SUMMARY

A geochemical soil and humus sampling program was completed on the Cart group of claims to evaluate an area previously reported to contain anomalous gold results from a heavy mineral stream sampling program, up to 1658 ppb Au.

Additional geochemical coverage within the claim group was completed to evaluate those areas indicated to host Eocene and mid-Tertiary aged diorite and biotite feldspar porphyry intrusive rocks.

A total of 92 C Horizon and 315 A₀ soil horizon samples were collected at 50 m intervals along compass, flag and chained lines emplaced at 500 m centres. A total of 17.75 line km were surveyed. Overburden is extensive with <2% outcrop exposure.

Results returned background levels in copper with a high of 58 ppm Cu while gold results report isolated single point anomalies up to 950 ppb Au with the majority returning 5 ppb Au.

INTRODUCTION

1.1 Location and Access

The Cart claim group is located 44 km southwest of Hanceville. Road access is available to the property south of Hanceville to Big Creek and west to the Bambrick main haulage road which provides all weather gravel road access to the central portions of the claim group (Figure 1, 2). Logging road access is within 500 m of the property's west boundary and 4x4 bush roads provides access to the east boundary along Bambrick Creek.

Elevations range from 1400 m to 1700 m. Topography is gentle slopes with open forest cover of Lodgepole pine and spruce. Clear cut logging is extensive on the Cart 2 & 3 claims.

1.2 Claims and Ownership

The Cart claim group is composed of the following claims (Figure 3).

Under an option agreement with Bitterroot Resources, Ltd., Hemlo Gold Mines, Inc. can earn a 60% interest in the Cart claim group. Noranda Exploration Company, Limited as agent for Hemlo Gold Mines, Inc. performed all the work on the claims.

1.3 Previous Exploration

1970: Northwest Ventures Ltd. conducted a program of soil sampling plus magnetometer - I.P. ground surveys in the area of the Sun and Mike occurrences located to the North of the present claim group. Six areas with potential for sulphide mineralization were delineated.

1982-1983: A limited program of heavy mineral sampling, prospecting and geochemical soil sampling was conducted in the western portions of the existing Cart claim group by Mr. R. Dunn. Initial heavy mineral samples included several which were anomalous in gold (13,000 to 50,000 ppb Au) with the remainder being >1000 ppb Au. A follow-up survey yielded anomalous results from 39 ppb Au to 1658 ppb Au.

2.1 1992 Exploration Program

From May 6 to May 13, 1992 a geochemical soil survey was conducted on the Cart 1, 3, 4 and 5 claims. Survey lines were established at 500 m centres with samples collected at 50 m intervals. A total of 17.75 line km were surveyed.

Soil development is poor with the B horizon forming a thin veneer above the C horizon. Sampling of the C horizon to depths of 30 cm were completed on Lines 10,000E and 11,000E resulting in 92 samples. The C horizon consists of grey clay to sand-size particles supporting pebble to cobble-size basalt rock fragments.

The majority of samples collected, totalling 315 sample sites, were from the A_o horizon consisting of decayed plant debris and scrapings of the B horizon, typically to depths of 7 cm. Figure 4 illustrates sample site locations.

Samples of approximately 1 kg in weight were placed in Kraft paper bags, and partially air-dried prior to shipment to Noranda's Vancouver laboratory. The samples were dried and analyzed for 30 elements by I.C.P. with gold analysis by Atomic Absorption. Appendix I describes Noranda's analytical procedure.

2.2 1992 Exploration Results

Results of the geochemical sampling program failed to delineate anomalous zones for copper or gold with copper reporting a high of 58 ppm while gold results returned background values of 5 ppb with single point isolated anomalies to 950 ppb Au.

Copper and gold results are illustrated at 1:10,000 on Figure 4 with analytical results attached as Appendix II.

3.0 Conclusions and Recommendations

The 1992 soil sampling program failed to delineate any zones anomalous in copper or gold. Extensive overburden covers most of the property with outcrop exposure of <2% restricted to ridge tops.

In light of the negative results received, no further action is recommended.

APPENDIX I
ANALYTICAL PROCEDURES

ANALYTICAL METHOD DESCRIPTIONS FOR GEOCHEMICAL ASSESSMENT REPORTS

The methods listed are presently applied to analyses geological materials by the Noranda Geochemical Laboratory at Vancouver.

Preparation of Samples:

Sediments and soils are dried at approximately 80°C and sieved with a 80 mesh nylon screen. The -80 mesh (0.18 mm) fraction is used for geochemical analysis.

Rock specimens are pulverized to -120 mesh (0.13 mm). Heavy mineral fractions are analyzed in its entirety, when it is to be determined for gold without further sample preparation.

Analysis of Samples:

ICP analyses for 28 elements is determined using a Leeman PS3000. For silts and soils a 0.2 g sample is digested with 3 ml of $\text{HClO}_4/\text{HNO}_3$ at a ratio of 4:1. This digestion occurs for 4 hours at a temperature of 203°C. The resulting liquid is diluted to 11 ml with water. Pulps of rock or core are weighed out at 0.4 g, and chemical quantities are doubled relative to the above noted method for digestion. Otherwise the procedure remains the same.

Gold (Au) content is determined by atomic absorption (AA), not ICP. A 10 g sample is weighed and ashed at 590°C for 3 to 5 hours. After cooling, 35 mls of aqua regia ($1\text{HNO}_3:3\text{HCl}$) is added and the samples are digested on a hot plate for 2 hours, or until 15 mls of aqueous solution is left. Dilute with water to 100 mls and add 5 mls MIBK. Addition of MIBK extracts and pre-concentrates the gold from the aqueous solution. Following this step the MIBK solution is analyzed on the AA.

Detection limits (D.L.) and low range sensitivities (L.R.S.)
for ICP and AA (Au only) analyses (Noranda Vancouver Laboratory).

NORANDA VANCOUVER LABORATORY
Geochemical Analysis

Project Name & No.: CART PROPERTY - 160

Material: 315 HUMUS/A horizon

Remarks: * Sample screened @ -35 MESH (0.5 mm)

Organic, Δ Humus, S Sulfide

Geol.: R.K.

Sheet: 1 of 8

Date received: MAY 14

LAB CODE: 9205-014

Date completed: JUNE 09

Au - 10.0 g sample digested with aqua-regia and determined by A.A. (D.L. 5 PPB)

ICP - 0.2 g sample digested with 3 ml HClO₄/HNO₃ (4:1) at 203 °C for 4 hours diluted to 11 ml with water. Leeman PS3000 ICP determined elemental contents.

N.B. The major oxide elements and Ba, Be, Ce, La, Li, Ga are rarely dissolved completely from geological materials with this acid dissolution method.
