1.0 INTRODUCTION

A geophysical program consisting of electromagnetic (VLF-EM) and magnetic surveys was carried out on a single grid located on the Ant Claim Group, NTS 104K/08, in the Atlin Mining Division, B.C. The data was collected by Canamera Geological Ltd. of Vancouver, B.C. from September 21 - October 4, 1990.

2.0 OBJECTIVES

- to establish a correlation between magnetic minerals and mineralized trends,
- to test the effectiveness of VLF-EM in following possible mineralized trends and to establish new unrecognized conductive trends,
- to establish geophysical areas of interest for future exploration.

3.0 SURVEY SPECIFICATIONS

Survey Parameters

- survey line separation - 100 meters.
- survey station spacing - 12.5 meters.
- VLF-EM and magnetic survey total 12.5 kilometers.

Equipment Parameters

- VLF-EM and Magnetic Surveys
 - Scintrex Omni Plus combined VLF-EM and magnetometer
 - Dip Angle (in-phase) and Quadrature (out-of-phase) measured in percent at each station
 - VLF-EM Field Strength measured at each station
 - transmitting stations used: NAA (24.0 kHz) - Cutler, MA.
NLK (24.8 kHz) - Seattle, WA.
 - earth's total magnetic field measured in gammas (nT)
 - magnetic variations controlled by automatic magnetic base station recording every 30 seconds
 - instrument accuracy +/- 0.1 nT.

Equipment Specifications - see Appendix I

4.0 DATA

Calculations

Total Field Magnetic Survey

Total field magnetic readings were individually corrected for variations in the earth's magnetic field using magnetic base station values. The formula used for magnetic corrections was;

$$\text{CTFR} = \text{TFR} + (\text{DBL} - \text{BSR})$$

where: CTFR = Corrected Total Field Reading
TFR = Total Field Reading
DBL = Datum Base Level
BSR = Base Station Reading

Presentation

- Magnetic data were profiled and are presented on Figure 1 at a scale of 1:5000
- Magnetic contours are presented on Figure 2 at a scale of 1:5000
- Cutler VLF-EM in-phase, out-of-phase and field strength readings are presented in profile form on Figure 3 at a scale of 1:5000
- Seattle VLF-EM in-phase, out-of-phase and field strength readings are presented in profile form on Figure 4 at a scale of 1:5000
- The Geophysical Interpretation Map is presented as Figure 5 at a scale of 1:5000

5.0 INTERPRETATION

Discussion and Conclusions

The VLF-EM transmitting station from Cutler had the best orientation for the north-south line direction of the present grid. The VLF-EM data appear to be somewhat noisy. This is particularly evident in the Seattle data since the greater transmitter power seems to have accentuated the problem. The noise is believed to be due to a problem with the backpack VLF-EM sensor. There are, however, a number of conductive trends that have been interpreted, many of which are within the noise envelope for this grid.

The VLF-EM conductor trends exhibit three strike directions; east-west, east-northeast and west-northwest. Strike lengths range from 100 to 1000 meters. In-phase and quadrature responses are generally quite weak with only several moderate strength anomalies.

Magnetic lineaments within the survey area have been delineated on the basis of offsets, terminations and disruptions in the magnetic contours. The dominant magnetic lineament strike directions are east-west and west-northwest.

VLF-EM conductive trends and magnetic lineaments interpreted from the results of the present survey are believed to represent structural features such as faults or contacts. VLF-EM conductors may reflect conductive, possibly reactivated and dilated, portions of structure.

Conductor C1 exhibits the best in-phase and quadrature response amplitudes within the survey area. This conductor extends for 300 meters, changing direction from east-west to northeast between lines 100 E and 200 E. At line 300 E, 550 N C1 appears to be terminated by east-west conductor C2 and magnetic lineament L3.

Magnetic lineament L1 seems to dissect the survey grid in an east-west direction. A series of weak conductors appear to be coincident at various points along lineament L1. This feature is interpreted to be a major structural feature, possibly with weakly conductive regions along strike.

The magnetic profiles display several distinctive magnetic environments. The section of the grid north of lineament L1 and east of line 100 E is characterized by a low magnetic intensity. The strongest magnetic intensity is located in the region bounded by lineament L2, between lines 0 and 600 E and the northern portion of lines 0 and 100 E.

Resulting from the lack of strong VLF-EM conductive trends, the focus for further exploration is based on magnetic attributes. This includes the intersection of interpreted magnetic lineaments, magnetic lows (which may indicate zones of alteration) and the intersection of magnetic lineaments with VLF-EM trends. Specific locations of interest are detailed in section 6.0 Recommendation.

6.0 RECOMMENDATIONS

The geophysical surveys have outlined a number of targets which are recommended for additional exploration on the ground. Geological investigations and sampling are recommended as a first pass exploration procedure for checking target locations. Encouraging results could then create priorities and establish targets for further geophysical work such as induced polarization. Drilling or trenching would then be in order to test for subsurface mineralization.

The following locations are recommended for detailed investigations on the ground:

Line #	Station #	Conductor #
300 E	550 N	C1
200 E	425 N	C1
100 E	362 N	C1

In addition the following locations, which may represent structural intersections, should be investigated:

- line 300 E, 150 N to 250 N
- line 200 E, 150 N to 225 N

- line 1100 E, 150 N to 300 N
- line 1000 E, 175 N to 200 N

- line 1200 E, 100 S to 50 N
- line 1100 E, 0 to 125 N

- line 1000 E, 100 S to 200 S
- line 900 E, 50 S to 200 S

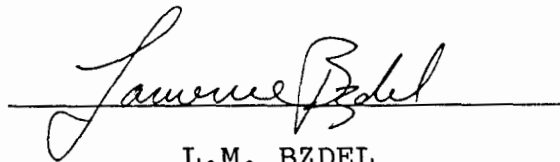

- line 600 E, 0 to 100 N

Favorable geological and/or geochemical information should be used to establish additional priorities for exploration of the remaining VLF-EM conductors and magnetic lineaments shown.

Respectfully Submitted

INTERPRETEX RESOURCES LTD.

AUTHOR'S NOTE

Data interpreted in this report were accumulated without supervision by Interpretex Resources Ltd. and were supplied by the Client to the writer(s). These data and the locations on the ground from which these data were accumulated are, except when specified otherwise by the writer(s), assumed to be reliable and correct and were interpreted using this assumption.

APPENDIX I

EQUIPMENT SPECIFICATIONS

OMNI PLUS VLF/Magnetometer System

Specifications*

Frequency Tuning Range	15 to 30 kHz, with bandwidth of 150 Hz; tuning range accommodates new Puerto Rico station at 28.5 kHz
Transmitting Stations Measured	Up to 3 stations can be automatically measured at any given grid location within frequency tuning range
Recorded VLF Magnetic Parameters	Total field strength, total dip, vertical quadrature (or alternately, horizontal amplitude)
Standard Memory Capacity	800 combined VLF magnetic and VLF electric measurements as well as gradiometer and magnetometer readings
Display	Custom designed, ruggedized liquid crystal display with built-in heater and an operating temperature range from -40°C to +55°C. The display contains six numeric digits, decimal point, battery status monitor, signal strength status monitor and function descriptors.
RS232C Serial I/O Interface	2400 baud rate, 8 data bits, 2 stop bits, no parity
Test Mode	A. Diagnostic Testing (data and programmable memory) B. Self Test (hardware)
Sensor Head	Contains 3 orthogonally mounted coils with automatic tilt compensation
Operating Environmental Range	-40°C to +55°C; 0 - 100% relative humidity; Weatherproof
Power Supply	Non-magnetic rechargeable sealed lead-acid 18V DC battery cartridge or belt; 18V DC disposable battery belt; 12V DC external power source for base station operation only.
Weights and Dimensions	
Instrument Console	2.8 kg, 128 x 150 x 250 mm
Sensor Head	2.1 kg, 130 dia. x 130 mm
VLF Electronics Module	1.1 kg, 40 x 150 x 250 mm
Lead Acid Battery Cartridge	1.8 kg, 235 x 105 x 90 mm
Lead Acid Battery Belt	1.8 kg, 540 x 100 x 40 mm
Disposable Battery Belt	1.2 kg, 540 x 100 x 40 mm

OMNI IV 'Tie-Line' Magnetometer

Specifications

Dynamic Range	18,000 to 110,000 gammas. Roll-over display feature suppresses first significant digit upon exceeding 100,000 gammas.
Tuning Method	Tuning value is calculated accurately utilizing a specially developed tuning algorithm
Automatic Fine Tuning	± 15% relative to ambient field strength of last stored value
Display Resolution	0.1 gamma
Processing Sensitivity	± 0.02 gamma
Statistical Error Resolution	0.01 gamma
Absolute Accuracy	± 1 gamma at 50,000 gammas at 23°C ± 2 gamma over total temperature range
Standard Memory Capacity	
Total Field or Gradient	1,200 data blocks or sets of readings
Tie-Line Points	100 data blocks or sets of readings
Base Station	5,000 data blocks or sets of readings
Display	Custom-designed, ruggedized liquid crystal display with an operating temperature range from -40°C to +55°C. The display contains six numeric digits, decimal point, battery status monitor, signal decay rate and signal amplitude monitor and function descriptors.
RS 232 Serial I/O Interface	2400 baud, 8 data bits, 2 stop bits, no parity
Gradient Tolerance	6,000 gammas per meter (field proven)
Test Mode	A. Diagnostic testing (data and programmable memory) B. Self Test (hardware)
Sensor	Optimized miniature design. Magnetic cleanliness is consistent with the specified absolute accuracy.
Gradient Sensors	0.5 meter sensor separation (standard), normalized to gammas/meter. Optional 1.0 meter sensor separation available. Horizontal sensors optional.
Sensor Cable	Remains flexible in temperature range specified, includes strain-relief connector
Cycling Time (Base Station Mode)	Programmable from 5 seconds up to 60 minutes in 1 second increments
Operating Environmental Range	-40°C to +55°C; 0-100% relative humidity; weatherproof
Power Supply	Non-magnetic rechargeable sealed lead-acid battery cartridge or belt; rechargeable NiCad or Disposable battery cartridge or belt; or 12V DC power source option for base station operation.
Battery Cartridge/Belt Life	2,000 to 5,000 readings, for sealed lead acid power supply, depending upon ambient temperature and rate of readings
Weights and Dimensions	
Instrument Console Only	2.8 kg, 238 x 150 x 250mm
NiCad or Alkaline Battery Cartridge	1.2 kg, 235 x 105 x 90mm
NiCad or Alkaline Battery Belt	1.2 kg, 540 x 100 x 40mm
Lead-Acid Battery Cartridge	1.8 kg, 235 x 105 x 90mm
Lead-Acid Battery Belt	1.8 kg, 540 x 100 x 40mm
Sensor	1.2 kg, 56mm diameter x 200mm
Gradient Sensor	
(0.5 m separation - standard)	2.1 kg, 56mm diameter x 790mm
(1.0 m separation - optional)	2.2 kg, 56mm diameter x 1300mm
Standard System Complement	Instrument console; sensor; 3-meter cable, aluminum sectional sensor staff, power supply, harness assembly, operations manual.
Base Station Option	Standard system plus 30 meter cable
Gradiometer Option	Standard system plus 0.5 meter sensor

SUMMARY REPORT ON
GEOPHYSICAL SURVEYS

TATSA PROJECT
ATLIN MINING DIVISION, B.C.

FOR
WATERFORD RESOURCES INC.

BY
INTERPRETEX RESOURCES LTD.

Vancouver, B.C.
December, 1990

L.M. Bzdel

1.0 INTRODUCTION

A geophysical program consisting of electromagnetic (VLF-EM) and magnetic surveys was carried out on two grids (Tatsa Main and K2) located on the Tatsa Claim Group, NTS 104K/08, in the Atlin Mining Division, B.C. The data was collected by Canamera Geological Ltd. of Vancouver, B.C. from September 2 - 27, 1990.

2.0 OBJECTIVES

- to establish a correlation between magnetic minerals and mineralized trends,
- to test the effectiveness of VLF-EM in following possible mineralized trends and to establish new unrecognized conductive trends,
- to establish geophysical areas of interest for future exploration.

3.0 SURVEY SPECIFICATIONS

Survey Parameters

- survey line separation - 100 meters.
- survey station spacing - 12.5 meters.
- VLF-EM and magnetic survey total 20.7 kilometers.

Equipment Parameters

- VLF-EM and Magnetic Surveys
 - Scintrex Omni Plus combined VLF-EM and magnetometer
 - Dip Angle (in-phase) and Quadrature (out-of-phase) measured in percent at each station
 - VLF-EM Field Strength measured at each station
 - transmitting stations used: NAA (24.0 kHz) - Cutler, MA.
NLK (24.8 kHz) - Seattle, WA.
 - earth's total magnetic field measured in gammas (nT)
 - magnetic variations controlled by automatic magnetic base station recording every 30 seconds
 - instrument accuracy +/- 0.1 nT.

Equipment Specifications - see Appendix I

4.0 DATA

Calculations

Total Field Magnetic Survey

Total field magnetic readings were individually corrected for variations in the earth's magnetic field using magnetic base station values. The formula used for magnetic corrections was;

$$\text{CTFR} = \text{TFR} + (\text{DBL} - \text{BSR})$$

where: CTFR = Corrected Total Field Reading

TFR = Total Field Reading

DBL = Datum Base Level

BSR = Base Station Reading

Presentation

- Magnetic data were profiled and are presented on Figure 1 (Tatsa Main) and Figure 5 (K2) at a scale of 1:5000
- Magnetic contours are presented on Figure 2 (Tatsa Main) and Figure 6 (K2) at a scale of 1:5000
- Cutler VLF-EM in-phase, out-of-phase and field strength readings are presented in profile form on Figure 3 (Tatsa Main) and Figure 7 (K2) at a scale of 1:5000
- Seattle VLF-EM in-phase, out-of-phase and field strength readings are presented in profile form on Figure 4 (Tatsa Main) and Figure 8 (K2) at a scale of 1:5000
- The Geophysical Interpretation Maps are presented as Figures 9 and 10 at a scale of 1:5000 for the Tatsa Main and K2 grids respectively

5.0 INTERPRETATION

Discussion and Conclusions

The VLF-EM transmitting station from Cutler had the best orientation for the north-south line direction of the Tatsa Main grid and the Seattle transmitter provided the best signal for the K2 grid. The primary VLF-EM conductor trends of interest exhibit a general east-west strike direction on the Tatsa Main grid and a northwesterly strike direction on the K2 grid. Strike lengths range from 100 - 1800 meters. In-phase responses vary from weak to strong with strong field strength anomalies associated with some VLF-EM trends.

Magnetic lineaments within the survey area have been delineated on the basis of offsets, terminations and disruptions in the magnetic contours.

VLF-EM conductive trends and magnetic lineaments interpreted from the results of the present survey are believed to represent structural features such as faults or contacts. VLF-EM conductors may reflect conductive, possibly reactivated and dilated, portions of structure. The stronger and more conductive anomalies may indicate the presence of sulphide mineralization within structures.

5.1 Tatsa Main Grid

The VLF-EM data appears to be clean except for the section of line 300 W from 725 S to 1175 S, and all of lines 400 W to 600 W. Here the Seattle field strength appears quite noisy.

Several problems were encountered with the raw magnetic data and corrections were applied before final plotting. A profile plot of the base station data indicates erratic magnetic values from 512.5 S to 712.5 S on line 300 E and from 712.5 S to 975 S on line 0 of the main grid. These spikes may have resulted from an intermittent cable problem between the sensor and the console, low fluid levels within the sensor, or perhaps atmospheric electrical disturbances. The base station values of the previous records on these lines appeared fairly constant, so an average of these values was used to correct the magnetic data.

On line 300 W, 725 S to 1175 S and all of lines 400 W to 600 W of the main grid, the base station values were more than 2000 nanoteslas greater than the remainder of the grid base station values. It is suspected that the base station was moved to a different location when this section of the grid was surveyed. The level shift created was corrected by subtracting 2095 nanoteslas from the elevated base station values and then correcting the magnetic readings as described in section 4.0 Calculations.

Conductor C1 exhibits the best VLF-EM response, characterized by a large in-phase amplitude, a reverse quadrature and a relatively strong field strength. From line 300 W to line 200 E conductor C1 correlates with Tatsa Creek which may contribute, to a small degree, to the conductivity. East of line 200 E Tatsa Creek begins to trend off in a northeasterly direction, while conductor C1 continues in an easterly direction. The strong responses suggest that conductor C1 is responding to a bedrock source, such as massive sulphides, possibly within a structural environment.

VLF-EM conductor C2 extends over a strike length of 1800 meters and is thought to represent an east-west trending fault zone. The response amplitudes range from weak to moderate with the best responses between lines 100 E and 200 E. From line 1000 E to line 1500 E conductor C2 divides regions of relatively high and low magnetic intensities, likely representing a faulted contact in this area.

Conductor C3 extends for 700 meters from line 1400 E to line 700 E. At line 700 E C3 appears to be terminated by interpreted magnetic lineament L1. This conductor is characterized by a moderately strong in-phase, a poor quadrature, and a moderate field strength response. Superimposing this VLF-EM trend on the magnetic profiles indicates that conductor C3 correlates with a weak magnetic high trend from line 1000 E to line 1400 E. Conductor C4 exhibits similar profile characteristics and magnetic correlation as C3, and may therefore be a continuation of C3 that has been offset by a fault. The correlation with increased magnetic intensity suggests possible magnetic sulphides, such as pyrrhotite, along these trends.

Conductor C5 correlates with a trough of low magnetic intensity that appears to form the northern boundary of a region of increased magnetism located in the southwest section of the grid. The best VLF-EM response along this trend is at line 100 E, 475 S. This conductive trend is believed to represent a fault/contact zone.

Conductor C6 is located along a seam of lower magnetic intensity within a region of overall higher magnetic activity. This relatively weak conductor is also interpreted as a structural feature.

Conductor C7 correlates with magnetic lineament L1, and likely represents a structure. The most important section along this conductor is from line 200 W to 100 E where the in-phase and quadrature show moderate response amplitudes.

Other unlabeled conductors on the Tatsa Main grid probably reflect structural environments in the area but are believed to be less significant and should be explored only after more important conductors have been investigated unless geological and/or geochemical information can be used to enhance their priority.

The magnetic data has delineated a number of distinctive magnetic environments within the main grid (Figure 2). The southernmost section of the grid, labeled M1, exhibits the greatest magnetic activity and strongest intensity in the survey area. This magnetic unit is bounded to the north by conductor C5 and appears open to the south and east.

M2 is an east-west trending feature of higher magnetic intensity extending from line 300 W to line 500 E between approximately 200 S to 400 S. The magnetic lows that flank M2 may be a result, in part, of the negative field produced by the dipole effect of the more magnetic body that is thought to represent a dike-like intrusion.

Another region of higher magnetic intensity, M3, is located in the northeastern region of the grid. M3 is bounded to the south and north by conductors C2 and C8 and to the west by lineaments L1 and L2.

The remainder of the Tatsa Main grid exhibits a generally less active magnetic environment.

5.2 K2 Grid

The VLF-EM survey has delineated several interesting conductive trends on the K2 grid. In-phase, quadrature and field strength responses vary from weak to moderate. Between lines 50 S and 100 S conductor C10 appears to split into two trends. Along the western edge of the grid on lines 0 S to 100 S there is the start of a strong in-phase and field strength response. Further coverage to the west is needed to better define the extent and significance of this trend (see Figure 8).

Interpreted magnetic lineament L3 defines a sharp contrast in magnetic environments on the K2 grid (Figure 6). The sharp contrast defined by L3 is believed to represent a fault or contact zone between more magnetic and less magnetic rocks. North of L3 the magnetic profiles display an increase in magnetic intensity and activity, whereas to the south of L3 the magnetics exhibit a quiet magnetic environment.

6.0 RECOMMENDATIONS

The geophysical surveys have outlined a number of targets which are recommended for additional exploration on the ground. Geological investigations and sampling are recommended as a first pass exploration procedure for checking target locations. Encouraging results could then create priorities and establish targets for further geophysical work such as induced polarization or a low frequency electromagnetic method. Drilling or trenching would then be in order to test for subsurface mineralization.

The following locations are recommended in order of geophysical priority for detailed investigations on the ground:

Line #	Station #	Conductor #
300 E	162 S	C1
400 E	150 S	C1
500 E	150 S	C1
600 E	15 S	C2
800 E	50 N	C2
900 E	75 N	C2
1300 E	300 N	C3
1500 E	375 N	C4
100 E	475 S	C5
200 W	925 S	C6

100 W	112 S	C7
1100 E	375 N	C8
100 S	262 E	C9 (K2)
150 S	200 E	C10 (K2)
150 S	175 E	C10 (K2)
0	25 E	(K2 grid)
100 S	25 W	(K2 grid)

In addition the following locations, which may represent structural intersections, should be investigated:

- line 800 E, 250 N to 400 N
- line 900 E, 250 N to 400 N
- line 1000 E, 200 N to 300 N
- line 400 E, 300 N to 400 N

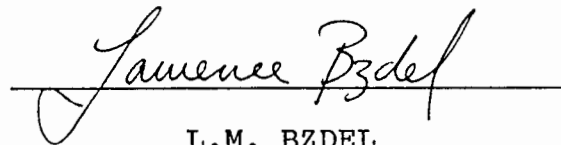

Favorable geological and/or geochemical information should be used to establish additional priorities for exploration of the remaining VLF-EM conductors and magnetic lineaments shown.

If encouraging results are obtained along conductors C1 and C4 then an extension of the grid to the south and east and further magnetic and VLF-EM coverage are recommended.

Respectfully Submitted

L.M. BZDEL

Geophysicist

CERTIFICATE

I, Lawrence Michael Bzdel, Geophysicist of Burnaby, British Columbia, Canada, hereby certify that:

1. I received a B.Sc. degree in Geophysics from the University of Saskatchewan in 1986.
2. I have been practising my profession since graduation.
3. I hold no direct or indirect interest in, nor expect to receive any benefits from, the mineral property or properties described in this report.
4. This report may be used for the development of the property, provided that no portion will be used out of context in such a manner as to convey meanings from that set out in the whole.
5. Consent is hereby given to the company for which this report was prepared to reproduce the report or any part of it for the purposes of development of the property, or facts relating to the raising of funds by way of a prospectus and/or statement of material facts.

Date: Dec 10/90

Burnaby,
British Columbia

Signed: _____

Lawrence Bzdel

Lawrence Michael Bzdel
B.Sc.

AUTHOR'S NOTE

Data interpreted in this report were accumulated without supervision by Interpretex Resources Ltd. and were supplied by the Client to the writer(s). These data and the locations on the ground from which these data were accumulated are, except when specified otherwise by the writer(s), assumed to be reliable and correct and were interpreted using this assumption.

APPENDIX I

EQUIPMENT SPECIFICATIONS

OMNI PLUS VLF Magnetometer System

Specifications*

Frequency Tuning Range	15 to 30 kHz, with bandwidth of 150 Hz; tuning range accommodates new Puerto Rico station at 28.5 kHz
Transmitting Stations Measured	Up to 3 stations can be automatically measured at any given grid location within frequency tuning range
Recorded VLF Magnetic Parameters	Total field strength, total dip, vertical quadrature (or alternately, horizontal amplitude)
Standard Memory Capacity	800 combined VLF magnetic and VLF electric measurements as well as gradiometer and magnetometer readings
Display	Custom designed, ruggedized liquid crystal display with built-in heater and an operating temperature range from -40°C to $+55^{\circ}\text{C}$. The display contains six numeric digits, decimal point, battery status monitor, signal strength status monitor and function descriptors.
RS232C Serial I/O Interface	2400 baud rate, 8 data bits, 2 stop bits, no parity
Test Mode	A. Diagnostic Testing (data and programmable memory) B. Self Test (hardware)
Sensor Head	Contains 3 orthogonally mounted coils with automatic tilt compensation
Operating Environmental Range	-40°C to $+55^{\circ}\text{C}$; 0 - 100% relative humidity; Weatherproof
Power Supply	Non-magnetic rechargeable sealed lead-acid 18V DC battery cartridge or belt; 18V DC disposable battery belt; 12V DC external power source for base station operation only.
Weights and Dimensions	
Instrument Console	2.8 kg, 128 x 150 x 250 mm
Sensor Head	2.1 kg, 130 dia. x 130 mm
VLF Electronics Module	1.1 kg, 40 x 150 x 250 mm
Lead Acid Battery Cartridge	1.8 kg, 235 x 105 x 90 mm
Lead Acid Battery Belt	1.8 kg, 540 x 100 x 40 mm
Disposable Battery Belt	1.2 kg, 540 x 100 x 40 mm

OMNI IV "Tie-Line" Magnetometer

Specifications

Dynamic Range	18,000 to 110,000 gammas. Roll-over display feature suppresses first significant digit upon exceeding 100,000 gammas.
Tuning Method	Tuning value is calculated accurately utilizing a specially developed tuning algorithm
Automatic Fine Tuning	± 15% relative to ambient field strength of last stored value
Display Resolution	0.1 gamma
Processing Sensitivity	± 0.02 gamma
Statistical Error Resolution	0.01 gamma
Absolute Accuracy	± 1 gamma at 50,000 gammas at 23°C ± 2 gamma over total temperature range
Standard Memory Capacity	
Total Field or Gradient	1,200 data blocks or sets of readings
Tie-Line Points	100 data blocks or sets of readings
Base Station	5,000 data blocks or sets of readings
Display	Custom-designed, ruggedized liquid crystal display with an operating temperature range from -40°C to +55°C. The display contains six numeric digits, decimal point, battery status monitor, signal decay rate and signal amplitude monitor and function descriptors.
RS 232 Serial I/O Interface	2400 baud, 8 data bits, 2 stop bits, no parity
Gradient Tolerance	6,000 gammas per meter (field proven)
Test Mode	A. Diagnostic testing (data and programmable memory) B. Self Test (hardware)
Sensor	Optimized miniature design. Magnetic cleanliness is consistent with the specified absolute accuracy.
Gradient Sensors	0.5 meter sensor separation (standard), normalized to gammas/meter. Optional 1.0 meter sensor separation available. Horizontal sensors optional.
Sensor Cable	Remains flexible in temperature range specified, includes strain-relief connector
Cycling Time (Base Station Mode)	Programmable from 5 seconds up to 60 minutes in 1 second increments
Operating Environmental Range	-40°C to +55°C; 0-100% relative humidity; weatherproof
Power Supply	Non-magnetic rechargeable sealed lead-acid battery cartridge or belt; rechargeable NiCad or Disposable battery cartridge or belt; or 12V DC power source option for base station operation.
Battery Cartridge/Belt Life	2,000 to 5,000 readings, for sealed lead acid power supply, depending upon ambient temperature and rate of readings
Weights and Dimensions	
Instrument Console Only	2.8 kg, 238 x 150 x 250mm
NiCad or Alkaline Battery Cartridge	1.2 kg, 235 x 105 x 90mm
NiCad or Alkaline Battery Belt	1.2 kg, 540 x 100 x 40mm
Lead-Acid Battery Cartridge	1.8 kg, 235 x 105 x 90mm
Lead-Acid Battery Belt	1.8 kg, 540 x 100 x 40mm
Sensor	1.2 kg, 56mm diameter x 200mm
Gradient Sensor (0.5 m separation - standard)	2.1 kg, 56mm diameter x 790mm
Gradient Sensor (1.0 m separation - optional)	2.2 kg, 56mm diameter x 1300mm
Standard System Complement	Instrument console; sensor; 3-meter cable, aluminum sectional sensor staff, power supply, harness assembly, operations manual.
Base Station Option	Standard system plus 30 meter cable
Gradiometer Option	Standard system plus 0.5 meter sensor

INTERPRETEX RESOURCES LTD. Data Listing

Area: ATLIN M.D. Current File Name: K2MINDAT.WR1
 Grid: K2MINI From File Name: K2MINI.XYZ
 Date: Nov., 1990

INSTRUMENT TYPE: EDA Omni Plus VLF-EM/Magnetometer System

(Line & Station + = Northings and Eastings,
 - = Southings and Westings)

DATA TYPE(S):	DATA DETAILS:
#1. Total Field Magnetic Values	Corrected total magnetic field
#2. VLF-EM In-Phase Values	Cutler Transmitter - facing east
#3. VLF-EM Quadrature	Cutler Transmitter - facing east
#4. VLF-EM Field Strength	Cutler total field strength
#5. VLF-EM In-Phase Values	Seattle Transmitter - facing east
#6. VLF-EM Quadrature	Seattle Transmitter - facing east
#7. VLF-EM Field Strength	Seattle total field strength

SUMMARY REPORT ON
GEOPHYSICAL SURVEYS

BING PROJECT
ATLIN MINING DIVISION, B.C.

FOR
WATERFORD RESOURCES INC.

BY
INTERPRETEX RESOURCES LTD.

Vancouver, B.C.
December, 1990

L.M. Bzdel

1.0 INTRODUCTION

A geophysical program consisting of electromagnetic (VLF-EM) and magnetic surveys was carried out on a single grid located on the Bing Claim Group, NTS 104K/08, in the Atlin Mining Division, B.C. The data was collected by Canamera Geological Ltd. of Vancouver, B.C. from October 5 - 8, 1990.

2.0 OBJECTIVES

- to establish a correlation between magnetic minerals and mineralized trends,
- to test the effectiveness of VLF-EM in following possible mineralized trends and to establish new unrecognized conductive trends,
- to establish geophysical areas of interest for future exploration.

3.0 SURVEY SPECIFICATIONS

Survey Parameters

- survey line separation - 100 meters.
- survey station spacing - 12.5 meters.
- VLF-EM and magnetic survey total 15.3 kilometers.

Equipment Parameters

- VLF-EM and Magnetic Surveys
 - Scintrex Omni Plus combined VLF-EM and magnetometer
 - Dip Angle (in-phase) and Quadrature (out-of-phase) measured in percent at each station
 - VLF-EM Field Strength measured at each station
 - transmitting stations used: NSS (21.4 kHz) - Annapolis, MD.
NLK (24.8 kHz) - Seattle, WA.
 - earth's total magnetic field measured in gammas (nT)
 - magnetic variations controlled by automatic magnetic base station recording every 30 seconds
 - instrument accuracy +/- 0.1 nT.

Equipment Specifications - see Appendix I

4.0 DATA

Calculations

Total Field Magnetic Survey

Total field magnetic readings were individually corrected for variations in the earth's magnetic field using magnetic base station values. The formula used for magnetic corrections was;

$$\text{CTFR} = \text{TFR} + (\text{DBL} - \text{BSR})$$

where: CTFR = Corrected Total Field Reading
TFR = Total Field Reading
DBL = Datum Base Level
BSR = Base Station Reading

Presentation

- Magnetic data were profiled and are presented on Figure 1 at a scale of 1:5000
- Magnetic contours are presented on Figure 2 at a scale of 1:5000
- Seattle VLF-EM in-phase, out-of-phase and field strength readings are presented in profile form on Figure 3 at a scale of 1:5000
- Annapolis VLF-EM in-phase, out-of-phase and field strength readings are presented in profile form on Figure 4 at a scale of 1:5000
- The Geophysical Interpretation Map is presented as Figure 5 at a scale of 1:5000

5.0 INTERPRETATION

Discussion and Conclusions

The VLF-EM transmitting station from Seattle had the best orientation for the east-west line direction of the present grid. The VLF-EM data appear to be somewhat noisy. This is particularly evident in the field strength data. The noise is believed to be due to a problem with the backpack VLF-EM sensor. There are, however, a number of conductive trends that have been interpreted.

The primary VLF-EM conductor trends of interest exhibit three strike directions; north-northeast, north-south and north-northwest. Strike lengths range from 100 - 1100 meters. In-phase and quadrature responses vary from weak to moderate. There are strong field strength anomalies associated with some VLF-EM trends, but these must be viewed with caution due to the uncertainty of the field strength data.

Magnetic lineaments within the survey area have been delineated on the basis of offsets, terminations and disruptions in the magnetic contours.

VLF-EM conductive trends and magnetic lineaments interpreted from the results of the present survey are believed to represent structural features such as faults or contacts. VLF-EM conductors may reflect conductive, possibly reactivated and dilated, portions of structure. The stronger and more conductive anomalies may indicate the presence of sulphide mineralization within structures.

Conductor C1 extends for almost 1100 meters in a north-northeast direction and is characterized by weak to moderate in-phase and quadrature responses. This conductor is believed to represent a fault/contact zone based on the change in magnetic character on either side of the conductor. Also, a series of magnetic lows seems to correlate with this conductive trend.

VLF-EM conductor C2 consists of a system of three parallel, north-northwest striking, weak to moderate strength trends. These conductors are believed to represent structural features and are terminated by conductor C1.

Other unlabeled conductors on the Bing grid probably reflect structural environments in the area but are believed to be less significant unless geological and/or geochemical information can be used to enhance their priority.

The magnetic profiles and contours display a very active magnetic environment throughout the grid. It has been found that some single station magnetic spikes correlate with spikes within the VLF-EM data. Thus some of the small, short wavelength magnetic features within the Bing grid could be spurious. The stronger and longer wavelength magnetic anomalies are considered to be valid.

The region west of conductor C1 has the highest magnetic intensity within the survey area. The section of the grid north of magnetic lineament L1 and east of lineament L2 is characterized by a predominantly lower magnetic intensity.

Magnetic lineament L1 strikes in an east-west direction between lines 400 S and 500 S. Usually magnetic lineaments between survey lines must be viewed with caution, but in this instance there is enough evidence to confidently support this feature. A very distinct change in magnetic profile and contour character is observed between these two lines, particularly from 0 - 250 W.

A number of other magnetic lineaments have been interpreted and are thought to represent structural features. The intersection of these lineaments are believed to be important targets for further evaluation.

6.0 RECOMMENDATIONS

The geophysical surveys have outlined a number of targets which are recommended for additional exploration on the ground. Geological investigations and sampling are recommended as a first pass exploration procedure for checking target locations. Encouraging results could then create priorities and establish targets for further geophysical work such as induced polarization or a low frequency electromagnetic method. Drilling or trenching would then be in order to test for subsurface mineralization.

The following locations are recommended for detailed investigations on the ground:

Line #	Station #	Conductor #
200 N	50 W	C1
100 S	175 W	C1
300 S	262 W	C1
400 S	337 W	C1
500 S	400 W	C1
200 S	25 E	C2
200 S	112 E	C2
300 N	375 E	

In addition the following locations, which may represent structural intersections, should be investigated:

- line 600 S, 425 W to 600 W
- line 700 S, 475 W to 600 W

- line 400 S, 250 W to 375 W
- line 500 S, 250 W to 375 W

- line 0, 75 W to 150 W
- line 100 S, 50 W to 250 W

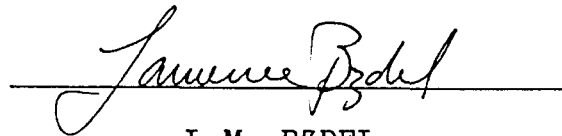

- line 400 S, 100 E to 250 W
- line 500 S, 100 E to 250 W
- line 600 S, 75 W to 250 W

Favorable geological and/or geochemical information should be used to establish additional priorities for exploration of the remaining VLF-EM conductors and magnetic lineaments shown.

AUTHOR'S NOTE

Data interpreted in this report were accumulated without supervision by Interpretex Resources Ltd. and were supplied by the Client to the writer(s). These data and the locations on the ground from which these data were accumulated are, except when specified otherwise by the writer(s), assumed to be reliable and correct and were interpreted using this assumption.

APPENDIX I

EQUIPMENT SPECIFICATIONS

OMNI PLUS VLF/Magnetometer System

Specifications*

Frequency Tuning Range	15 to 30 kHz, with bandwidth of 150 Hz; tuning range accommodates new Puerto Rico station at 28.5 kHz
Transmitting Stations Measured	Up to 3 stations can be automatically measured at any given grid location within frequency tuning range
Recorded VLF Magnetic Parameters	Total field strength, total dip, vertical quadrature (or alternately, horizontal amplitude)
Standard Memory Capacity	800 combined VLF magnetic and VLF electric measurements as well as gradiometer and magnetometer readings
Display	Custom designed, ruggedized liquid crystal display with built-in heater and an operating temperature range from -40°C to +55°C. The display contains six numeric digits, decimal point, battery status monitor, signal strength status monitor and function descriptors.
RS232C Serial I/O Interface	2400 baud rate, 8 data bits, 2 stop bits, no parity
Test Mode	A. Diagnostic Testing (data and programmable memory) B. Self Test (hardware)
Sensor Head	Contains 3 orthogonally mounted coils with automatic tilt compensation
Operating Environmental Range	-40°C to +55°C; 0 - 100% relative humidity; Weatherproof
Power Supply	Non-magnetic rechargeable sealed lead-acid 18V DC battery cartridge or belt; 18V DC disposable battery belt; 12V DC external power source for base station operation only.
Weights and Dimensions	
Instrument Console	2.8 kg, 128 x 150 x 250 mm
Sensor Head	2.1 kg, 130 dia. x 130 mm
VLF Electronics Module	1.1 kg, 40 x 150 x 250 mm
Lead Acid Battery Cartridge	1.8 kg, 235 x 105 x 90 mm
Lead Acid Battery Belt	1.8 kg, 540 x 100 x 40 mm
Disposable Battery Belt	1.2 kg, 540 x 100 x 40 mm

OMNI IV 'Tie-Line' Magnetometer

Specifications

Dynamic Range	18,000 to 110,000 gammas. Roll-over display feature suppresses first significant digit upon exceeding 100,000 gammas.
Tuning Method	Tuning value is calculated accurately utilizing a specially developed tuning algorithm
Automatic Fine Tuning	$\pm 15\%$ relative to ambient field strength of last stored value
Display Resolution	0.1 gamma
Processing Sensitivity	± 0.02 gamma
Statistical Error Resolution	0.01 gamma
Absolute Accuracy	± 1 gamma at 50,000 gammas at 23°C ± 2 gamma over total temperature range
Standard Memory Capacity	
Total Field or Gradient	1,200 data blocks or sets of readings
Tie-Line Points	100 data blocks or sets of readings
Base Station	5,000 data blocks or sets of readings
Display	Custom-designed, ruggedized liquid crystal display with an operating temperature range from -40°C to $+55^{\circ}\text{C}$. The display contains six numeric digits, decimal point, battery status monitor, signal decay rate and signal amplitude monitor and function descriptors.
RS 232 Serial I/O Interface	2400 baud, 8 data bits, 2 stop bits, no parity
Gradient Tolerance	6,000 gammas per meter (field proven)
Test Mode	A. Diagnostic testing (data and programmable memory) B. Self Test (hardware)
Sensor	Optimized miniature design. Magnetic cleanliness is consistent with the specified absolute accuracy.
Gradient Sensors	0.5 meter sensor separation (standard), normalized to gammas/meter. Optional 1.0 meter sensor separation available. Horizontal sensors optional.
Sensor Cable	Remains flexible in temperature range specified, includes strain-relief connector
Cycling Time (Base Station Mode)	Programmable from 5 seconds up to 60 minutes in 1 second increments
Operating Environmental Range	-40°C to $+55^{\circ}\text{C}$; 0-100% relative humidity; weatherproof
Power Supply	Non-magnetic rechargeable sealed lead-acid battery cartridge or belt; rechargeable NiCad or Disposable battery cartridge or belt; or 12V DC power source option for base station operation.
Battery Cartridge/Belt Life	2,000 to 5,000 readings, for sealed lead acid power supply, depending upon ambient temperature and rate of readings
Weights and Dimensions	
Instrument Console Only	2.8 kg, 238 x 150 x 250mm
NiCad or Alkaline Battery Cartridge	1.2 kg, 235 x 105 x 90mm
NiCad or Alkaline Battery Belt	1.2 kg, 540 x 100 x 40mm
Lead-Acid Battery Cartridge	1.8 kg, 235 x 105 x 90mm
Lead-Acid Battery Belt	1.8 kg, 540 x 100 x 40mm
Sensor	1.2 kg, 56mm diameter x 200mm
Gradient Sensor (0.5 m separation - standard)	2.1 kg, 56mm diameter x 790mm
Gradient Sensor (1.0 m separation - optional)	2.2 kg, 56mm diameter x 1300mm
Standard System Complement	Instrument console; sensor; 3-meter cable, aluminum sectional sensor staff, power supply, harness assembly, operations manual.
Base Station Option	Standard system plus 30 meter cable
Gradiometer Option	Standard system plus 0.5 meter sensor

APPENDIX II

VLF-EM and Magnetic Data List

INTERPRETEX RESOURCES LTD. Data Listing

Area: ATLIN M.D. Current File Name: BDAT.WR1
 Grid: BING From File Name: B.XYZ
 Date: Nov., 1990

INSTRUMENT TYPE: EDA Omni Plus VLF-EM/Magnetometer System

(Line & Station + = Northings and Eastings,
 - = Southings and Westings)

DATA TYPE(S):	DATA DETAILS:
#1. Total Field Magnetic Values	Corrected total magnetic field
#2. VLF-EM In-Phase Values	Annapolis Transmitter - facing east
#3. VLF-EM Quadrature	Annapolis Transmitter - facing east
#4. VLF-EM Field Strength	Annapolis total field strength
#5. VLF-EM In-Phase Values	Seattle Transmitter - facing east
#6. VLF-EM Quadrature	Seattle Transmitter - facing east
#7. VLF-EM Field Strength	Seattle total field strength
