APPENDICES

- I Harmony Gold Project Claims
- II Airborne Geophysical Survey

1.0 SUMMARY

The Harmony Gold Project is located on Graham Island, the largest and most northern island of the Queen Charlotte Islands, 779 km north of Vancouver, British Columbia. The Project area consists of 265 mineral claims that are owned by Romulus Resources Ltd., Mutual Resources Ltd. and Misty Mountain Gold Limited. Romulus Resources Ltd. acts as Operator to all the claim holdings.

The majority of the Harmony Gold Project area is accessible by well maintained logging roads from Masset, Queen Charlotte City and Port Clements, British Columbia. Helicopter support is necessary to access some regions within the Project area.

The Harmony Gold Project is considered to be a prime exploration target for precious and base metal deposits due to the presence of the mineral-rich Specogna Deposit within the claim area and the dilational tectonic regime of the region. The Specogna deposit, located 18 km south of Port Clements, is a large epithermal gold resource. Previous exploration activity in the Project area concentrated on the Specogna Deposit, on which some 50,000 m of drilling has been completed. Minimal exploration activity has occurred beyond the Specogna Deposit area.

Romulus Resources Ltd. contracted Dighem I. Power to perform an airborne geophysical survey over the Project Area in early 1995. The survey focused on three claim areas proximal to the Specogna Deposit: the Shields Bay/Riley Creek block, the Lignite Creek block and the Gold Creek block.

The Airborne Geophysical survey was successful in identifying several geophysical targets which warrant additional exploration work. The results of this survey will be integrated with geochemical survey results in order to identify prime exploration targets.

2.0 INTRODUCTION

Located in the Skeena Mining Division, the Harmony Gold Project is comprised of 265 mineral claims. The claims are located on Graham Island, the largest and most northerly island of the Queen Charlotte Islands. This area is considered to be a prime exploration target for precious-metal deposits.

Romulus Resources Ltd. contracted Digem I Power to perform an airborne geophysical survey over the project claims in early 1995. The results of the airborne geophysical survey will be integrated with geochemical survey results in order to identify targets for future exploration and development activity in the area.

3.0 LOCATION AND ACCESS

The Harmony Gold Project is located approximately 779 kilometres north of Vancouver, British Columbia (Figure 1.0). The Project, which is centred around latitude 53° 32' North and 132° 13' West, is contained within the boundaries of the Skeena Mining Division.

The Queen Charlotte Islands are accessible by regularly scheduled Canadian International Airlines jet service from Vancouver to Sandspit or via twice weekly ferry service from Prince Rupert to Skidegate, British Columbia.

The majority of the claim area is accessible from the towns of Masset, Queen Charlotte City and Port Clements, British Columbia by well maintained logging roads. Helicopter support is necessary to access some areas of the claim group.

ROMULUS RESOURCES LTD.

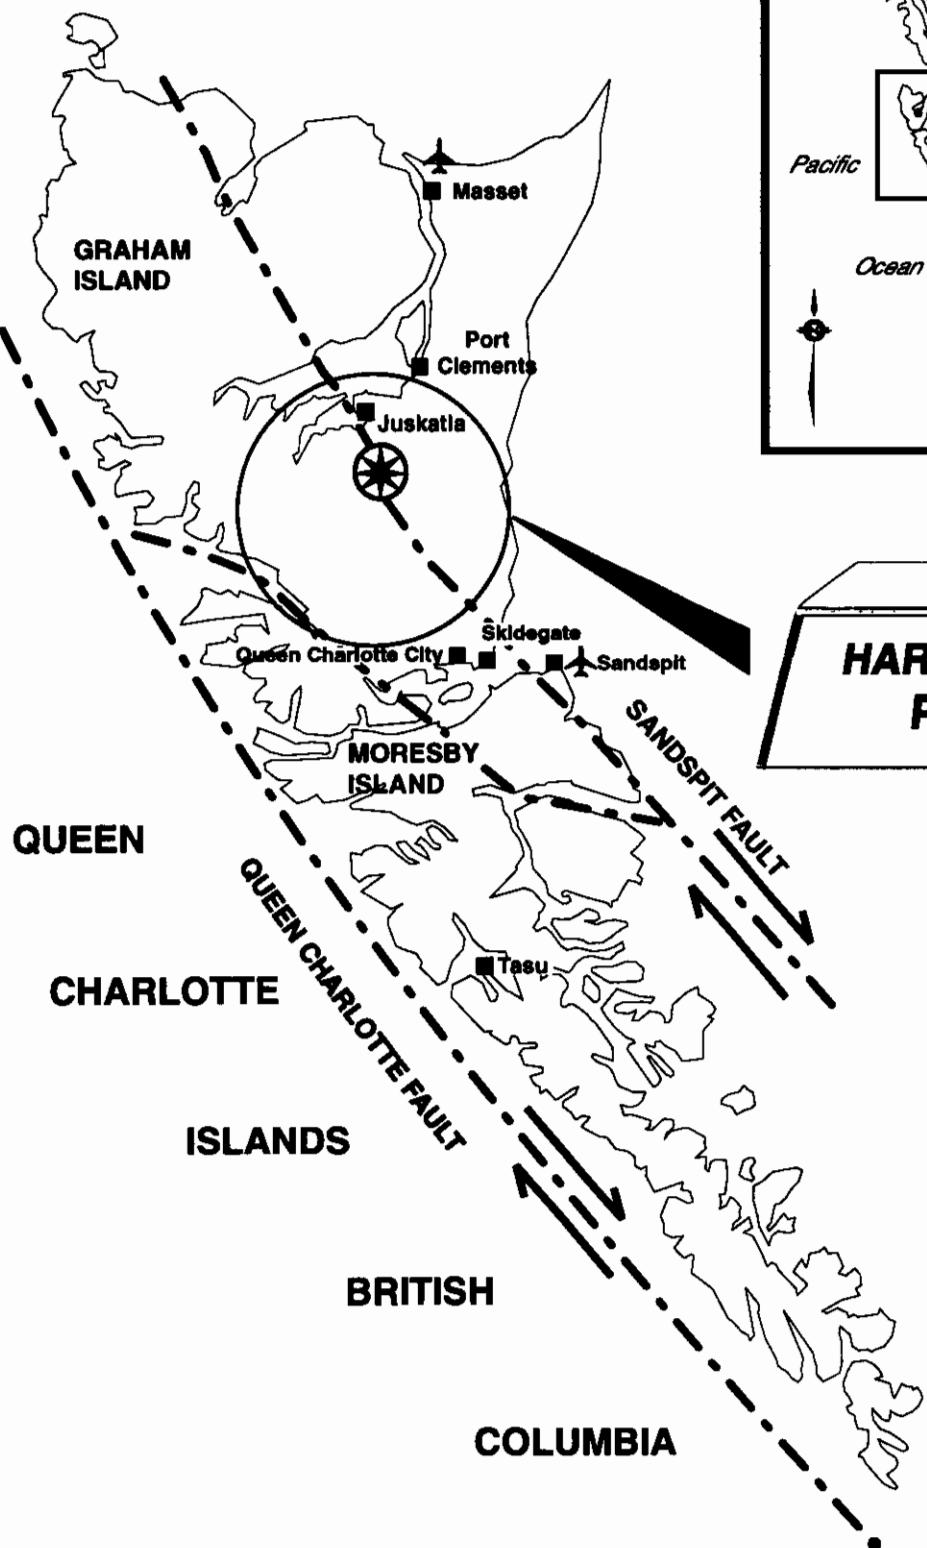

Figure 1.0
Location Map

4.0 PHYSIOGRAPHY AND CLIMATE

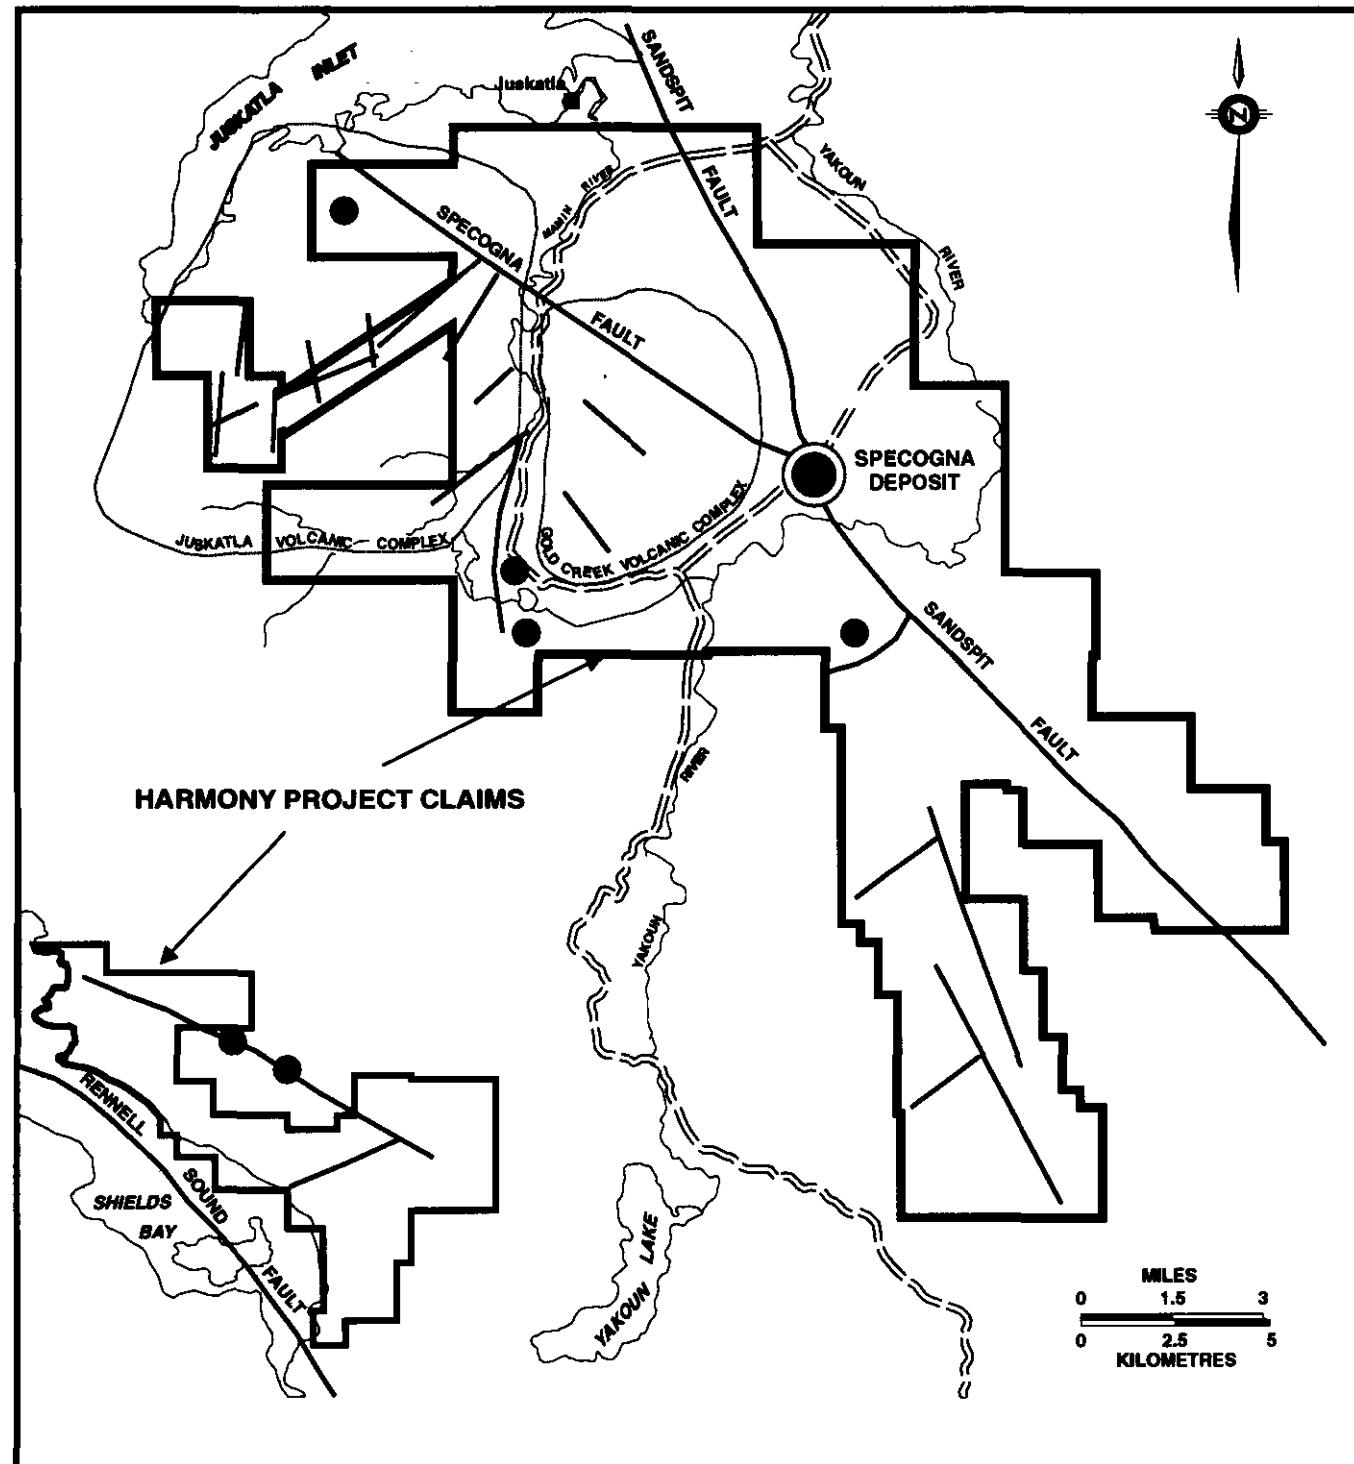

Previous exploration activity in the area of the Harmony Gold Project has focused on the Specogna Deposit. The Specogna Deposit is interpreted to be situated at the intersection of a dilational jog in the Sandspit Fault (Figure 2.0). The northwesterly trending Sandspit Fault forms a major physiographic and geological boundary on Graham Island. The Fault separates the hilly and mountainous terrain associated with Mesozoic and Tertiary rocks of the Skidegate Plateau to the west from the predominantly flat terrain associated with Late Tertiary rocks of the Charlotte Lowlands in the east.

A substantial part of the claim area has been clear-cut logged, including the Specogna Deposit area. Logging activity is presently ongoing in the claim area.

The climate of the Queen Charlotte Islands is typical of British Columbia maritime areas, with temperatures ranging from 1°C in January to 15°C in August. Annual average precipitation is in the order of 200 mm. Rain falls on approximately 213 days of each year. Snow falls on approximately 18 days of each year.

5.0 CLAIM DATA

The Harmony Gold Project consists of 265 mineral claims that are divided into three separate claim blocks: the Shields Bay/Riley Creek Block, the Lignite Block, and the Gold Creek Block. The Shields Bay/Riley Creek Block, located on NTS map sheet 108F7, consists of 18 claims that are located in the vicinity of Shields Bay on the west coast of Graham Island. The Lignite Block, located on NTS map sheet 108F15, consists of 3 claims that are located at the north end of Graham Island, south of Naden Harbour and on the east side of Lignite Creek. The Gold Creek Block, located on NTS map sheets 108F8 and 108F9, consists of 215 claims located in the vicinity of Gold Creek and the Yakoun River, to the south of Juskatla Inlet, on North Central

Graham Island. The location of all Harmony Gold Project mineral claims are illustrated by Figure 3.0.

The Project claims, which are situated in the Skeena Mining Division, are operated by Romulus Resources Ltd. A listing of the claims referred to in this report may be found in Tables 1.0, 2.0 and 3.0. A listing of all Harmony Gold Project claims is attached as Appendix 1.

6.0 EXPLORATION HISTORY

The Specogna Deposit was discovered in 1970 by Efrem Specogna and Johnny Trinco. Specogna and Trinco were prospecting along the trace of the Sandspit fault zone when they noticed a jarositic gossan and quartz veining. The vein and wallrock samples carried gold and thus the Babe Property, now known as the Specogna Deposit, was staked.

The Specogna Deposit was optioned to a number of companies, including Kennco, Canex Aerial Exploration, Cominco Ltd., Silver Standard Mines Ltd. and Quintana Minerals Corporation before it was acquired by Consolidated Cinola Mines Ltd. in 1977. Consolidated Cinola Mines conducted exploration activity on the deposit from 1977 to 1984. This activity included diamond drilling, percussion drilling, construction of an underground adit, metallurgical testwork, bulk samples and a 4,500 tonne pilot plant test.

In 1986, City Resources (Canada) Limited acquired control of Consolidated Cinola Mines Ltd. Between 1986 and 1989, City Resources (Canada) Limited completed a diamond and reverse circulation drill program, relogged all existing project drill core, drove crosscuts, performed metallurgical test work and carried out geostatistical and ore reserve studies.

In 1989, Barrack Mine Management acquired control of City Resources (Canada) Limited and completed further confirmation drilling and metallurgical test work before suspending all work in mid 1990.

* Pending Acceptance of this Assessment Report

In March 1994, City Resources (Canada) Limited changed the company name to Misty Mountain Gold Limited. In late 1994, Romulus Resources Ltd. entered into the current Joint Venture agreement with Misty Mountain Gold Limited to actively explore the Specogna Deposit and the Harmony Project claim area in order to earn a 50% interest in the Property. Romulus Resources Ltd. acts as Operator of the Joint Venture between the two companies.

Romulus Resources Ltd. entered into a Joint Venture agreement with Mutual Resources Ltd., who own claims adjacent to the Specogna deposit, in 1995. Romulus Resources Ltd. acts as Operator of the Joint Venture between the two companies.

7.0 PROPERTY GEOLOGY

The geology of the Queen Charlotte Islands has been mapped by A. Sutherland-Brown and documented in the British Columbia Department of Mines bulletin No. 54 (1968). The bulletin identifies five main rock formations within the Harmony Gold Project area: the Jurassic Yakoun Formation; the Cretaceous Queen Charlotte Group, which includes the Haida and Honna Formations; the Early Tertiary Masset Formation; and the Late Tertiary Skonun Formation. The Gold Creek and Juskatla Tertiary volcanic complexes have been mapped and described more recently by K. Hickson (GSC Paper 90-10). Figure 4.0 illustrates the geology in the area of the Harmony Gold Project.

7.1 Yakoun Group

The lithology of the Middle Jurassic (Bajocian) Yakoun Group is described by Indrelid et al (1991). The Yakoun Group contains an abundance of primary and reworked volcanic material that was deposited in a marine or subaerial environment. Volcanism is marked by tuff, lapilli, volcanic breccia and andesitic flows. Lithologies of the reworked sedimentary sections include the following: relatively deep water interbedded tuff and shale; shallower marine, interbedded

tuffaceous shale, siltstone and fine to coarse sandstone; and conglomerate, ranging from matrix supported gravel conglomerate to clast supported pebble and cobble conglomerate.

7.2 Queen Charlotte Group

The Middle to Upper Cretaceous Queen Charlotte Group rock sequence is composed of a tripartite sedimentary package of conglomerates, sandstones and mudstones: the Albian Haida Formation, the Cenomanian to Santonian Skidegate Formation, and the Coniacian to Santonian Honna Formation (Forgarassy and Barnes, 1991). These rock types have been identified in outcrop at numerous localities in the Queen Charlotte Islands (Haggart, 1991).

It has been suggested by Forgarassy and Barnes (1991) that the Haida-Skidegate-Honna sequence represents an overall fining upwards sedimentary package deposited during a marine transgression event. The base of the Haida Formation is recognized as a non-marine, probably fluvial, deposit that quickly grades upward into nearshore, shallow marine deposits. The overlying mudstones of the Skidegate formation indicate the gradual deepening of waters in this marine environment. The Honna Formation, which overlies the Haida and Skidegate formations, consists of coarse grained clastics that may represent either submarine channel and turbidite deposition or a fan-delta deposit.

7.3 Masset Formation

The Late Oligocene to Early Pliocene Masset Formation is composed of aphyric to feldsparphyric, mafic to felsic lava flows and pyroclastics. Minor intercalated sediments that underlie much of Graham Island occur within the Formation (Hickson, 1991). Hickson observed thick rhyolite flows at the core of inland hills along the west coast of Graham Island. These flows may represent vent areas from which volcanic products and sediments were shed to the east and west. Hickson indicates that the Masset Formation accumulated at or above sea level.

7.4 Skonun Formation

The Specogna Deposit is hosted by the Tertiary (Miocene to Pliocene) Skonun Formation. This Formation is the youngest present on Graham Island and it is characterized by marine and non-marine detrital sediments. These sediments consist of a thick sequence of conglomerates, sandstones, mudstones, siltstones, and volcanic pyroclastics. Seven units of the Skonun Formation have been identified in the area of the Specogna Deposit (Deighton et al, 1989). These units include mudstones, siltstones, sandstones, conglomerates and sedimentary breccias.

8.0 AIRBORNE GEOPHYSICAL PROGRAM

In early 1995, Romulus Resources Ltd. contracted Dighem I Power to perform an airborne geophysical survey over the Harmony Gold Project. The electromagnetic/resistivity/magnetic/VHF/radiometric survey was flown over the three claim blocks: Shields Bay/Riley Creek block, Lignite Creek Block and Gold Creek Block (which includes the Gold Creek extension). The purpose of the survey was to detect zones of conductive mineralization and to provide information that could be used to map geology and geologic structures in the area.

Survey coverage consisted of approximately 4785 line kilometres, including tie lines. The flight lines for each of the three blocks were flown in an east-west direction with a line spacing of 100 metres. A DIGHEM^V multi-coil, multi-frequency electromagnetic system, supplemented by a high sensitivity Cesium magnetometer, a 256 channel spectrometer and a four-channel VLF receiver was used to accomplish this survey. A detailed explanation of the survey logistics and results is attached as Appendix II.

9.0 RECOMMENDATIONS

The airborne geophysical survey was successful in identifying several anomalous features. These features warrant additional exploration work. The results of this survey will be integrated with geochemical survey results and geological information in order to identify prime exploration targets.

10.0 STATEMENT OF COSTS

1995 AIRBORNE GEOPHYSICAL PROGRAM

Lignite Creek Block

223 Line kilometres @ 76.50 / Line Kilometre	\$ 17,060.50
Subtotal:	<hr/> \$ 17,060.50

Shields Bay/Riley Creek Block

577 Line kilometres @ 76.50 / Line Kilometre	\$ 44,143.09
Subtotal:	<hr/> \$ 44,143.09

Gold Creek Block

3596 Line kilometres @ 76.50 / Line Kilometre	\$ 275,110.11
290 Line kilometres @ 76.50 / Line Kilometre	\$ 22,186.30
Subtotal:	<hr/> \$297,296.41

Report Preparation

El Condor Personnel: 2 man days @ \$250.00/day	\$ 500.00
	<hr/> \$ 500.00

EXPENDITURES 1995 AIRBORNE GEOPHYSICAL PROGRAM	<hr/> \$359,000.00

12.0 STATEMENT OF QUALIFICATIONS

I, Lena Kathryn Brommeland, of the City of Vancouver, Province of British Columbia, DO HEREBY CERTIFY THAT:

1. I am a Geologist employed by Romulus Resources Ltd. at Suite 1020 - 800 West Pender Street, Vancouver, British Columbia.
2. I am a graduate of the University of British Columbia, with a Bachelor of Science in Geology, 1989.
3. I have practiced my profession continuously since graduation.
4. I reviewed the data from the 1995 airborne geophysical program on the Harmony Gold Project.

Lena K. Brommeland

Lena K. Brommeland, B.Sc.

Dated at Vancouver, British Columbia, this 08 th day of August, 1995.

12.0 STATEMENT OF QUALIFICATIONS

I, Clarence Mark Rebagliati, of the City of Vancouver, Province of British Columbia, DO HEREBY CERTIFY THAT:

1. I am a consulting Geological Engineer with a business office at Suite 1020 - 800 West Pender Street, Vancouver, British Columbia.
2. I am a graduate of the Provincial Institute of Mining, Haileybury, Ontario (Mining Technology, 1966).
3. I am a graduate of the Michigan Technological University, Houghton, Michigan, U.S.A. (B.Sc., Geological Engineering, 1969).
4. I am a registered member, in good standing, of the Association of Professional Engineers and Geoscientists of British Columbia.
5. I have practiced my profession continuously since graduation.
6. I supervised the 1995 airborne geophysical program on the Harmony Gold Project.

C.M. Rebagliati, P.Eng.

Dated at Vancouver, British Columbia, this 08 th day of August, 1995.
