INTRODUCTION

The property is located 30km south-west of the city of Cranbrook, B.C. in the Moyie River drainage (see fig.1&2).

The property consists of flat areas and south-facing slopes up to -20° . Most of the claim area has been logged approximately 20 years ago. Access is via the main Moyie forest road to kilometer 10 via the Lumberton turnoff.

Two sets of high voltage power lines cross the claims and head south-west.

Previous work includes some trenching by Dragoon Resources Ltd. in 1989/90 and minor magnetometer and VLF work by P.Klewchuk in 1990/91.

The area is 95% drift covered.

The property is underlain by argillites and quartzites of the Middle Aldridge Formation. A few small gabbro sills cross the claims but attitudes are uncertain. Depth to Sullivan Time is thought to be in the order of 600 - 1200 meters on the property.

Geophysical Survey

Approximately $10\frac{1}{2}$ line kilometers with readings taken every 10m were worked over the central portion of the property (see fig.3). Magnetometer and VLF readings were taken using a Gem System (GSM-19) Overhauser Magnetometer and VLF. All magnetic measurements were done in nano-Teslas (nT) using only vertical magnetic component corrected for diurnal variation. All VLF measurements used vertical component in-phase and out-of-phase (%) and total field strength (pT). Station used was Annapolis in all calculations. Data was also collected from Cutler but as this closely matched the data from Annapolis no separate calculations were made for Cutler.

(4)
INTERPRETATION

Central Area

Signals on all lines are excessively noisy. Many sign shifts occur in the field strength plots on every line. This is probably due to the fact that the only available transmitters were sub-parallel to the line directions. Rough data shows field strength values of between 0.5 and 1.5 pT.

despite the noisy data several sharp VLF anomalies appear on Line 1500E. These are all suspect due to their symmetrical nature and the fact that field strength rises are never sustained. No anomalies exist of note on any other lines.

Sharp magnetometer anomalies exist at L1500N,4690E; L1500N,4200E and L1800,2110N. The first anomaly is attributed to old logging scrap. The second anomaly is unexplained and the third is a small but real anomaly probably due to increased pyrrhotite concentrations observed in argillite at that location.

S.W.Lines

Low field strength and noise induced from the nearby hydrolines has again caused sign shifts in both the field strength and the in-phase / out-of-phase plotting.

Several possible sharp point VLF anomalies show on L600N. Anomalies at 600N,580E; 600N,820E; 600N,1580; 600N,1600E are probably due to metal culverts. The apparent strength of these anomalies is probably enhanced by secondary fields generated by the nearby hydroline. VLF anomalies at 600N,750E, 600N,1070E, 600N,1260E, 600N,1290E and 600N,1500E are unexplained but suspect due to the proximity of the hydroline.

Only one verifiable magnetometer anomaly exists (600N,2190E) which is probably due to metal in the nearby bridge.

CONCLUSIONS

The low angle of incidence between lines and transmitter (Annapolis) and the proximity of the high voltage hydroline have been responsible for very noisy data with directional sign shifts common. As well, metal such as culverts or old logging debris (cable) gave many false VLF anomalies.

Line 600N shows 5 sharp anomalies which are unexplained by culverts or metal debris. They are at; 600N760E; 600N1070E; 600N1260E; 600N1290E and 600N1500. The raw data shows that field strength are mostly consistent at about 2.0 except for 60 N620E (8.1) and 600N1110E (4.2). This anomaly at 620E is probably due to a culvert or other metal. The anomaly at 1110E is unexplained.

The other anomalies are likely due to metal which was probably energized by the nearby high voltage hydroline.

Only one real magnetic anomaly exists at 1800N,2110E on the Central Grid (Pyrrhotite observed in flat lying argillaceous sediments) and at 600N,2200E on the S.W. line600 (bridge). Other sharp mag anomalies are believed to be due to culverts and old logging cables left in the bush.

(6)

Statement of Costs

4 days of GSM-19 surveying (approx. 1000
readings) @ \$500./day
(operator and helper plus
GSM-19 rental (\$100./day)
amount claimed = \$ 2000.

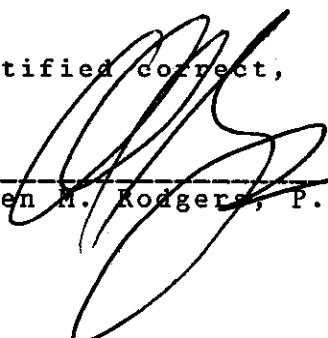

4*4 truck . (4 days @ \$50./day) \$ 200.

office plotting and computer time
(1 days @ \$150./day) \$ 150.
field expenses (flagging, thread) \$ 50.

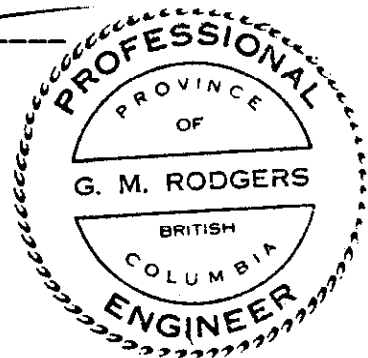

meals (groceries) \$ 125.

Total Expenses = \$ 2525.

-certified correct,

(Glen M. Rodgers, P.Eng.)

CERTIFICATE

I, Glen M. Rodgers of Skookumchuck, Province of British Columbia, hereby certify as follows:

-I am a consulting geologist presently registered with the Association of Professional Engineers of British Columbia.

-I graduated from the University of Manitoba in 1977 with a bachelors degree in Geological Engineering.

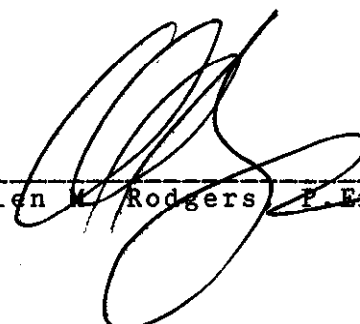

-I have practised my profession continuously since graduation in British Columbia, Yukon Territory, Alaska and Central America working primarily in the field of mineral exploration.

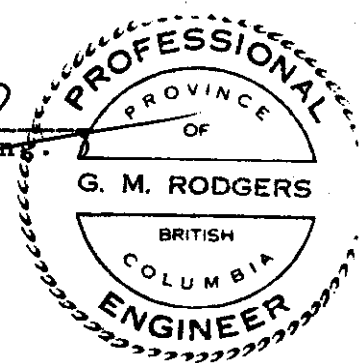

-I have based this report on personal observation and work done while working as geologist for Otis J. Exploration Corp. during 1995.

-I hold shares of Otis J. Exploration Corp. which I both purchased and received for property vending. I hold a 25% interest in the Bingo claim group. I do not expect to receive any shares of Otis J. Exploration Corp. as a result of writing this report.

-I consent to the use of this report by Otis J. Exploration Corp. for whatever purposes they deem necessary provided the context is not altered to change its intended meaning.

August 10, 1995

(Glen M. Rodgers) P. Eng.)

The seal is circular with a dashed border. The text 'PROFESSIONAL' is at the top, 'OF' is in the center, 'G. M. RODGERS' is below the center, 'BRITISH COLUMBIA' is at the bottom, and 'ENGINEER' is at the very bottom.
