## SUMMARY

The Donna property, located some 60 kilometres east of Vernon, B.C. was identified as a strategic gold prospect during a regional compilation of the gold potential of the Shuswap region. Work in 1992 comprised claim staking (66 units), grid work (49 kilometres), sampling of "B" horizon soils (503 samples), trenching, bedrock sampling and detailed geological mapping. This work was completed between June and October, 1992. Rocks at Donna comprise a metamorphosed, poly-deformed sequence of metasediments and tuffaceous rocks intruded by small stocks and plugs of diorite and quartz diorite. The latter rocks are the chief gold hosts where shallow dipping shears are the chief control of gold distribution. Boudinaged quartz veins, rarely more than 20 cm thick, commonly fill the shear zones and often contain variable amounts of arsenopyrite, galena, pyrite, stibnite and tetrahedrite.

Soil sampling work developed a large zone of gold-enhanced soils some 300 metres by 2,000 metres lying along south-facing slopes of the Kettle River valley. Trenching and bedrock sampling of this zone returned low grade gold tenors generally less than 500 ppb.

## INTRODUCTION

This report presents the results of a work program completed on the Donna property between June 16 and October 15, 1992. The program comprised staking of additional claims to cover and enlarge the original 17 unit block, collection of 503 soil samples along 49 kilometres of grid lines, sampling, geological mapping and back-hoe trenching. Work is supported herein for grid preparation, soil survey and bedrock sampling.

## LOCATION AND ACCESS

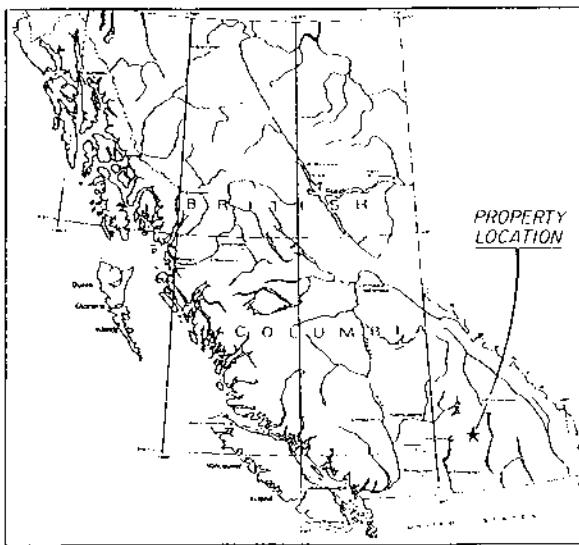

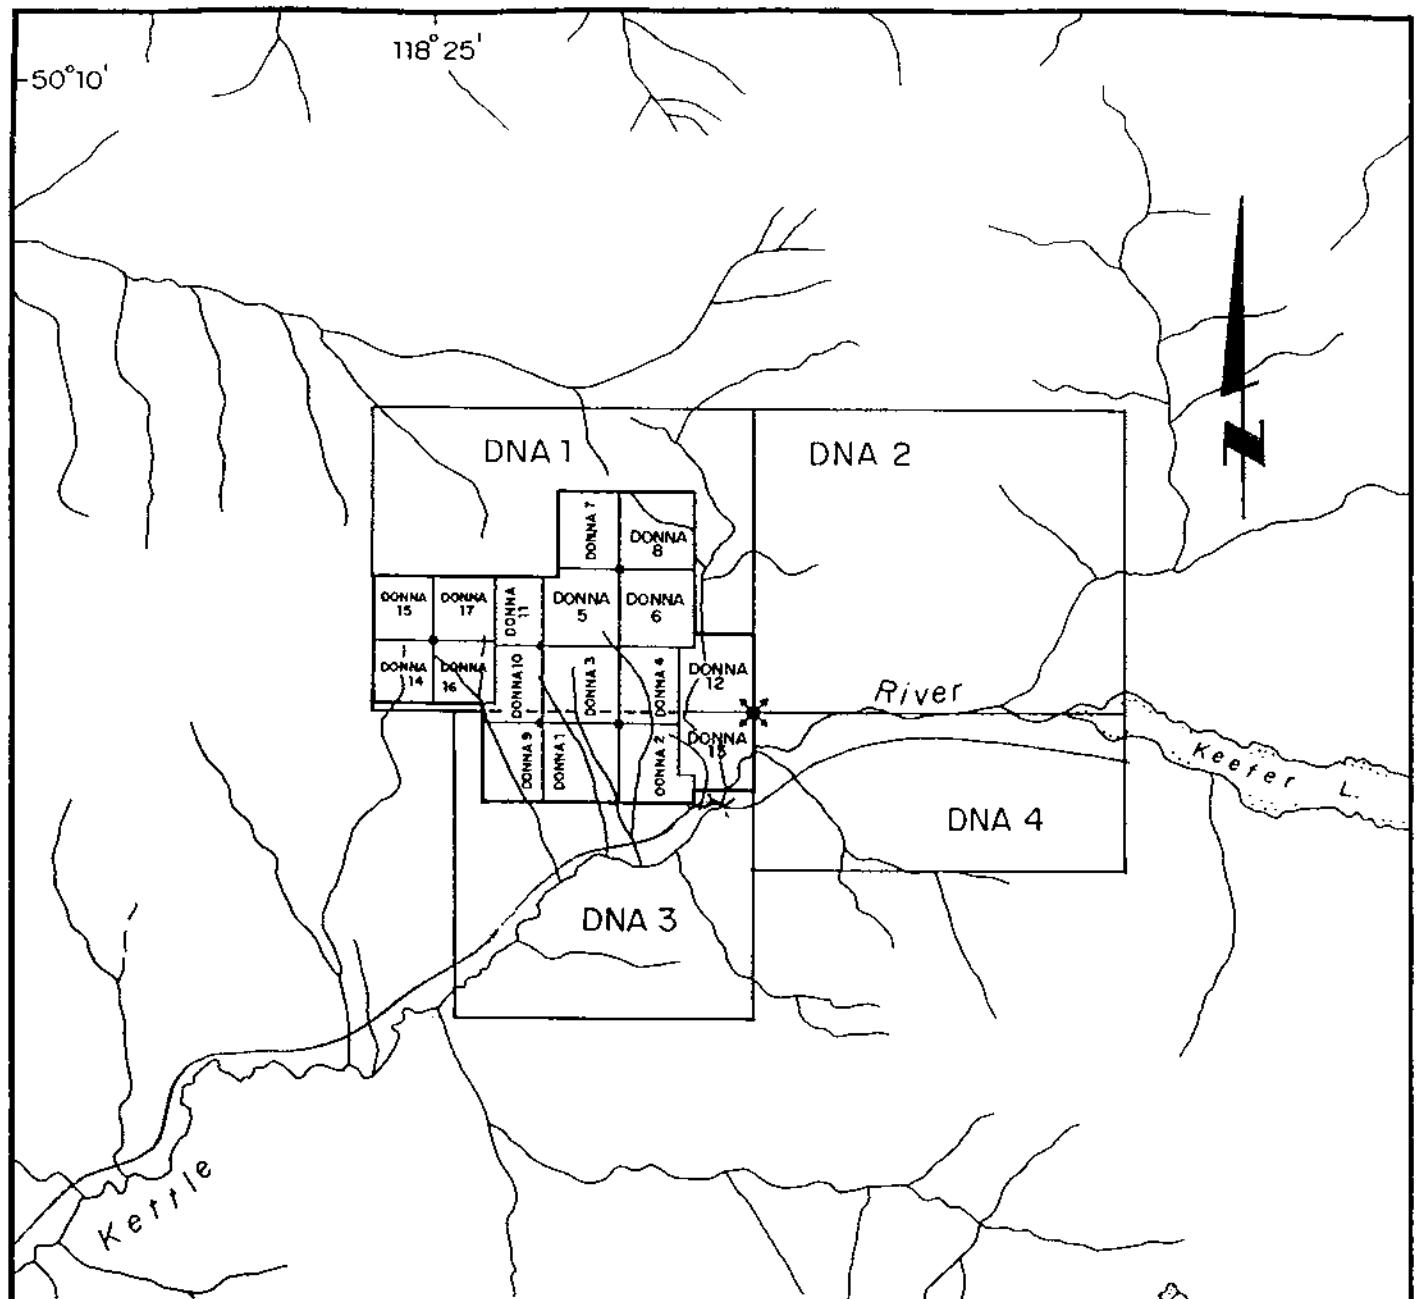

The Donna claims are located in the Vernon Mining Division of southern British Columbia approximately 63 kilometres southeast of Vernon. The claims lie near the headwaters of the Kettle River on Monashee Mountain three kilometres west of Keefer Lake and two kilometres southeast of Yeoward Mountain (Figure 1).

The property is readily accessible from B.C. Highway #6 at a point approximately 85 kilometres east of Vernon. Here the Keefer Lake Forest Access Road originates and is followed northeasterly for nine kilometres to a bridge crossing the Kettle River. Immediately north of the bridge, a four-wheel drive road branches off and leads one kilometre into the claims.

The claims lie on the eastern end of Monashee Mountain, which is characterized by moderate slopes leading up to a rounded, somewhat flat summit. Elevations range from 1,340 metres to 1,650 metres. The central part of the property is located within an old burn, which is now covered by thick brush and thick second growth fir. Elsewhere, commercial size fir, hemlock, pine and spruce are common.

## CLAIMS

The Donna 1 to 17 claims are situated in the Vernon Mining Division. Claim data are summarized below.

PHELPS DODGE CANADA LIMITED			
PROJECT N° 187		VERNON M.D.	
DONNA PROPERTY			
Fox Geological Consultants Ltd.			
SCALE	DATE	NTS	FIG. N°
1:50000		82L/1W	1

Shiell L.  
Wauchope Cr.

Claim Name	No. of Units	Record Numbers
Donna 1-11	11	302501-11
Donna 12-17	6	304985-990
DNA 1-4	66	310836-839

Four additional claim blocks, the DNA 1 to 4 claims (66 units), were staked in June, 1992. Claim outlines are plotted in Figure 1. Assessment work will be applied against DNA 1 claim and a reduced 4 unit subset of the DNA 3 claim.

### **PREVIOUS WORK**

The general area east of Vernon has a placer mining history dating from the 1870's to the present. Limited production came from a number of streams. Gold was obtained from Cherry and Monashee Creeks 14 kilometres and seven kilometres respectively to the northwest, Barnes Creek ten kilometres to the southeast and Marsh Creek five kilometres to the southwest.

Veins mineralized with pyrite, chalcopyrite, galena and sphalerite with significant values in gold and silver were explored on the St. Paul Group, located on Monashee Mountain five kilometres to the west. Intermittent mining from this property produced a small tonnage of both direct shipping and milling ores. The last production was in the mid 1970's.

The Donna property was staked as a result of prospecting and stream sediment sampling conducted in 1973 by El Paso Mining and Milling Company. A sediment sample taken from one tributary stream in the upper Kettle River area returned anomalous values in gold and arsenic. Follow-up prospecting confirmed the stream anomaly as well as locating quartz float containing coarse pyrite and arsenopyrite that assayed 0.50 oz/ton gold and 200 oz/ton silver. As a result, the property was staked and a soil sampling survey conducted. Results from this survey defined a large area some 250 metres by 800 metres anomalous in gold, silver, arsenic and lead. This work was followed by a backhoe

airtrack percussion drilling program drilling nineteen 2" diameter holes. In 1975, El Paso ceased exploring in British Columbia.

In 1980, the property was optioned to Salamet Resources Corp. who later transferred them to Granex Resources Ltd. who in turn transferred them to Keefer Resources Ltd. The latter company, in part financed by Mohawk Oil Ltd., conducted intermittent exploration between 1982 to 1988. The work included trenching, trench sampling and soil surveys, the latter in previously untested areas.

## REGIONAL GEOLOGY

The Donna prospect occurs in a faulted terrane underlain by Paleozoic and Mesozoic sedimentary and volcanic rocks all intruded by Middle Jurassic granodiorite to the south (Spruce Grove Batholith). Both the stratified rocks and the granodiorite body have been down dropped along low angle normal faults against high grade metamorphic rocks of the Okanagan and Monashee complexes. These normal faults probably formed during a period of crustal extension during the Eocene, a tectonic event which was accompanied by widespread intermediate to felsic magmatism and local formation of epithermal and mesothermal precious metal deposits. Regional geology is plotted on Figure 2.

The fault-bounded block in which the Donna prospect occurs contains two groups of rocks, Middle to Upper Paleozoic rocks, the "Thompson Assemblage" and Mesozoic sedimentary and volcanic rocks that collectively form the Slocan and Takla Groups. Together, the Thompson Assemblage and Mesozoic rocks form a slice of Quesnellia which, during Middle Jurassic times, was thrust onto strata of continental provenance now exposed in the Shuswap and Monashee metamorphic complexes.

Most precious and base metal vein deposits of the region are hosted by Eocene extensional structures. Polymetallic veins are commonly lead-rich but with associated zinc, silver, antimony, arsenic, gold and copper. These veins are of mesothermal type and, in several parts of the region, occupy low angle Eocene extensional structures thought to be root zones of listric normal faults. At higher structural levels these faults host epithermal precious metal veins.

## PROPERTY GEOLOGY

### Lithologies

Within the prospect area, rocks of both the Thompson Assemblage and the Slocan and Takla groups are represented. Thompson Assemblage rocks are exposed in the southwestern part of the property while Slocan and Takla rocks underlie the northeastern part (Figure 3). All known polymetallic veins occur within rocks of the Thompson Assemblage.

The dominant rocks of the Thompson Assemblage are interbedded dark grey argillite and buff to grey, siliceous siltstone. Reworked felsic volcaniclastic rocks and tuff of dacitic and rhyolitic compositions form a well defined unit some 20 metres thick in the area of the Donna showings. Carbonate members common to the west of the Donna property are exposed in a single outcrop of interbedded dark grey calcareous argillite and limestone in a road cut west of the Donna trenches.

To the northeast grey, greenish grey and buff phyllite and shale are correlated with the Middle to Upper Triassic Slocan Group. These rocks are overlain by hornblende-bearing, massive to poorly bedded, latite tuff in the northeastern corner of the property. These rocks are correlated with the Upper Triassic Takla Group.

In the Donna trenches, fine to medium grained, equigranular diorite and quartz diorite are exposed forming a northwesterly-striking elongate pluton. Fine grained biotite-rich diorite commonly occurs as dykes cutting both sedimentary rocks and hornblende diorite. Small, equigranular, medium grained granite dykes have been recognised to the west of the hornblende diorite body.

### Structure

The Donna property may be divided into two structural domains corresponding to the Thompson Assemblage and rocks of the Slocan and Takla groups. Layered rocks of the Thompson Assemblage have been isoclinally folded about northwesterly-striking axes with folds overturned to the northeast. A northwesterly isoclinal syncline, plunging at about

15° to the northwest in the area of the Donna trenches, has been refolded about northeasterly-striking axes. Whereas northwesterly-striking axial planar cleavage has developed in Thompson Assemblage rocks, northeasterly folds have no accompanying axial planar fabric. Rocks of the nearby Slocan Group have a well-developed penetrative fabric striking at about 080° and dipping moderately southwest. This foliation is cut by a subvertical fracture cleavage striking to the northwest and commonly contains infillings of quartz and calcite. Northwesterly-striking fracture cleavage occurs throughout the Takla Group volcanic rocks.

In the area of the Donna showings, gently dipping shear zones have developed that postdate folding in the area. These are best developed within the hornblende diorite body. Most sulphide-bearing veins are hosted by these shears. Quartz veins have been boudinaged within the plane of shearing and now appear to take the form of elongate "pancakes" with maximum elongation in a northerly direction. Wallrock to the quartz veins commonly has a poorly-preserved cataclastic fabric. A shallow-dipping, closely-spaced fracture cleavage is ubiquitous.

In the area of the old Donna trenches a northerly-striking, steeply-dipping normal fault which has juxtaposed calcareous argillite and limestone against siliceous siltstone is exposed in a road cut of a trail accessing the northern trenches. Easterly-striking faults are inferred in this area and are interpreted to have cut and displaced the main hornblende diorite intrusion by about 70 metres. Movement along these faults postdates the development of northerly-striking shears.

### Mineralization

Shallow-dipping shears host quartz veins which contain pods and irregular masses of arsenopyrite along with pyrite, stibnite, galena and minor chalcopyrite, tetrahedrite-tennantite and possibly sphalerite. Sulphide minerals form open-space fillings with occasional euhedral crystal habit and laminar bands. These sulphide bodies vary from a few millimetres to a maximum of about 10 centimetres thick and do not exceed a few metres in length. Adjacent to the shears are irregularly distributed zones of silicification in which primary and cataclastic fabrics have been largely obliterated. These silicified zones contain disseminated pyrite in amounts up to about 2%. In silicified tuff of Trench 2 (extension) green mica has formed around some pyrite grains, the only indication of

phylosilicate alteration observed in the trench area. Quartz veins generally have hematite-rich selvages. Hematite also occurs as fracture fillings.

Diorite, the main host to quartz-sulphide veins, is commonly weakly propylitized and, near shears, is pyritic. In places the diorite has also been weakly silicified and calcite-altered. Strong silicification and ankerite (?) alteration of diorite and adjacent argillaceous sedimentary rocks, is evident in outcrop exposed along Trench 6A.

## 1992 WORK PROGRAM

The 1992 work program on the Donna property was completed between June 16 and October 15, 1992. Work included the preparation of a flagged grid totalling 49 line-kilometres, the collection of 503 "B" horizon soil samples at 100-metre intervals along lines spaced 100 metres apart, trenching and geological mapping. Soil samples (-80 fraction) were analysed for gold by standard AA methods and an additional 31 elements were analysed by ICP methods by Acme Analytical Laboratories Ltd., 852 East Hastings Street, Vancouver, B.C.

Rock chip samples were collected over two metre intervals along the trenches. In addition, vertical channel samples were taken over those areas of exposed bedrock where either flat lying or shallowly-dipping quartz veins or shear zones occur in the trench walls. Results are given in Figures 4, 5 and 6 and further detailed in Appendices I and II.

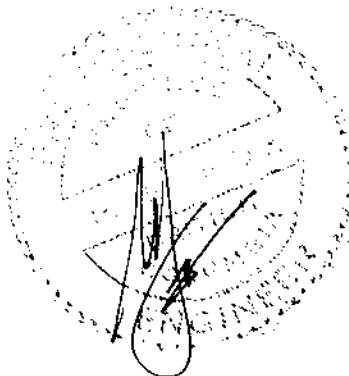

## RESULTS

Soil geochemical results for gold together with sample numbers are presented in Figure 4. Gold defines an arcuate anomaly 2,000 metres long and up to 300 metres wide extending from line 111+00N to 95+00N. The highest value, 3470 ppb, corresponds to the southern limits of the old showings. Arsenic (not plotted) is in part coincident with gold over the entire anomaly. Lead, zinc and antimony (not plotted) are in part coincident with the highest gold values. Results for gold in rocks are plotted in Figure 5. Gold values in bedrock vary from background to one isolated sample grading 8,120 ppb. The majority of gold assays were less than 1,000 ppb.

Results for Trenches 92-1 and 92-2 are plotted in Figure 5 and for trenches 92-3 and 92-4 in Figure 6. Trench 92-1 was excavated northerly from previous Trench 6. It encountered weakly anomalous values throughout. Trench 92-2 was excavated 300 metres south of previous Trench 1A. It uncovered argillite containing weakly anomalous gold values associated with limonitic intervals. Trench 92-3 and 92-4 and pits 1, 2 and 13 were excavated on lines 96N and 97N. The trenches were designed to test a bedrock source for the southerly extension of the gold soil geochemical anomaly. Gold values in bedrock were generally barren except for isolated weakly anomalous (260 ppb) values.

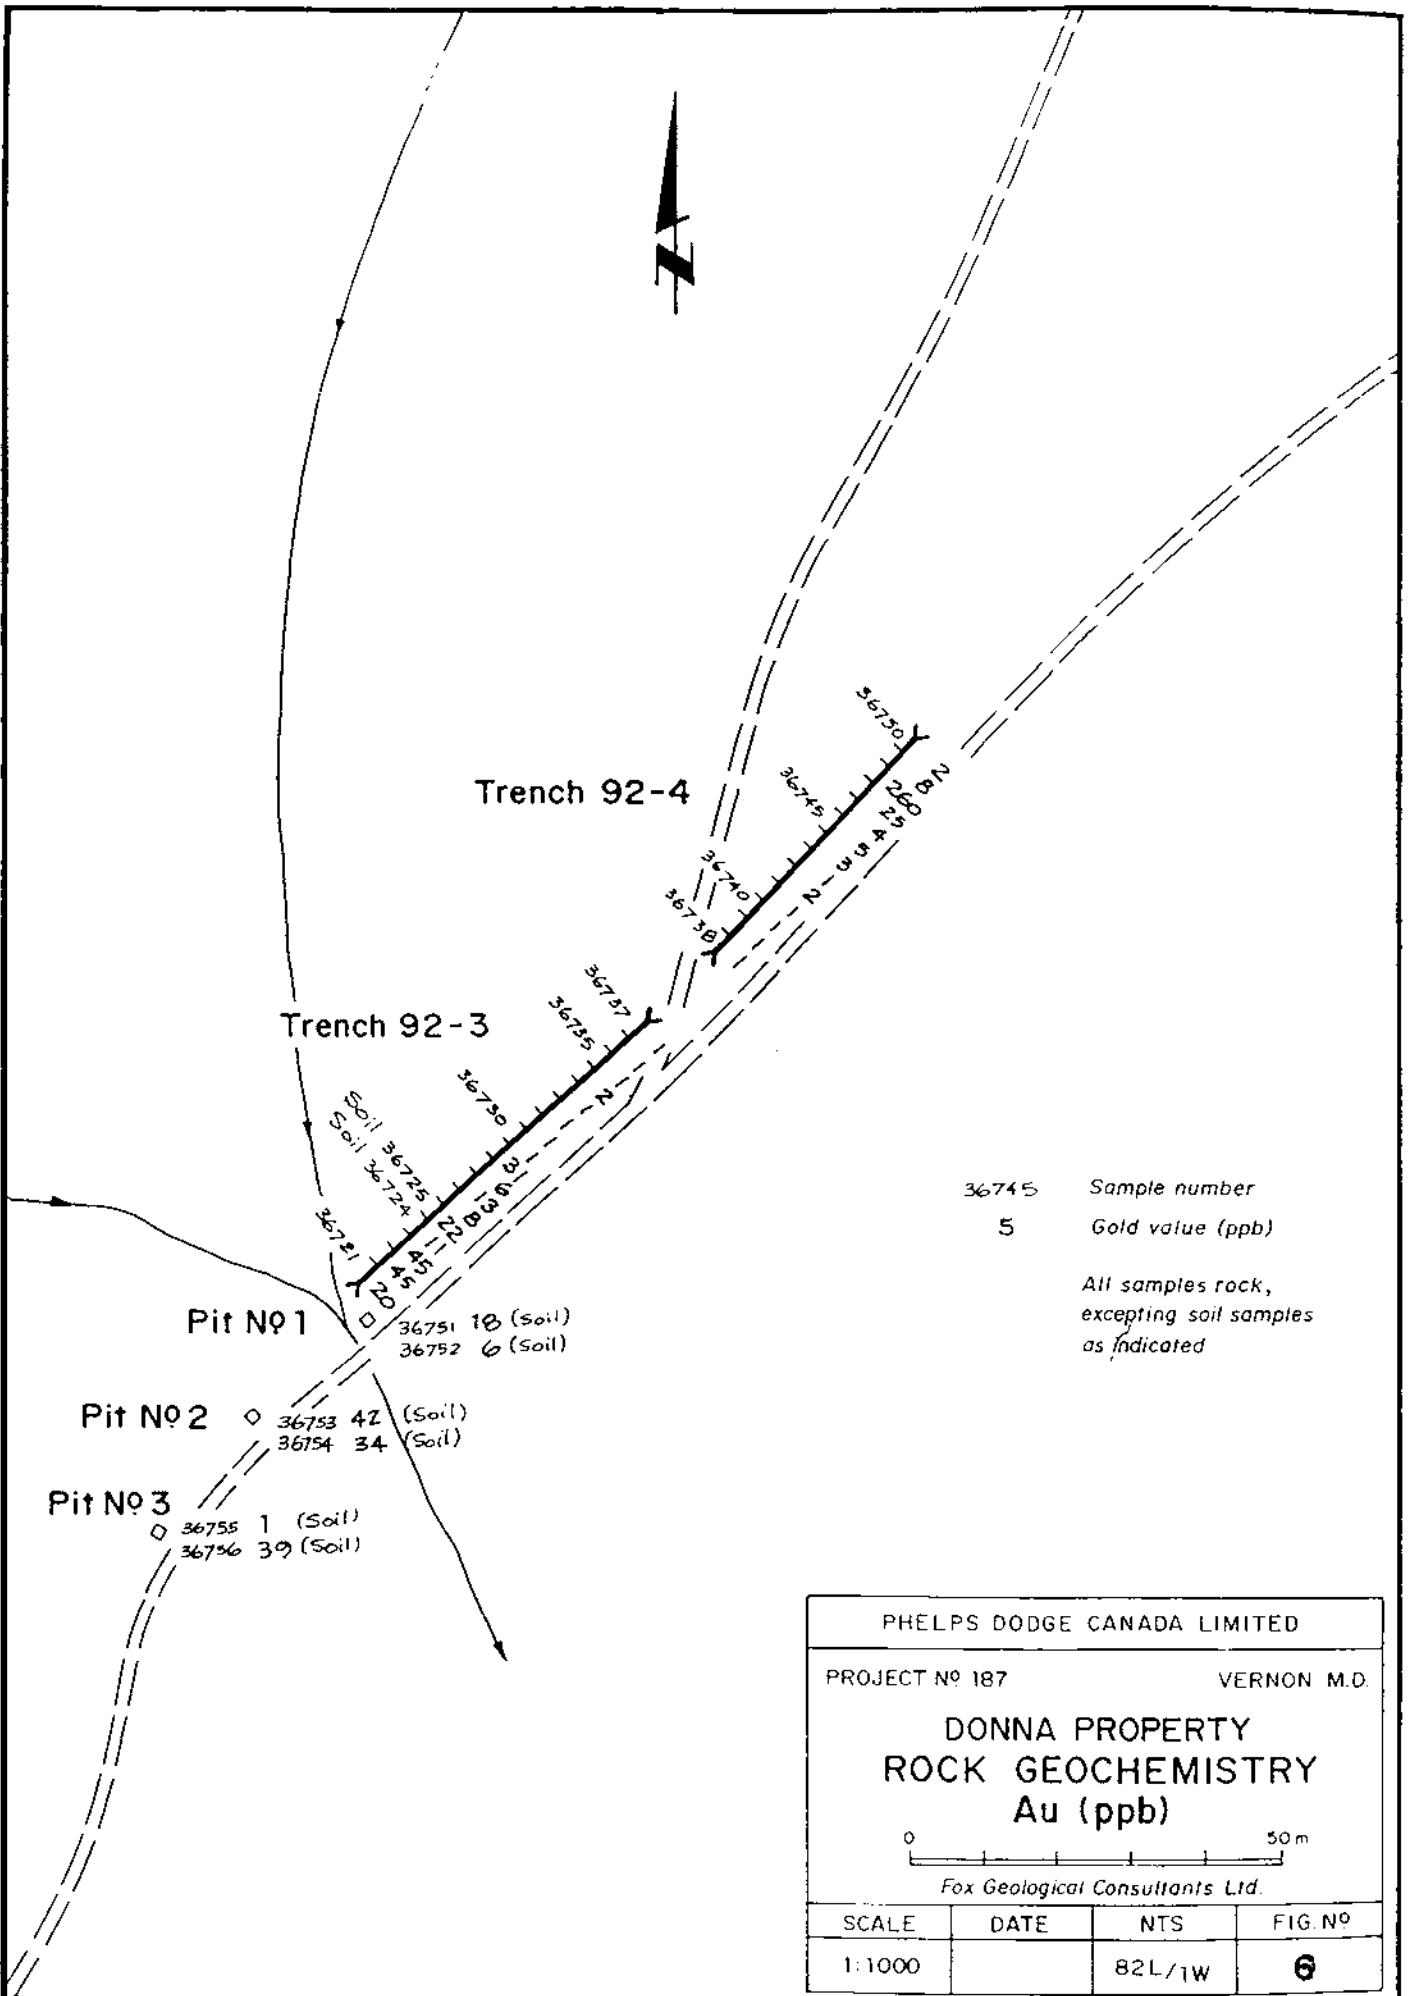

## DISBURSEMENTS

• Backhoe Rental by Contract (Watson Excavating, Vernon, B.C.)	\$ 3,308.97
• Analyses - Acme Analytical Laboratories, Vancouver Au and 30 element ICP - 297 rock, 126 soil	5,577.90
• Geological Contract and Sampler D. G. Bailey - 18 days @ \$350	7,131.01
• Four Wheel-Drive - 17 days @ \$60	1,020.00
• Report Preparation	<u>500.00</u>
<b>Total Disbursements</b>	<b>\$ <u>17,537.88</u></b>

## CONCLUSIONS

Soil geochemistry outlined a large arcuate gold, arsenic anomaly for some 2,000 metres long between lines 111N to 95N. Sampling of the bedrock in trench excavations returned elevated gold values in bedrock related to low angle shears. Gold tenor is anomalous throughout but low, less than 500 ppb gold.

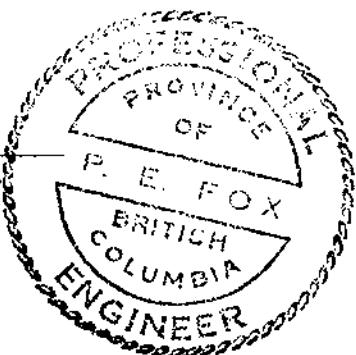

## CONCLUSIONS

Soil geochemistry outlined a large arcuate gold, arsenic anomaly for some 2,000 metres long between lines 111N to 95N. Sampling of the bedrock in trench excavations returned elevated gold values in bedrock related to low angle shears. Gold tenor is anomalous throughout but low, less than 500 ppb gold.

## CERTIFICATE

I, Peter Edward Fox, certify to the following:

1. I am a consulting geologist residing at 902 - 2077 Nelson Street, Vancouver, B.C.
2. I am a Professional Engineer registered in the Association of Professional Engineers and Geoscientists of British Columbia.
3. My academic qualifications are:  
B.Sc. and M.Sc., Queens University, Kingston, Ontario  
Ph.D., Carleton University, Ottawa, Ontario
4. I have been engaged in geological work since graduation in 1966.

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.  
 THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND LIMITED FOR NA K AND AL. AU DETECTION LIMIT BY ICP IS 3 PPM.  
 ASSAY RECOMMENDED FOR ROCK AND CORE SAMPLES IF CU PB ZN AS > 1%, AG > 30 PPM & AU > 1000 PPB  
 - SAMPLE TYPE: P1 ROCK P2 SOIL AU\* ANALYSIS BY ACID LEACH/AA FROM 10 GM SAMPLE.  
Samples beginning 'RE' are duplicate samples.

LITHOLOGY	
TERTIARY (?)	
Tg	Medium grained, equigranular granite
JURASSIC (?)	
Jdb	Biotite diorite: fine- to medium-grained, hornblende-bearing in places
Jdh	Hornblende diorite: fine- to medium-grained, equigranular to slightly porphyritic
CARBONIFEROUS - PERMIAN	
THOMPSON ASSEMBLAGE:	
PT3	Calcareous dark grey argillite and grey argillaceous limestone
PT2	Buff and cream, massive to well-bedded dacitic and rhyolitic tuff and reworked quartz-feldspar sandstone
PT1	Intertbedded dark grey carboniferous argillite and buff siltstone

SYMBOLS	
Lithological contact	: known, assumed and approximate
Fault	: known, inferred (sense of displacement)
Fold	: syncline, anticline, overturned syncline
Fold axis	: direction of plunge, $F_1, F_2$
15	
30	
Bedding attitude, angle of dip	
Shear	: symbol on hangingwall side
Outcrop	: large, small
