## **1.0 INTRODUCTION**

The RAM-TUT-TOT property consists of eleven contiguous mineral claims, staked between 1981 and 1994. They are 100% owned by North American Metals Corp. (NAMC), an 81.4% owned subsidiary of Wheaton River Minerals Ltd. Between the dates of June 8 and June 18, 1994, an exploration program consisting of contour soil sampling, rock chip sampling and limited geological mapping was carried out on the property.

### **1.1 SCOPE OF REPORT**

This report summarizes the exploration program conducted during the 1994 field season. Much of the introductory section of this report is summarized from previous authors. Geological and geochemical data from the 1994 program is shown together with data from previous work. All known reports on the RAM-TUT-TOT property are listed in Section 6.0 of this report.

### **1.2 LOCATION, ACCESS AND PHYSIOGRAPHY**

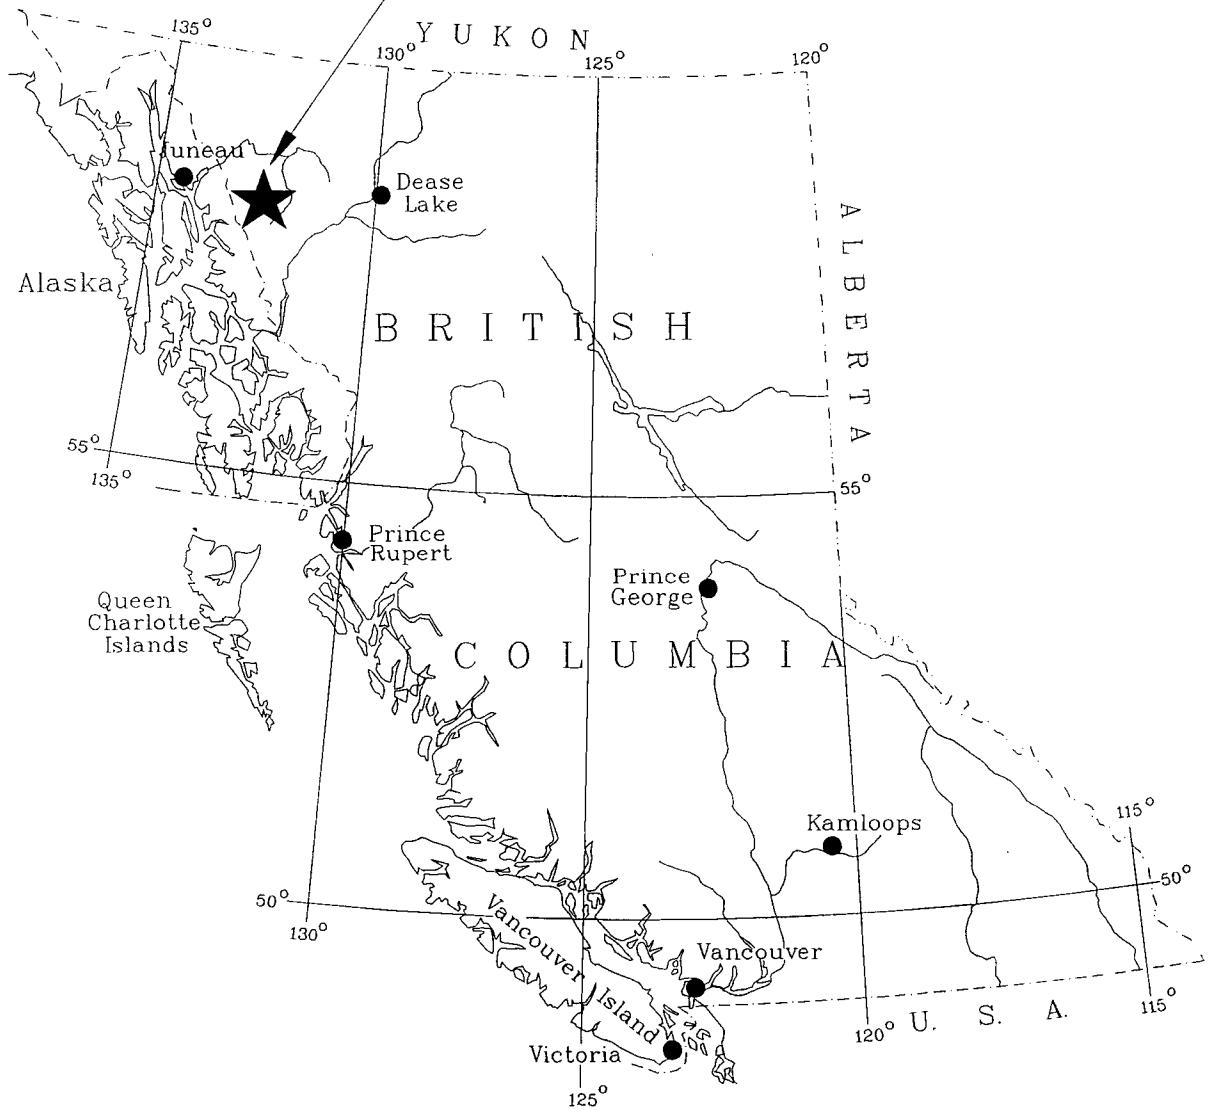

The center of the RAM-TUT-TOT property is located at  $132^{\circ} 21'W$  and  $50^{\circ} 17'N$  on NTS map sheet 104K/08, approximately twelve kilometres north of the Golden Bear Mine and one hundred kilometres northwest of Telegraph Creek, B.C. (Figure 1). Although the two-wheel drive Golden Bear Mine road passes within ten kilometres of the southern edge of the property, access can be gained only by helicopter, usually from the Golden Bear Mine or Dease Lake.

The RAM-TUT-TOT property lies within moderately rugged terrain where elevations vary from 800 meters at Tatsamenie Lake to over 2300 meters in the southeast corner of the Tut 1 claim. Treeline occurs at approximately 1100 metres elevation, slopes are primarily talus covered, but soil horizons are developed below treeline. Little or no vegetation other than grass occurs above tree-line; while dense spruce, pine and poplar forest occur on the lower slopes. Glaciers and permanent snow are not abundant and only account for approximately 5% of the total claim area. The climate is typical for a northern mountainous area, abundant snow and freezing temperatures occur for eight months of the year. Snow melts slowly on the western and northern slopes and surface exploration can only be conducted between July and mid-September.

### **1.3 PROPERTY DEFINITION AND STATUS**

The property is comprised of eleven claims totalling one hundred and eighty-three units. All of the claims are located in the Atlin Mining Division and are recorded as listed in Table 1 and shown in Figure 2 (expiry date assumes acceptance of this report).

#### **1.4 EXPLORATION HISTORY**

The RAM-TUT-TOT property was first staked in 1981 by Chevron Minerals Ltd. with the Tut 1-4 claims to cover an area of anomalous silt geochemistry discovered during a reconnaissance program in the southeastern Tulsequah map area (104K). The property was expanded with the addition of the Tot 1-4 claims in 1983. The Ram Baa claim was staked in 1989. The Ying claim was staked in 1987 to hold tenure in the area of the Tatsamenie Lake Base Camp. The Ram Baa 4 claim was added in 1994 to cover a fraction between the Tot 4 and Ram Baa claims.

Chevron completed a program of mapping and rock sampling on the property in 1982 (Shannon 1982, Brown and Shannon 1982) and followed up with a more thorough program of detailed geological mapping, rock and soil sampling, and minor trenching in 1983 (Brown and Walton, 1983). Further trenching and sampling was completed during 1984 (Bruaset 1984). During 1985, a student from the University of British Columbia completed a study of the albited unit on the Tut claims (Hewgill 1985a,b). In 1987, Chevron conducted a 674m diamond drill program to test the silicified limestone contact mineralization on the Tut claims, and a narrow shear zone on the Tot 4 claim.

During 1990 Chevron and Armeno Resources Inc. entered into an option agreement. Between July and September 1990, Armeno completed a VLF EM survey and drilled 437 metres in four diamond drill holes to further evaluate the silicified limestone mineralization on the Tut claims. A compilation and discussion of all previous work on the property can be found in the report by Armeno Resources (Allen 1990).

North American Metals Corp. acquired 100% interest in the property, as part of the Asset Sale Agreement between Chevron and NAMC, prior to the 1992 field season. Homestake Canada Ltd. was contracted by NAMC to carry out the 1992 exploration program during which several known zones were re-evaluated and several new showings were discovered and evaluated.

### **1.5 WORK COMPLETED DURING 1994**

During the the 1994 field season work was carried out on the RAM-TUT-TOT property in two disinct periods. Firstly, between June 8 and June 18, 1994 a three man field crew, mobilized out of the Golden Bear minesite, camped and worked on the Tot 3 and 4 claims. Secondly, between June 29 and July 17, 1994 a total of 7 man days were spent working on the Tut claims and 6 man days were spent working on the Tot 1-4 claims. During this second period of time access to the property was gained by helicopter from the minesite.

The work on the Tot claims carried out from the field camp consisted of contour soil sampling and detailed rock chip sampling. A total of 93 soil samples and 75 rock samples were collected. This is the only work reported herein that is being applied for assessment.

Work on the Tut claims consisted of soil sampling, rock chip sampling and limited geological mapping at a scale of 1:10,000. A total of 19 soil samples and 45 rock samples were collected. This work is not being applied for assessment but is included here for completeness.

Follow up soil and rock sampling was carried out on the Tot claim group on July 15 and 16, during which 111 soil samples and 11 rock samples were collected. This work was carried out after the anniversary date of the Tot 1-4 claims and is therefore not applicable as assessment for 1994 but is included in this report for completeness.

### **2.0 REGIONAL GEOLOGY**

The regional geology in this area has been documented by Souther (1970) and recently by Brown and Bradford (1993). An alteration, mineralization and structural study of the Tatsamenie - Golden Bear area was completed by Oliver (1990). A geochronological study of the Tatsamenie Lake area was also completed by Oliver and

Gabites (1993).

The RAM-TUT-TOT property lies within the Stikine terrane, a composite terrane comprised of Paleozoic, Triassic and Jurassic island arc rocks (Figure 4). Basement rocks of the Stikine terrane are known as the Stikine Assemblage and include Devonian to Permian limestones, argillites, cherts and a variety of volcanic and epiclastic rocks. These rocks are strongly deformed and stratigraphic relationships are not well understood. The Stikine Assemblage is overlain by Upper Triassic oceanic arc rocks of the Stuhini Group both of which are crosscut by Upper Triassic and Jurassic intrusive rocks of intermediate to felsic composition. Early Tertiary intermediate to felsic subaerial volcanics, intrusives and derived sediments of the Sloko Group unconformably overlie pre-Upper Triassic and Triassic rocks. The youngest rocks in the area are basaltic flows and pyroclastics of the late Tertiary Level Mountain Group and Hearts Peak Formation. These volcaniclastics overlie glacial till and are, in part, of Pleistocene age.

### 3.0 PROPERTY GEOLOGY

The RAM-TUT-TOT property is predominantly underlain by a tightly folded package of clastic, carbonate and volcanic rocks of the pre-Upper Triassic Stikine Terrane which is in turn overlain by a thick succession of less deformed and weakly chloritic volcaniclastics of the Upper Triassic Stuhini Group. These lithologies are locally cut by diorites to quartz-diorite intrusions of Triassic age, and plagioclase  $\pm$  hornblende porphyritic dykes and fine-grained aphanitic rhyolite dykes of the Tertiary Sloko Group. A detailed description of each lithology, structure, alteration and mineralization is given below. A simplified stratigraphic column is shown on Figure 2a. Property geology and the location of mineralized zones are shown on Figure 3(in pocket).

#### *Unknown*

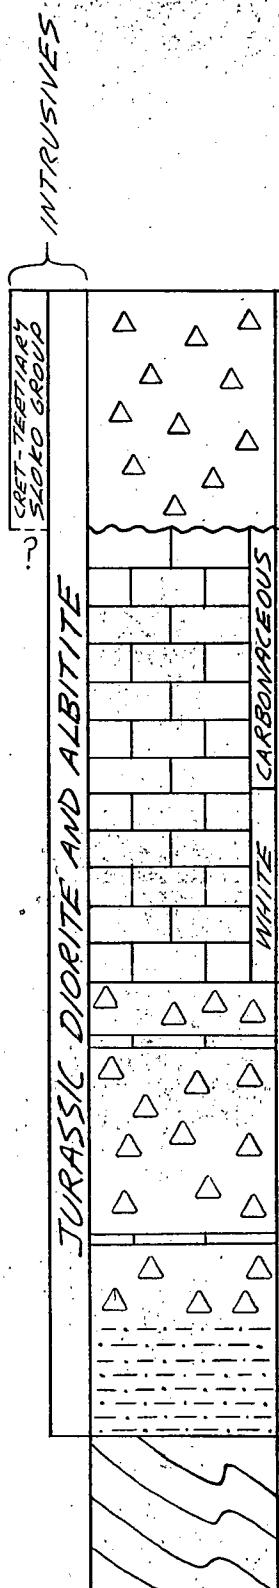

##### Ultramafic (Unit 1)

The only outcrop of this unit on the property is a thin fault-bounded lozenge on the Tot 1 claim. This unit is seen in several other locations between Tatsamenie Lake and the Golden Bear Mine, usually at higher elevations. It is always fault-bounded and probably thrust over younger Stikine Assemblage rocks. The ultramafic unit is strongly altered to serpentine  $\pm$  carbonate  $\pm$  talc, but small, isolated pods of acicular actinolite needles occur locally. Despite alteration, this unit possesses a strong remnant magnetism.

#### *Pennsylvanian*

##### Phyllites and Metavolcanics (Unit 2)

This unit is comprised of phylitic siltstone and felsic to mafic metavolcaniclastics. Howe and Reddy (1993) divided the local section into 100-200 metres of well-bedded siltstone overlain by approximately 800

metres of poorly bedded volcaniclastics with minor interbedded clastic units including carbonate layers. Folding and/or faulting may have artificially increased the thickness of this unit which typically exhibits a well developed penetrative fabric relative to overlying units. most of the package has a phyllitic texture and and an alteration assemblage dominated by quartz, sericite and chlorite. The volcanic rocks vary from light buff to medium to pale green in color and contain very fine-grained euhedral pyrite and specular hematite as disseminations. Bedding parallel and cross-cutting quartz viens and sweets are common throughout the unit and locally contain coarse potassic feldspar, specularite and muscovite.

To date most work has treated this unit as being stratigraphically younger than the limestone unit. Regionally however, this package has been identified as being stratigraphically lower than the limestones (Oliver and Gabites, 1993), therefore the phyllite and metavolcanicd unit must have been thrust over the carbonates. Bradford and Brown (1993) have mapped the limestone phyllite contact as a thrust and have a zircon date of 302 Ma from a felsic unit from within the package. Oliver (1993) obtained U-Pb zircon dates very close to this number. In addition Bruaset (1984) mapped outcrops of this unit in the core of the Tatsamenie anticline on the Tot 3 claim underlying the limestones as well as above the limestones. These observations were confirmed in the field in 1994.

### *Permian*

#### Limestone (Unit 3)

This unit has an estimated thickness of 1000m (Howe and Reddy, 1993) and has been folded into a north-northwest trending antiform. Two varieties of limestone have been mapped: massive, white, thick bedded, grey weathering, recrystallized limestone or marble in the core of the antiform, and an overlying grey weathering, carbonaceous thin bedded limestone. Conodonts samples from the limestone have been age-dated by Brown and Bradford (1993) of the BCMEMPR-Geological Survey Branch and confirm the Permian age for the unit.

### *Upper Triassic - Stuhini Group*

#### Mafic to Intermediate Volcaniclastics (Unit 4)

The mafic volcaniclastic rocks of the Stuhini Group appear to be andesitic in composition based on thin section analyses from similar units to the south of Tatsamenie Lake. Textures vary from fine-grained ash tuff to coarse crystal-lithic tuff and coarse-grained, augite porphyritic flows. This unit is typically medium to dark green, unfoliated and weakly chloritized with primary textures and mineralogy well preserved. Trace amounts of fine-grained, euhedral pyrite are disseminated throughout the

volcaniclastics. Iron carbonate alteration occurs locally as fracture controlled veins or weak to moderate replacement of the pyroclastic matrix. Bedding attitudes are usually shallow dipping towards the east. Well bedded volcaniclastics can be seen in the eastern portion of the Tut 2 claim.

Fine-grained mafic sills intrude the Stikine Assemblage phyllites below the unconformable contact with the Stuhini volcaniclastics on the Tut claims. Although these sills are not plagioclase or hornblende-phyric, they are weakly altered, undeformed and may be genetically and temporally related to the Stuhini volcanics.

#### *Jurassic*

##### Diorite (Unit 6a)

This unit outcrops in several locations on the RAM-TUT-TOT property and is typically coarse-grained hornblende ± plagioclase porphyritic in a plagioclase matrix. The diorite is unaltered, unfoliated and postdates Stuhini volcaniclastic rocks (Plate 2) . Narrow contact zones of intense iron carbonate alteration are common near these contacts.

##### Albitite (Unit 6b)

This unit only outcrops on the Tut 2 claim. It is probably a sodium metasomatized variety of the Jurassic diorite (Hewgill 1985), resulting from a late magmatic process occurring in magmatic bodies with a high degree of volatiles and the correct chemistry and was caused by the evolution of a volatile phase.

#### *Tertiary - Cretaceous*

##### Sloko Group Basalt Dykes

This unit only outcrops in one location on the Tot 3 claim at the contact between the Permian limestones and the Stuhini volcanics. Basalt dykes of the same group have been observed in this structural position within the Bear Main deposit to the south.

### **3.1 STRUCTURE**

The oldest structural feature is the Tatsamenie Antiform which trends roughly north-northwest through the property (see Figure 3). The bedding on the eastern limb is shallowly east dipping and may have been truncated by the thrust fault at the limestone/phyllite contact on the Tut 2 claim (Bradford and Brown, 1993).

Northeast trending extensional faults exist along Tatsamenie Lake and a graben

structure is developed along Tatsamenie Lake valley. Very late east-northeast trending structures cross-cut the extensional faults and are the locus for some silicification at the north end of the Limestone Contact Zone on the Tut claims.

### **3.2 ALTERATION**

Alteration associated with mineralization occurs mainly as silicification in both brecciated limestones close to the limestone/phyllite contact and as silicified shears or fault structures wholly within the phyllites. The breccias are completely silicified, typically dark grey to black with fragments of limestone and phyllite. Fine cockscomb quartz is common between breccia fragments. The overlying phyllites are often quartz veined with narrow limestone interbeds, if present, being selectively silicified. Locally the limestones are dolomitized in addition to being silicified (Bruaset, 1984). The best example of this is to the north of the Limestone Contact Zone in close proximity to faulting.

Iron carbonate is common within the volcanics peripheral to quartz-sulphide veining.

### **3.3 MINERALIZATION**

Gold mineralization on the RAM-TUT-TOT property is strongly associated with silicification, which is quite possibly related to a single mineralizing event but appears to have manifested itself differently depending on the lithology and competency of the host rock. There are two primary modes of occurrence :

- pervasively silicified and locally brecciated limestone with pyrite, arsenopyrite, anomalous silver and antimony, and localized gold mineralization.
- Quartz veining and/or silicified shear zones with stibnite, arsenopyrite ± base metal mineralization.

Work to date has outlined three main zones of mineralization: the Limestone Contact Zone (LCZ); the Tut Zone (the silicification surrounding the fault at the north end of the LCZ); and the Tot Zone.

## **4.0 DISCUSSION AND RESULTS OF THE 1994 EXPLORATION PROGRAM**

The following section discusses the results of work carried out during the 1994 field season. Attention was focussed on three areas: the Limestone Contact Zone, the West Zone (located on the Tot 3 claim at the west end of Tatsamenie Lake) and the Tot Zone. The nature and purpose of work carried out on each zone is as follows:

- Limestone Contact Zone: prospecting, rock sampling and minor soil sampling aimed at tracing the geologically favorable limestone phyllite contact to the south.
- West Zone: contour soil sampling and rock sampling over the Permian limestone and

overlying phyllites to assess the area for mineralization similar to that occurring in the Limestone Contact Zone

-Tot Zone: detailed rock chip sampling of silicified shear zones in order to define diamond drill targets on the Tot 4 claim and contour soil sampling on the Tot 1 and 2 claims in order to trace the mineralized zone to the north.

The location of each area is shown on Figure 3 and 1994 field data is displayed on Figures 4 through 7.

#### **4.1 GEOCHEMICAL AND ANALYTICAL PROCEDURES**

All soil and talus samples were collected using long bladed shovels from depths between 15 and 30 centimetres. Where possible B horizon soils were collected, however soil development was often poor and talus fines were taken instead. The material was placed in kraft waterproof bags and dried. Rock samples were collected from float, and as grab samples and continuous chip samples from outcrop, and placed in plastic bags. All samples were shipped to Chemex Labs in Vancouver for analysis.

At Chemex Labs soil samples were dried and sieved to -80 mesh, all talus and rock samples were dried and ring milled to approximately -150 mesh. All samples were subjected to an analytical package that includes 32 element ICP, gold by AA and mercury by cold vapour. All assay results are listed in Appendix I and the details of the analytical procedure, including detection limits, are given in Appendix II. Soil and rock sample locations are plotted on Figures 4 and 6 respectively. Plotted results are shown on Figures 5 and 7.

#### **4.2 LIMESTONE CONTACT ZONE**

The Limestone Contact Zone (LCZ) is a 1.5 kilometre long zone of silicification and brecciation within the Permian limestone. The zone follows the limestone/phyllite thrust contact on the Tut 2 claim and consists of a multi-lithic tectonic breccia with fragments of tuff, limestone and siltstone in a matrix of silica, pyrite and fine black sulphides (Reddy, 1993). Gold values of up to 7,020 ppb were obtained from samples collected by Bruaset (1984).

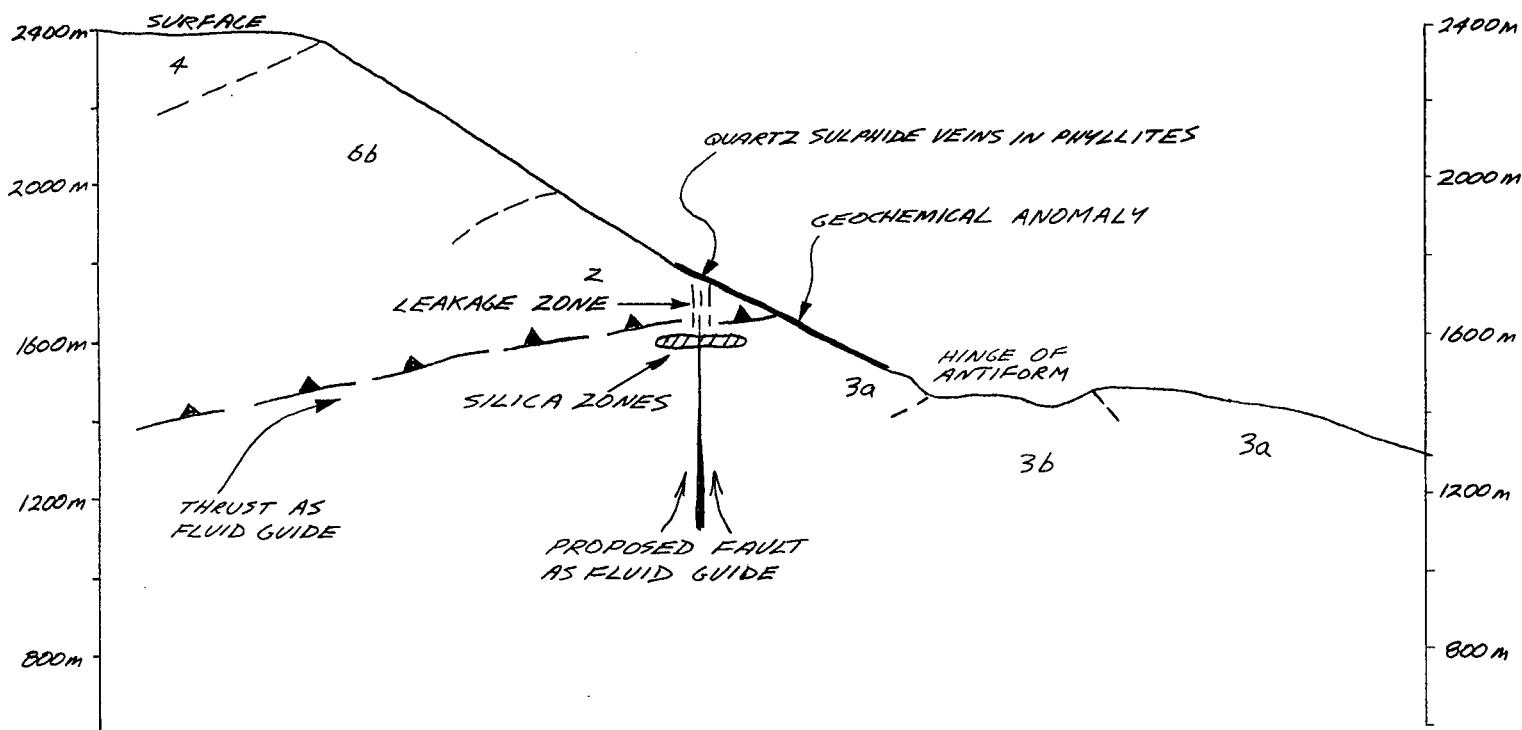

A 900 x 400 metre gold, arsenic ,antimony soil anomaly originates in the phyllitic siltstone above the contact and is caused, in part, by quartz-sulphide veins within the siltstone. Chevron geologists hypothesized that the manto-like silicified zone was fed by fluids from a vertical feeder zone within the limestones and that there was leakage of fluids into the overlying phyllites. The thrust itself may also have acted as a fluid conduit (see cross section - Figure 2b).

Chevron Canada Resources Ltd.(1987) and Armeno Resources Inc. (1990) have drilled a total of 6 holes to partly test the LCZ. Values returned include 1.38 g/t Au over 4.76m, 2.10 g/t Au over 1.75m, and 1.30 g/t Au over 2.0m. None of

the holes have tested very far down dip and drill spacing is at least 200m (Reddy, 1993).

The Limestone Contact Zone is truncated at its north end by an east-northeast trending fault around which exists an area of silicification in limestones that is known as the Tut Zone. Surface samples from this area have returned values of up to 1.6 gpt Au (Walton, 1985) from within silicified limestones and up to 3900 ppb Au over 1.1 metres from within dolomitized limestone (Reddy, 1993).

Chevron drilled a single hole through the east-northeast fault and assays up to 275 ppb over 0.95 metres were returned from a 10.0 m intersection of silicified limestone.

During the **1994 program** prospecting to the south of the Limestone Contact Zone located a silicified limestone outcrop with overlying phyllites containing silicified shears and limestone lenses. This area is now referred to as the LCZ Extension. Mineralization in the limestones consisted of sparse, fine grained, euhedral pyrite with a trace of very fine dark grey sulphides. The phyllites host narrow, silicified, pyritic shear zones with minor quartz veining. Several of the limestone lenses were found to be silicified and carrying strongly disseminated pyrite, lesser chalcopyrite and tetrahedrite, and malachite.

Rock samples of LCZ Extension silicified limestone failed to return any significant gold, the highest value being 75 ppb Au, however only very limited outcrop is exposed. Of 17 samples collected from silicified shears in the phyllites 3 returned strongly anomalous results:

- Sample #1154 - 2000 ppb Au over 1.8m
- Samples #1144 & 1145 - 1130 ppb Au weighted average over 3.0m

5 samples from silicified limestone lenses within the phyllites were strongly anomalous in Ag, As, Cu, Sb and Hg, however the lenses are of very limited size (less than 10m long and 3m wide).

A single, short contour soil line of 19 samples at 10m spacing, aimed at tracing the silicified limestone returned 7 values between 70 and 225 ppb Au. It is uncertain whether these anomalous results represent the contact zone or downhill dispersion from mineralization in the overlying phyllites.

#### **4.3 WEST ZONE**

The West Zone is underlain by the Permian limestones and the phyllite package and represents the same environment as in the LCZ across the lake to the south. Silicification in the limestones was not observed. Mineralization within the phyllites consists of narrow, short (<100m), silicified shears and silicic "patches" containing trace to three percent disseminated pyrite.

Contour soil lines were placed every 100m vertically across the zone and sampled at 50m spacing. During subsequent follow up sampling the two lowest lines were filled in at 25m spacing and two additional contour lines at 25m spacing were placed between the earlier work.

Contouring the results at 50 ppb Au outlines two geochemical anomalies with values commonly greater than 100 ppb and up to 1700 ppb Au (Figure 5). Field inspection of these areas indicates that they originate from zones of patchy and poddy silicification and pyrite mineralization within the phyllites. One grab sample from a silicic, pyritic pod 20 centimetres in size ran 5300 ppb Au and a second grab from a silicic, pyritic outcrop ran 1900 ppb Au (Figure 7). Other samples from this zone failed to return gold values. Sufficient outcrop is present within the area to indicate that no mineralized zones of significant size are present.

#### 4.4 TOT ZONE

The Tot Zone consists of an approximately 800 metre long, north-south trending zone of en echelon, silicified shear zones within felsic metatuffs. Mineralization present includes minor quartz veining, disseminated pyrite and minor arsenopyrite. Two samples collected in 1981 returned values of 4,125 and 4,005 ppb Au. A trench blasted in 1983 at the 900m elevation returned 4.5 g/t Au over 2.0m and a second trench, blasted at 1100m elevation in 1984, returned 3.92 g/t Au over 2.42m.

In 1987 Chevron drilled a single hole at the 1100m elevation. Two anomalous zones were intersected returning values of 2.5 g/t Au over 3.05m and 3.80 g/t Au over 2.26m.

Detailed rock chip sampling was carried out in 1994 on the Tot 3 and 4 claims from Tatsamenie Lake at 770m elevation up to the top of the mountain at 1700m elevation. Above 1400m mineralization was found to consist primarily of narrow (< 1.0m) quartz-carbonate veins that carry trace to 2% disseminated pyrite. Gold was not detected in 20 samples collected from these veins.

Below 1400m elevation 42 rock chip samples were collected from silicic shear zones including 4 from the 1983 Chevron trench, 26 of which returned anomalous values greater than 100 ppb gold. 8 samples ran greater than 1000ppb Au as summarized below:

- Samples #1226 & 1227 - 3150 ppb Au weighted average over 0.8m.
- Sample #1245 - 1800 ppb Au over 0.5m.
- Samples #1276 & 1279 - 2350 ppb Au weighted average over 2.0m
- Samples #1279 & 1280 - 2840 ppb Au weighted average over 1.9m.

-Sample #1288 - 2800 ppb Au grab sample.

It must be noted that much of the Tot Zone is on very steep ground including a deep, narrow gully that is not accessable on foot between 950m and 1100m elevation. Several of the strongest and most persistant shears within the zone lie in this area and remain untested. Rock climbing equipment would be needed to reach and sample these shears.

Two contour soil lines were run on the north facing slope on the Tot 1 and 2 claims in an effort to locate the northern extension of the Tot shear zone. several anomalous gold values were returned on the uppermost line at 1450m elevation, however no values were returned on the lower line and the anomaly is closed off upslope (see Figure 5).

## **5.0 SUMMARY AND RECOMMENDATIONS**

Work during 1994 was designed to evaluate three areas: the southern extension of the Limestone Contact Zone, the West Zone and the Tot Zone. LCZ style mineralization was located at the LCZ extension, however no gold was detected in the limestones and only erratic values were returned from silicic shears in the overlying phyllites. Anomalous soil and rock values were found in the West Zone phyllites related to very patchy mineralization, but no mineralization was detected in the limestones. Chip sampling in the Tot Zone returned the most consistant gold values with results up to 2840 ppb Au over widths up to 2.0m.

Recommendations for future work on the Ram-Tut-Tot property are as follows:

- Limestone Contact Zone: a thorough assessment of surface and diamond drill hole data should be made in order to define drill targets for both the LCZ and Tut Zones.
- LCZ Extension: no further work is recommended for this zone.
- West Zone: no further work is recommended for this zone.
- Tot Zone: untested shears should be sampled through the use of rock climbing equipment and drill targets defined.

Project: RAM-TUT-TOT  
 P.O. #: EX441622

Samples submitted to our lab in Vancouver, BC.  
 This report was printed on 9-JUL-94.

## SAMPLE PREPARATION

CHEMEX CODE	NUMBER	SAMPLES	DESCRIPTION
205	75		Geochem ring to approx 150 mesh
274	75		11-15 lb crush and split
229	75		ICP - AQ Digestion charge

\* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

Comments: CC: ANDREW HAMILTON

**APPENDIX III**  
**(Statement of Qualifications)**

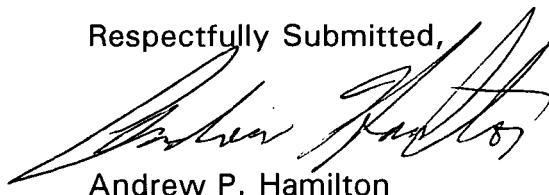

## **STATEMENT OF QUALIFICATIONS**

I, Andrew P. Hamilton, with a residence address of 201-2166 West 8th Avenue, Vancouver, B.C., V6K 2A4, do hereby certify that:

1. I am a graduate of the University of British Columbia at Vancouver, British Columbia with a Bachelor of Science Degree in Geological Sciences (1991).
2. I have practiced my profession as a Geologist in Northwest Territories and British Columbia since 1985.
3. I am registered as a Geoscientist-in-training with the Association of Professional Engineers and Geoscientists of British Columbia.
4. I am presently employed as a Geologist by North American Metals Corp. of 1500-700 West Pender Street, Vancouver, B.C.
5. The work described in this report is based on fieldwork conducted during June and July 1994 in which I supervised.
6. I have no direct or indirect financial interest in any company known by me to have an interest in the mineral properties described in this report, nor do I expect to receive any such interest.
7. I am the author of this report.

Dated at Vancouver, B.C. this 26<sup>th</sup> day of SEPTEMBER, 1994 .

Respectfully Submitted,

A handwritten signature in black ink, appearing to read "Andrew P. Hamilton".

Andrew P. Hamilton

## STATEMENT OF QUALIFICATIONS

I, Dunham L. Craig, P. Geo., with a residence address of 703 - 409 Lonsdale Avenue, North Vancouver, B.C. V7M 2G5, do hereby certify that:

- \* I am a graduate of the University of British Columbia with a Bachelor of Science Degree in Geological Sciences (1988).
- \* I am a member of the Association of Professional Engineers and Geoscientists of British Columbia as a registered Professional Geoscientist.
- \* I have practised my profession as a Geologist in British Columbia and the Yukon Territory since 1988.
- \* I am presently employed by North American Metals Corp. of 1500 - 700 West Pender Street, Vancouver, British Columbia, V6C 1G8 as Exploration Manager.
- \* The work described in this report is based on field work conducted during June and July, 1994 in which I supervised.
- \* I have reviewed this report and state that the contents are a factual representation of the work performed during the period covered by this report.

Dated at Vancouver, British Columbia this 26<sup>th</sup> day of September, 1994

Respectfully Submitted,

Dunham L. Craig, P. Geo.  
Exploration Manager  
North American Metals Corp.

**APPENDIX IV**  
**(Statement of Costs)**

## STATEMENT OF COSTS

Applies only to work carried out on the Tut 3 and 4 claims.  
Work performed June 8th - 30th, 1994.

### WAGES

Andrew Hamilton (geologist) - 11 field days @ \$270.00/day	2970.00
Paul Henry (sampler) - 11 field days @ \$236.25/day	2598.75
John Rozendahl (sampler) - 11 field days @ \$236.25/day	2598.75
Andrew Hamilton (geologist) - 10 days report preparation and drafting @ \$270.00/day	2700.00

GROCERIES (field days)	910.13
------------------------	--------

ROOM AND BOARD - mob/demob days and report preparation at Golden Bear Minesite - 16 days @ \$45.00/day	800.00
---	--------

AIR SUPPORT (Pacific Western Helicopters - Bell 206) 8 hrs. @ 705.00/hr inc. fuel	5640.00
--	---------

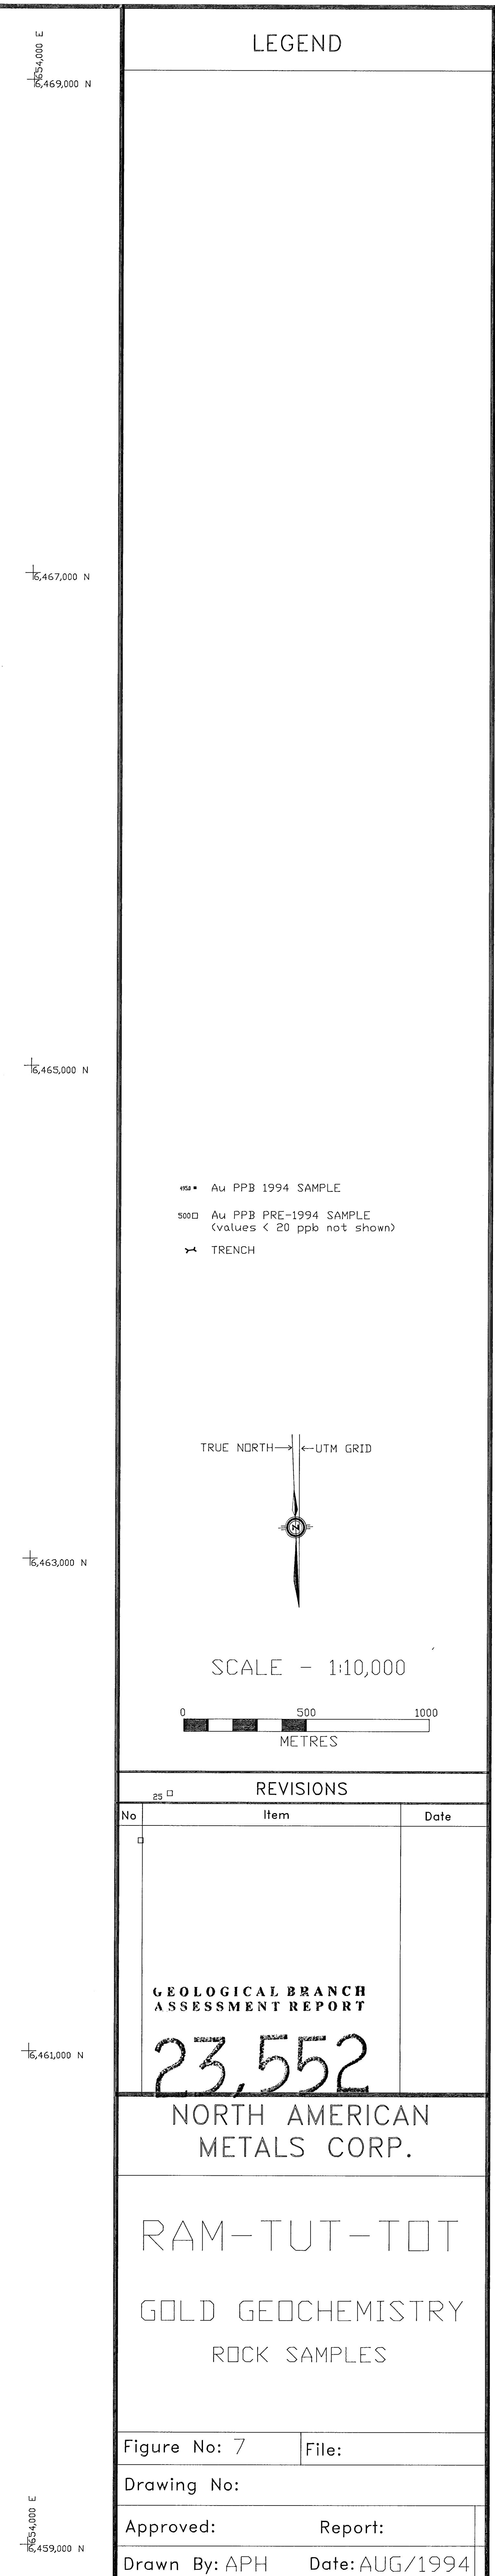

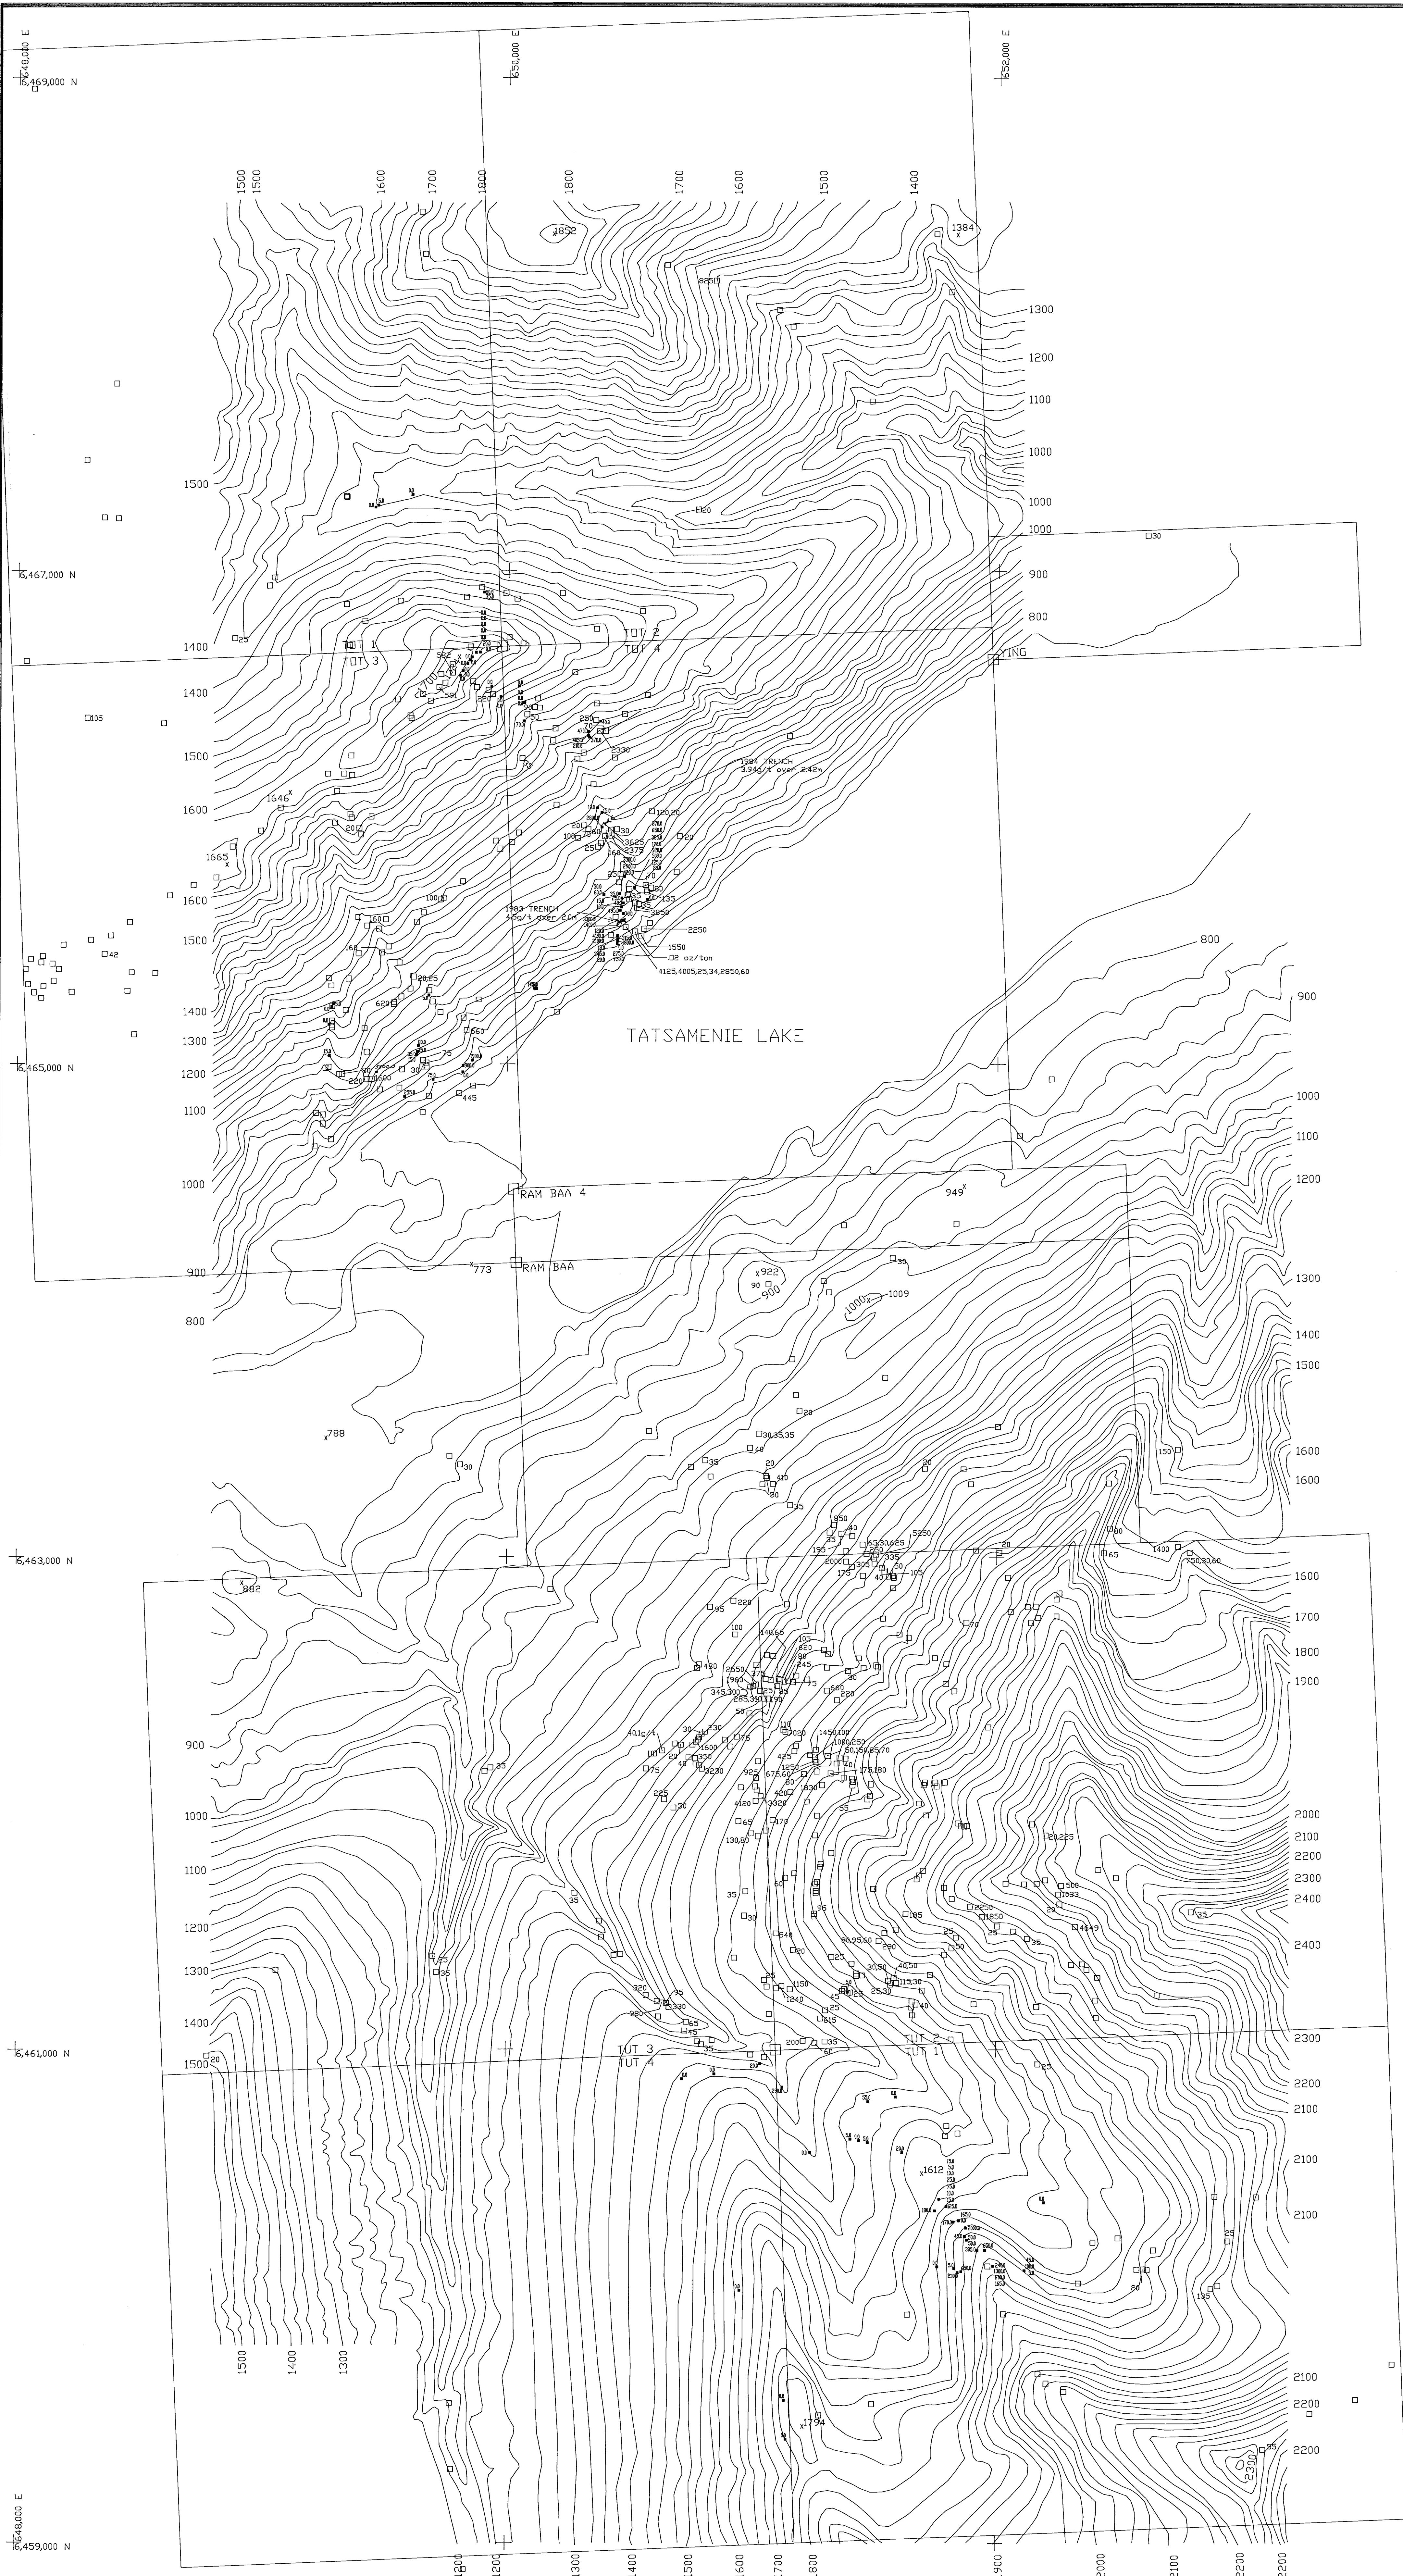

INSTRUMENT RENTAL - radios	160.00
----------------------------	--------

LABORATORY ANALYSES (Chemex Labs - 32 element/CP, Au-AA, Hg cold vapour) 168 rock & soil samples @ \$12.05/sample	2025.00
---	---------

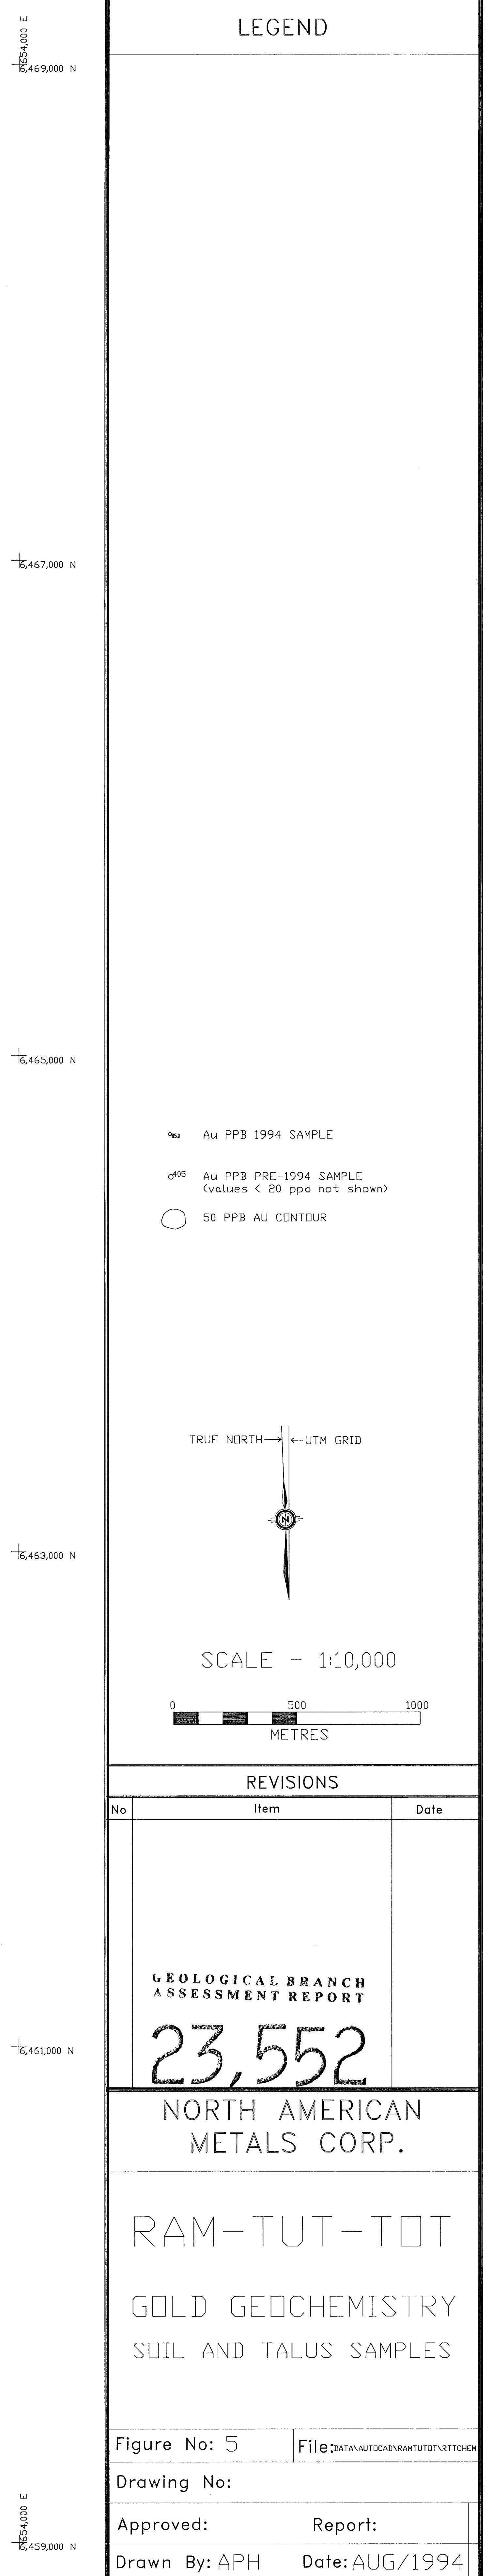

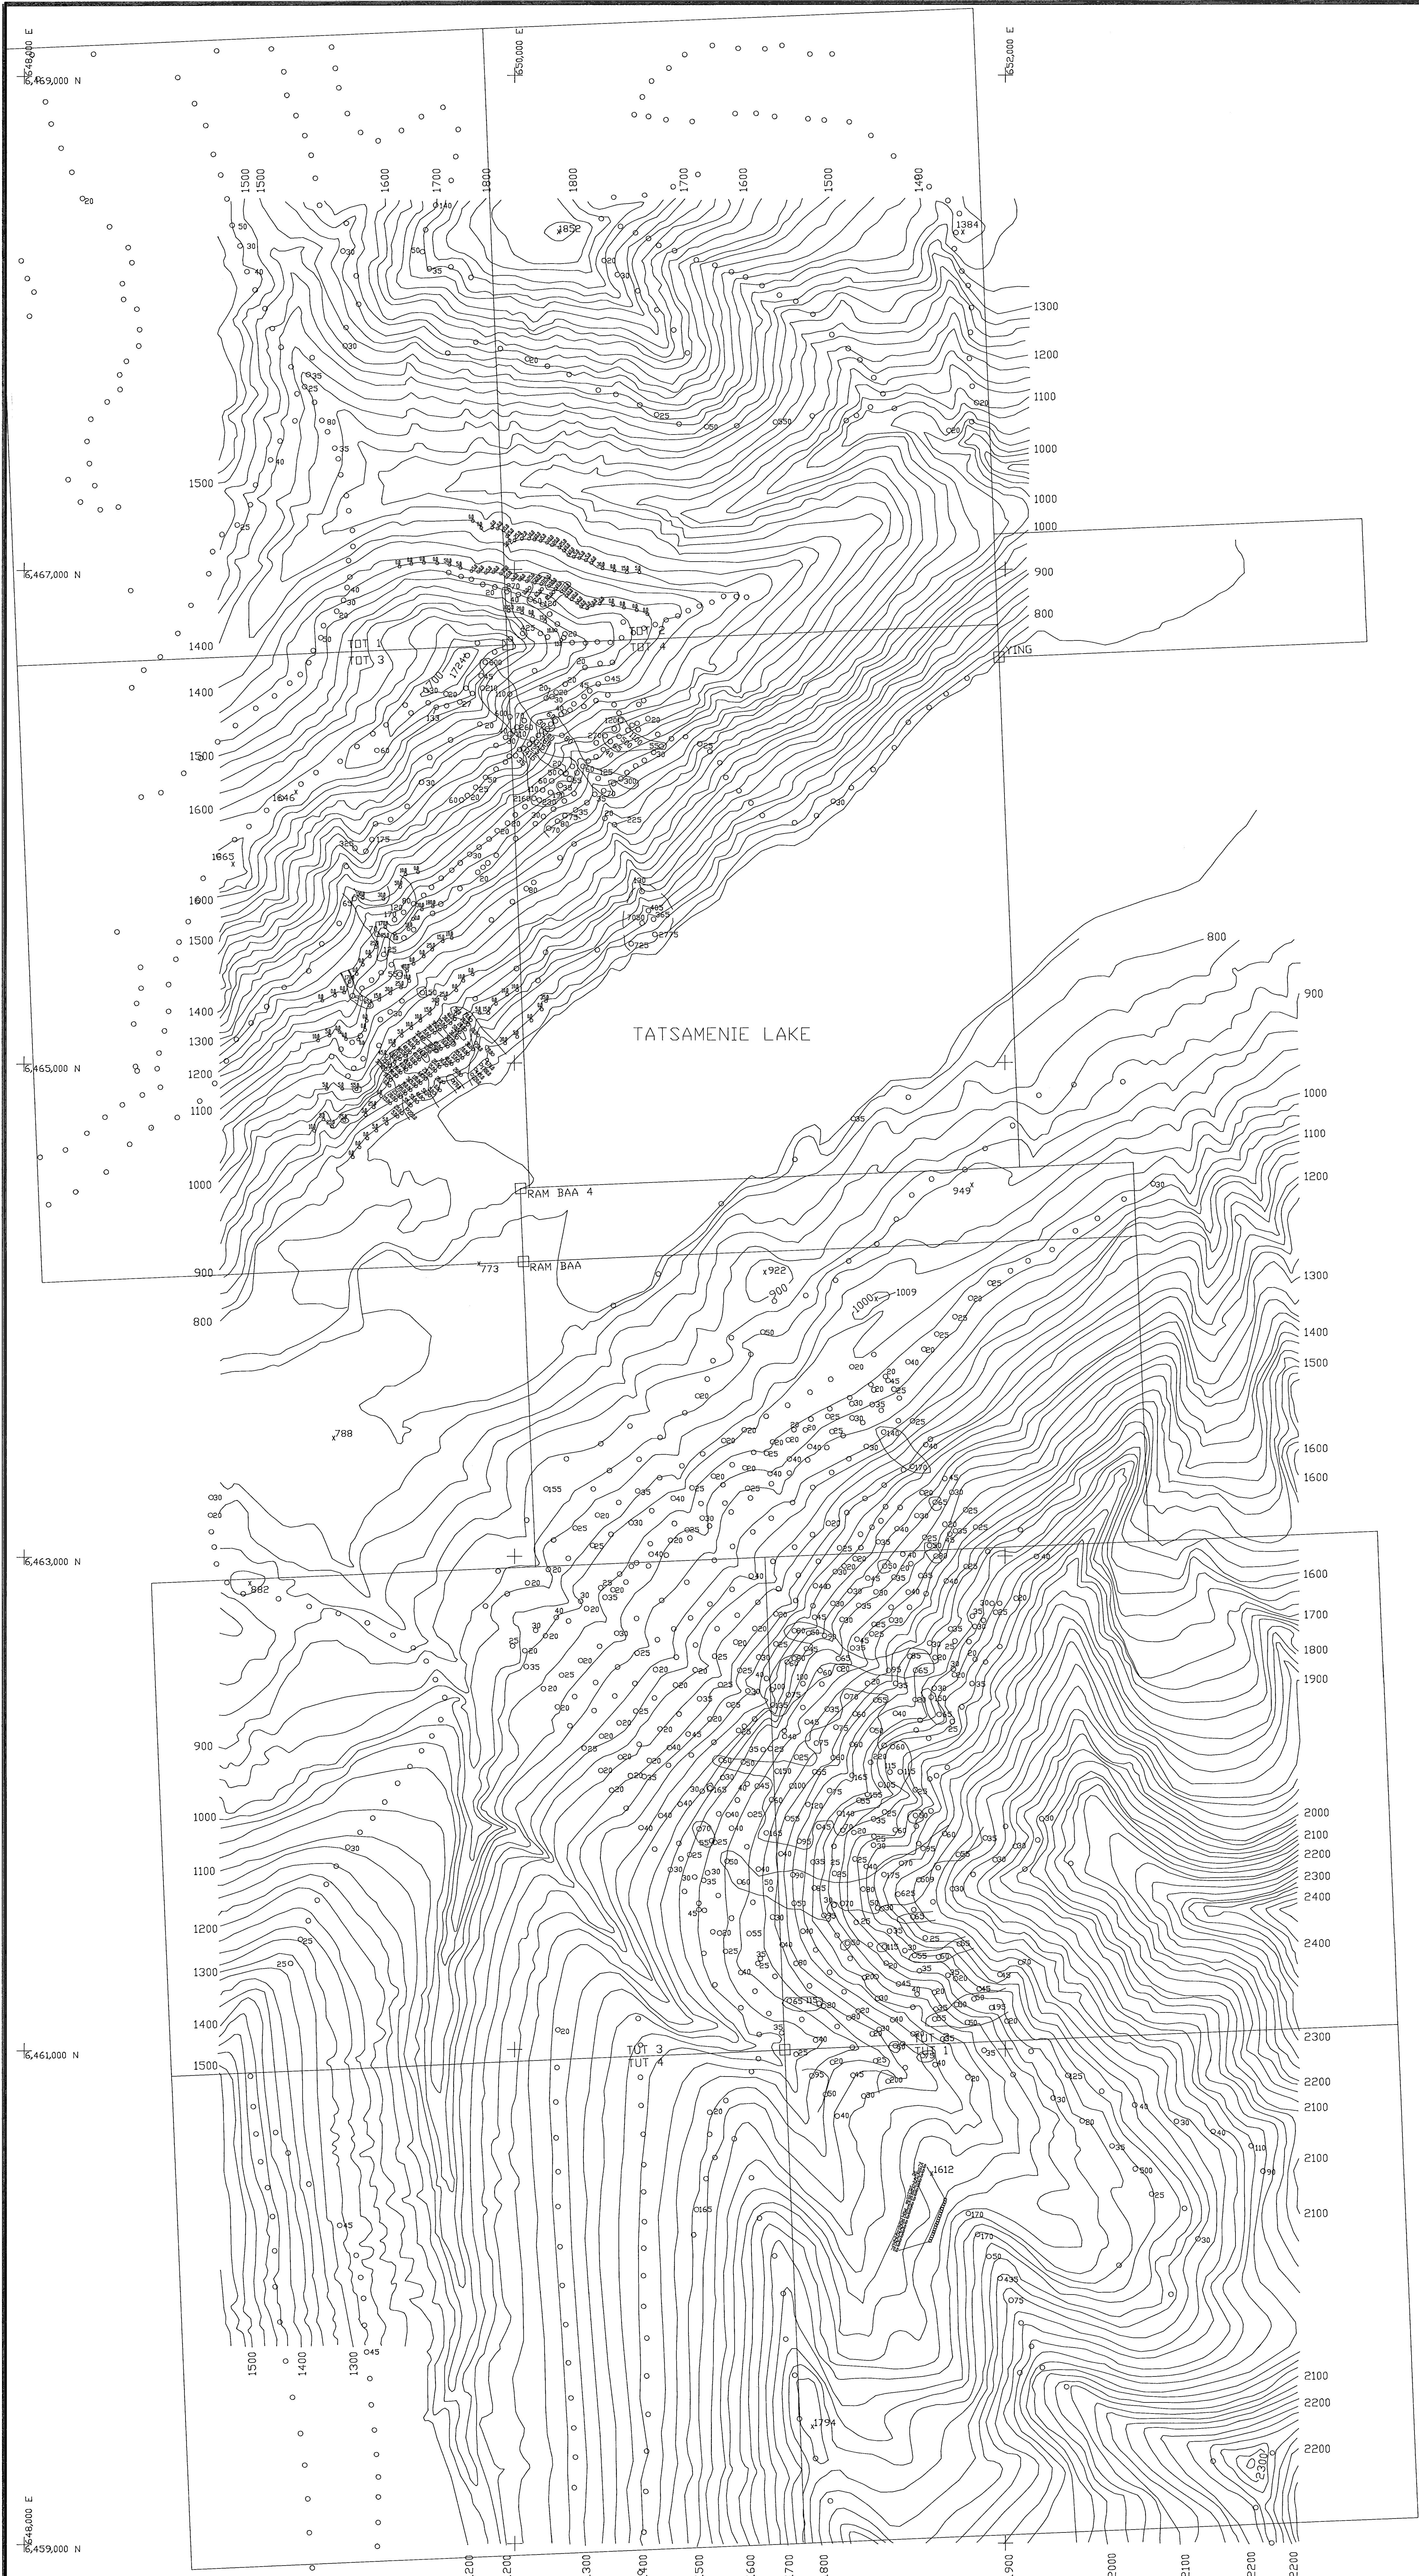

### EQUIPMENT AND SUPPLIES

- 1000 watt generator	1011.00
- Field equipment	2120.00
- Field supplies (consumable)	300.00
- Air photos	407.00
- Field camp rental	<u>820.00</u>

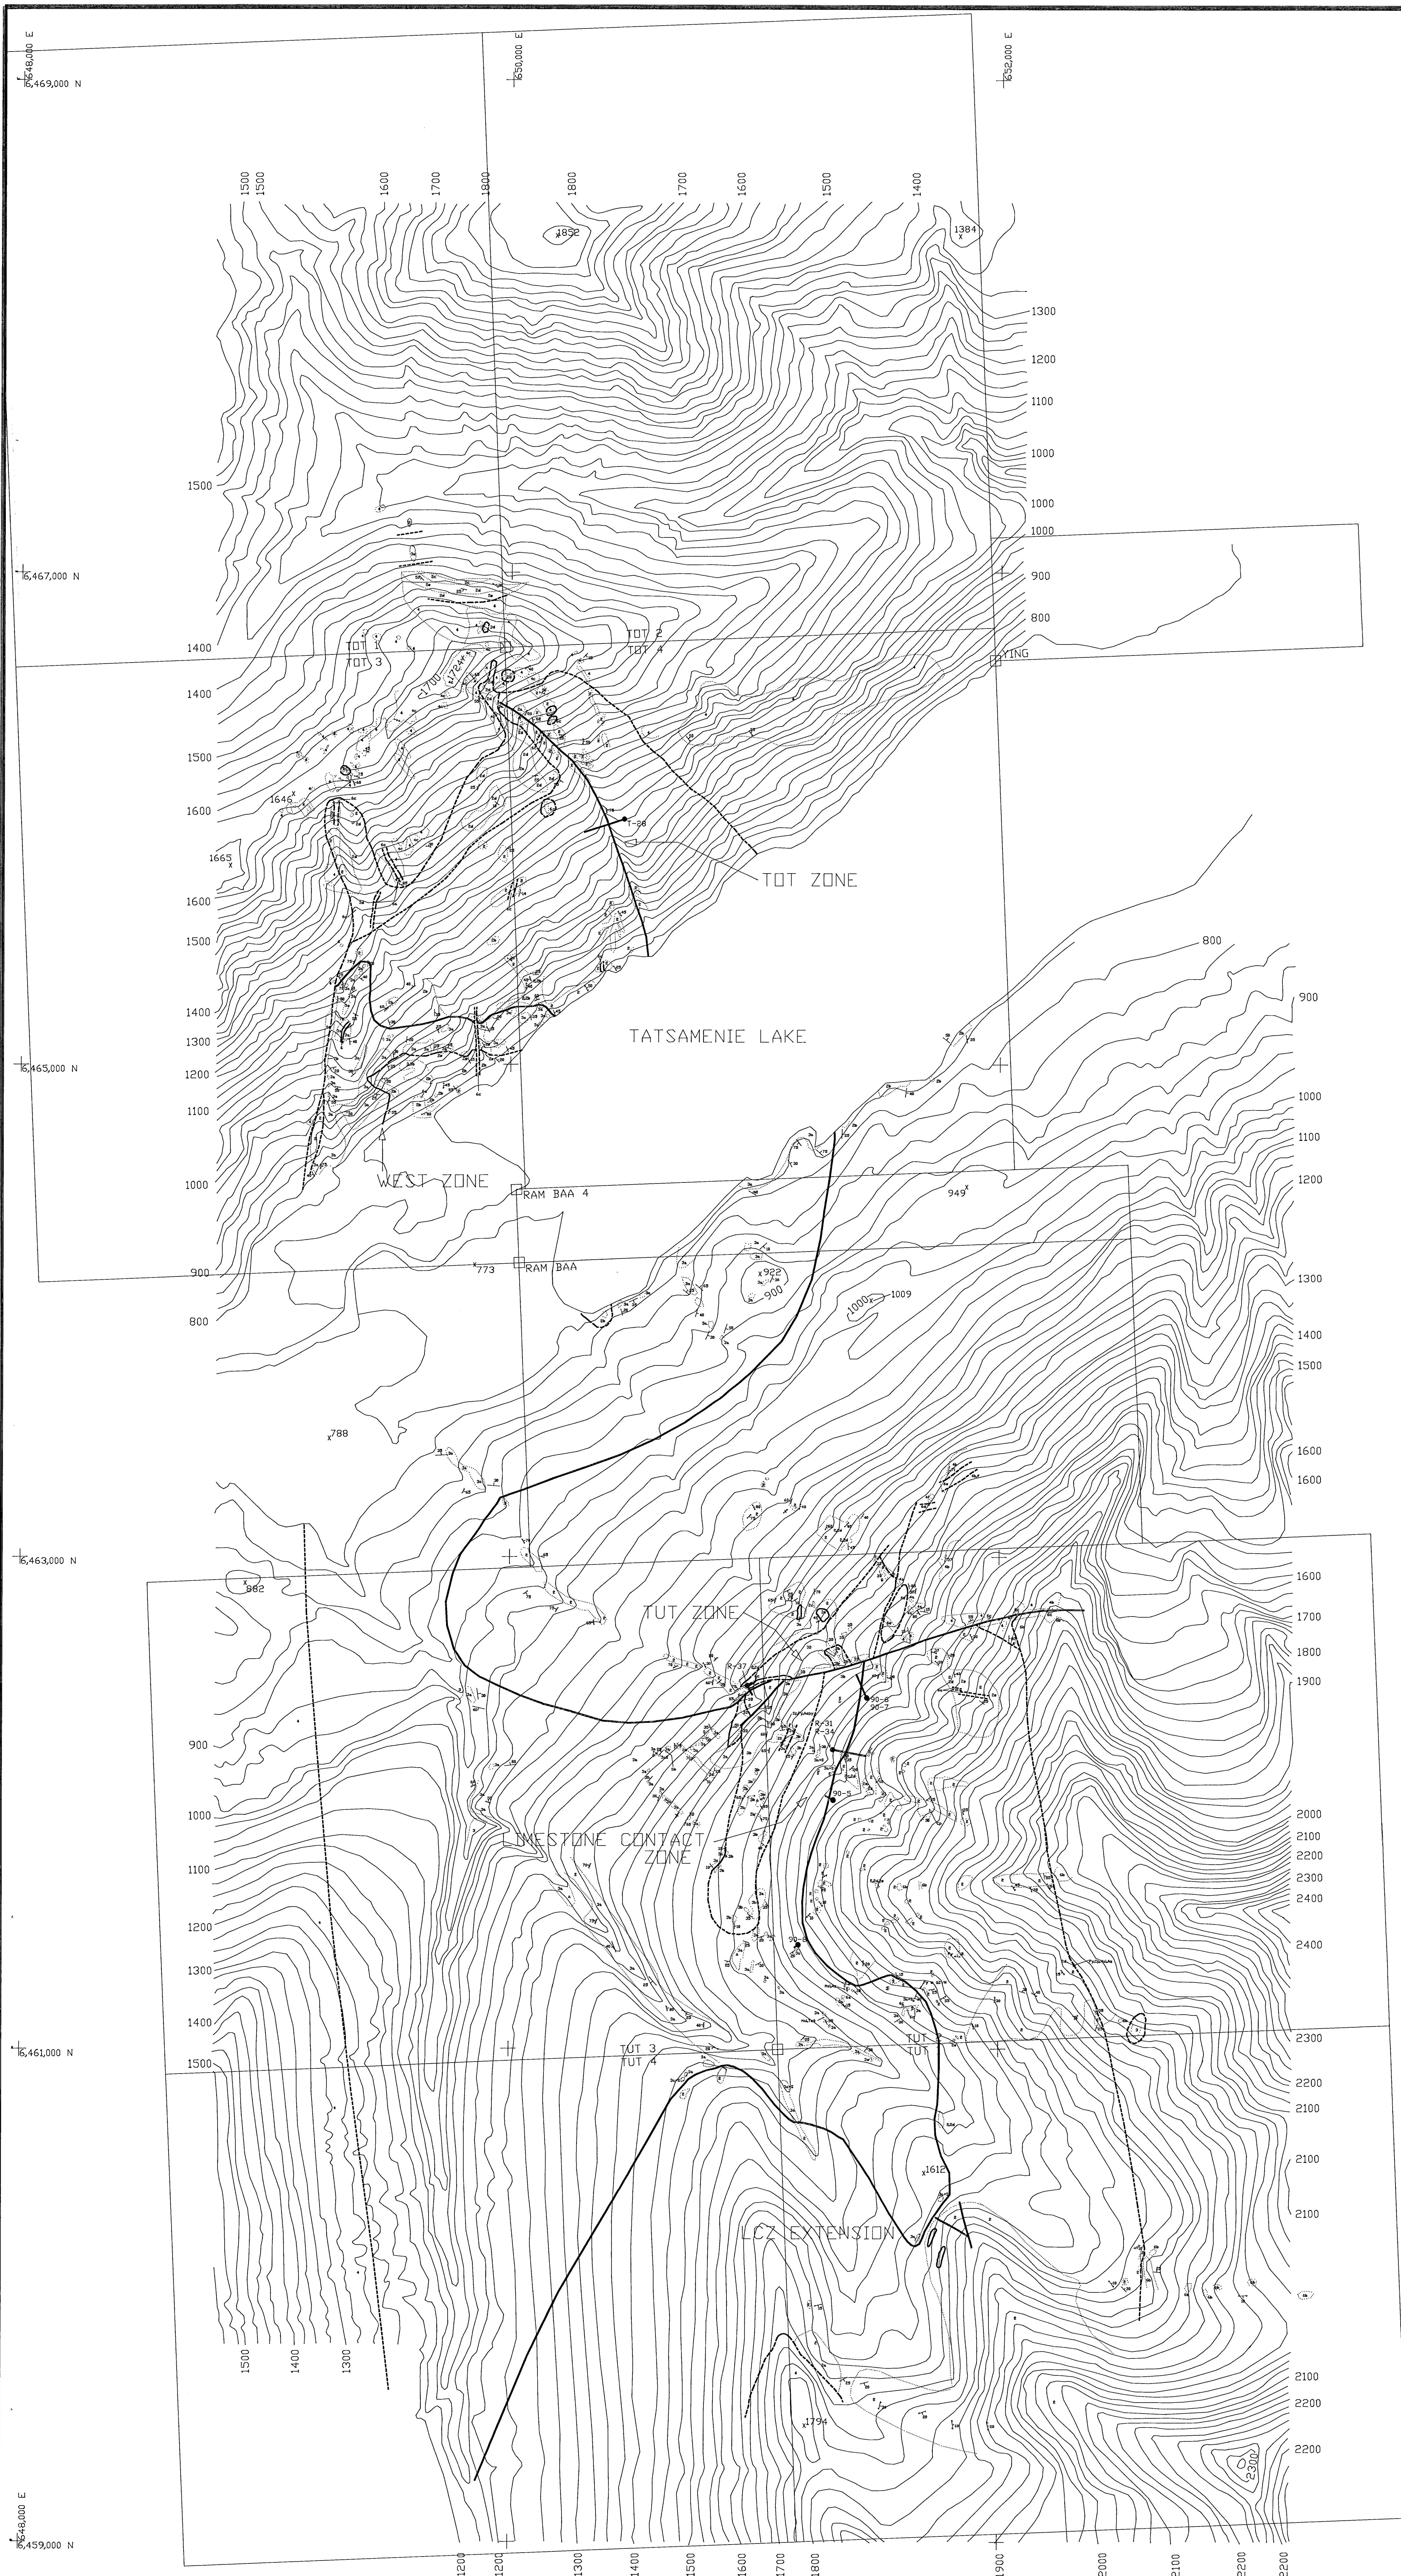

TOTAL	\$25,060.63
-------	-------------
