1.0 Summary

The Hen Group is owned by David W. Ridley. Pioneer has the right to earn 100% of the property by making further cash payments totalling \$30,000 dollars by January 1, 1996 and performing a further \$55,200 of work on the property by December 31, 1997. Ridley will maintain a 2% N.S.R. royalty subject to a \$2 million buyout.

Ridley discovered the mineralization in 1992 in a number of float boulders containing arsenopyrite, pyrrhotite, and minor stibnite in hornfelsed Andesite Tuff with gold values up to 9.0 gm/tonne.

Pioneer optioned the property in June, 1993 and carried out a program of prospecting, reconnaissance soil and rock chip sampling, and limited mechanized trenching. Two other zones of anomalous gold values were outlined, but the source of the high grade float was not found.

A program consisting of geological mapping, grid soil geochemistry, mechanized trenching, and two NQ diamond drill holes totalling 199 meters was carried out in 1994 and is the subject of this report.

Geological mapping, combined with air photo interpretation, outlined a major east-west trending regional structure, traced for 11 km, that crosses the area of the high grade float. This structure was assumed to be the source of the mineralized float, and mechanized trenching was laid out to cross this structure. Trenching approximately 50 meters up slope from the float uncovered a 2.1 meter wide calcite, quartz, arsenopyrite vein grading 3.98 gm/t in the large east-west trending structure. This structure was present for the whole 54 meter length of the trench. Strong potassic alteration in the form of biotite, intense shearing and ubiquitous quartz-calcite stringers and veins are the main manifestations of the regional structure. The altitude of the structure varies in detail, but trends 97° to 105° and dips 64°N to 72°N.

Based on these results, two N.Q. diamond drill holes were drilled from the same set-up, roughly 15 meters north of the mineralization in the trench. Both holes were drilled at a bearing of 160°, Hen 94-1 at -45° for 157.3m, and Hen 94-2 at -70° for 41.8 meters. Both holes intersected the down dip extension of the mineralization trenched on surface, but in both cases the mineralization had horsetailed, giving geochemically anomalous values over 12.4 meters in the Hen 94-1 and 15.3 meters in Hen 94-2. Drill hole Hen 94-1 intersected another zone of calcite-quartz with pyrrhotite and arsenopyrite from 63.0 to 73.0 meters. Eight meters of this zone assay 0.86 gm/tonne gold.

2.0 Conclusions

A new gold discovery has been made on the Hen property. Mineralization is associated with a regional scale structure at least 144.8 meters wide, where tested. This structure is part of a tectonic scale transverse structure. Right lateral movement on the Hendrix Creek fault has offset this structure and the structure on the Hen is most probably the continuation of the Ten Mile Fault, located immediately north of the Boss Mountain Molybdenum Mine. Calcite-Quartz Arsenopyrite mineralization has been sampled in a trench and returned ore grade mineralization over a mineable width (3.98 gm/t over 21 meters). This mineralization returned geochemically anomalous values over wide intersections in two drill holes. Another zone of Calcite-Quartz Arsenopyrite mineralization returned highly anomalous values (0.86 gm/t over 8.0 meters). Further work is definitely warranted.

3.0 Recommendations

A Magnetometer/VLF geophysical survey should be carried out on north south lines with 100 meter line spacing and 25 meter station spacing from 500 meters west of the trench showing to 1.5 kilometers east of this area. A 2,000 meter diamond drill program should be carried out following the geophysical program. At least one hole should be drilled north, under the area of Hen-94-1. The steep slope makes it possible to drill this hole from the junction of the access road to Hen-94-1 and the 6300 logging road. The other holes, probably five, should be drilled to intersect the main structure at short (< 50 meters) step-outs from Hen 94-1.

The proposed program would cost approximately \$250,000 and take six weeks.

Respectfully submitted,

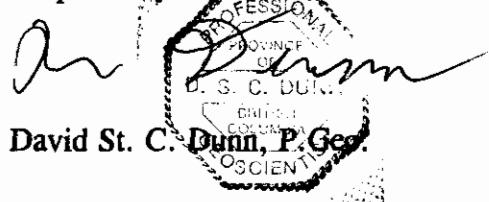

David St. C. Dunn, P.Geo.

4.0 Introduction

4.1 Location and Access

The Hen property is located approximately 75 kilometers northeast of 100 Mile House, B.C. and is readily accessible by vehicle. Access from highway 97 is via the Canim Lake road to the Eagle Creek bridge, thence the Hendrix lake road for a distance of 27.5 kilometers to its junction with the 6300 forest access road. Trenching and drilling were carried out 80 meters ENE of the 6303 kilometer post. The other area of interest lies beside a secondary logging road near the 6305 kilometer post. A hydro transmission line, which powered the Boss Mountain molybdenum mine at Hendrix Lake, cuts through the central portion of the property. This line is currently in good repair and provides power to the townsite at Hendrix Lake.

4.2 Physiography and Climate

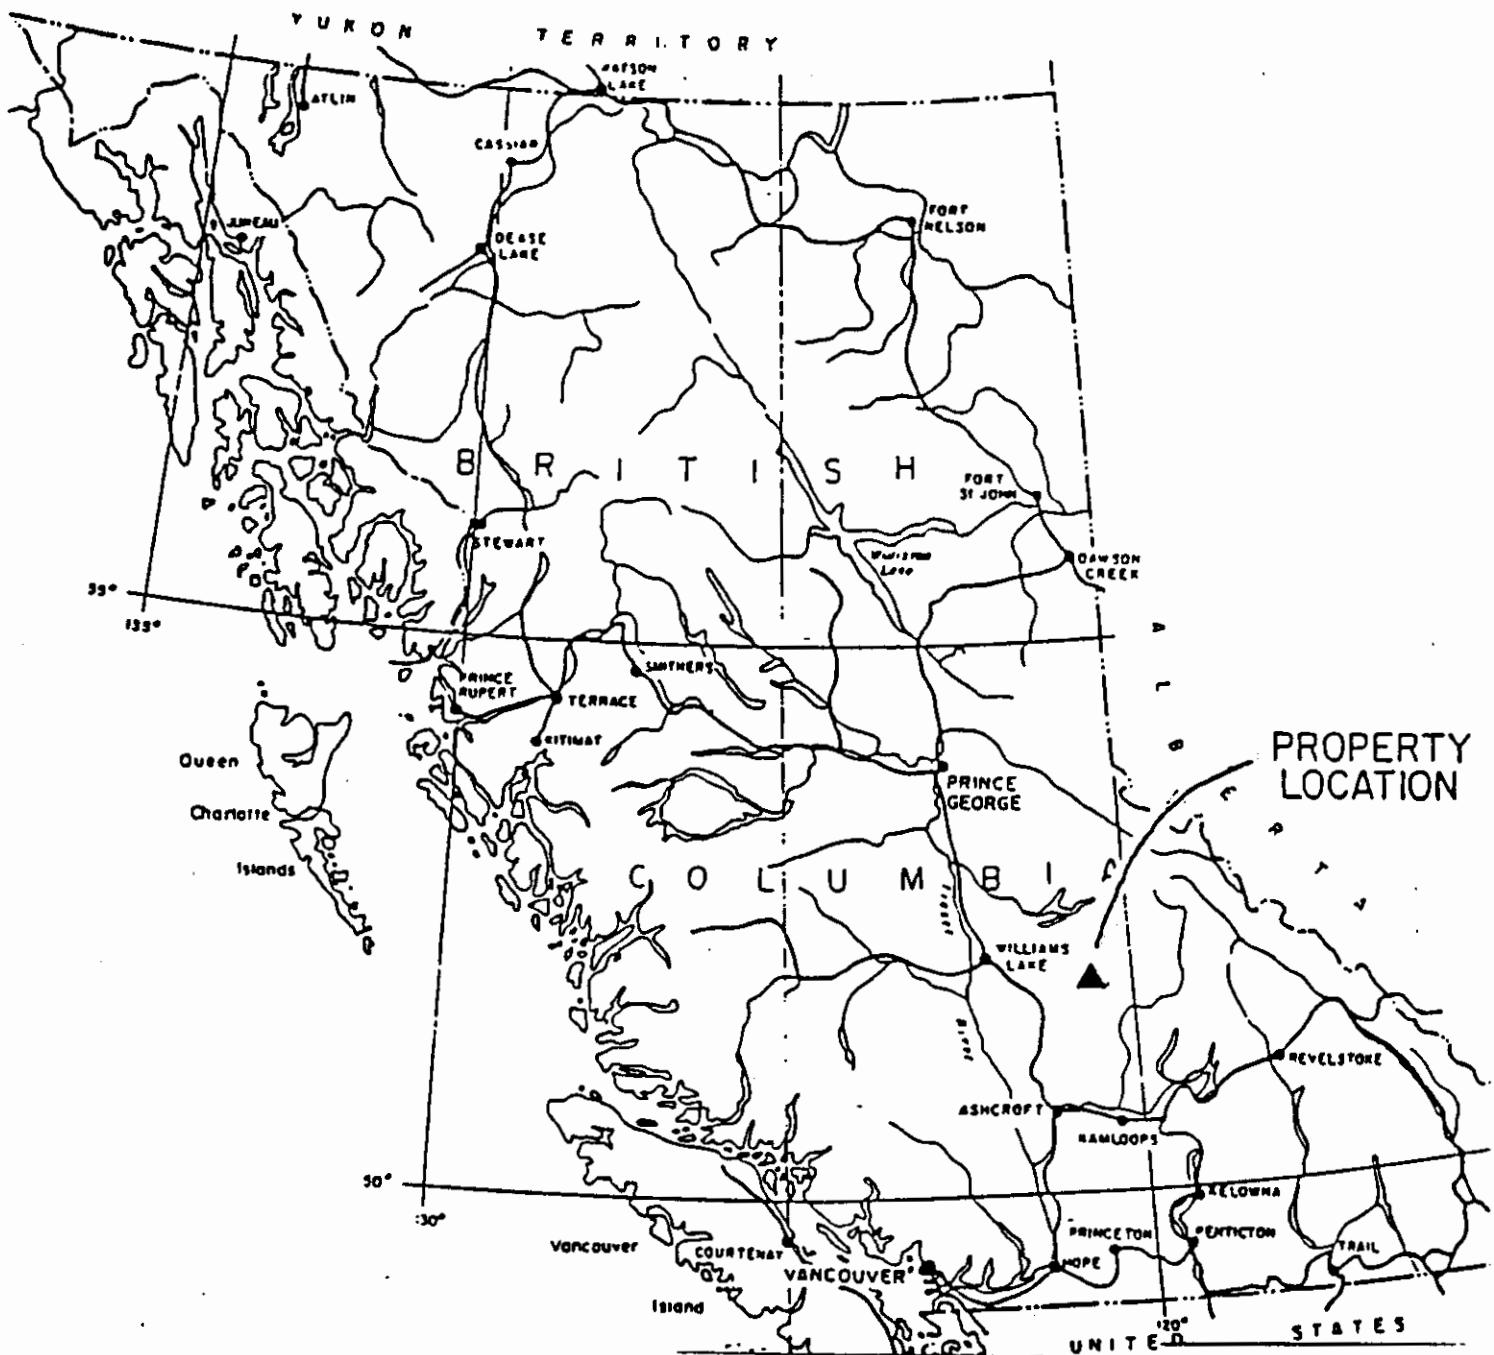

The claims are adjacent to the west side of the Interior Wet Belt bioclimatic zone and lie within Quesnel Highlands physiographic region. Rainfall is moderate with up to three meters of snow accumulating in the winter. Elevations range between 1,037 meters in Hendrix Creek valley to 1,616 meters in the northeast corner of the property.

Topography is moderate, except in the Hendrix Creek Valley, where steep slopes are present. The area is well forested with mature spruce, fir and pine, except where clear cut. Approximately 20% of the claims have been clear cut.

Water is readily available from Hendrix Creek and an unnamed creek which flows southerly through the eastern part of the property.

4.3 Property Status and Ownership

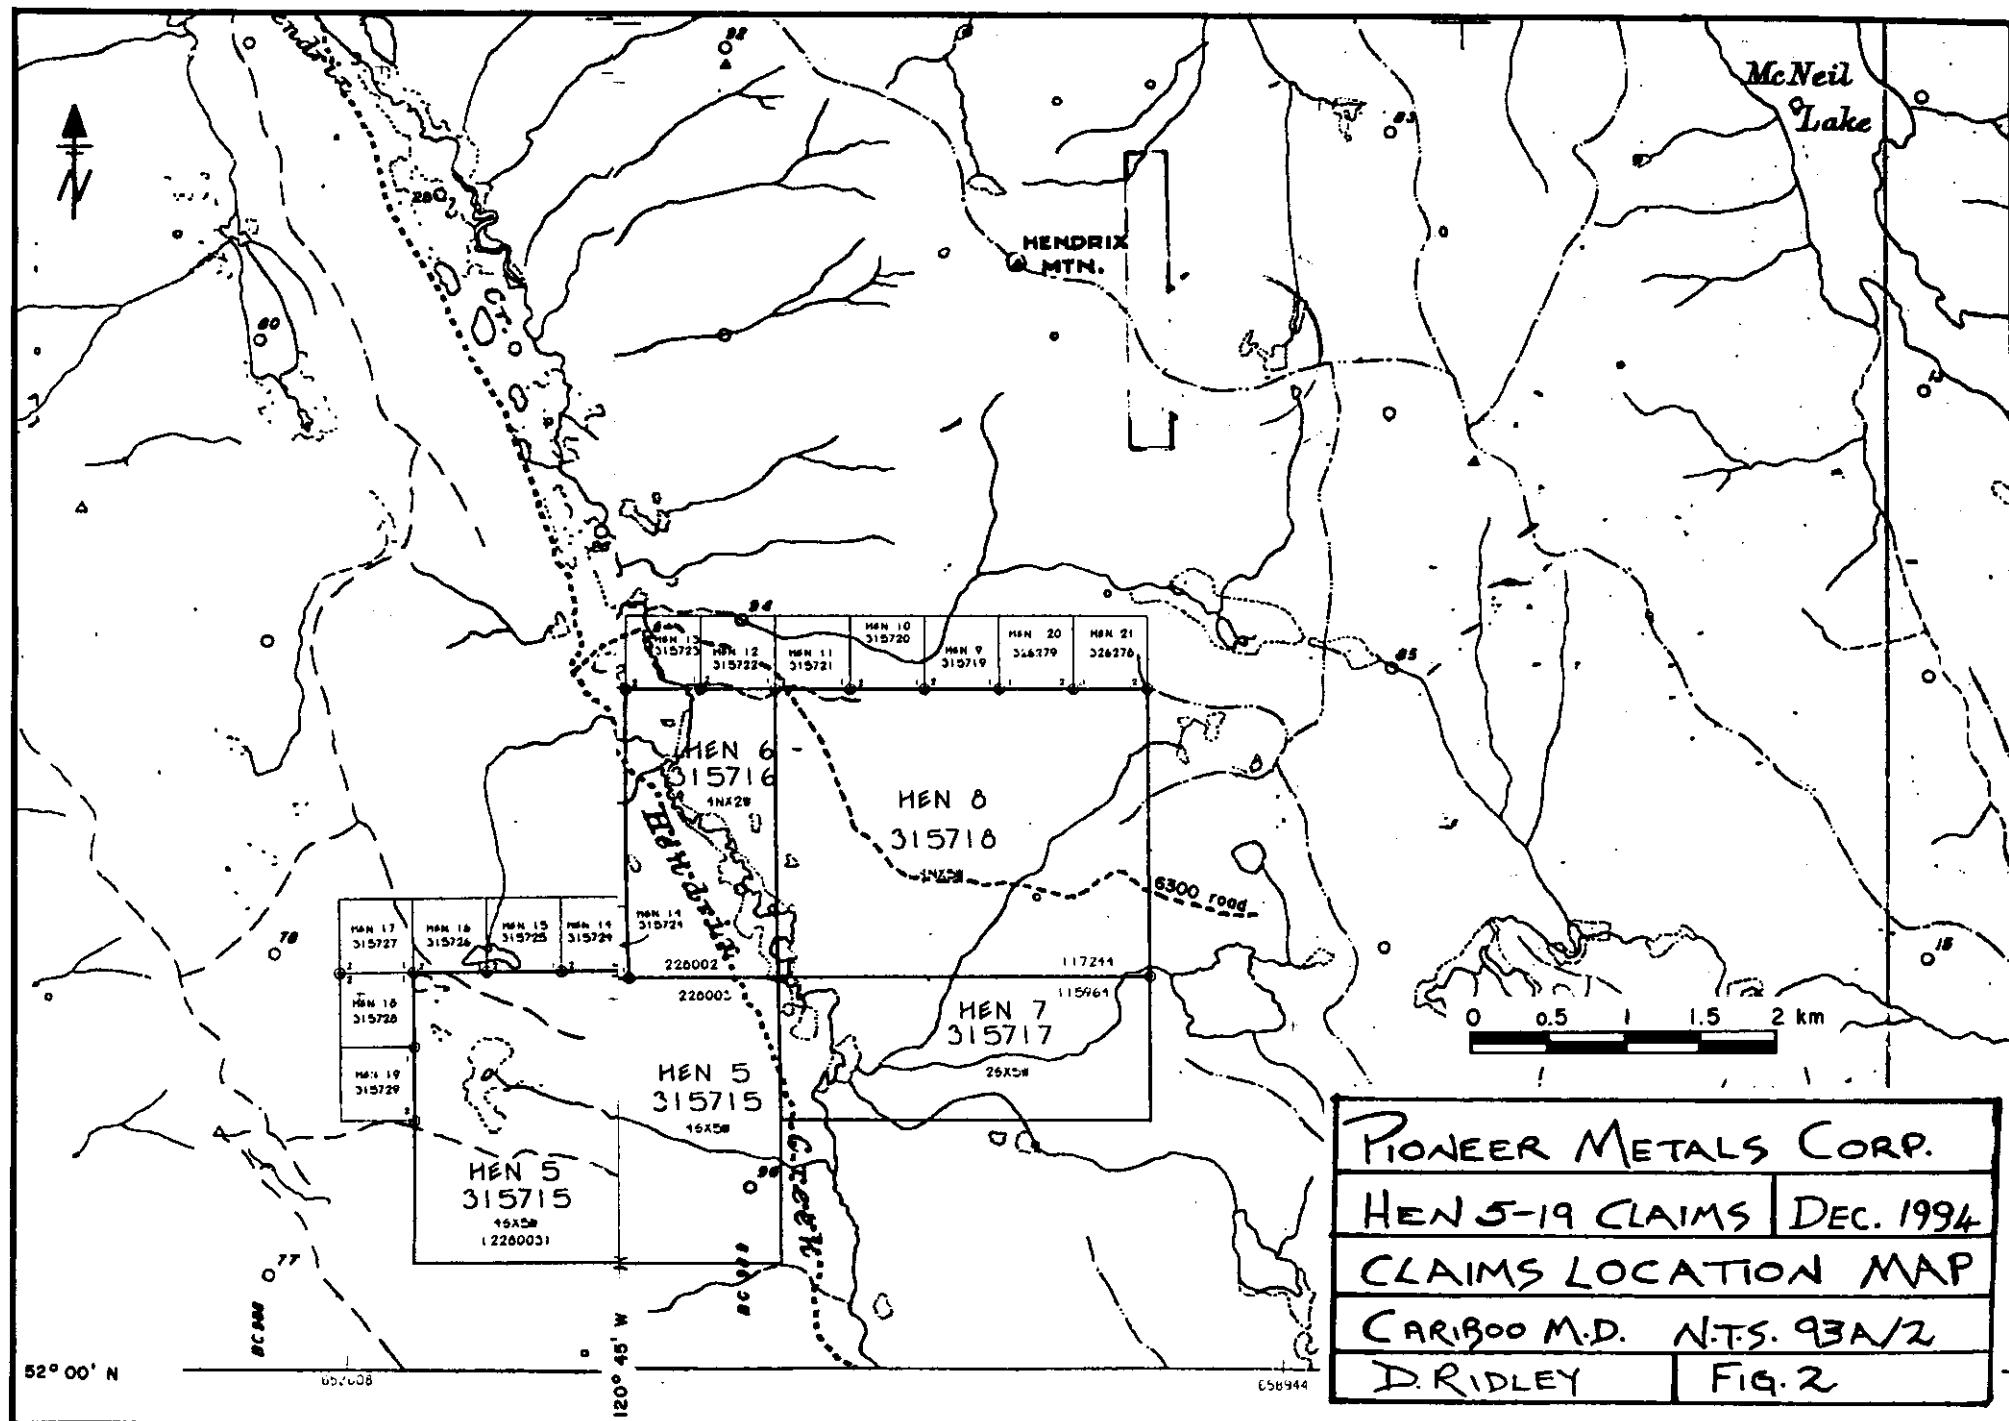

The Hen property is owned by David W. Ridley of Eagle Creek, B.C. The property is presently under option to Pioneer Metals Corp. Pioneer has the right to earn 100% of the property by paying Ridley a further \$30,000 by January 2, 1996 and by completing exploration work equivalent to four years assessment on the claims, roughly \$55,200, by December 30, 1997. Ridley will maintain a 2% NSR with a two million dollar buyout. The property consists of 69 units. (See Fig. 2)

4.4 History of Exploration

The area was first prospected during the Cariboo gold rush, as the Hendrix Creek valley provided one route, via Horsefly, to the Cariboo gold fields. Intermittent prospecting was no doubt carried out up to the late sixties and early seventies, when the area received considerable work in search for copper porphyry deposits. The Hen showings were first discovered in 1992 by Ridley, when he sampled mineralized float uncovered by the construction of the 6300 logging road. Pioneer optioned the property in June, 1993 and carried out a program of reconnaissance soil and rock geochemistry, prospecting, and limited mechanical trenching. Pioneer's 1994 work program is the subject of this report.

4.5 Objectives of the 1994 Work Program

The objectives of the 1994 program were to locate the source of the high grade float with mechanized trenching, evaluate this source using geological mapping and drilling, if warranted, and evaluate the surrounding area of the claims with a grid soil geochemical program and geological mapping. This work was carried out largely by D. and C. Ridley with assistance from S. Stone, J. Delaney, G. Mowatt, and C. MacDonald under the supervision of D. Dunn.

5.0 Geology

5.1 Regional Geology

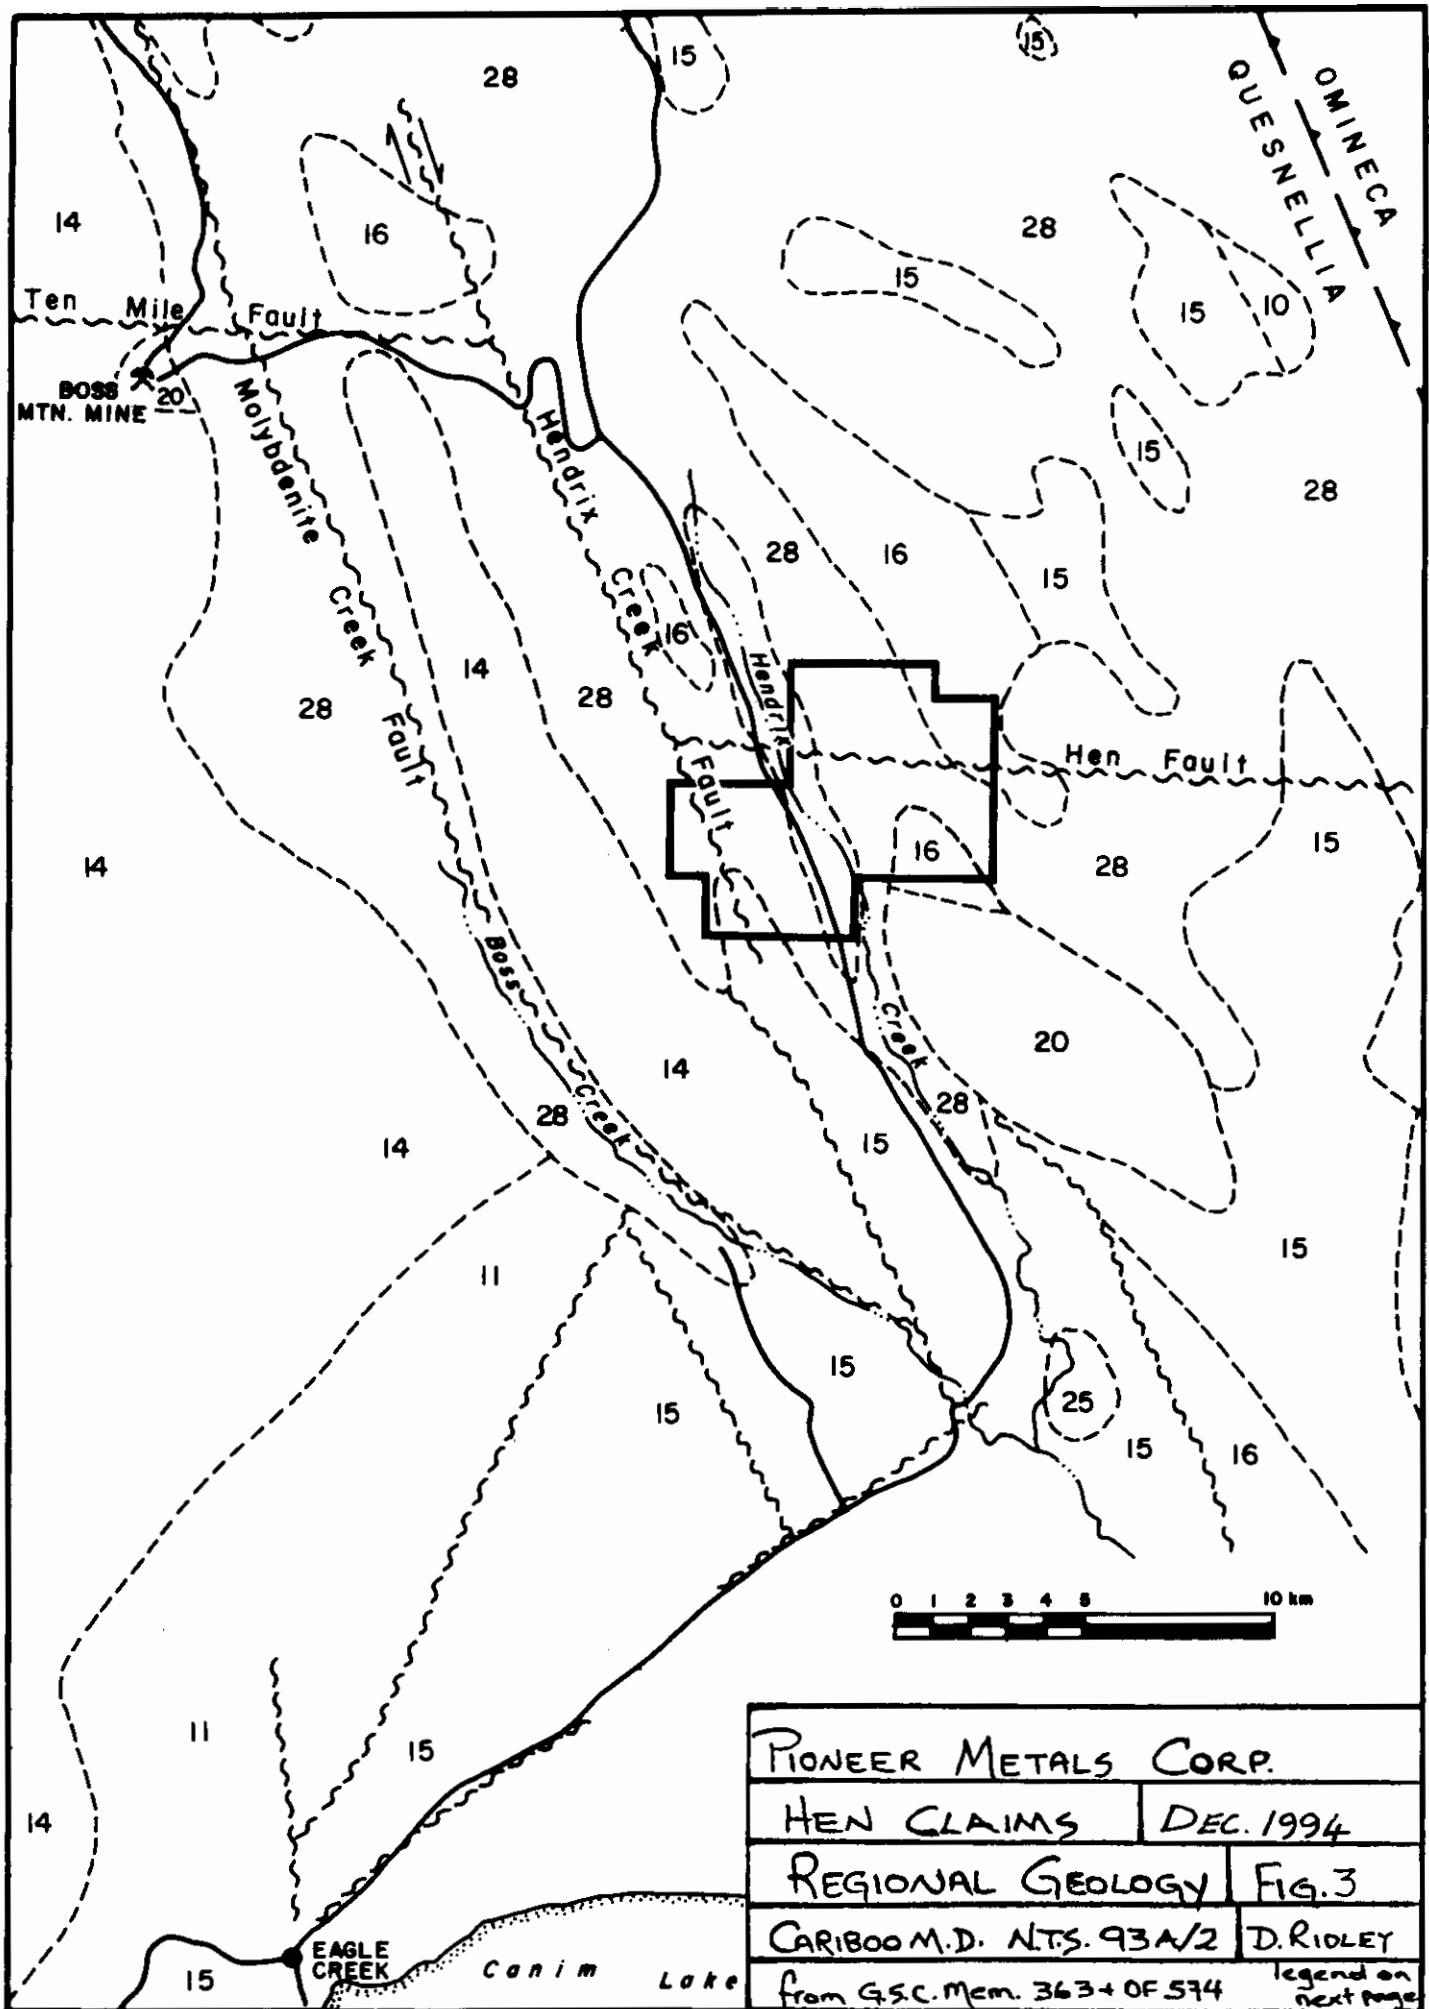

The Hen property lies in the Quesnel Trough, a subdivision of the Intermontane belt, which is composed of Triassic to Jurassic volcanic and sedimentary rocks and intruded by various plutons, ranging in age from Triassic to Cretaceous. The following is a reprint from a private report by D.E. Blann to the Sun Joint Venture in 1993.

"The property straddles a northerly trending contact zone between the composite upper Triassic-Jurassic Takomkane Batholith, coeval Nicola Group volcanics and Jurassic andesite and related sediments. Cretaceous stocks cut the earlier sequence along the eastern contact of the batholith and as several satellite intrusions further east. The Molybdenite Creek fault, a major northerly trending contact-related fault zone, runs through the property west of Hendrix Creek valley. The Boss Mountain Mine lies approximately ten kilometers north of the Hen property along the Molybdenite Creek fault; the past producing mine was a predominately molybdenite-bearing breccia of Cretaceous age, intruded into the eastern edge of the Takomkane batholith.

The Nicola Group is comprised of augite andesite-basaltic flows, breccias and agglomerate, tuff, argillite, phyllite, greywacke and black to grey limestone. The Takomkane Batholith is a composite granodiorite intrusion with hornblende-biotite quartz diorite and granodiorite, hornblende diorite, monzonite, gabbro and hornblendite. Phases may be syenodiorite-diorite or quartz monzonite in composition and locally K-feldspar porphyritic, and quartz-rich.

The Jurassic rocks appear similar to the Nicola Group rocks, and are comprised of porphyritic augite andesite breccia and conglomerate, arenite, tuff, argillite and flows. The Cretaceous stocks are composed of biotite-quartz monzonite and granodiorite. In the vicinity of the Hen property, the stock is composed of magnetite-biotite-hornblende quartz monzonite" (Blann D.E., 1993).

On a Plate Tectonic scale, the Quesnel trough is an island arc assemblage that docked onto ancestral North America in the late Jurassic - early Cretaceous. The Hendrix Creek and Molybdenite Creek faults are major north-west - south-east trending faults that parallel the terrain boundary. These faults have considerable right-lateral displacement. north of the Boss Mountain Mine is a major transverse fault, called the Ten Mile Fault. This fault is displaced southward by the Hendrix Creek fault eight kilometers and its extension to the east is assumed to be the major fault which runs through the Hen discovery showing (See Fig. 3). This fault can be traced for a further 11 kilometers eastward to Deception Creek where it has been mapped on the D.L. property and is associated with quartz veins containing sporadic gold mineralization.

5.2 Property Geology

5.2.1 Lithology

The Hen claims are underlain by a sequence of medium to coarse grained augite-feldspar porphyritic Basaltic to Andesitic agglomerate, tuffaceous and carbonate rich volcanic derived sediments. These rocks are conformably overlain to the east by a thick succession of tuffaceous to calcareous Argillaceous sediments, which are locally pyritic. All of the volcanic-sedimentary rocks are intruded by a medium to coarse grained magnetite hornblende quartz monzonite in the south-eastern part of the property. A broad zone of contact hornfelsing and local exo-skarn development is associated with this intrusion.

Two rocks, one of the gold bearing mineralization and one of wall rock, were submitted for petrographic analysis (Harris, J.F. 1993). The mineralized rock is composed predominantly of fine grained plagioclase and K-feldspar. It has been cut by carbonate veinlets and shows pervasive sericitization and biotitization. Arsenopyrite and pyrrhotite are relatively abundant and evenly distributed. The wall rock is an altered Andesite now a Diopside - Plagioulase Hornfels.

Exposure on the property is less than five percent and confined to logging roads, clear cuts, creek gullies and steeper hillsides.

The area of the main showings is situated 80 meters ENE of the 6303 kilometer post.

Some dykes of the intrusive extend northwards from the main intrusive body, with associated areoles of hornfelsing. These dykes are up to 10 meters in width and occur roughly 1.0 km east of the main showing.

5.2.2 Structure

The most significant structural feature on the Hen property is the regional scale transverse fault which trends through the area of the discovery showing. This fault has been traced on air photos and topographic maps for 11 kilometers east to the D.L. claims. The fault has been mapped on the D.L. property, and is associated with large, gold bearing quartz veins. In the area of the Hen discovery showing, the fault strikes 97° to 105° and dips 64°N to 72°N . On a regional scale the fault appears to strike 94° . This fault is probably the eastward extension of the Ten Mile Fault. The Ten Mile Fault is a regional scale east-west fault present immediately north of the Boss Mountain Mine. The Ten Mile Fault is cut-off by the north-west trending Hendrix Creek Fault and probably displaced southwards eight kilometers to the Hen property. This is the common direction of displacement on plate boundaries and the major faults that parallel them in the Canadian Cordillera.

The bedded rocks on the property are on the east flank of a broad north-west tending anticline.

5.2.3 Mineralization

Economically interesting gold mineralization found to date has all been associated with arsenopyrite and calcite. Pyrrhotite is also present, but is widespread on the property and is not necessarily indicative of gold mineralization. The discovery showing is in the regional fault previously described. Associated minerals, besides those mentioned, are diopside, biotite, minor garnet, and K-feldspar.

6.0 Geochemistry

6.1 Methodology

A total of 1,375 soil samples were taken in May and June. Initially a grid was laid out with lines running 800 meters east and west every 100 meters from a cut and picketed base line. Eleven cross lines were laid out with compass and flagging with stations every 25 meters. When this work was completed, the main mineralizing trend was thought to run north-south, so the grid was oriented to cross this trend. Soil samples were taken from the "B" Horizon at 30 to 50 cm depth at each station. The samples were

placed in Kraft bags, air dried and shipped to Eco Tech in Kamloops where they were analyzed as per Appendix F.

Latterly in the 1994 program, a smaller grid was established over the main showing. This grid had 50 meter spaced north-south lines with 10 meter sample spacing.

6.2 Interpretation of Results

Simple results are plotted on Map 3. Generally, soil sample results do not reflect underlying mineralization. The reason for this became apparent when the main showing was trenched. More than ten meters of overburden was revealed on a 30° plus slope. The overburden consisted of interlayered glacial debris and rubble. Some gold anomalies are present, roughly 70 meters down slope from the main showing.

Soil sampling is not an effective method of outlining mineralization on the Hen property due to the depth of overburden and the exotic nature of much of it.

7.0 Trenching

Four Trenches were dug, sampled, and all but one reclaimed between July 20th and September 15th. (See Map 1) When the regional structure described in "Property Geology" was uncovered in Trench B, it became apparent why Trench A did not uncover the zone. Trench C did not reach bedrock and, in any case, might have been situated too far south to cross the fault. Trench D was on the structure but failed to reach bedrock for most of the fault zone. Trench B uncovered highly sheared biotite altered volcanics with ubiquitous calcite - quartz veining and pyrrhotite. One 2.1 meter wide zone assayed 3.98 gm/t. Anomalous values averaging 25 ppb gold over 8.85 meters, before bedrock was lost in Trench D, also provided encouragement.

8.0 Drilling

Based on the results of the trenching program, two diamond drill holes were laid out and drilled from the north at 160° through the zone of interest. Terrain constraints and environmental considerations led to holes Hen 94-1 and Hen 94-2 being drilled at 60° rather than 90° to the structure. This work was carried out from October 11th until October 27th. 199.1 meters of N.Q. diamond drill core were drilled by Core Enterprises Ltd. of Clinton, B.C. The core is stored on David Ridley's property, Hawkins Lake, B.C. Hen 94-1 was drill at -45° for

157.3 meters and Hen 94-2 was drilled at -70° from the same set-up for 41.8 meters. The collar location is at 1994 Grid co-ordinates 52 + 68m/N 45 + 30mE and an elevation of 1,357 meters. Approximately 40% of the core from both holes was split and a half core splits sent to Eco-Tech Labs in Kamloops for 1 tonne fire assay for gold plus 30 element I.C.P. Both holes intersected the down dip extension of the mineralized zone trenched on surface. Where drilled, the zone had horsetailed and was manifested by a number of sub-parallel calcite-quartz stringers and veins up to 10 cm wide every 5-10 cm. The zone averaged 0.046 gm/t gold over 12.4 meters in Hen 94-1 and 0.096 gm/t gold over 15.3 meters in Hen 94-2. The zone contains 2% pyrrhotite and very minor arsenopyrite, where intersected.

Hen 94-1 intersected another zone 10 meters in core length, whose surface projection would outcrop beyond the area trenched. This zone is characterized by calcite-quartz stringers, pyrrhotite to 5%, and arsenopyrite to 2%. Eight meters of this zone averaged 0.86 gm/t gold. The whole 157.3 meters of Hen 94-1 was in the regional fault.

Drill logs are attached in Appendix C.

Sample Descriptions

ROCK SAMPLE SHEET

Dr (1) of (6)

Sampler D. Ridley
Date May - June 1994

Property HEN

NTS 93A/2

SAMPLE NO.	Sample Width	Rock Type	Alteration	Mineralization	ADDITIONAL OBSERVATIONS	ASSAYS				
						Au	As	% Ca	Cu	Sb
HEN 94 DR1	F	volcanic sediment	carbonate veins + blobs	up to 5% py-py ← hornfelsed	± 25m E of BL50E: 56+25N: on skid road. very angular.	5	10	2.0	87	<5
HEN 94 DR2	F	f-grained andesite	silica biotite?	3-4% pyrrhotite	@ L 53N: 52+25E: very angular: from roots of blown-down tree:	5	<5	0.6	164	<5
HEN 94 DR3	F	"	hornfels	up to 10% py-po	west side: ± 25m S of HEN 93C5	5	<5	2.4	86	5
HEN 94 DR4	F	"	hornfels calcite veining	up to 7% py-po	15 m N of DR3: as DR3 but with calcite stringers 067° to trenching on 6300 road: subcrop	5	<5	3.8	77	10
HEN 94 DR5	F	feldspar porphyry	hornfels	" " trace cpy	@ HEN 93C5 14: subcrop?? fair bit lying around	5	<5	5.3	79	5
HEN 94 DR6	1m	Pyroxene porphyry basalt	calcite stringers	trace pyrite	@ 3960' on bearing 060° to trenching on 6300 road:	5	50	5.2	232	15
HEN 94 DR7	F	"	"	1% pyrite	@ 4000' just north of CS 14 creek (HEN 94 DS7)	5	<5	3.7	169	25
HEN 94 DR8	2m	"	spotty limonite	no visible sulphides	Anomaly Creek @ 3780' (H2150): shear @ 172/80E outcrop at least 7m long: South side	5	250	4.0	120	20
HEN 94 DR9	1m	basalt	carbonate	trace py-cpy	Anomaly Cr. @ 3840' (3+40) main fractures trend 094/60N. South side	5	30	3.4	129	10
HEN 94 DR10	70cm	bisaltic tuff?	blanched + carbonate	up to 3% pyrite	Anomaly Cr @ 3850' (3+50) ± 3m downslope from HEN 92 DR1: South side	5	<5	2.7	519	15
HEN 94 DR11	20cm	"	albite? chlorite carbonate	semi-massive py trace cpy	Anomaly Cr. @ 3940' (5+15). North side: wall rocks appear brecciated: abundant chlorite alter. zone appears to trend along creek: @ creek level	5	<5	1.3	1109	<5
HEN 94 DR12	1m	altered basalt?	blanched carbonate K-spar?	trace pyrite	wall rocks to DR11: major fractures trend 174/80E	5	<5	5.1	53	10
HEN 94 DR13	30cm	shear zone	clay limonite	no visible sulphides	Anomaly Cr. @ 4000' (6+10): with qtz breccia frags; trends 170/40E. South side; @ 6120 hornblende porphyry dyke?	5	25	0.4	71	<5
HEN 94 DR14	1m	sheared andesite	limonite chlorite	up to 10% py trace cpy	Anomaly Cr. @ 4020' (6+40): resample of HEN 92 DR2: N side: hornblende porphyry outcrop on South side of creek.	5	<5	1.1	1211	<5
HEN 94 DR15	F	hornfels tuff	carbonate hornfels	up to 7% pyrite	edge of fireguard in 1st upper clearcut near L52N.	15	<5	1.0	85	<5

C-CHIP G-GRAB F-FLOAT

ROCK SAMPLE SHEET

(2) of 161

Sampler D. Ridley
Date July 1994Property HENNTS 93A/2

SAMPLE NO.	Sample Width	Rock Type	Alteration	Mineralization	DESCRIPTION		ADDITIONAL OBSERVATIONS					ASSAYS				
												Au	As	Ca	Cu	Sb
HEN 94 DR16	F	f-grained volcanic	garnet stringers	up to 3% pyrrhotite			± 10m SSE of L54N: 52+50E: fairly angular float.					5	35	47	110	<5
HEN 94 DR17	F	volcanic conglomerate	limonite	up to 15% pyrite			± 65 m S of DR16 on fire guard: non-magnetic					5	50	2.9	148	<5
HEN 94 DR18	F	basaltic tuff	limonite hornfels carboveinlets	1-2% pyrite trace cpy.			± 30m S. of DR17 on fireguard:					10	95	3.2	176	<5
HEN 94 DR19	F	volcanic sediment?	hornfels limonite	up to 2% pyrite trace cpy ??			SW corner of landing in upper clearcut near breakin slope: (± 40m N to L53N).					10	18/0	50	196	15
HEN 94 DR 20	G	" "	" carbonatc veining	trace pyrite			11m south of L55N: 46+25E: along top of small ridge: poorly exposed.					5	45	5.8	105	<5
HEN 94 DR 21	F	volcanic conglomerate	limonite	up to 5% pyrite			edge of 2nd upper clearcut ± 20m E of L53N: 57+75E. large boulder of granite pegmatite with garnets nearby.					5	15	3.4	134	<5
HEN 94 DR 22	F	andesite	"	up to 7% f-grain pyrite			in creek 10 m N of L53N: 57+50E: partially rounded float indicative of washing down creek some distance.					5	35	1.1	75	<5
HEN 94 DR 23	1m	hornfels volcanic tuff	hornfels minor carb	1% dissem pyrrh			Trench B: 30 → 29 m:					5	30	1.6	115	20

APPENDIX E
Statement of Qualifications

I, David St. Clair Dunn, with a business address of 1770 -401 West Georgia Street, Vancouver, B.C., V6B 5A1, declare that:

1. I am a professional Geoscientist registered under the Professional Engineers and Geoscientists Act of the Province of British Columbia;
2. I am a Fellow of the Geological Association of Canada;
3. I am a member of the Association of Exploration Geochemists;
4. I have practiced my profession as a prospector and geologist for more than 20 years in Canada, U.S.A. and Australia;
5. I supervised the work program on the Hen property described in this report;
6. I am Vice President - Exploration for Pioneer Metals Corp.

APPENDIX F
Laboratory Procedures

**ECO-TECH LABORATORIES LTD.**

ASSAYING - ENVIRONMENTAL TESTING

10041 East Trans Canada Hwy., Kamloops, B.C. V2C 2J3 (604) 573-5700 Fax 573-4557

GEOCHEMICAL LABORATORY METHODS**SAMPLE PREPARATION (STANDARD)**

1. Soil or Sediment: Samples are dried and then sieved through 80 mesh nylon sieves.
2. Rock, Core: Samples dried (if necessary), crushed, rifled to pulp size and pulverized to approximately -140 mesh.
3. Heavy Mineral Separation: Samples are screened to -20 mesh, washed and separated in Tetrabromothane. (SG 2.96)

METHODS OF ANALYSIS

All methods have either certified or in-house standards carried through entire procedure to ensure validity of results.

1. Multi-Element Cd, Cr, Co, Cu, Fe (acid soluble), Pb, Mn, Ni, Ag, Zn, Mo

<u>Digestion</u>	<u>Finish</u>
Hot aqua-regia	Atomic Absorption, background correction applied where appropriate

A) Multi-Element ICP

<u>Digestion</u>	<u>Finish</u>
Hot aqua-regia	ICP

2. Antimony

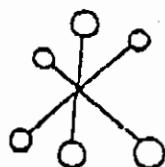

<u>Digestion</u>	<u>Finish</u>
Hot aqua regia	Hydride generation - A.A.S.

3. Arsenic

<u>Digestion</u>	<u>Finish</u>
Hot aqua regia	Hydride generation - A.A.S.

4. Barium

<u>Digestion</u>	<u>Finish</u>
Lithium Metaborate Fusion	I.C.P.

**ECO-TECH LABORATORIES LTD.**

ASSAYING • ENVIRONMENTAL TESTING

10041 East Trans Canada Hwy., Kamloops, B.C. V2C 2J3 (604) 573-5700 Fax 573-4557

13. TinDigestion

Ammonium Iodide Fusion

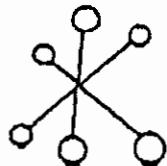

Finish

Hydride generation - A.A.S.

14. TungstenDigestion

Potassium Bisulphate Fusion Colorimetric or I.C.P.

Finish**15. Gold**DigestionFinisha) Fire Assay Preconcentration Atomic Absorption
followed by Aqua Regiab) 10g sample is roasted at 600°C then digested with hot
Aqua Regia. The gold is extracted by MIBK and
determined by A.A.**16. Platinum, Palladium, Rhodium**DigestionFinishFire Assay Preconcentration Graphite Furnace - A.A.S.
followed by Aqua Regia

**ECO-TECH LABORATORIES LTD.**

ASSAYING - ENVIRONMENTAL TESTING

10041 East Trans Canada Hwy., Kamloops, B.C. V2C 2J3 (604) 573-5700 Fax 573-4557

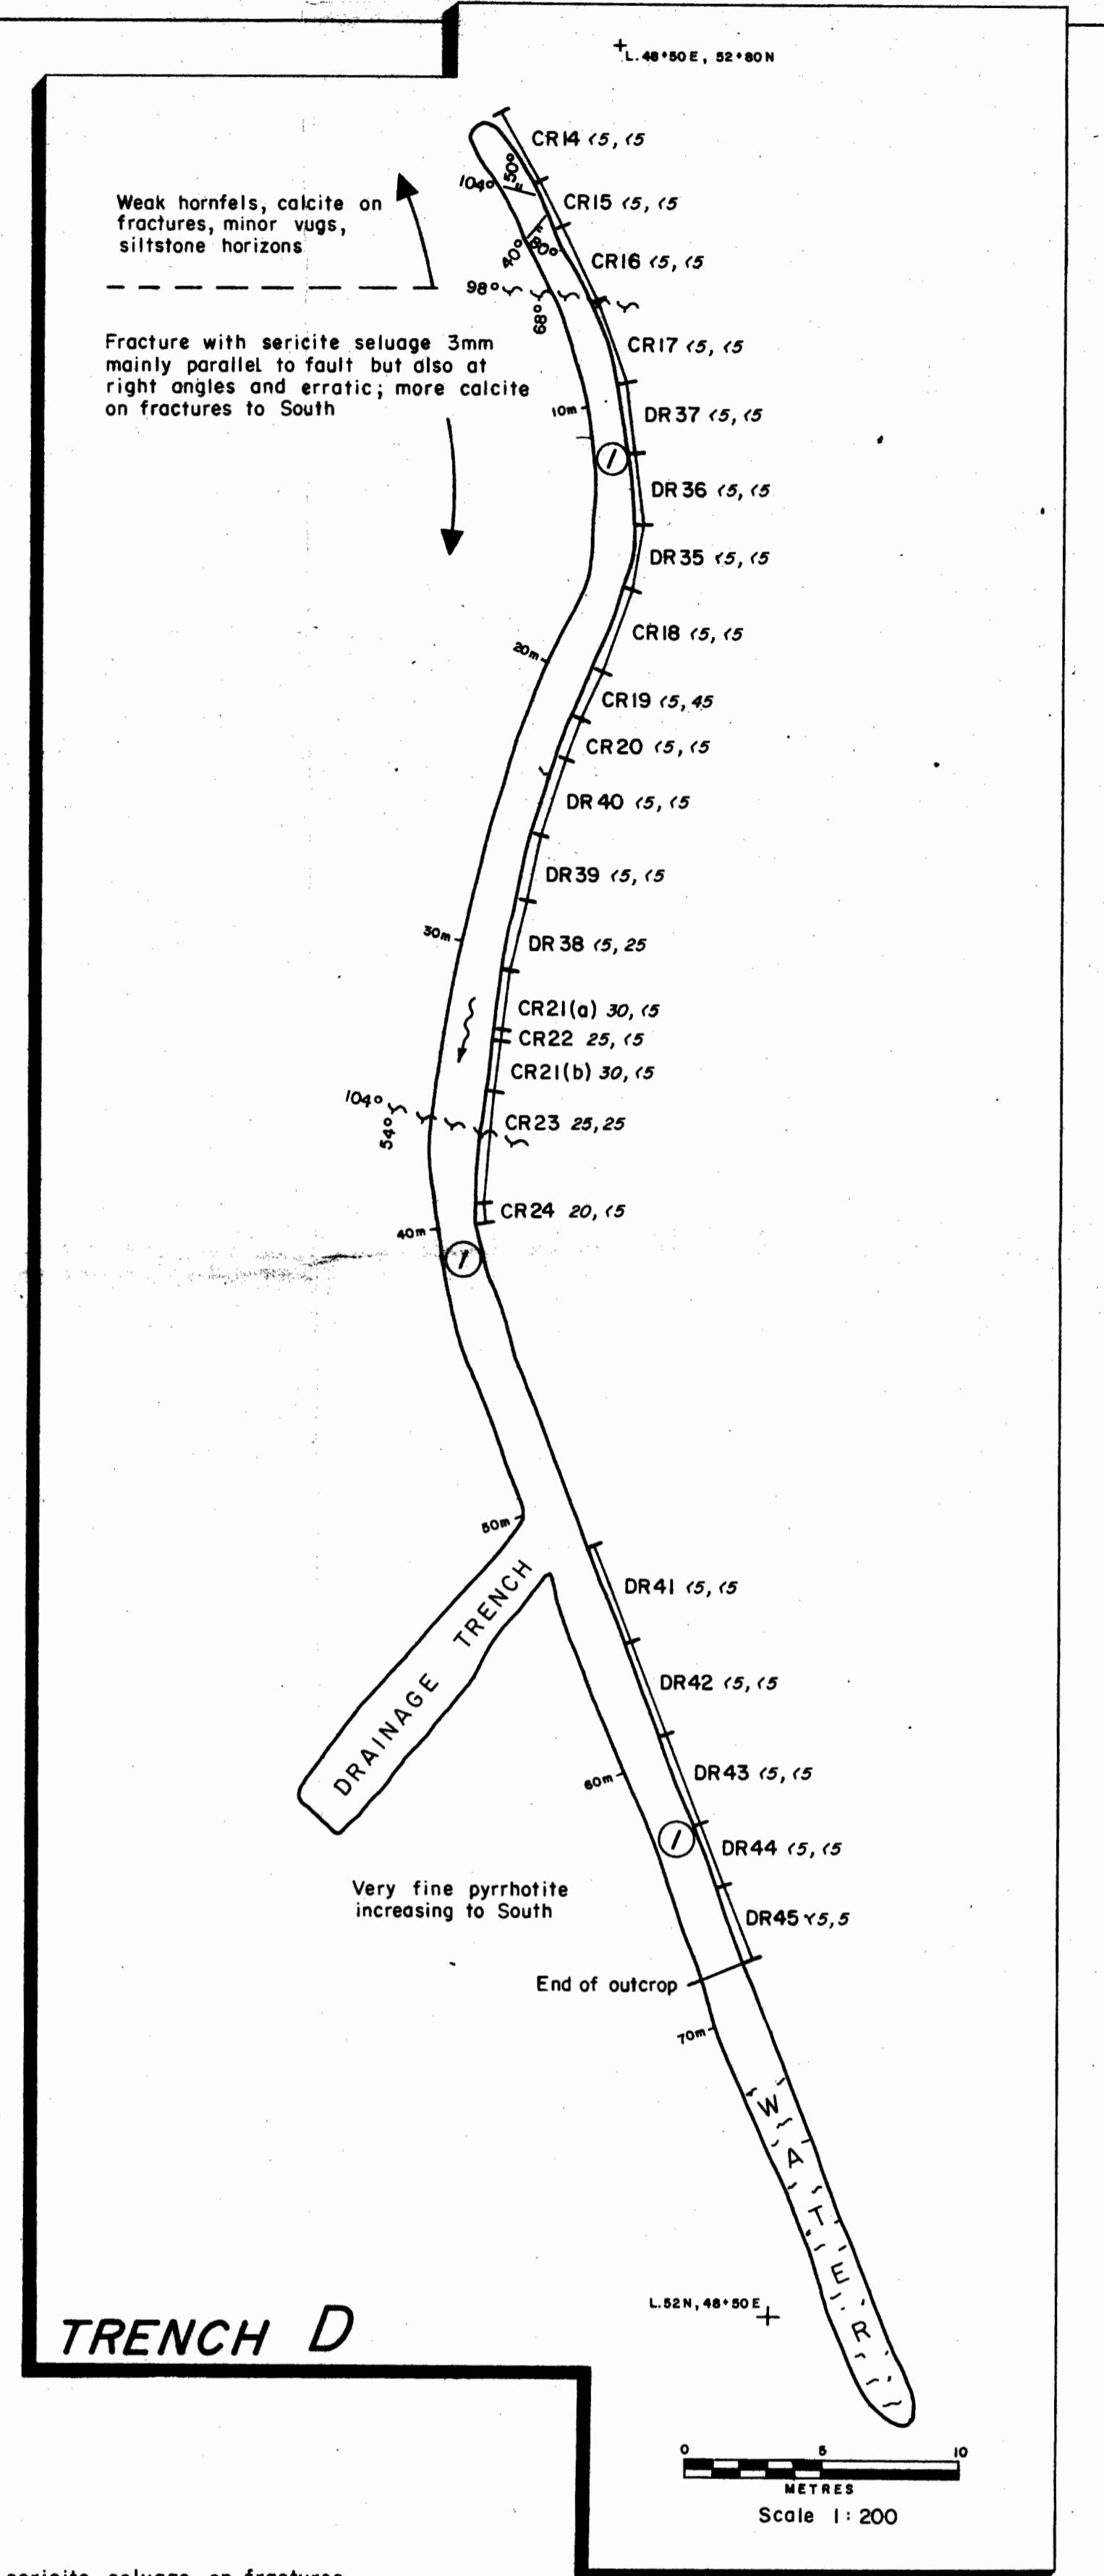

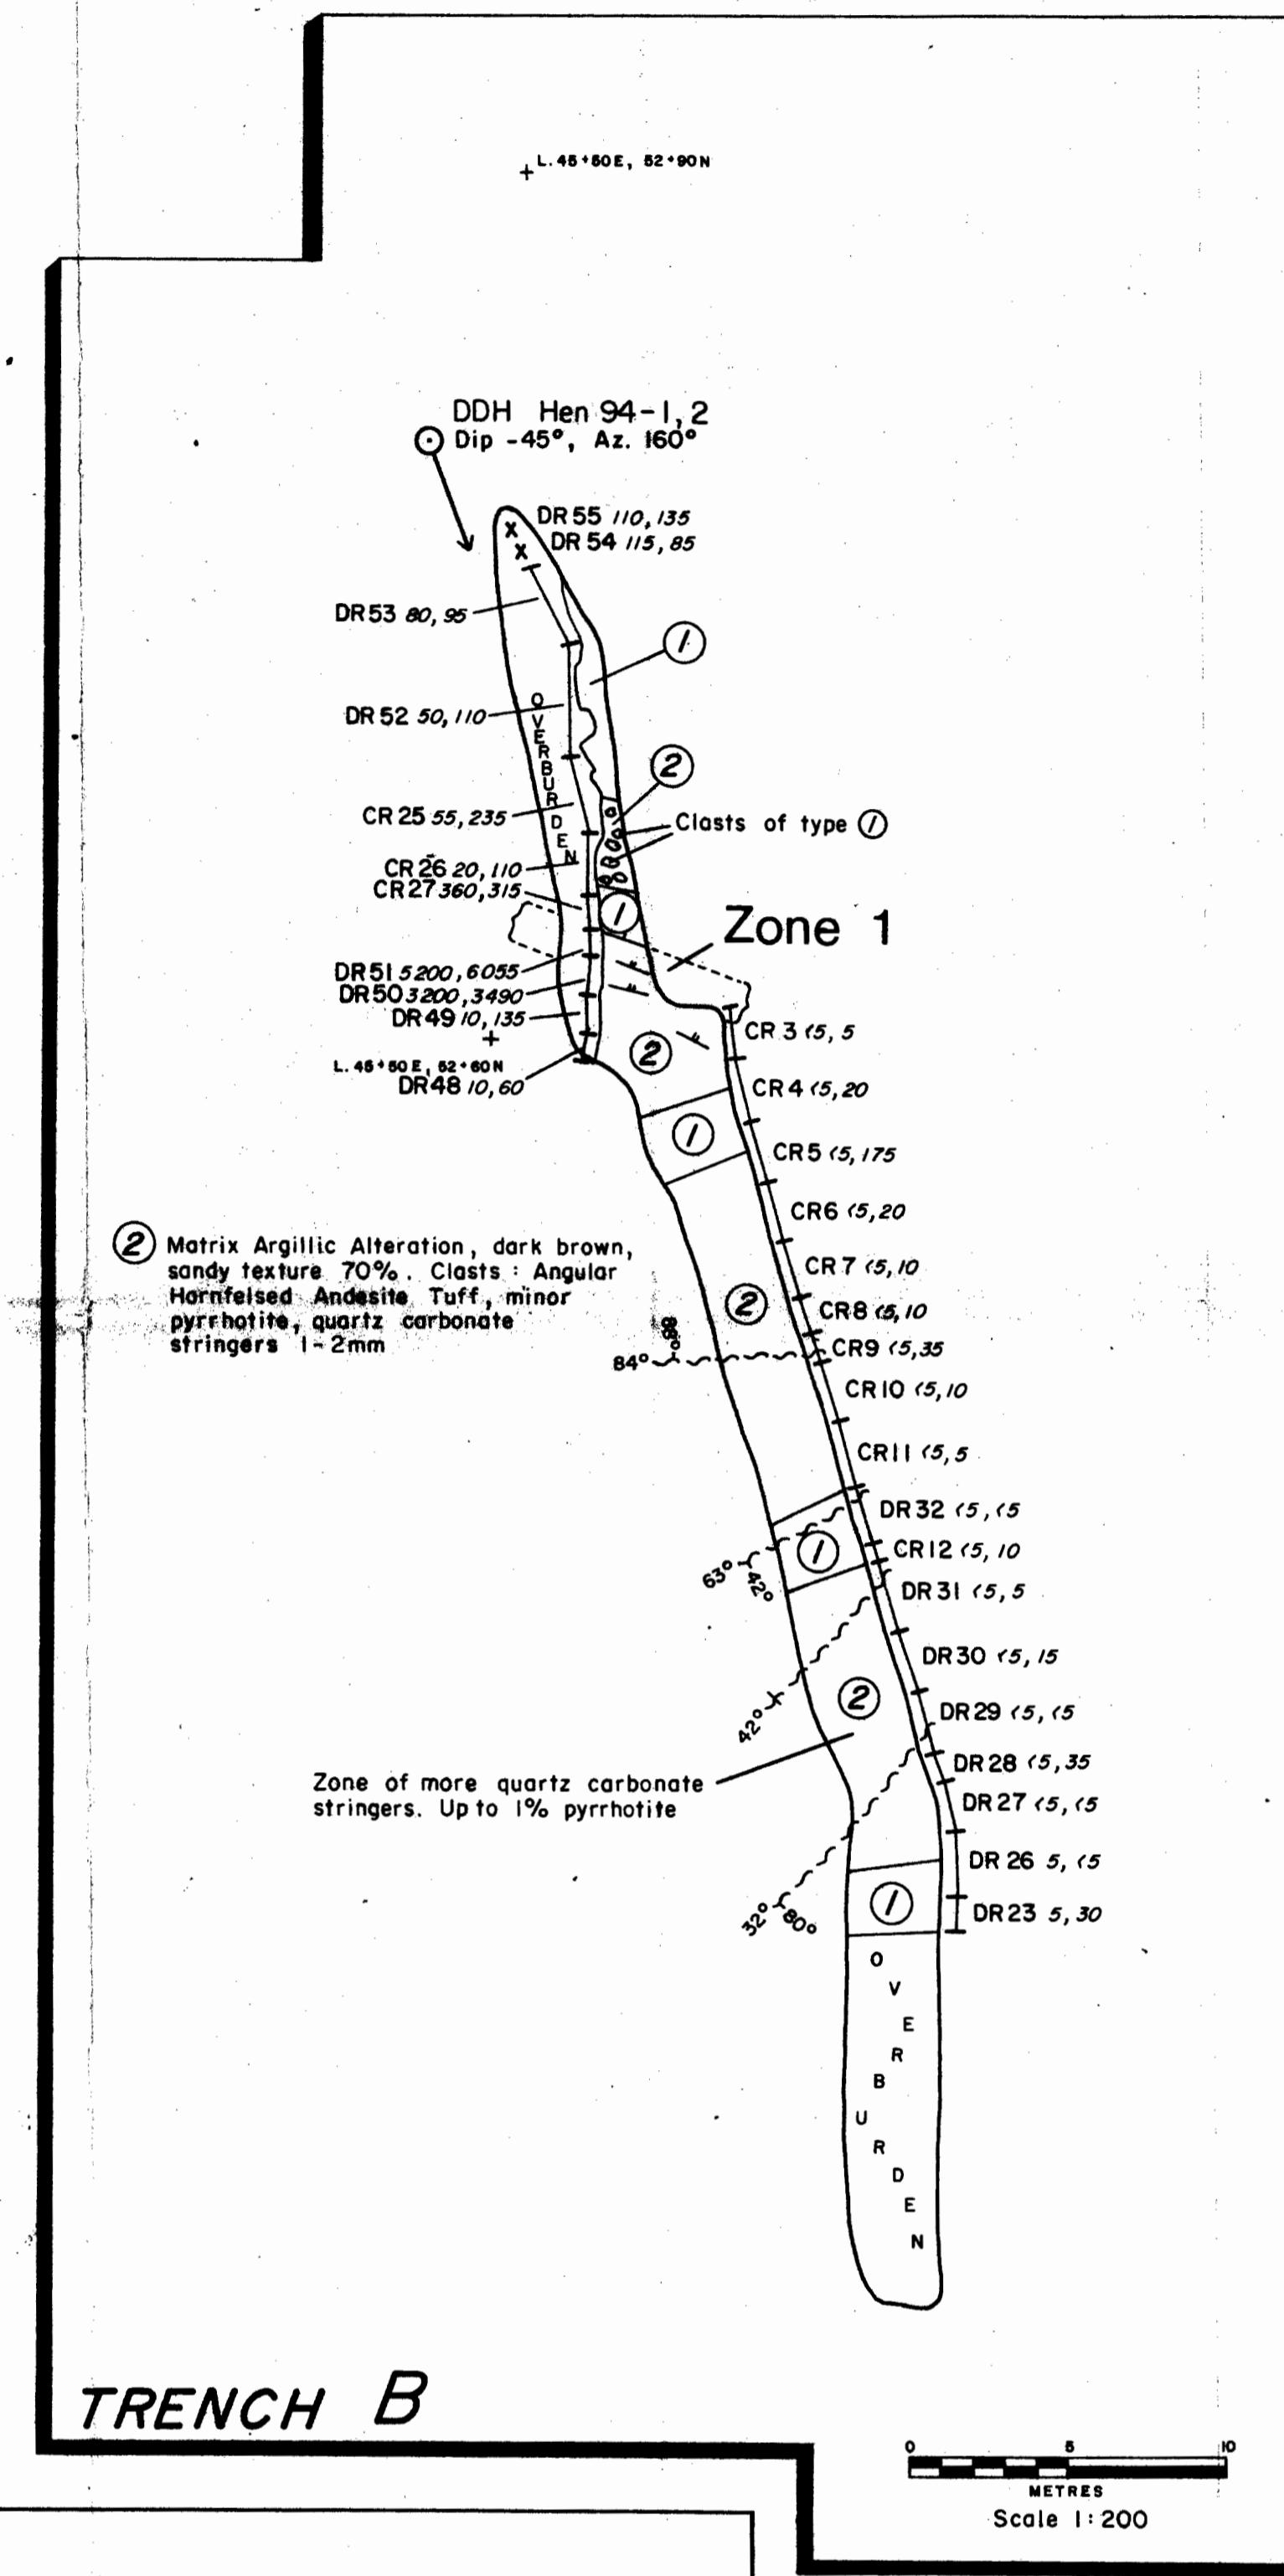

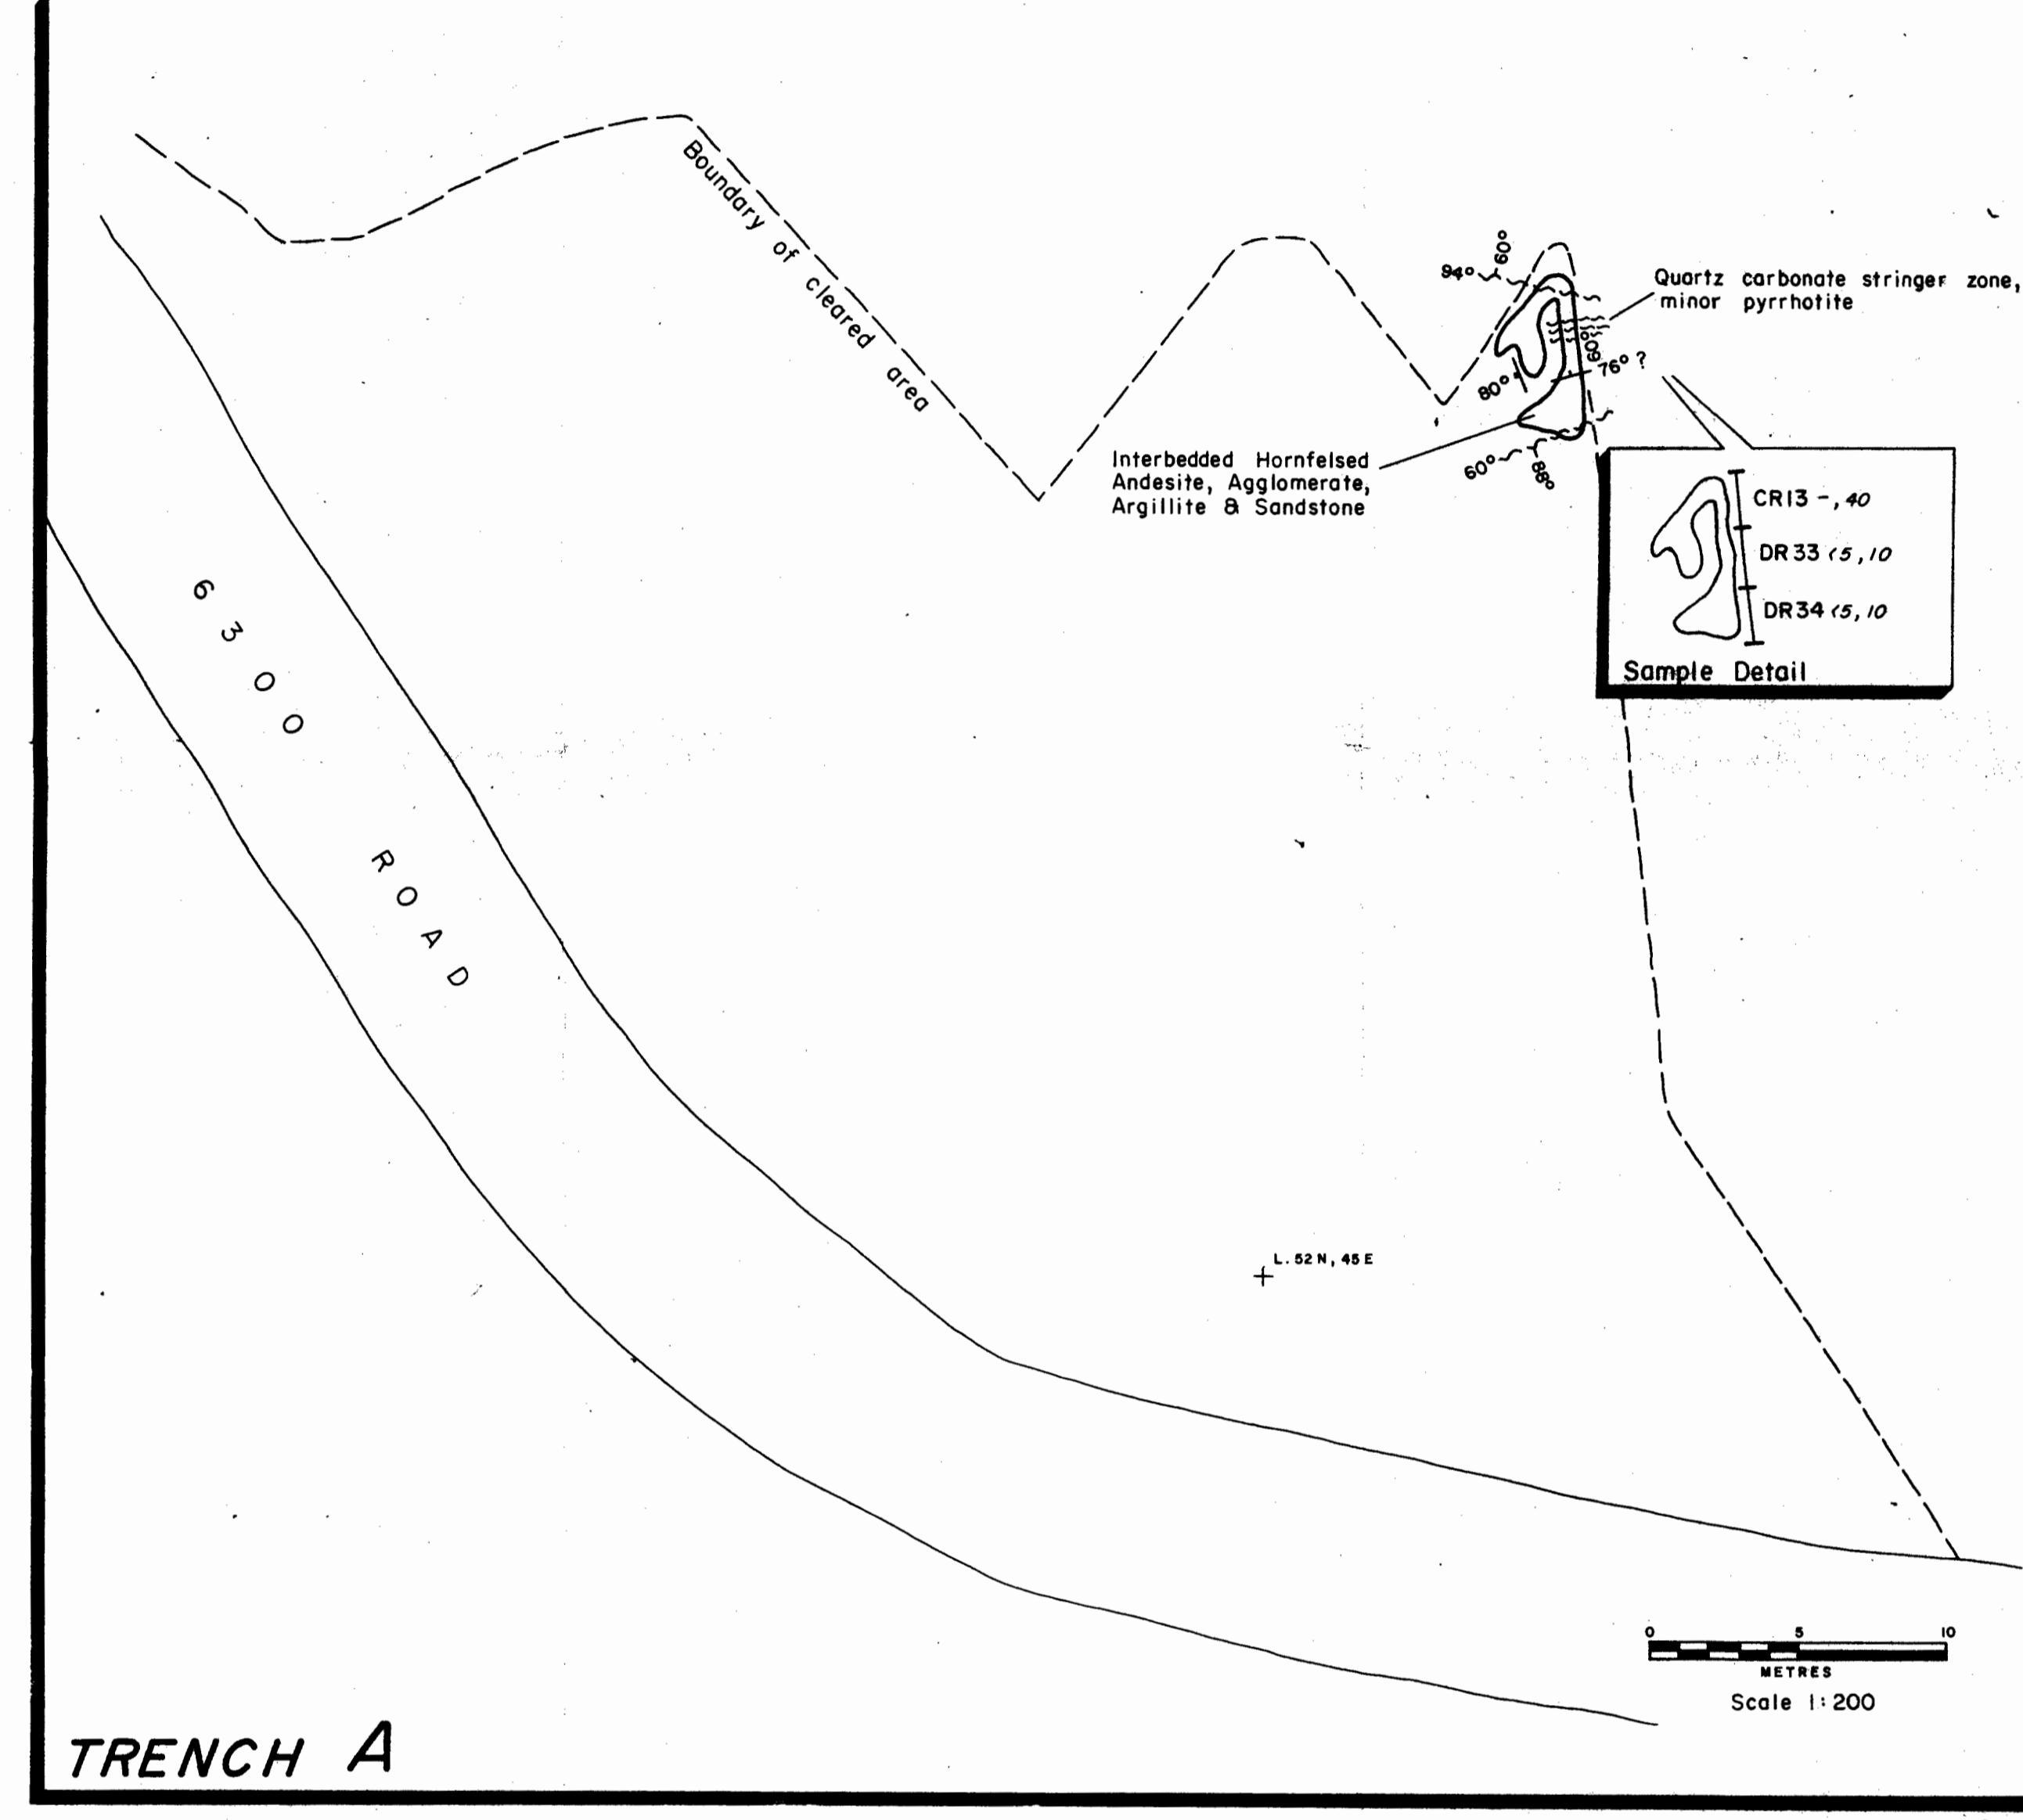

LABORATORY METHOD ASSAYS

Gold - Conventional fire assay with A.A. finish

Gold "Metallics" - A 300g re-split is taken from the rejects and pulverized in a ring and puck pulverizer. The entire split is screened to -140mesh. The entire +140 mesh oversize is assayed separately. Two replicate assays are performed on the -140 mesh fraction.

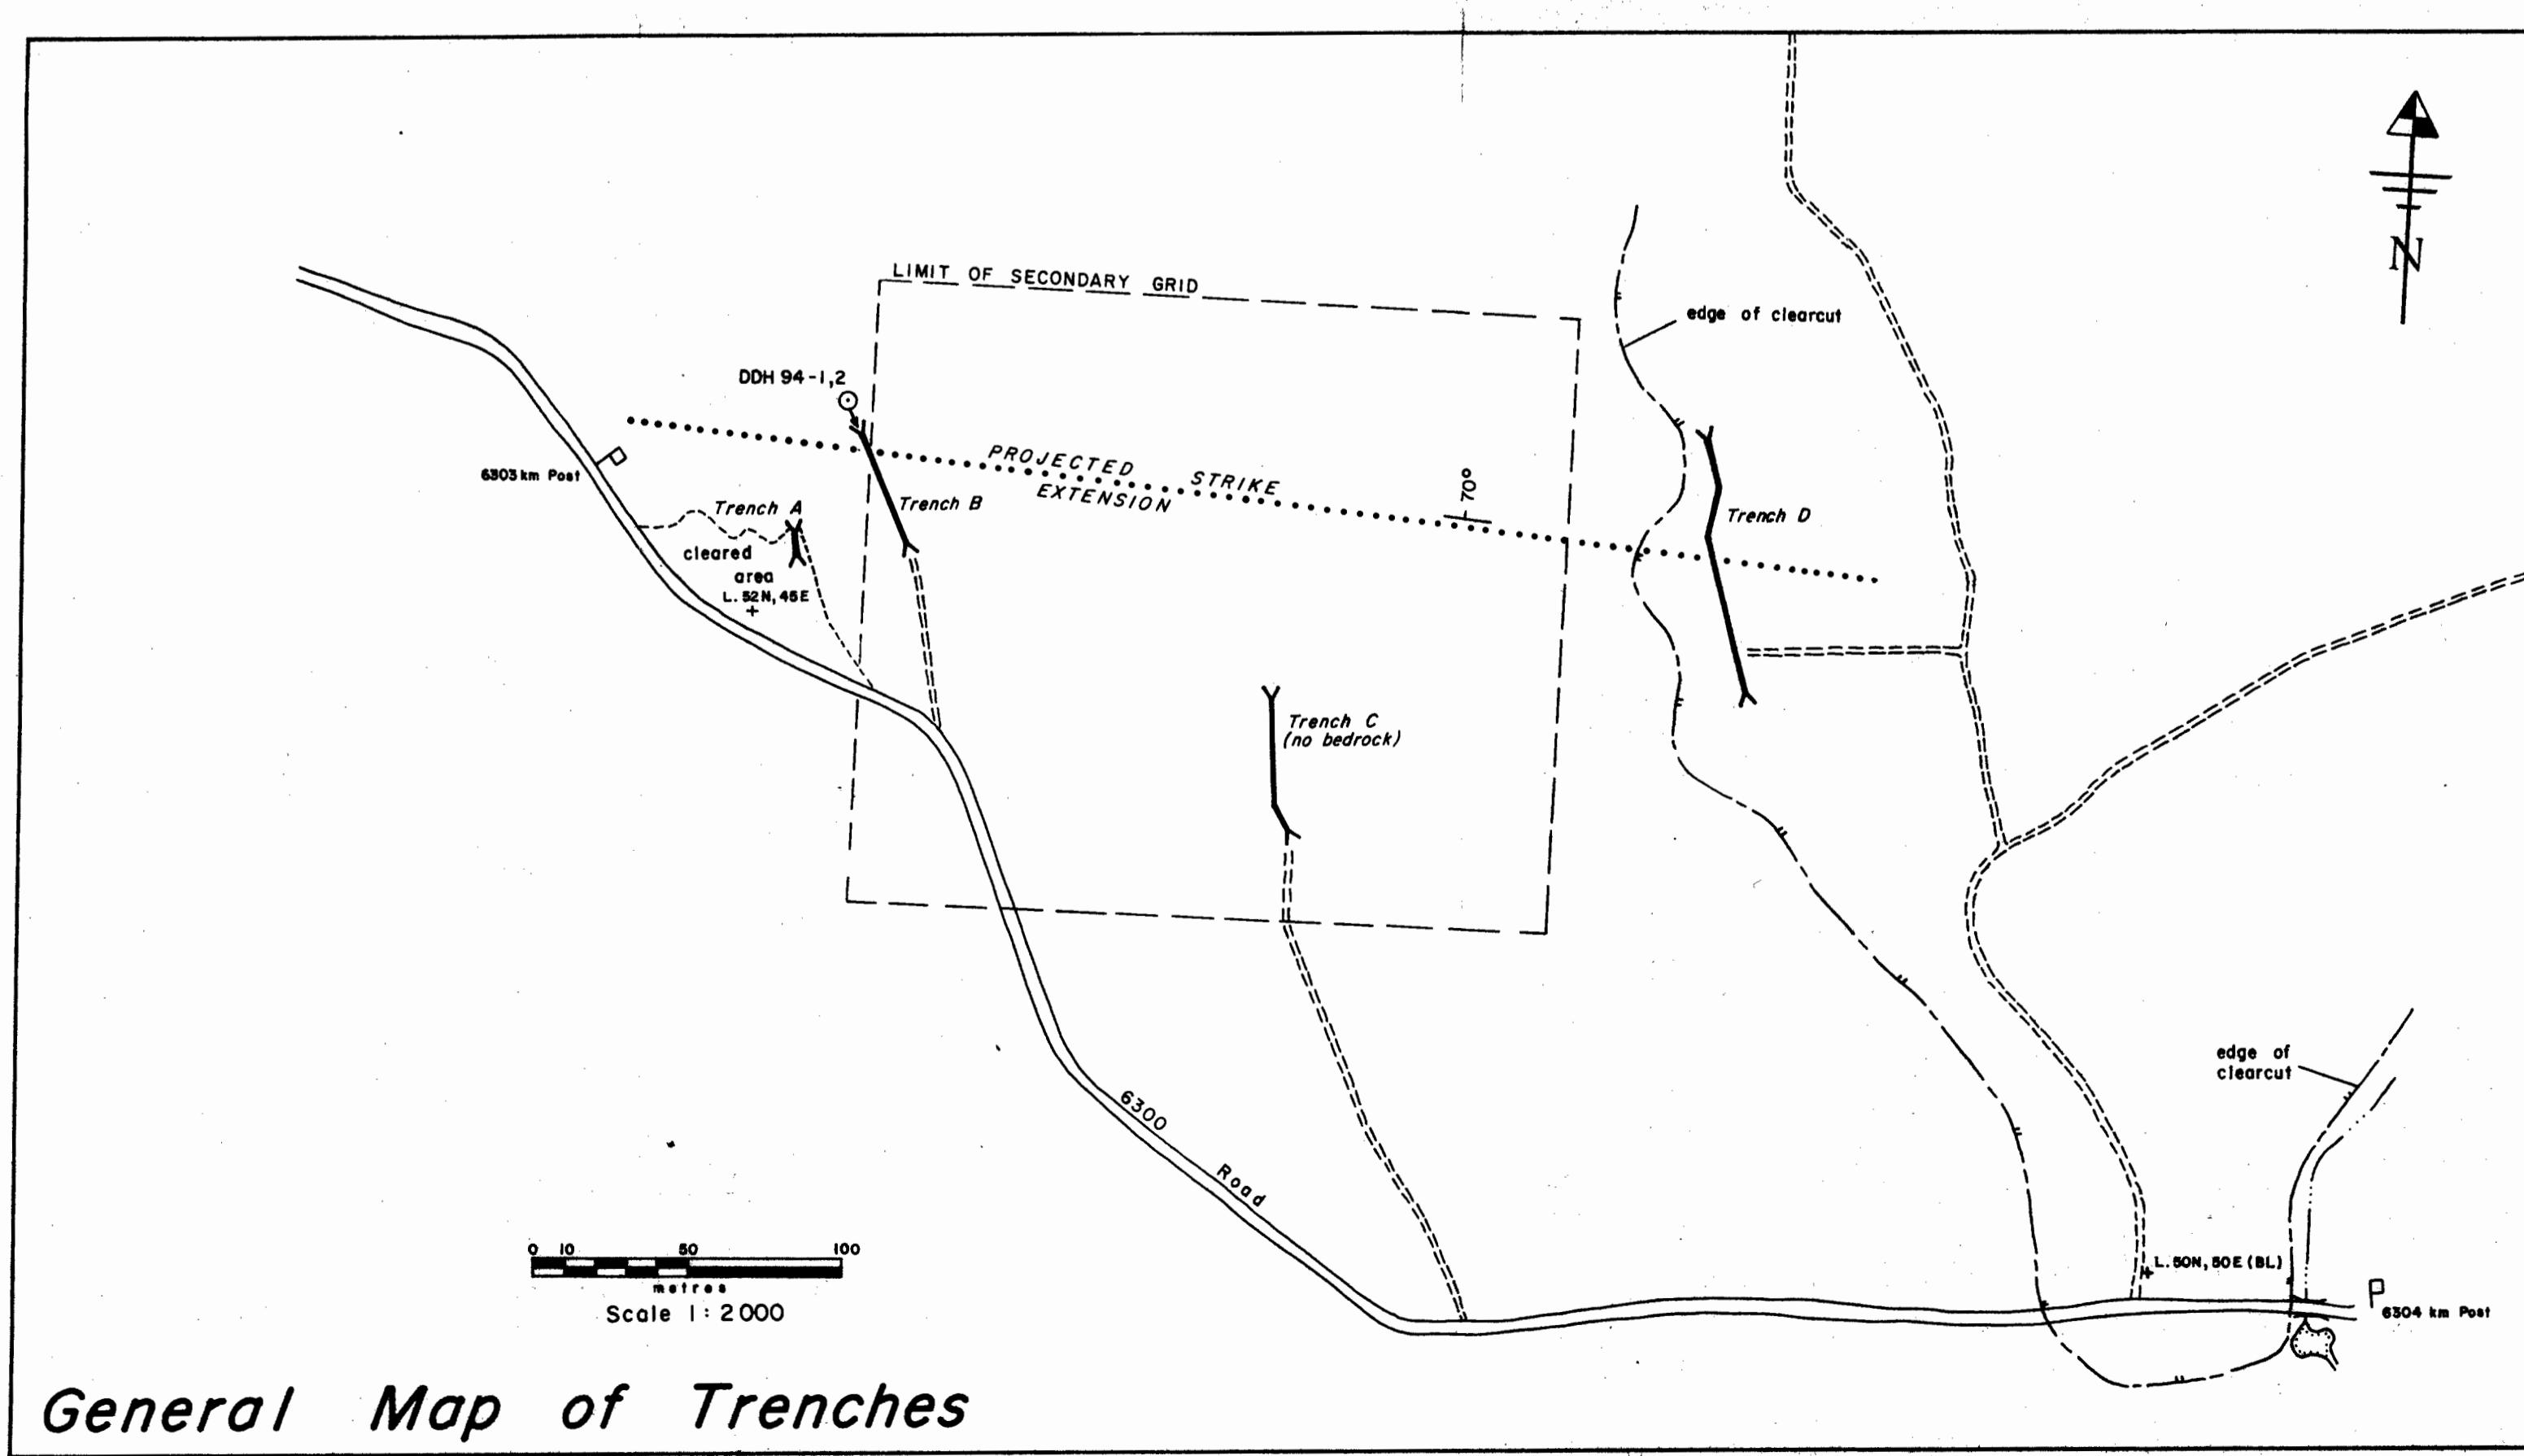

Ag Pb Sb Zn - Aqua regia digestion, A.A. finish

As - Aqua regia digestion, ICP finish

LEGEND

- (1) Hornfelsed Andesite Agglomerate. Minor garnet, pyrrhotite, sericite selvage on fractures. Quartz carbonate stockwork with easterly trend, northerly dip.
- (2) Highly foliated fault breccia. Strong argillic alteration. Some clasts of angular hornfelsed andesite tuff. Quartz carbonate stringers ubiquitous.
- Fault with dip
- Bedding
- Contact
- Foliation
- DR24 5, 30 Trench sample with assay values - Au(ppb), As(ppm)
- x Float sample
