SUMMARY AND CONCLUSIONS

The Sprout Property consists of one claim and two, two post claims totalling 22 units and is located 30 kilometres west of Kamloops in south-central British Columbia. Forestry roads provide access to the eastern and southern parts of the property.

The claims are 100% owned by C.R.C. Explorations Limited.

Previous exploration work in the area concentrated on mercury (in the late 1800's) and for copper in the 1970's.

The property is underlain by Nicola Group intermediate to basic volcanic rock intercalated with conglomerate and siltstone. Laterally extensive faulting and brecciation accompanied by quartz porphyry intrusions are believed (in part) responsible for the development of extensive ankeritic alteration zones with chalcedonic veining and quartz stockworks.

The 1992 soil sampling is a continuation of soil sampling carried out in 1990. A grid extension to the south totalling 1.875 kilometres was established to further explore the southern strike extent of anomalous gold soil anomalies on the property. A total of 69 soil samples were collected at 25 metre stations along grid lines spaced 100 metres apart. Analytical results of the soil samples indicate four northerly trending gold-in-soil anomalies ranging in values from 20ppb to 130ppb. These anomalies remain open to the north and south. Anomalous values of "indicator" elements such as arsenic and antimony are also coincident with or flank gold soil anomalies.

Recent exploration work carried out indicates the property has significant potential to host "epithermal style" base and precious metal deposits.

INTRODUCTION

This report is a summary of exploration work carried out on the Sprout 89 and Oro 1 and 2 claims during the period June 24 to 26, 1992. Exploration work consisted of establishing 1,875 kilometres of grid and collection of 69 soil samples.

LOCATION AND ACCESS (Figure 1)

The Sprout property is located approximately 30 kilometres west of Kamloops and eight kilometres southeast of Savona in south-central British Columbia. The property is centered at 50° 43' north latitude and 120° 43' west longitude.

Access to the property is via Highway 1 for 30 kilometres west of Kamloops, south on the old Kamloops highway and southwest on forestry roads to the eastern side of the claims.

TOPOGRAPHY AND VEGETATION

Elevations on the property range from about 975 metres in the southern part to 610 metres in the northern part of the claim block. Relief is moderate to steep.

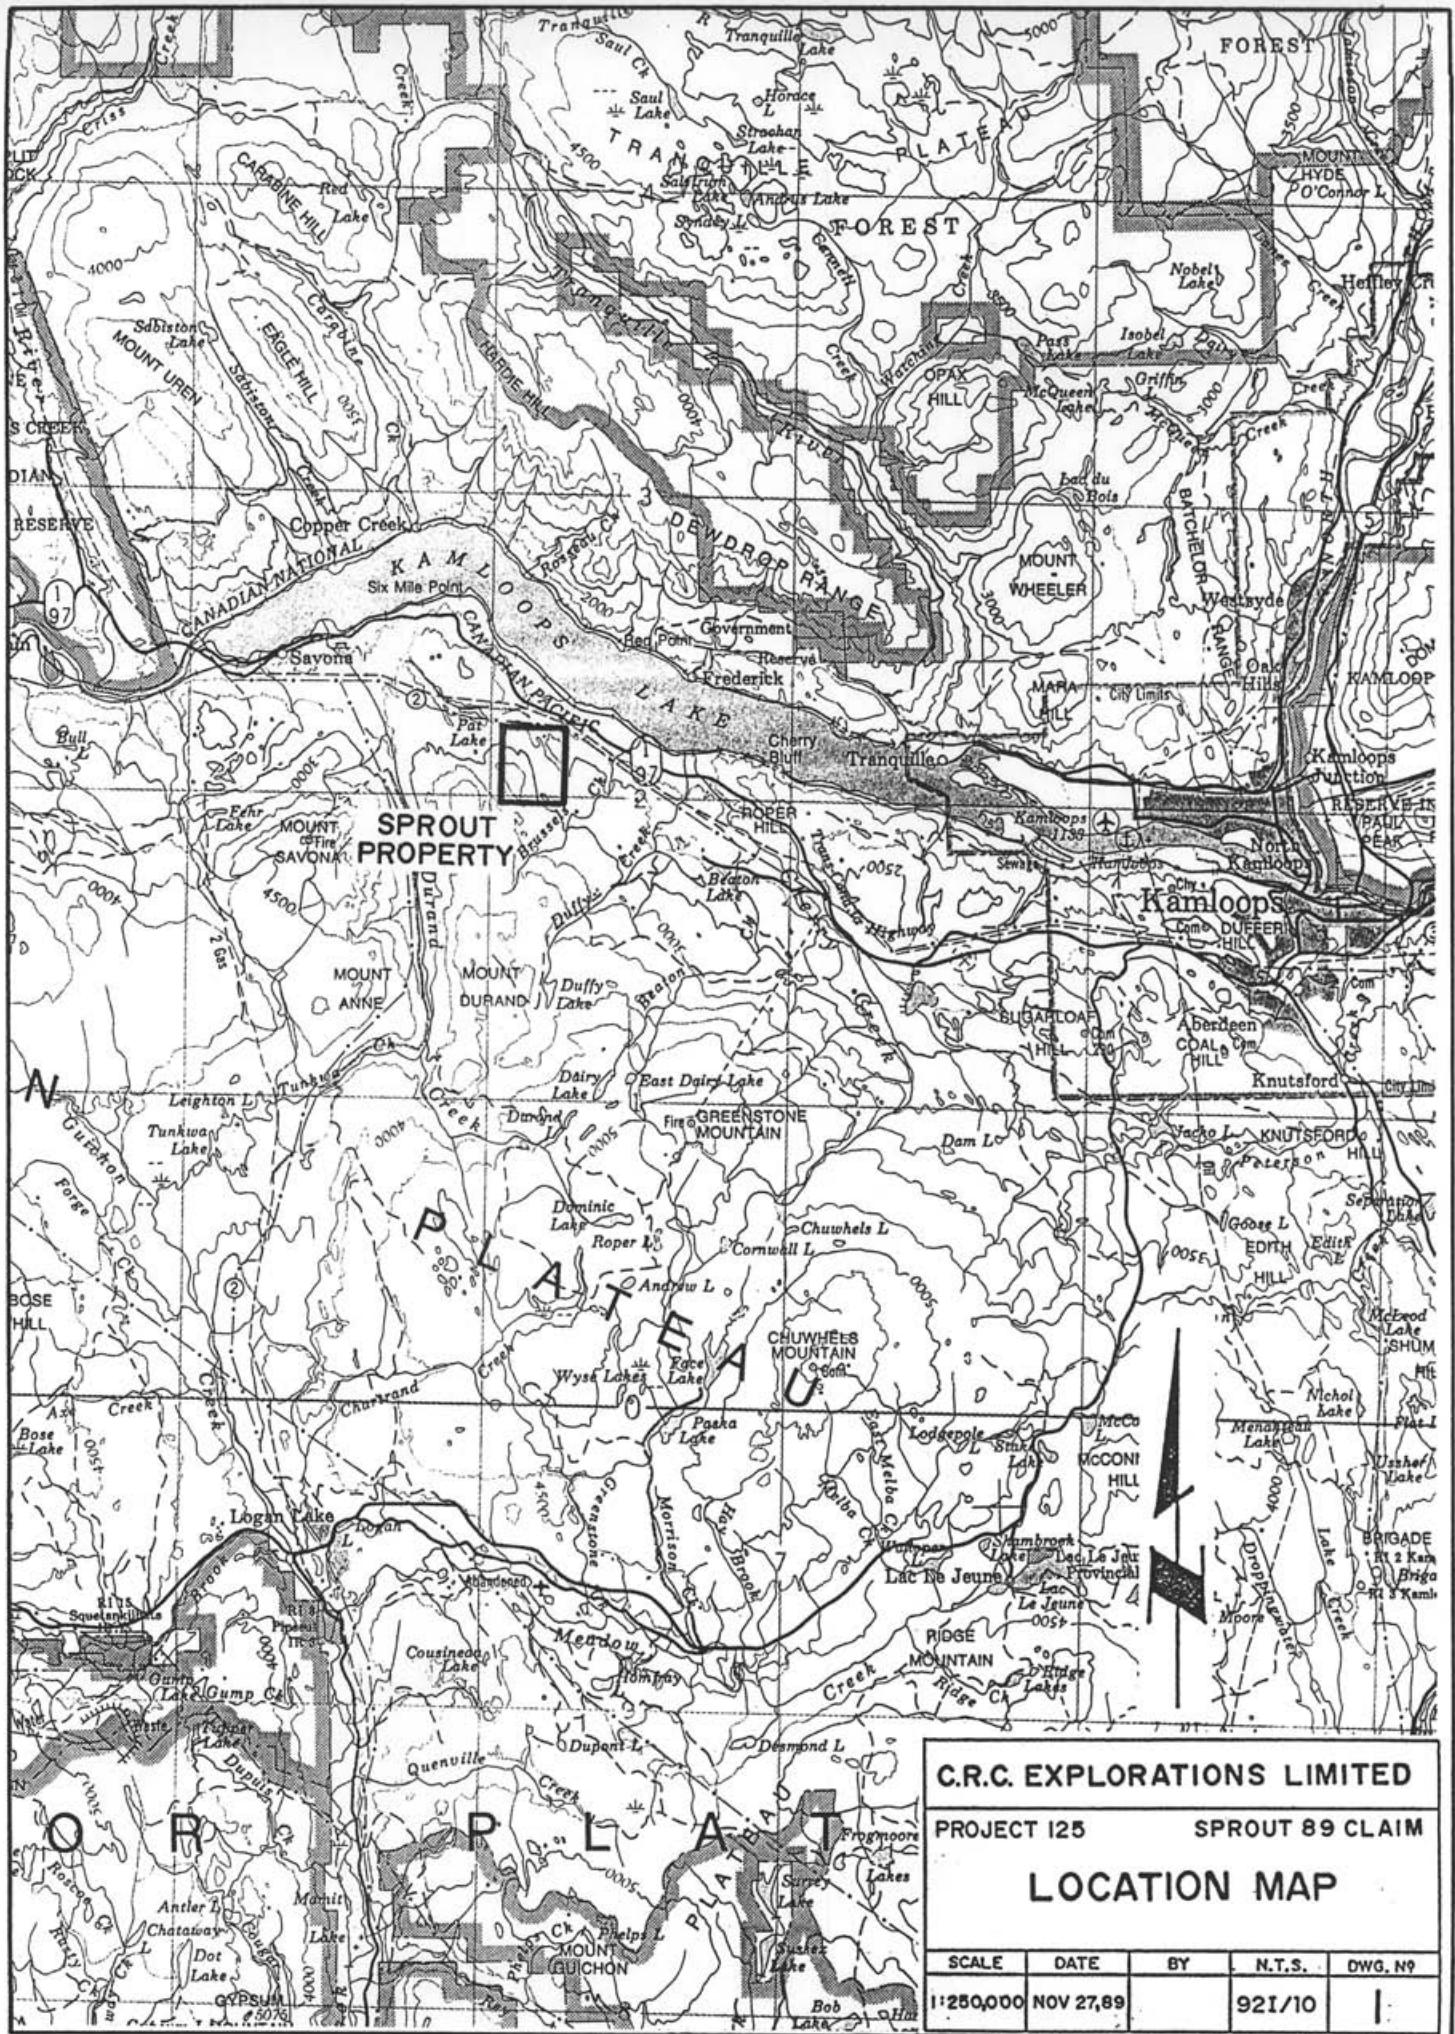

Vegetation is typical of semi-arid region of the Kamloops area consisting of grasses, sagebrush, ponderosa pine and at higher elevations douglas fir. Much of the mature timber has been selectively logged.

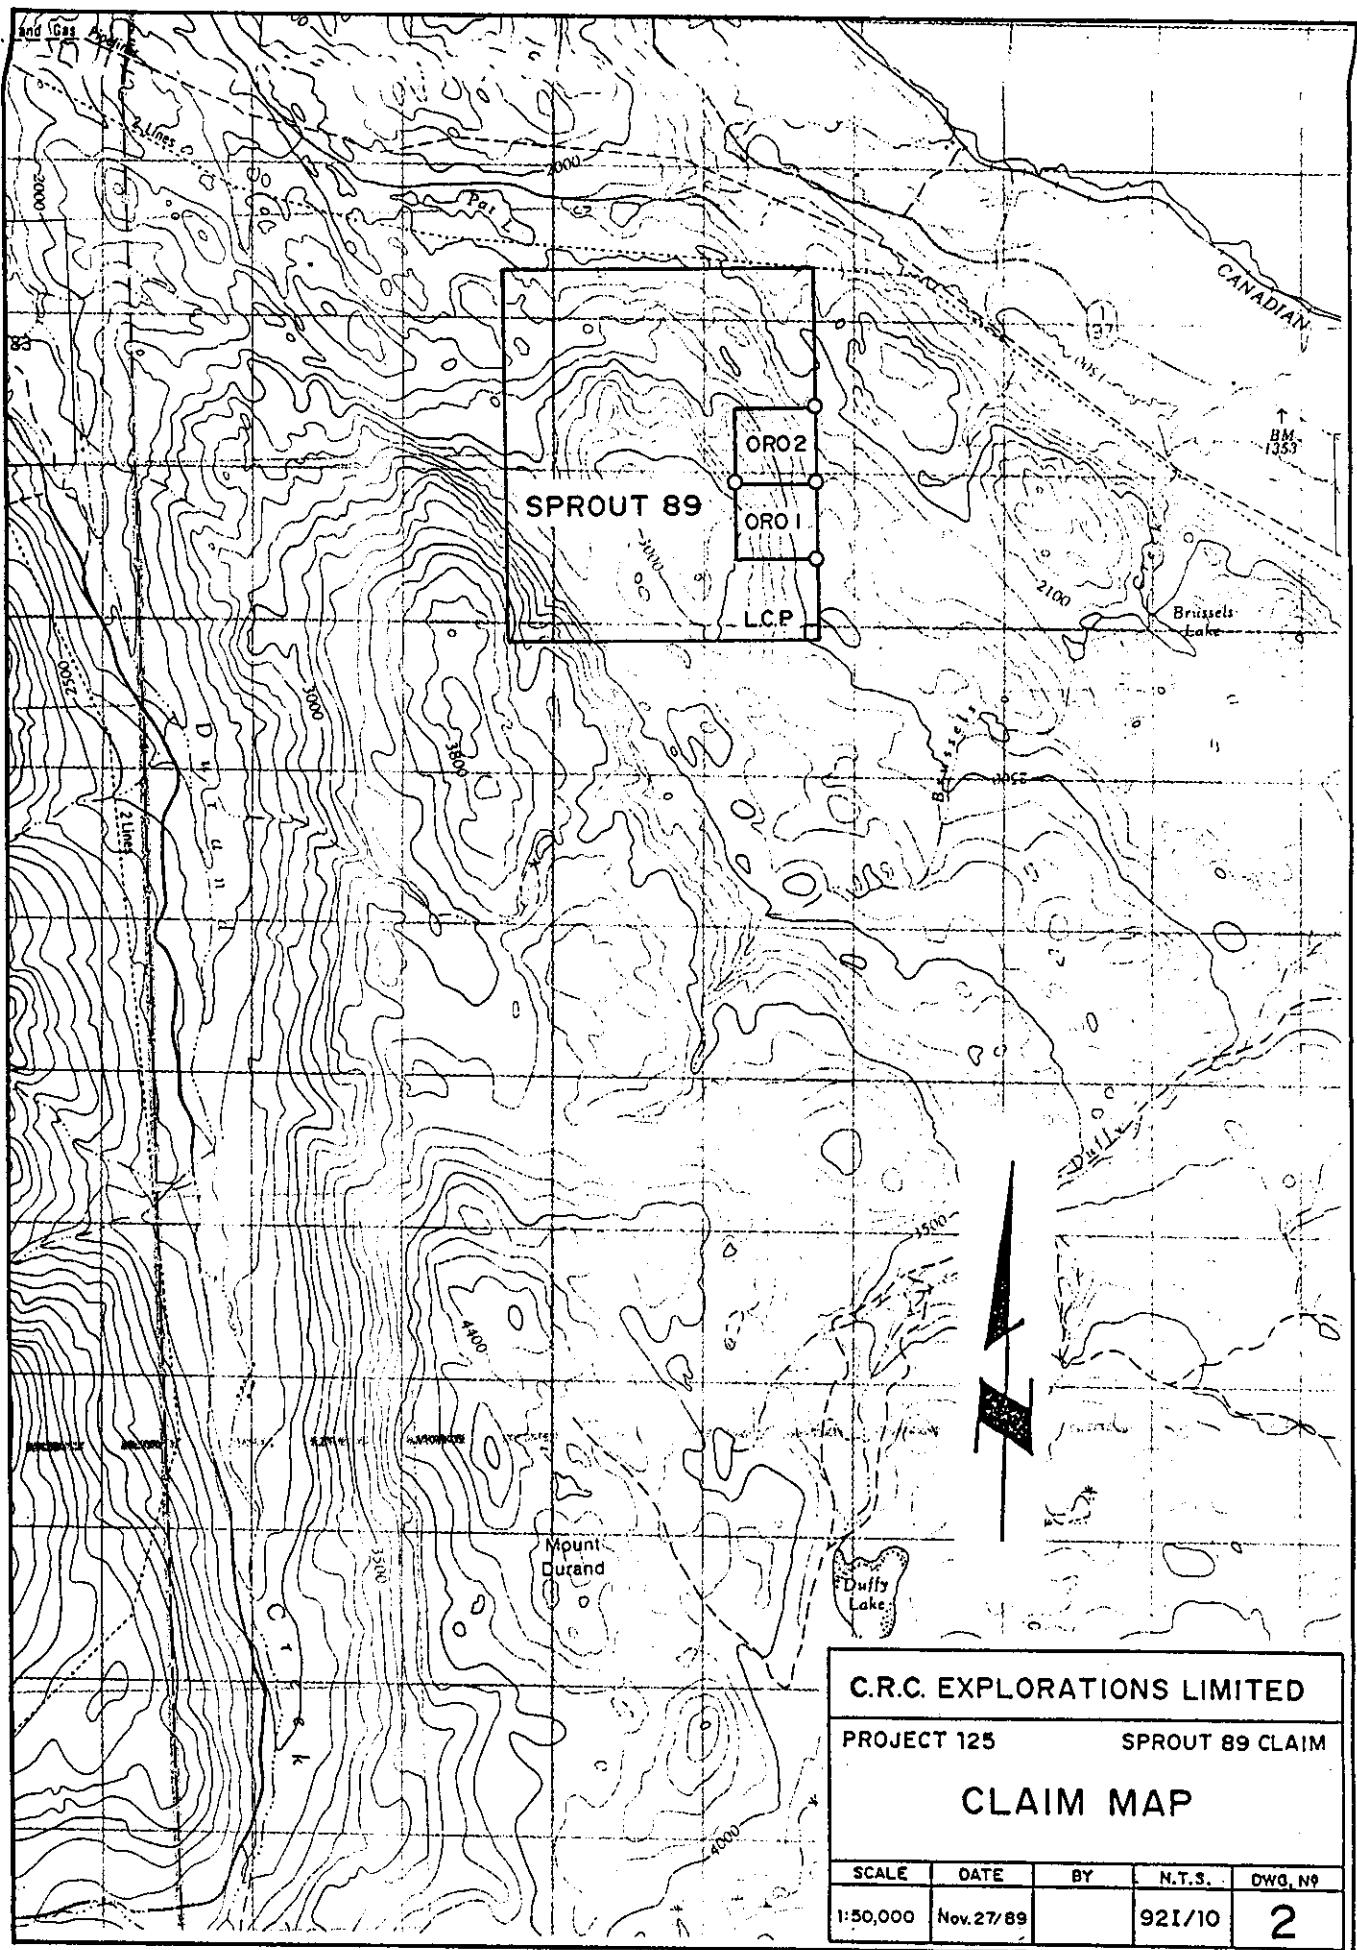

CLAIMS (Figure 2)

The Sprout property consists of one claim and two, two post claims totalling 22 units (550ha). All claims are registered in the name of C.R.C. Explorations Limited.

Claim Name	Record No.	Units	Anniversary Date	Mining Division
Sprout 89	8661	20	July 1, 1993*	Kamloops
Oro 1	8624	1	July 1, 1993*	Kamloops
Oro 2	8625	1	July 1, 1993*	Kamloops

* Subject to acceptance of 1992 assessment work.

HISTORY

The area of the Sprout claims has been explored for mercury, base metals and precious metals since the late 1800's.

The area now covered by the Sprout claim was explored by Newmont Exploration in 1982. Newmont discovered a wide band of altered and silicified volcanics which returned up to 0.23 ounces gold per ton over one metre. Soil sampling on the property outlined zones containing significant mercury values in excess of 1000 ppb.

REGIONAL GEOLOGY (Figure 3)

The Sprout property is underlain by Upper Triassic, Nicola Group volcanic and minor sedimentary rocks. The volcanic rocks consist of andesite, basalt, agglomerate and tuff. Sedimentary rocks include conglomerate, siltstone, argillite and limestone. The north-northwesterly trending Nicola Group package varies in width up to 40 kilometres and extends some 50 kilometres north of Kamloops Lake and 170 kilometres to the south. Nicola Group rocks are intruded by Jurassic-Cretaceous rocks ranging in composition from granite and syenite to pyroxenite.

Within the Savona area, laterally extensive faults have occurred along Deadman River, Sabiston Creek, Carabine Creek and Durand Creek. The Sabiston Creek fault and associated linements pass through the Sprout group of claims.

Early Tertiary syenitic intrusives with related carbonate and siliceous alteration zones are coincident with these linements.

Mercury deposits occur in a belt roughly 14 kilometres wide, extending from Tunkwa/Dominic Lakes in the south to Criss Creek to the north, a distance of some 39 kilometres. Mineralization occurs in Nicola Group rocks as well as Late Cretaceous sedimentary and volcanic rocks. Generally, the rocks exhibit extensive silicification with chalcedonic veining, intense alteration to ankerite and the development of dolomitic veins or stringers in shear and fracture zones. Associated with the cinnabar is stibnite, galena, tetrahedrite, malachite, azurite, chalcopyrite, pyrite and gold.

LOCAL GEOLOGY

The Sprout property is underlain by northwest trending Upper Triassic, Nicola Group volcanic and sedimentary rocks. The volcanics are predominantly andesite and basalt with intercalated agglomerate (andesite/basalt clasts) and tuffaceous horizons. Locally, three to four metre thick beds of conglomerate and siltstone outcrop in the central and western part of the property.

On the property and to the east, Nicola Group rocks have been intruded by syenitic quartz-eye porphyry stocks and dykes.

1990 WORK PROGRAM

An exploration program of grid establishment totalling 1.875 kilometres and soil geochemical sampling was carried out on the Sprout 89 and Oro 1 & 2 claims. A total of 69 soil samples were collected during the period June 24 to 26, 1992.

GRID ESTABLISHMENT

A metric grid network totalling 1.875 kilometres was established on the Sprout 89 and Oro 1 and 2 claims. Grid lines were turned off a previously established baseline with crosslines every 100 metres. Grid coordinates and soil sample sites are marked on wooden pickets or flagging on crosslines and baseline.

SOIL GEOCHEMICAL SURVEY

Soil samples were collected at 25 metre stations along grid lines spaced 100 metres apart. A total of 69 soil samples were collected. Samples were collected from the B soil horizon at varying depths between 15 centimetres to 35 centimetres. Samples were placed in kraft bags and numbered according to grid coordinates. The samples were shipped to Acme Analytical Laboratories Ltd., Vancouver, B.C. Samples were analysed for 30 elements by ICP methods, gold by atomic absorption. Sample preparation is described in Appendix I and soil geochemical results are listed in Appendix II.

Soil Geochemical Results - Gold (Figure 4)

Gold values ranged from 1ppb to 130ppb. Anomalous values for gold were visually estimated from the data as follows:

Threshold: 19ppb
Anomalous: $\geq 20\text{ppb} \leq 40\text{ppb}$
Highly Anomalous: $\geq 41\text{ppb}$

Four gold soil anomalies are evident from the data. Each of the gold soil anomalies extend in a north-south direction and remain open to the southeast. The soil anomalies range in width from 40 metres to 150 metres. All four gold soil anomalies defined by the 1992 soil sampling program extend the 1990 gold soil anomalies a further 100 metres to the south.

Soil Geochemical Results - Arsenic (Figure 5)

Arsenic values range from 4ppm to 67ppm. Anomalous values were visually estimated from the data as follows:

Threshold: 14ppm
Weakly Anomalous: $\geq 15\text{ppm} < 24\text{ppm}$
Anomalous: $\geq 25\text{ppm}$

Arsenic values appear to be sporadic throughout the grid area. Only two areas show consistent anomalous arsenic values. Both arsenic soil anomalies extend previously defined 1990 arsenic soil anomalies a further 100 metres to the south-southeast and both remain open to the south-southeast. The arsenic soil anomalies range up to 120 metres wide and are coincident with 1992 gold soil anomalies.

Soil Geochemical Results - Antimony (Figure 6)

Antimony values range from 2ppm to 23ppm. Anomalous values were visually estimated from the data as follows:

Threshold: 9ppm
Weakly Anomalous: $\geq 10\text{ppm} < 19\text{ppm}$
Anomalous: $\geq 20\text{ppm}$

Two weak soil anomalies in antimony trend in north-northeasterly zones. The west zone varies up to 80 metres wide while the east zone ranges up to 30 metres in width. Both anomalous zones are coincident with anomalous gold and arsenic soil anomalies.

RECOMMENDATIONS

Based on the encouraging results from the property to date, a staged exploration program is recommended.

Stage 1

The existing grid should be expanded to the northwest and southeast. Approximately 15 kilometres of grid lines spaced 100 metres apart with stations every 25 metres along the crosslines. B horizon soil sampling should be carried out along the grid lines with samples analysed for 30 elements (ICP) including gold and mercury. Magnetometer and VLF-EM survey should also be carried out to aid in geological mapping and the definition of the faults. The property should be geologically mapped and prospected in detail. Several test lines of induced polarization should be carried out over areas of known mineralization to determine if this geophysical technique helps define targets to be drill tested.

Stage 2

If Stage 1 defines further anomalous soil geochemical and geophysical targets, a diamond drill program should be carried out. The initial drill program should consist of 1000 metres of NQWL drilling.

Respectfully Submitted

APPENDIX I

SAMPLE PREPARATION

SAMPLE PREPARATION

Soil samples are dried at 60° celcius and sieved to minus 80 mesh. A 0.5 gram sample is digested with 3mls 3-1-2 HCl-HNO₃-H₂O at 95° celcius for one hour and diluted with water. This leach is near total for base metals, partial for rock forming elements and very slight for refractory elements. Solubility limits Ag, Pb, Sb, Bi, W for high grade samples.

Soil samples were analysed by ICP methods and a 10gm sample was analysed for gold using atomic absorption. A 10gm sample was also used for mercury and analysed by flameless atomic absorption.

Rock samples are crushed to approximately 0.5cm and then approximately half of the sample is ground to -100 mesh. A 20gm sample is digested as described above for soils.

Rock samples were analysed by ICP methods except gold which was analysed by atomic absorption and mercury by flameless atomic absorption.

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3:1:2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR Mn Fe Sr Ca P La Cr Mg Ba Ti B W AND LIMITED FOR Na K AND Al. AU DETECTION LIMIT BY ICP IS 3 PPM.
 - SAMPLE TYPE: SOIL AU** ANALYSIS BY FA/ICP FROM 20 GM SAMPLE. Samples beginning 'RE' are duplicate samples.

DATE RECEIVED: JUN 30 1992 DATE REPORT MAILED: July 7/92 SIGNED BY: D.TOE, C.LEONG, J.WANG; CERTIFIED B.C. ASSAYERS

ASSESSMENT REPORT

LEGEND

QUATERNARY

PLEISTOCENE AND RECENT

PRv

"VALLEY BASALT": vesicular olivine basalt; local acidic to intermediate breccia in Coast Mountains only

TERTIARY

MIOCENE AND PLIOCENE

IMPv

"PLATEAU BASALT": basalt, olivine basalt, minor tuff

Tv

Olivine basalt

T1

Small intrusions of mainly intermediate composition

EK

KAMLOOPS GROUP: basalt, andesite, dacite, rhyolite, breccia, tuff and local intercalated sandstone; conglomerate, shale

Ec

"COLDWATER BEDS": arkosic sandstone, conglomerate, shale, local coal seams

JURASSIC AND CRETACEOUS

Jgd

PENNASK BATHOLITH, DOUGLAS LAKE STOCK AND SIMILAR GRANITIC ROCKS: granodiorite, quartz monzonite

ImJA

ASHCROFT FM.: argillite, siltstone, sandstone, conglomerate, local minor carbonate

EARLIEST JURASSIC (?)

eJgd

WILD HORSE BATHOLITH, NICOLA BATHOLITH, PARTS OF MT. LYTTON PLUTONIC COMPLEX AND SIMILAR GRANITIC ROCKS: granodiorite, quartz monzonite; latter has local K-feldspar megacrystic phases

TRIASSIC AND (?) JURASSIC

TJgd,qm

GUICHON CREEK BATHOLITH AND SIMILAR GRANITIC ROCKS: quartz monzonite and granodiorite (qm (gd)); granodiorite, quartz diorite (gd(qd)) and subordinate diorite (d)

TJs,d,u

IRON MASK BATHOLITH AND SIMILAR ALKALINE INTRUSIONS: syenite(s); diorite(d); gabbro(gb); ultramafic(u)

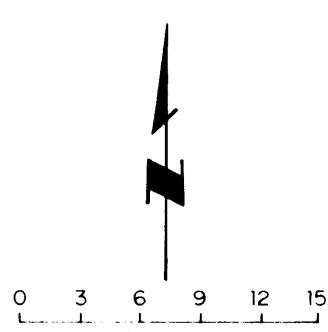

uTN

NICOLA GROUP: undifferentiated

PALAEOZOIC AND MESOZOIC

PMm

Biotite quartz schist, biotite muscovite schist, garnet biotite schist local (in Coast Mountains), kyanite, sillimanite; protolith age unknown
