1.0 INTRODUCTION

1.1 **PROJECT SETTING**

The Red Mountain Project is located in the Coast Mountain Ranges approximately 12 km east of the community of Stewart, B.C. The property is situated in a cirque bowl between the Pre-Cambria Ice Cap and the Bromley Glacier at the 1500 m elevation. Access to the property is by helicopter usually from the Stewart airport with a flight time of about 10 minutes.

The project is drained by Goldslide Creek which has a northwest aspect flowing through the short cirque bowl, through a steep canyon and finally cascading down steep valley side walls into a small lake at the base of the Bromley Glacier. Goldslide Creek is a tributary to Bitter Creek which flows into the Bear River and eventually to the west into the Portland Canal and the Pacific Ocean.

1.2 <u>PURPOSE OF THE REPORT</u>

This report presents environmental baseline data collected at the Bond Gold Canada Inc., Red Mountain Project initiated in October 11, 1990. The report is intended to be a data report with an explanation of the metering installations and the monitoring program.

Environmental baseline data collection was initiated for purposes of gathering data which would be available if the project proceeded to the permit application stage. All data is presented in the Appendices of this report in the form of Lotus 123.R3 spread sheets and in certain cases graphed for purposes of illustration. The files are also available in diskette form as well. Drawing No. H1231.101 located in Appendix A illustrates the location of the data collection sites.

2.0 METEOROLOGY

2.1 WEATHER STATION INSTALLATION

The weather station was installed October 11, 1990 in the middle of a cirque bowl immediately to the west of Goldslide Creek at the 1524 m elevation. Meteorology instrumentation at the station consists of a R.M. Young Wind Speed and Direction Sensor and a Lakewood Systems TP 50 Temperature Probe mounted at the top of a 10 m tower plus a Sierra-Misco 2502 Tipping Bucket Rain Gauge situated 6 m from the base of the tower. These sensors are connected to a Lakewood Systems UL-16 Ultralogger with 64 K memory and powered by lithium batteries for purposes of allowing continuous recording at this remote site. The logger was programmed and data retrieved using a lap top computer.

2.2 DATA COLLECTION

The weather station data logger was initially programmed on October 11, 1990 to take readings of each sensor every 5 minutes and to store the maximum, minimum values every 1.5 hours and the average values every 24 hours. Data was recovered on May 22, 1991, however the memory in the logger had filled by February 24, 1991 resulting in the loss of two months of data. The data storage time frame was subsequently altered on May 22, 1991 from 1.5 hours (permits 6 months data collection) to 3.0 hours (permits 1 year data collection) to reduce the drain on the battery system and permit data collection for longer periods between data retrieval. Data retrieval on October 30, 1991 was attempted but it was discovered that the data had been scrambled by an electrostatic event. The station was restarted and data was to be retrieved every two weeks during the winter period as part of an avalanche monitoring program. The avalanche monitoring program was cancelled but the station remained in operation. Data will be retrieved in July 1992 and incorporated into this report.

Appendices B-1, B-2, B-3 and B-4 contain the maximum, minimum, average and midnight signature data, respectively, from the weather station data logger for the period October 10, 1990 to February 24, 1991.

2.2.1 Temperature

Appendix B-5 presents graphs of the maximum daily, minimum daily and average daily temperatures taken from the original data. During the period of record, temperatures varied from an extreme minimum of -24.5 °C on December 28, 1990 to an extreme maximum of 12.2 °C on February 15, 1991 with daily averages ranging from -20.3 °C in December to 1.2 °C in February.

2.2.2 Precipitation

The tipping bucket rain gauge was connected throughout the data recording period October 1990 to February 1991 but did not produce any data due to snow cover.

2.2.3 Wind Speed and Direction

Wind speed and direction data is presented in Appendix A-1 to A-4 in the form of a Lotus 123.R3 spreadsheet. When the data logger was programmed in October 10, 1990, all sensors connected to the logger were set to provide minimum, maximum and average data. This presented some difficulties when it came to interpret the wind direction data since raw data would translate wind directions into numeric values between 0° and 360° relative to the installed direction on the tower. These values were adjusted to degrees true (relative to true north) by taking into consideration the compass bearing of the wind sensor and the magnetic variation of 27°E at the Red Mountain Project latitude. Appendix B-6 presents a spreadsheet which contains the steps used to prepare wind direction histograms using both corrected average and uncorrected average wind direction from the adjusted minimum and adjusted maximum data contained in Appendices A-1 and A-2.

The results indicate biases in the 360° and 180° sectors in both the corrected and uncorrected histograms. These biases can more likely be attributed to:

- The station is located in a cirque bowl which would tend not to have a prevailing wind direction and wide oscillations in wind direction would be expected.
- The data collection program and the frequency of recordings. Due to the remote location of the station, the sampling frequency (recording every 1.5 hours) may have resulted in broad wind direction oscillations between recordings. This meant that "logical statements" were required in the spreadsheets to arrive at the desired histograms.

The remaining six sectors in the histograms present more reliable information due to the narrower range of oscillation.

Appendix B-7 presents the mean daily, and daily instantaneous minimum and maximum wind speed data in the form of Lotus 123R3 spreadsheets and graphs. Mean daily wind speeds ranged from 2.3 km/hr to 38.1 km/hr over the period of recordings. Wind speeds at the site reached maximum values of:

- 94.4 km/hr on October 26, 1990,
- 71.6 km/hr on November 21, 1990,
- 85.9 km/hr on December 6, 1990,
- 72.2 km/hr on December 27, 1990 and
- 64.3 km/hr on February 6, 1991.

The cycle of wind speed peeks ranges from 3 to 10 days suggesting the cycle or pattern of storms passing through the area.

3.0 HYDROLOGY

3.1 HYDROLOGY STATION INSTALLATION

The hydrology station (H3) was located at the Highway 37A bridge crossing of Bitter Creek approximately 200 m upstream of the confluence with the Bear River (Drawing No. H1231.101 in Appendix A). The staff gauge and water level transducer were strapped to the downstream edge of the bridge abutment with wire cable and the data logger attached to a cross beam on the underside of the bridge deck for protection. This location provided the best access for staff gauge readings, calibrating flows off the bridge deck and relating flows with water quality samples to calculate loadings.

The model PS9000 water level transducer, a 5PSIG sensor, was connected to a Lakewood Systems DRX data logger and programmed to record water level data every hour. The station was installed on October 11, 1990 and data retrieved on May 22, October 10 and October 30, 1991 during calibrations of the station. The data was imported into a Lotus 123R3 spreadsheet for purposes of developing a hydrograph for the creek.

3.2 DATA COLLECTION

3.2.1 Streamflow Calibrations

Streamflows were calibrated when the station was installed in October 11, 1990 and subsequently on May 22, October 10 and October 30, 1991 and February 18, 1992. During each calibration, water depths were obtained using a weighted line every 0.5 m interval across the channel and streamflow measurements taken. Streamflow was measured at the 0.5 m intervals at 0.4 of total depth from the stream bottom using a weathermetrics flow meter and digital readout which was averaged over 45 seconds. Staff gauge readings were taken and the data logger downloaded.

The flow measurement data was compiled into Lotus 123.R3 spreadsheets and the total discharge calculated. These calculations are presented in Appendix C-1.

3.2.2 Stage Discharge Curve

The stage discharge curve was compiled using the flow calibrations and staff gauge readings in a least squares fit program in a Lotus 123R3 spreadsheet. The resulting table and graph are presented in Appendix C-2.

3.2.3 Hydrograph

The Lakewood data loggers provide voltage readings which were translated using calibration coefficients into water level fluctuations in metres and matched to the staff gauge readings for purposes of obtaining a hydrograph which is presented in Appendix C-3.

The sensor remained covered except for intermittent periods during the winter months when water levels dropped below the sensor producing negative numbers in the data. These negative values are not representative of water levels below the sensor's position and negative numbers were given a zero value in the hydrograph even though there is approximately 0.5 m water depth at the deepest point in the cross section.

During the winter low flow calibration taken on February 18, 1992, water levels were sufficient to cover the sensor and give a staff gauge reading of 0.020 m. A spring freshet flow has not been calibrated, although high flow conditions in October 10, 1991 provided the data needed to determine the high flow point on the stage discharge curve. Summer low flow probably does not exist due to the diurnal fluctuations typical of glacial fed streams such as Bitter Creek and late seasonal snow melt at higher elevations.

The hydrograph illustrates the diurnal fluctuations in flows in Bitter Creek particularly during the summer months caused by daily glacial melt and the extreme peak flows experienced in October 1991 during heavy rain and flood conditions that prevailed thought the Smithers, Terrace and Stewart areas in early October.

4.0 WATER QUALITY

4.1. SAMPLING STATION LOCATIONS

The water quality sampling program was set up to coincide with stream flow calibration and weather station data retrieval field trips. Samples were collected at stations W1 through W7 on September 27 and W1 through W9 on October 10, 1990. A tenth station was added to the program on May 22 and October 30, 1991. The sample sites (W1 to W10) are illustrated on Drawing No. H1231.101 located in Appendix A. Drill Hole BZ89-02 was sampled and is presented in the data as sample site W6.

4.2 DATA COLLECTION

All samples were collected, field-filtered, preserved, and shipped to Analytical Services Laboratories (ASL) in Vancouver within 48 hours of collection for analysis. Water quality samples were preserved as follows:

- 1 litre cyanide preserved with NaOH to pH of 12 or more.
- 1 litre general parameters; kept cold.
- 500 ml low level mercury preserved with HNO₃ to pH 2 or less.
- 250 ml dissolved metals were filtered (0.45 u cellulose nitrate) and preserved with HNO₃ to pH 2 or less.
- 250 ml total metal samples were preserved with HNO₃ to pH 2 or less.

Analyses of water were performed by ASL in accordance with "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, 1985 and 1989. Analysis consisted of physical parameters such as conductivity, turbidity, pH, alkalinity, suspended and dissolved solids, nutrients (including nitrogen and phosphorous species),

_ Hallam Knight Piésold Ltd.

Page 8

cyanide and a variety of total and dissolved metals.

Environment Canada, Water Surveys Branch has been sampling water quality on the Bear River on an intermittent basis since October 18, 1983. This data is presented in Appendix D-2 and is accompanied by data on floppy diskette. Field parameters including air temperature, water temperature and specific conductivity are provided. The samples were analysed in the laboratory (not identified) for pH, turbidity, apparent colour, alkalinity and various metals.

APPENDIX B-2

WEATHER STATION MAXIMUMS

BOND GOLD CANADA INC. RED MOUNTAIN PROJECT WEATHER STATION DATA - MAXIMUMS October 10, 1990 to February, 24,1991

Notes: Date - Date of installation. Time - Time data logger started in Pacific Standard Time. Analog 1 - Temperature is in degrees celsius. Analog 2 - Wind direction in degrees relative to tower installation. Adjusted - Wind direction has been adjusted to true degrees. Analog 3 - Wind speed in metres/second. Acc. 9 - Tipping bucket rain gauge (number of tips).

APPENDIX D-2

WATER QUALITY ENVIRONMENT CANADA

RECEIVED MAR 2 6 1992

WATER QUALITY MONITORING DATA

Enclosed please find the data printouts which you requested from the Environmental Surveys Branch of Environment Canada. It should be noted that <u>not all of this data has been verified.</u> As a result, it is possible that there may be some errors in the printouts.

When reviewing the data, you should be aware of the following:

- Data which is flagged with a 'Q' is presently being verified by Branch staff
- Data which is flagged with an 'X' is suspected of being contaminated
- Data which is flagged with an 'L' reflects values which are below the laboratory detection limit
- pH values for the approximate period of May, 1987 May, 1988 are currently under review, as they are somewhat lower than the rest of the pH data. As a result, these values should be used with caution.

Please call us if you have any questions regarding the data.

Environmental Operations Division Environmental Surveys Branch Inland Waters Directorate Pacific and Yukon Region 224 West Esplanade North Vancouver, B.C. V7M 3H7
