## **1.0 SUMMARY**

The glacial till covered LYS property was tested for alkaline porphyry Au-Cu mineralization by reconnaissance style geological prospecting and mapping, and stream and soil geochemical sampling.

The results suggest that only the northeast and northwest corners of the property have potential for mineralization.

The strongly magnetic central one-third of the property is considered to reflect Hogem Batholith gabbro/pyroxenite intruding Takla Group volcanic rocks, and as such, is not likely to have any significant alkaline porphyry Au-Cu potential.

## **2.0 INTRODUCTION**

### **2.1 Exploration Target**

Primary exploration target is large tonnage low grade alkaline porphyry Au-Cu deposits of similar or better grade than the Mt. Milligan deposit. Secondary exploration target is moderate tonnage high grade Au-Cu-Zn sulphide deposits replacing fracture zones adjacent to or crosscutting Au-Cu porphyry mineralization.

### **2.2 Location and Access**

LYS property is located in the Valleau Creek drainage, approximately 220 km northwest of Prince George, B.C. and 65 km northwest of the Mt. Milligan porphyry Au-Cu deposit. Refer to Figure 1. Access is via helicopter from the western end of Tchentlo Lake.

### **2.3 Topography**

Topography varies from gently rolling to moderately mountainous, with elevations ranging from 1,150 m to 1,350 m. Most of the property is forest covered, consisting mainly of pine, balsam, fir and spruce, with alder in low lying areas.

### **2.4 Claims**

The LYS property is 100% owned by Cathedral Gold Corporation, and is currently under option to Westmin Resources Limited. Refer to Figure 2. The property consists of the following claim:

Claim Name	Record Number	Number of Units	Current Expiry Date	Expiry Date Upon Acceptance of This Report
LYS	10640	20	June 12, 1992	June 12, 1995

## 2.5 Exploration History

No history of previous exploration on the property, apart from coverage by government regional stream sediment, geological mapping and airborne magnetic surveys.

Cathedral Gold Corporation staked the LYS claim on June 12, 1989, in response to a strong regional airborne magnetics anomaly.

## 3.0 REGIONAL GEOLOGY

LYS property is situated within the central portion of the Quesnel Trough, a 30 to 60 km wide by 1,300+ km long depositional basin which extends northwestward from the southern B.C. border (49th parallel) to the Stikine River in northern B.C. The boundaries of the Trough are regional faults in some areas. For example, the Pinchi Fault, situated approximately 20 km west of the LYS property, forms a portion of the western boundary of the Trough.

The Trough contains an assemblage of alkalic and calc-alkalic volcanic and sedimentary rocks of Upper Triassic to L. Jurassic age (Rosslund, Nicola, Takla, Stuhini Groups), which are intruded by comagmatic plutons. In the vicinity of the LYS property the comagmatic plutons form a portion of the Hogem Batholith. The Hogem intrusions range in composition from granite to monzonite to pyroxenite. The somewhat younger L. Cretaceous, granite to K-spar megacrystic granodiorite of the Germansen Batholith borders the LYS property to the east.

The potential for porphyry Au-Cu deposits is considered to be quite good along the Quesnel Trough, especially in areas of well developed structural control. Good structural control is interpreted to exist on the LYS property.

## **4.0 PROPERTY GEOLOGY**

Geological mapping and prospecting on the LYS property was undertaken by geologists Murray Jones and Ron Lane of Westmin Resources Limited, in follow-up to anomalous Au stream geochemical values, minor amounts of anomalous Au and Cu soil geochemical values, and strongly anomalous airborne magnetic values.

The property and surrounding area is almost totally covered by glacial till, except for a few isolated outcrops. Geology was interpreted from airborne geophysical response (Total Magnetics and Calculated Vertical Magnetic Gradient) defined by a detailed survey flown for Westmin by Aerodat Limited in 1990.

The property geology is interpreted to consist of approximately 65% Upper Triassic/Lower Jurassic Takla Group pyroxene porphyritic andesite flows and tuffs, and 35% coeval intrusions of the Hogem Batholith.

The central one-third of the property is interpreted to consist mainly of a northwest trending zone of strongly magnetic gabbro to pyroxenite. Outcrops in a few locations along Snipe Creek and elsewhere partially confirm this interpretation. Gabbro-pyroxenite intrusions are not considered to be very favourable for alkaline porphyry Au-Cu mineralization.

The gabbro/pyroxenite zone appears to grade into more favourable monzonite/monzogabbro/diorite along strike to the northwest, as evidenced from a decrease in intensity of the magnetic anomalies, and a change in their character. A parallel zone of monzonite/monzogabbro/diorite intrusions is also interpreted to trend through the northwest corner of the property.

## **5.0 STREAM SEDIMENT GEOCHEMISTRY**

### **5.1 Introduction**

Detailed stream sediment sampling was undertaken on LYS in 1991, in follow-up to anomalous Au stream sediment values defined by Westmin in 1990 in the immediate area. A total of 12 silt samples were collected on the LYS property and are the subject of this report. An abundance of additional silt samples were collected from the immediate area surrounding LYS in 1990 and 1991, and their results are also presented, to enable a more complete appraisal of the area's potential to be made.

Considerable effort was expended to collect high quality silt samples, consisting wherever possible, of fine silt containing a minor amount of grit, and representative of several depositional cycles.

Chemex Labs of North Vancouver sieved the samples to -80 mesh and analyzed them for Au (fire assay with atomic absorption finish), and for an additional 10 elements (As, Ag, Co, Cu, Fe, Mn, Mo, Ni, Pb, Zn) by the ICP-AES method. Refer to Appendix A.

Each sample was analyzed twice for gold for a total analyzed weight of 60 g (two 30 g samples), whenever sufficient sample weight was available. A few of the samples collected in 1990 were analyzed for gold three or four times as a check on results by Chemex Labs and/or Westmin. The duplicate analyses were undertaken to deal with the nugget effect of gold. Results indicate that nugget effect is a significant problem, and that a total sample weight of 60 g is the absolute minimum that should be analyzed. The quality of data and the ability to confidently outline area of anomalous gold is vastly improved using a minimum of 60 g of sample, as opposed to a single 10 g or 30 g sample.

## 5.2 Results

Results for gold and copper are plotted on Figures 4 and 5, respectively. Values for the remaining elements were not plotted but are available in Appendix B. The 1991 sampling returned consistently anomalous Au values, ranging from 20 ppb to 320 ppb, along the lower 2 km of Snipe Creek immediately west of its junction with Valleau Creek. No anomalous Cu values ( $\geq 100$  ppm) were defined. The lack of anomalous Cu values in association with the anomalous Au values is of concern with respect to potential for porphyry Au-Cu mineralization.

## 6.0 SOIL GEOCHEMISTRY

### 6.1 Introduction

A reconnaissance style soil geochemical survey was undertaken along grid lines spaced 400 m apart. Samples of unoxidized glacial till were taken at a depth of approximately 20 to 30 cm, every 50 m, using a shovel. Poor ground conditions prevented the collection of several samples.

Chemex Labs of North Vancouver sieved the samples to -80 mesh and analyzed them for Au (fire assay with atomic absorption finish), and for an additional 9 elements (Ag, Co, Cu, Fe, Mn, Mo, Ni, Pb, Zn) by the ICP-AES method. Refer to

## Appendix A.

### 6.2 Results

Results for Au and Cu are plotted on Figures 6 and 7, respectively. Results for the remaining elements were not plotted but are available in Appendix B. The widely spaced sampling lines defined a few anomalous Au values, in areas interpreted to be underlain by volcanic rocks. The best Au value of 300 ppb, located at 75550E-44800N, plots near an interpreted north-northwest trending fault (air photo linear).

Several scattered, weakly anomalous Cu values ( $> 100$  ppm) were defined by the survey. However, their distribution and strength does not suggest any significant potential for porphyry Au-Cu mineralization.

### 7.0 CONCLUSIONS

The strongly magnetic central one-third of the LYS property is considered to reflect Hogem Batholith gabbro/pyroxenite intruding Takla Group volcanic rocks, and as such, is not likely to have any significant alkaline porphyry Au-Cu potential. Results of stream and soil geochemical sampling for Au and Cu over this area yielded a few anomalous values, but nothing of any apparent consequence. The anomalous Au stream sediment values defined along the lower 2,000 m of Snipe Creek drain this area, but likely reflect weak shear/fault hosted Au values rather than any alkaline porphyry Au-Cu potential.

Favourable stratigraphy consisting of monzonite/monzogabbro/diorite intruding Takla Group volcanic rocks is interpreted to exist in the northwest and northeast corners of the property. As such, these areas are considered to have moderate potential for Au-Cu mineralization. However, geochemical response from these areas was not very encouraging. The poor response may be due to thick glacial till, or simply a lack of mineralization. The northeast corner of the property lies proximal to IP chargeability and Au geochemical anomalies defined on Westmin's adjacent Kwanika/Valleau property.

### 8.0 RECOMMENDATIONS

The northeast and northwest corners of the LYS property warrant testing by a few lines of reconnaissance IP if an IP survey is undertaken on the adjacent Kwanika/Valleau and Wudleau properties. However, if funds are unavailable to test the Kwanika and Valleau targets in 1991, then the LYS option should be terminated

prior to its June 26, 1991 anniversary date.

## 10.0 STATEMENT OF QUALIFICATIONS

I, Ron W. Lane, of 7673 Sutton Place, North Delta, B.C., graduated in 1971 from the University of Alberta, Edmonton, Alberta, with a Bachelor of Science, majoring in Geology.

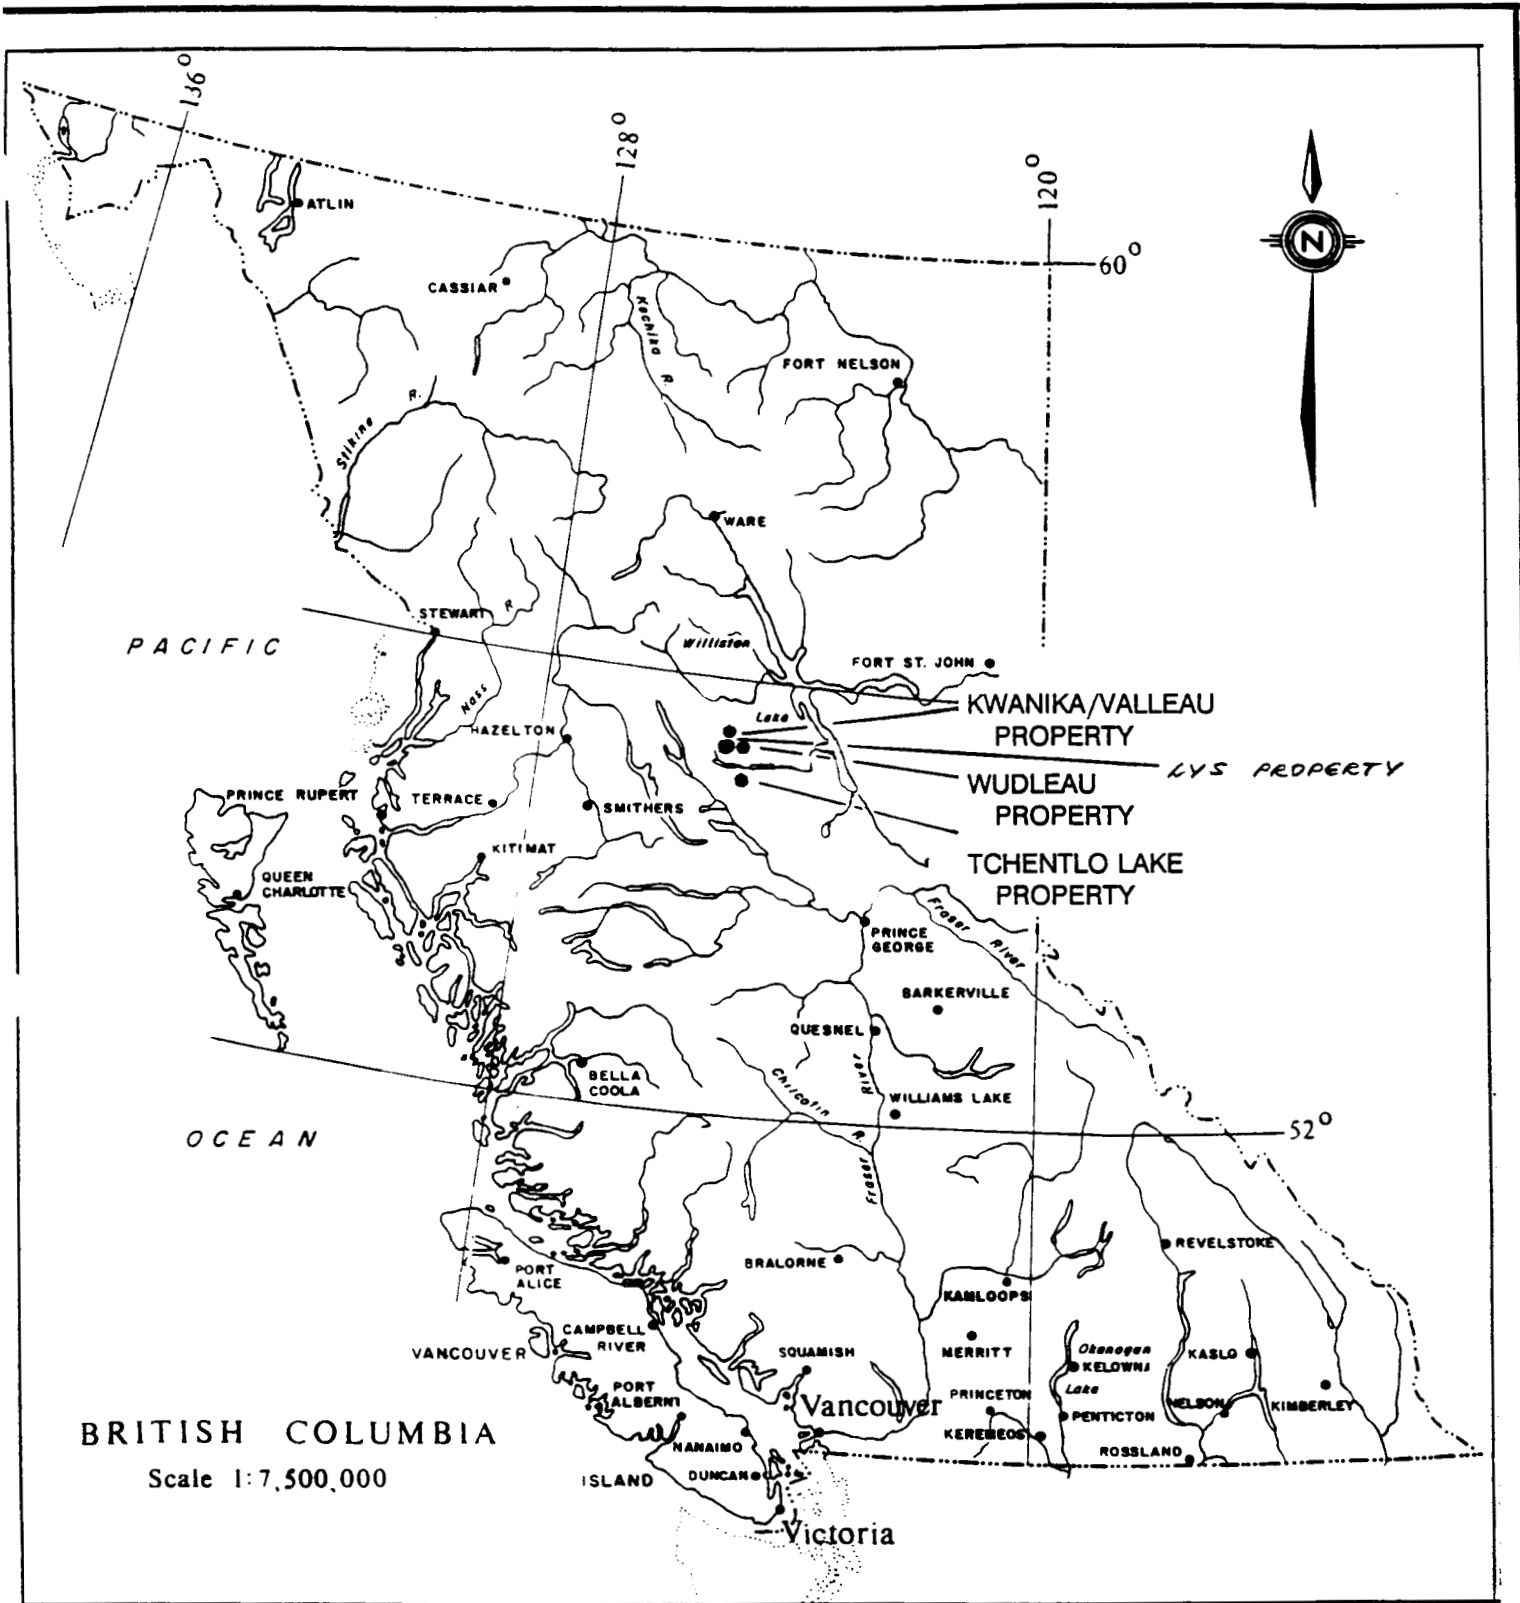

Since graduation, I have worked on a continuous basis as an exploration geologist, first for Cominco International (6-1/2 years), Cominco Ltd. (5-1/2 years), and then for Westmin Resources Limited (9 years). Work was undertaken in British Columbia, Alberta, Yukon Territory, Northwest Territories, Idaho, Southern Africa and Italy.

I supervised the work undertaken on the LYS property, which is described in this report.

A handwritten signature in black ink, appearing to read "Ron W. Lane". The signature is written in a cursive style with a large initial "R" and a long, sweeping underline.
