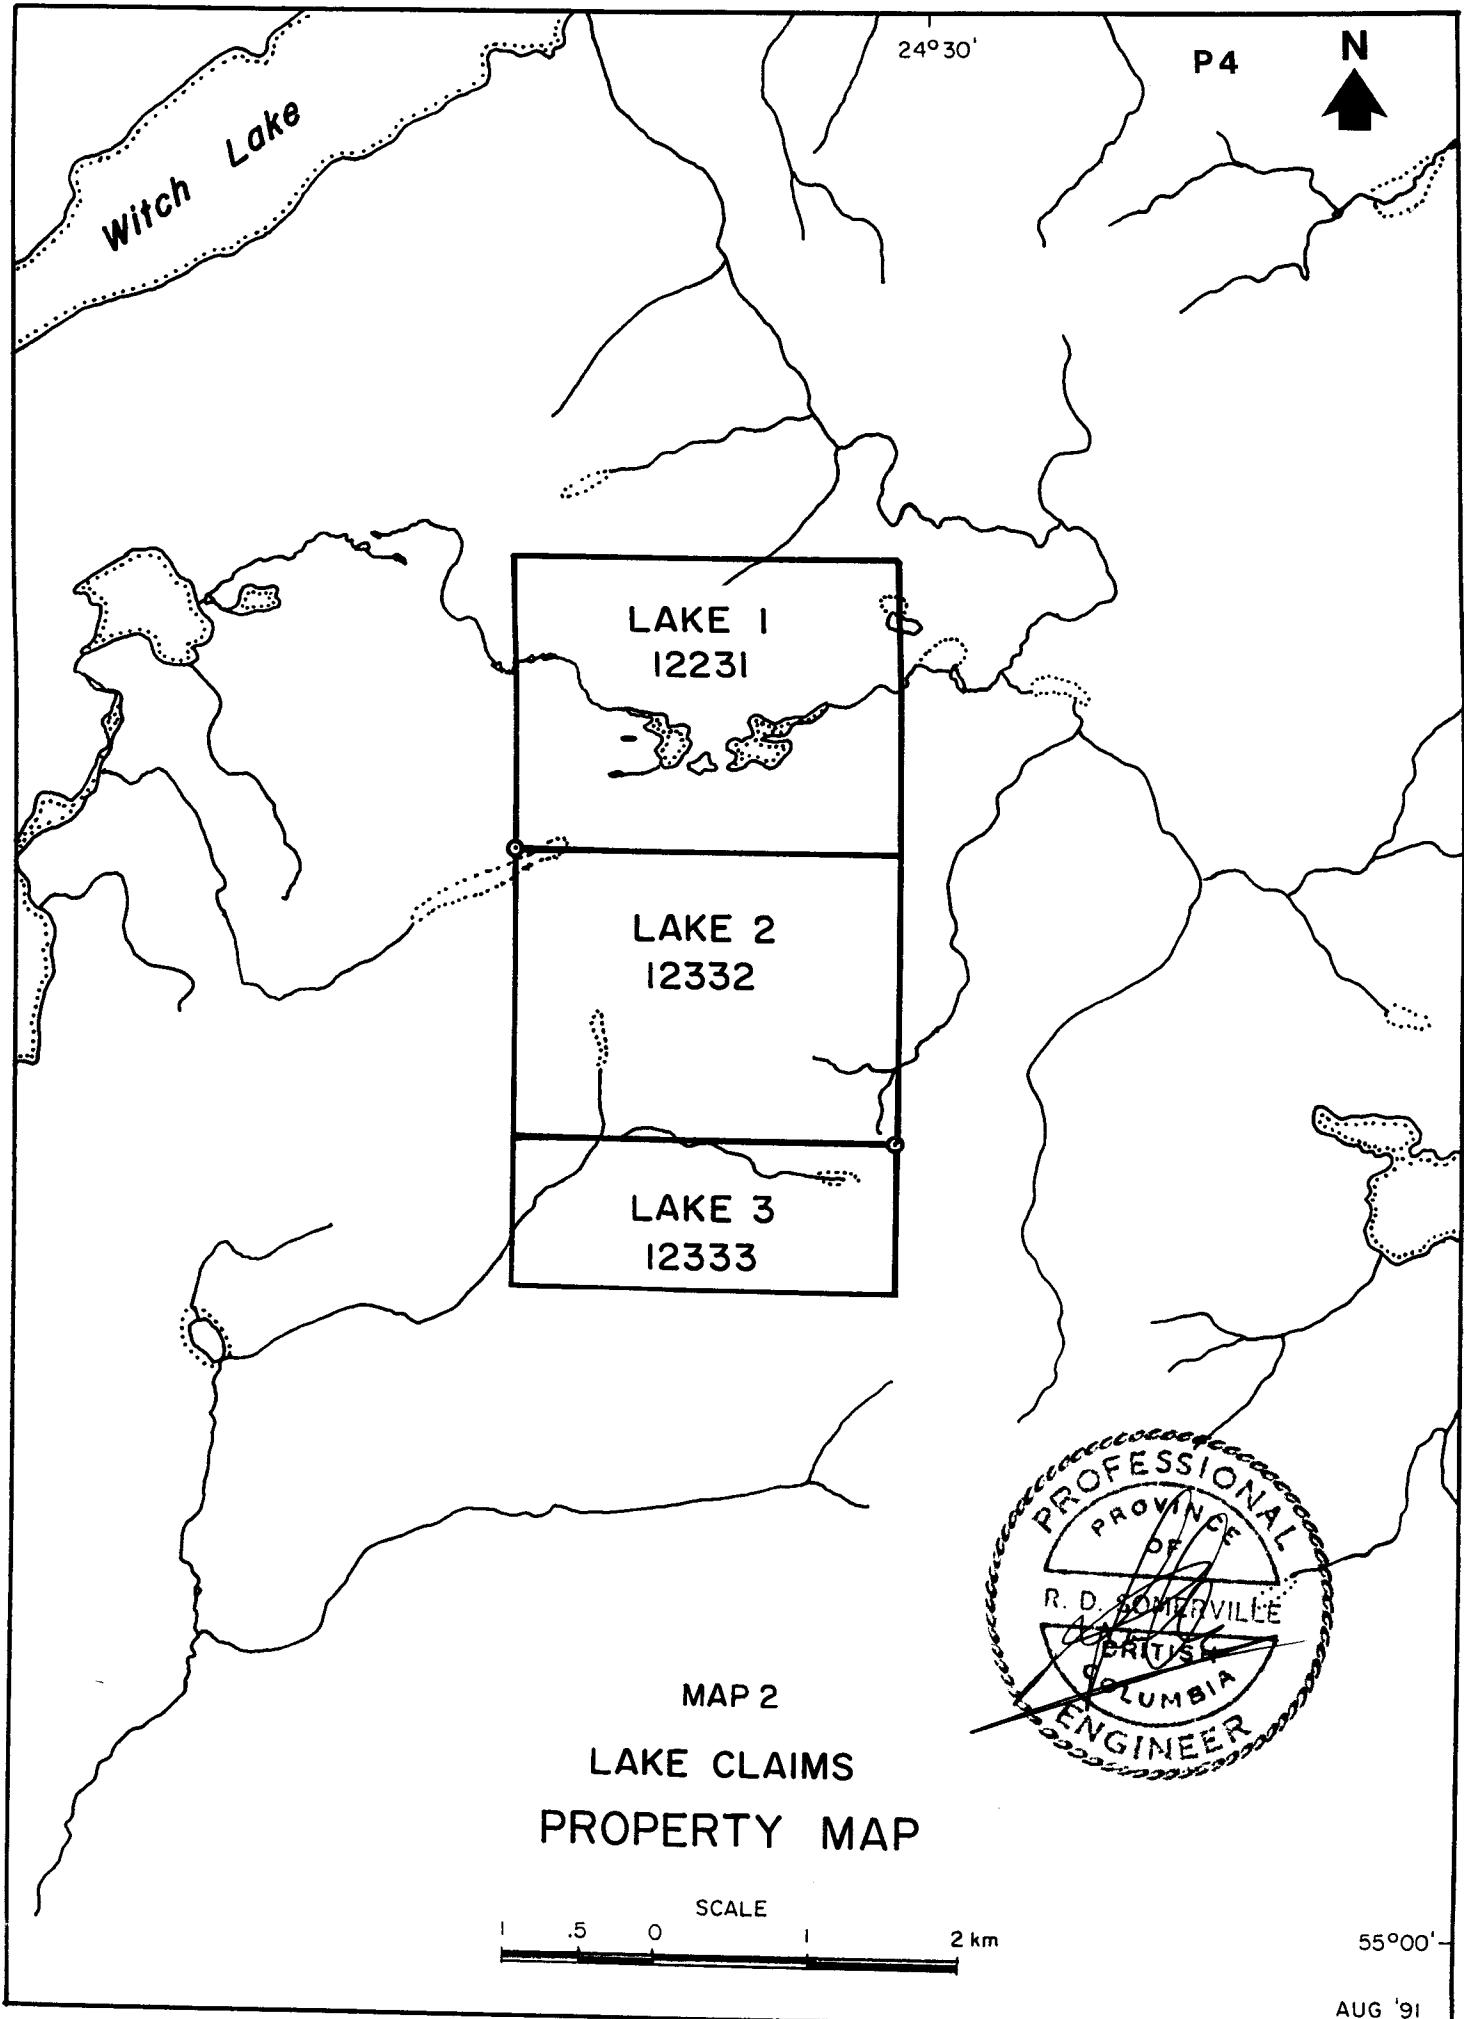

PROPERTY

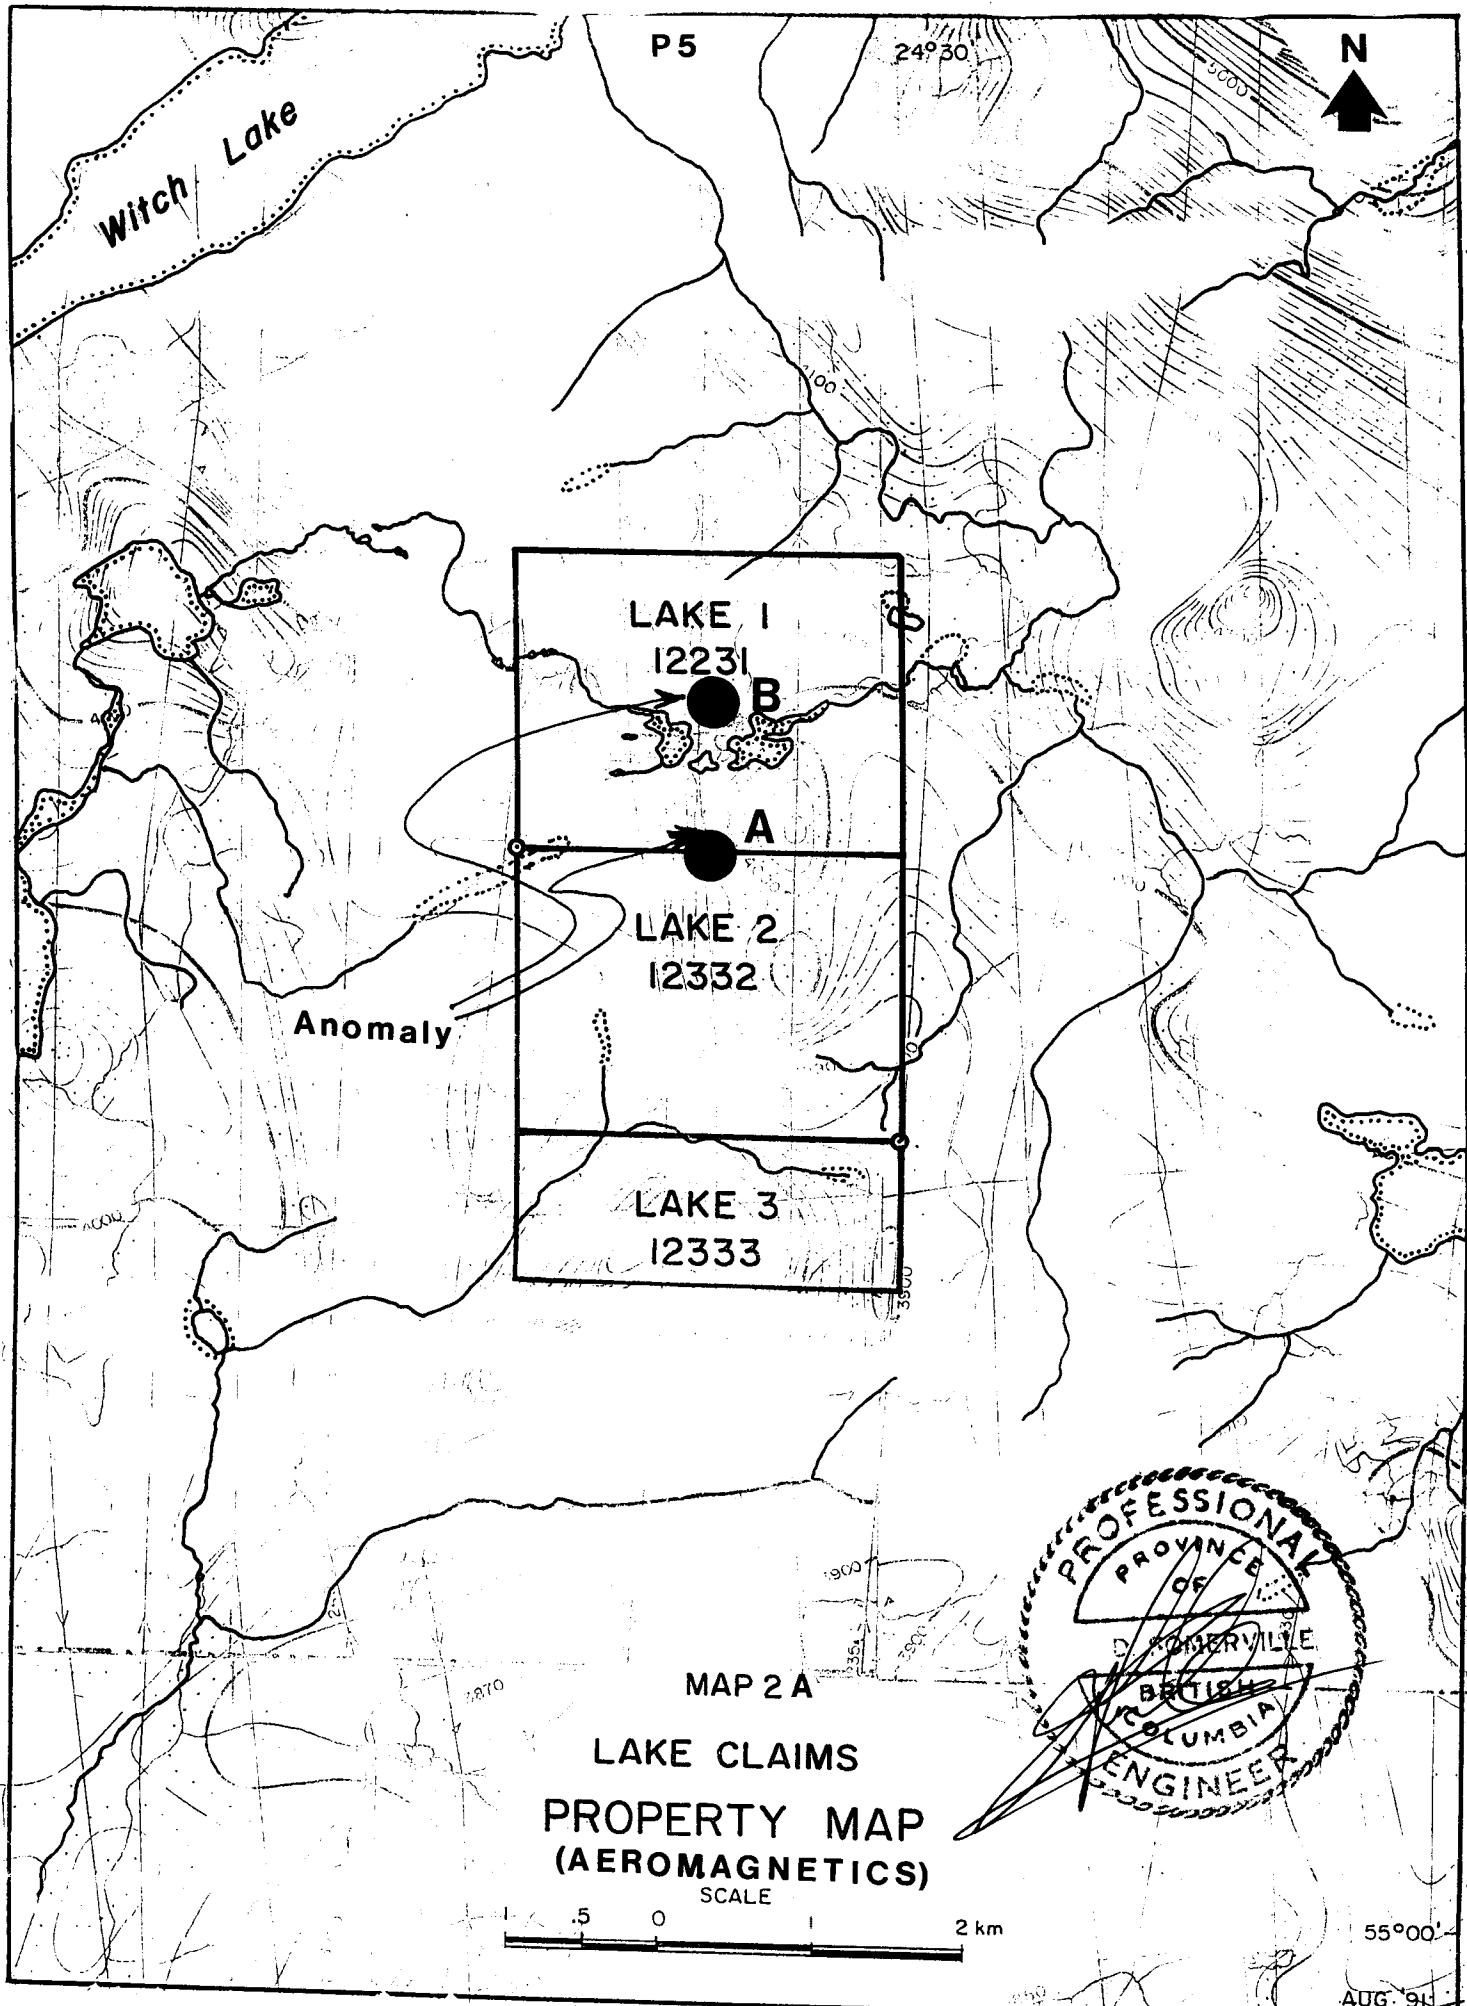

The property consists of 50 units located as 5 units wide and 10 units long. Record Numbers are 12231, 12232, 12233. See Map #2

TENURE

<u>CLAIM</u>	<u>UNITS</u>	<u>RECORD NO.</u>	<u>EXPIRY DATE</u>
LAKE 1	20	12231	July 23, 1991
LAKE 2	20	12232	July 23, 1991
LAKE 3	10	12233	July 23, 1991

GEOLOGY

The rocks underlying the claim block are believed to consist mainly of shallow-dipping Takla volcanics (Upper Triassic to Lower Jurassic) intruded by Omenica diorite and porphyry.

A strong northwest-trending fault structure which is clearly evident in the aeromagnetics (see Map #2A) cuts the northwest corner of the property. A northwest-trending fault structure also underlies this same area.

The aeromagnetic pattern suggests that three small (dioritic?) intrusive bodies may underlie the property.

On the TAS property to the south and the Camp property to the northeast, copper and gold mineralization are associated with small dioritic/porphyry intrusions adjacent to the main northwesterly fault trend and cut by smaller northeasterly trending cross faults.

GEOCHEMISTRY

GENERAL

The objective of the first-phase geochemical program was to identify any areas of mineralization and/or alteration by means of a reconnaissance soil sampling and geological mapping program. In particular the sampling program was directed towards locating copper/gold anomalous areas adjacent to airborne magnetic anomalies.

GEOCHEMICAL SURVEY

The soil sampling survey was conducted by R. Somerville Geological and Mining Engineering Ltd. The soil sampling grid was established at the same time as the samples were collected and the work was completed by a crew of two men under the on-site supervision of R. Somerville, P.Eng.

The grid was established by using a hip chain and flagging tape. Stations were marked and flagged at 50 m. intervals on both the lines and baselines. The baselines were also marked with metal tags at 100 meter intervals.

All the samples were taken by using an Eijkelkamp soil auger. A total of 242 samples were taken and another 9 control samples were inserted in numerical sequence at 25 sample intervals. Data

was collected for the depth, colour and type of soil (horizon) for each sample. Landmark features (streams, lakes etc.) were also logged, and rock specimens were taken when outcrops were noted on or near the lines.

TECHNICAL PROCEDURE

Approximately 1 pound (0.5 kg.) of sample material was obtained by making several auger holes at each sample station. The sample material was placed in a gusseted kraft paper sample bag, packed in a cardboard box and shipped to Acme Laboratories, Vancouver, British Columbia for analysis. After the samples were screened, the minus 80 mesh fraction was analysed by the ICP method for the following thirty elements: Mo, Cu, Pb, Zn, Ag, Ni, Co, Mn, Fe, Ag, U, Au, Th, Sr, Cd, Sb, Bi, V, Ca, P, La, Cr, Mg, Ba, Ti, B, Al, Na, K, W. The results are listed on the analytical report in the Appendix and plotted on maps 3 to 17 inclusive. Maps #18, #19, #20 show the location of the sample numbers. The analytical method for the ICP method is detailed in the Appendix.

DISCUSSION OF RESULTS

All of the results are plotted on maps #3 through 17 with the exception of the following elements: Fe, V, Au, Th, Bi, Ca, P, B, Al, Na, K, and W. The results for these elements were judged to have no significance in the current exploration program. As a

result, these elements were not plotted on the plans or considered in this report. From a visual examination of the Geochemical Analysis Certificate and the results for each element, the following elements have no significantly anomalous results:

Mo - ranges from 1 ppm to 3 ppm - barely detectable but plotted for reference

Fe - ranges from 1.6% to 5.2% with 1 anomalously low sample at 0.23% I do not believe that any of the values for this element are significant.

U - ranges from 5 ppm to 7 ppm. Not significant.

Au - the detection limit of 3 ppm for gold is too high to make ICP a useful analytical tool for this element

Th - ranges from 1 ppm - 3 ppm; barely detectable

Bi - ranges from 2 ppm - 6 ppm; not significant

B - ranges from 2 ppm - 8 ppm; probably not significant

Na & K - too low for any significant interpretation and there does not appear to be any correlation

W - ranges from 1 ppm - 3 ppm; barely detectable

Al - was not plotted as the data has no known significance to the current exploration program

Sb - all samples were very low with the exception of sample #81 which gave a value of 436 ppm. Possibly this is an analytical error.

V, Ca, and P were not considered since they have no known

correlation in a gold/copper exploration program.
Mn, Mg and Ti in soils using a partial digestion ICP method has no
obvious significance in the current program either.

Cr - the results were low and discarded as being uninformative.

The analytical results for the remaining elements were considered statistically, and were plotted in the form of a series of histograms, and various statistical calculations were made for each element. These results are tabulated in the Appendix. From the histograms and the calculated data it was decided that only the highest 5% of the results are probably anomalous, and only the highest 2.5% of the results are anomalous. These values are summarized in Table 1 and the anomalous values are indicated on the maps by appropriate symbols.

TABLE 1 - ANOMALOUS ELEMENTS

<u>ELEMENT</u>	<u>PROBABLY ANOMALOUS</u>	<u>ANOMALOUS</u>
Ba	>175	>245

CERTIFICATE

I, Richard D. Somerville, residing at 1052 Esquimalt Avenue, West Vancouver, British Columbia, V7T 1J8 certify that:

1. I am a practising Consulting Geologist with offices at 103 - 255 West 1st Street, North Vancouver, B.C., V7M 3G8.
2. I am President of R. Somerville Geological and Mining Engineering Ltd.
3. I am a Registered Professional Engineer of the Provinces of Ontario and British Columbia.
4. I am a Fellow of the Geological Association of Canada and a member of the Canadian Institute of Mining & Metallurgy.
5. I am a graduate of Queen's University at Kingston, Ontario, having received a B.Sc. (honours) degree majoring in Geology, and a B.A. degree majoring in physics and mathematics.
6. This exploration work was conducted under my direction. I have visited the property, and I am satisfied that the work was conducted in a proper and professional manner.

North Vancouver, British Columbia
August 15, 1991

R. Somerville, P.Eng.

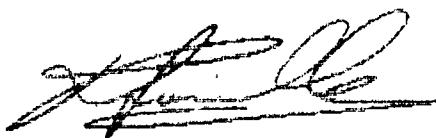

STATEMENT OF COSTS
RE: LAKE CLAIMS

July 15, 1991

Accomodation	\$442.50
Camp	\$1,300.54
Meals	\$409.39
Vehicle	\$930.12
Helicopter	\$4,338.24
Supplies	\$734.64
Air Photos	\$109.90
Analysis	\$1,506.00
Wages	\$5,734.50
Miscellaneous Expenses	\$77.57
Supervision & Technical Support	\$1,356.08

	\$16,999.48
	=====

I certify that the above expenditures were incurred on the Lake Claims (Record #12231, 12232, 12233) between May 1 and July 15, 1991

R. Somerville, P.Eng.

Telephone: (604) 253-3158 Fax: (604) 253-1716

**Geochemical Methods
Acme Analytical Laboratories Ltd.**

- * Soil Preparation: Dry soil or silt sample up to 1 Kg at 60 deg.C and sieve to -80 mesh.

Rock Preparation: Rocks or cores are crushed to -3/16" and 250 gm is split out. This split is pulverized using a ring mill pulverizer to 99% -100 mesh.

- * ICP Analysis: 0.50 gm sample is digested with 3ml 3-1-2 HCL-HNO₃-H₂O at 95 deg.C for one hour and is diluted to 10ml with water. This leach is partial for Mn, Fe, Sr, Ca, P, La, Cr, Mg, Ba, Ti, B, W and limited for Na, K, Al.

Gold Analysis (Fire Geochem): 10 gm is ignited at 600 deg.C for 4 hours and fused with F.A. flux. The dore bead is dissolved in Aqua Regia and analysed by ICP.

Detection limit for Au 1 ppb
Pt 3 ppb
Pd 3 ppb
Rh 3 ppb

** Larger sample - on special request.
