1	Dragon Mineral Claims	5

1.0 SUMMARY

The Dragon property is located about 80 kilometres west of Campbell River, British Columbia and approximately 65 kilometres southeast of Westmin Resources Limited's mining operation at Myra Falls. The property consists of 32 staked mineral claims totalling 515 units.

Grid and reconnaissance geological mapping, lithogeochemical sampling, soil sampling, moss-mat sampling, linecutting and hipchain-and-compass grid surveying were performed during April and May 1995 on the Dragon property. This work was done in two episodes or phases.

Paleozoic Sicker Group volcanic and sedimentary rocks are overlain by Triassic Karmutsen Formation basalt and gabbro of the Vancouver Group. These rocks have been intruded by the Jurassic plutonic Island Intrusions. The stratified rocks generally strike north-northeasterly and dip at moderate to shallow angles to the west.

Myra Formation rocks of the lower Sicker Group, which are favourable for hosting volcanogenic massive sulphide deposits, underlie the Dragon property. Limestone, argillite, rhyolite, dacite, andesite, gabbro and basalt are all present in the Sicker Group rocks at the Dragon property.

Intense pyrite mineralization and wall rock alteration have occurred in the central part of the Norgate grid area. Disseminated pyrite, pyrrhotite, sphalerite and galena were found in silicified rhyolite lapilli tuff-agglomerate stratigraphically above the zone of intense pyrite mineralization. Selected samples of this rock assayed up to 0.7% zinc, 0.46% lead, 49.0 g/t silver and 1.4 g/t gold. More than one interval within the stratigraphic sequence contains base metals. The Falls and North showings, discovered earlier by Noranda Exploration Company, Limited, are stratigraphically above this mineralized zone.

Geochemical lead-, zinc- and copper-in-soil anomalies occur in the Norgate grid area.

A limited amount of logical mapping and rock sampling should be done in areas of interest not examined during spring 1995 due to snow cover at higher elevations. This work should better define the volcanic stratigraphy, and also better define mineralized and altered horizons.

The source of selected geochemical soil anomalies at Norgate grid area should be investigated.

Induced polarization surveying may be required to trace sulphide-bearing target units.

Diamond drilling will be required to test targets resulting from the above work.

Assuming three holes each about 180 metres in length are drilled, the cost of the proposed work is estimated to be $120,000.

2.0 INTRODUCTION

2.1 Geography, Physiography and Access

The Dragon property is located about 80 kilometres west of Campbell River, British Columbia (Figure 1). The mineral claims are in the Nanaimo and Alberni mining divisions, within NTS map-areas 92E/16E and 92L/1E. They occupy a rectangular area centered near latitude 49° 55' N, longitude 126° 20' W. Access to the property is by gravel logging roads or by helicopter chartered from Gold River.

The Dragon property is between approximately 100 and 1,475 metres (330 and 4,840 feet) above sea level. The area is characterized by moderate to steep slopes and numerous cliffs. The property is covered by mature cedar, hemlock, fir and spruce forest below the treeline at approximately 1,100 metres (3,500 feet) above sea level. Much of the lower areas has been recently logged and is now open clearcut. The area contains numerous streams and a few small lakes.

The region has wet weather conditions. Fieldwork can be performed at lower elevations during most of the year, but the higher areas are snow-covered until June. Snow fell on several days during April 1995.

2.2 Property Description

The Dragon property consists of 32 staked mineral claims totalling 515 units. The claims are shown on Figure 2 and are tabulated in Table 1. The expiry dates shown are those in effect with the current work being applied as assessment.

The claims are owned by Doromin Resources Ltd. of Vancouver and Efrem Specogna of Nanaimo.

The current exploration program was operated by Westmin Resources Limited, holder of an option to acquire an interest in the property.

2.3 Exploration History

Little exploration work was performed within the Dragon property area prior to 1992. The Dragon, Dragon 2, Dragon 3 and Dragon 4 mineral claims were owned by Efram Specogna of Specogna Minerals Inc. at that time. Massive sulphide float discovered south of the Muchalat River by Mr. Specogna was named the Dragon Showing.

Noranda Exploration Company, Limited optioned the Dragon claims in 1992, and conducted an airborne geophysical survey over the property area. Magnetometer, radiometric, resistivity, electromagnetic and VLF-EM surveying was done (Robertson, 1993). Noranda subsequently staked numerous additional mineral claims in the area of interest. Airborne resistivity anomalies were followed up by geological mapping during late 1992.

Noranda conducted detailed mapping, geochemical soil sampling and prospecting from May to July 1993. A succession of felsic and mafic volcanics overlain by sediments and limestone was delineated. Two semi-massive sulphide occurrences, the Falls Showing and the North Showing, were discovered (Kemp and Gill, 1993). The stratigraphy down-dip of the Falls Showing was tested by two diamond drillholes which failed to intersect significant mineralization. Geochemical soil sampling results showed local areas with elevated zinc and copper concentrations along strike both north and south of the Falls Showing.

Noranda performed geological mapping and lithogeochemical sampling during October 1993. The lithogeochemical sampling outlined local areas of sodium depletion, potassium enrichment and zinc enrichment within the rocks (Gray, 1994). Gray recommended that detailed geological mapping, lithogeochemical sampling and ground geophysical surveys be done south of the Falls Showing prior to testing favourable stratigraphic units with diamond drillholes.

2.4 Summary of the 1995 Work Program

In early 1995 Westmin Resources Limited completed a program of geological mapping, soil sampling, lithogeochemical sampling, moss-mat sampling and linecutting on the Dragon property.

A limited amount of reconnaissance geological mapping was performed during a preliminary geological examination of the property by Westmin in September and October 1994. Geological mapping performed during the property examination is plotted on Figure 5; this work was done along the Leighton Peak ridge.

Between April 2 and May 20, 1995 the following was done on the Dragon property:

The Norgate and Much grids were established by cutting baselines and tielines; hipchain-and-compass surveyed crosslines covered areas of detailed work. Several contour lines with stations at 25-metre intervals were established outside of the grid areas.

At Norgate grid area the baseline is oriented at azimuth 090° (Figure 5); station pickets were surveyed at 25-metre intervals. Crosslines were established at 100-metre intervals with flagged stations at 25-metre intervals.

At Much grid area the baseline is oriented at azimuth 360°; station pickets were also surveyed at 25-metre intervals. The crosslines were put in at 200-metre intervals with flagged stations at 25-metre intervals (Figure 6).

A total of 8.35 line-kilometres of baselines and tielines was cut in the two grid areas. Approximately 32.32 line-kilometres of hipchain-and-compass lines were surveyed on the Dragon property.

The grid areas were geologically mapped and prospected at a scale of 1:5,000. Selected parts of the property outside of the grid areas were also mapped at 1:5,000 and 1:20,000 scale. Topographic maps and airphotos were used for survey control outside of the grid areas.

Concurrent with the prospecting and geological mapping, 86 lithogeochemical samples were collected. Fifty-two of these rocks underwent whole rock analysis as well as lithogeochemical analysis. 1,481 soil samples were collected. Eighty-two stream sediment (moss-mat) samples were collected.

3.0 GEOLOGY

3.1 Regional Geology

The Dragon property is underlain by Paleozoic Sicker Group sediments and volcanic rocks, and by Triassic Karmutsen Formation basalt and gabbro of the Vancouver Group. These rocks have been intruded by the Jurassic plutonic Island Intrusions (Figures 3 and 4). The stratified rocks generally strike north-northeasterly and dip at moderate to shallow angles to the west. Supracrustal rocks in the area are locally characterized by greenschist to amphibolite facies mineral assemblages. Bedrock is covered by thick till and unconsolidated glacio-alluvial deposits in the lower parts of the valleys.

Sicker Group rocks host the volcanogenic massive sulphide orebodies being mined by Westmin Resources Limited at Myra Falls. The mine area is approximately 65

kilometres southeast of the Dragon property. The Sicker Group rocks hosting the zinc-copper deposits at Myra Falls have been described in detail by Walker (1985) and by Juras (1987), among others.

3.2 Property Geology

The geology of the Dragon property is presented on Figures 3 to 6. The property geology is outlined below.

A preliminary geological examination by Stephen Juras of Westmin Resources Limited and by David Caulfield of Equity Engineering Ltd. determined that Myra Formation rocks of the lower Sicker Group, which are favourable for hosting volcanogenic massive sulphide deposits, underlie the Dragon property (Juras, 1994; Caulfield, 1994). Their mapping of the Leighton Peak ridge area is incorporated in Figure 5.

The most extensive section of Sicker Group rocks at the Dragon property occurs as a homoclinal, westerly-dipping sequence along the ridge east of Leighton Peak, between Muchalat River and Norgate Creek in the south-central part of the property (Figure 5). The Sicker Group rocks along the ridge are estimated to be at least 1,600 metres thick. These rocks have been intruded and cut off by large gabbro-diorite bodies of the Island Intrusions at both the eastern and the western ends of the ridge. The eastern intrusive contact has not yet been delineated by geological mapping. However, float in the streams southwest of Muchalat Lake indicates that the contact is perhaps 500 metres or so east of the present eastern limit of mapping. In addition, a sill-like body of diorite and gabbro extends along the base of the north side of the ridge east of Leighton Peak (Figure 5).

Sicker Group rocks elsewhere on the property are of limited extent, and are mainly Buttle Formation limestone with minor argillite (Figures 3 and 4). In several places the Island Intrusions appear to have been emplaced as sill-like features parallel the lower limestone contact. There is little disruption of the Sicker Group rocks along these intrusive contacts.

3.2.1 Geological Units at the Dragon Property

- **Quartz Veins**

Quartz veins are milky-white to occasionally watery-grey or maroon-grey, and usually up to a few centimetres wide. They form up to 2% of the rock volume, and are most abundant within siliceous rhyolite. A quartz vein at Norgate grid area has a siliceous

alteration envelope 0.5 to 0.75 metres wide which also contains 5 to locally 10% sericite. Quartz veins are only rarely sinuous and deformed.

Quartz veins within andesite often have epidote along selvages. Muscovite flakes to 7 millimetres across are locally present along quartz vein margins within felsic volcanic rock.

- **Late Intrusive Dykes**

Quartz feldspar porphyry, aplite, andesite, diabase and mafic dykes are all present within the Dragon property area, and crosscut all other rock types. The dykes comprise a small portion of the total rock volume on the property. The dykes are steeply dipping and mainly strike approximately easterly, although some strike in other directions. The intrusive dykes locally contain 1% disseminated pyrite. Plagioclase phenocrysts within the feldspar porphyry dykes usually range up to 3 or 4 millimetres in length, are subhedral and off-white on weathered surface. Some of the intermediate feldspar dykes are glomeroporphyritic, with radiating clusters of plagioclase laths.

The age relationship of the dykes to the other igneous rocks within the Dragon property has not been established. The dykes may be in part coeval with the Sicker Group, or may be related to the later Island Intrusions.

- **Island Intrusions**

The Island Intrusion rocks at Dragon property are mainly medium-grained diorite and gabbro. In addition to gabbro and diorite, granodiorite, granite and quartz diorite are also part of the Island Intrusion suite within the Dragon property area (Figures 3 to 6).

These rocks are medium- to locally fine-grained, and relatively fresh with only local weak to moderate chlorite alteration. They contain local traces of finely disseminated pyrite.

- **Karmutsen Formation (Vancouver Group)**

Karmutsen Formation at the Dragon property is dark green to black, generally massive basalt flows and gabbro. The unit is usually magnetic. Locally the rock is pillowed. Karmutsen Formation overlies, and is younger than, the other stratified units (Sicker Group rocks) within the property area. Therefore, these rocks are not overturned.

- **Sicker Group**

  - **Buttle Formation Limestone**

Buttle Formation limestone at Dragon property is pale grey to locally white or medium grey, recrystallized, variably silicified and hard. Locally, as at western Norgate grid area, thin, stylolitic(?), black laminae are present within the limestone. The lowermost limestone sections often contain felsic tuff bands. Argillite lenses and beds up to a few metres thick are also found at several places within limestone.

In many parts of the property the Buttle Formation limestone is the only member of the Sicker Group present, as the units underlying the limestone have been cut off and replaced by the Island Intrusions. These Island Intrusions are often emplaced as sill-like bodies with contacts that appear conformable with the bedding in the limestone. Occasional skarns are found along the limestone/intrusion contact. These skarns locally contain grossular garnet, pyrrhotite, chalcopyrite and sphalerite.

  - **Argillite**

Bands of dark grey to black, thinly bedded and friable argillite occur within the Sicker Group sequence at Norgate grid area. Argillite often appears to have been brecciated by any strain that has been imposed on the rocks. Argillite is the least competent rock within the property area. Faults in argillite are marked by limonitic or graphitic gouge. Fracture surfaces are often bleached. Locally hematite occurs both as disseminated grains and as veinlets along fractures in the argillite. Argillite contains up to 2% finely disseminated pyrite.

- **Rhyolite**

Rhyolite is the most abundant rock type in the Sicker Group rocks along the Leighton Peak ridge (Figure 5). Rhyolite flows, lapilli tuff and ash tuff as well as massive rhyolite are all present. Lateral facies variations occur within rhyolite on the property; such variations also occur at the Myra Falls area. The rhyolite units often have a chalky, weathered surface. The rhyolite is pale brownish-grey to medium greenish-grey, and often has a high silica content. The silica is often bluish-grey. Rhyolite flows often contain siliceous spherules up to a few millimetres across. Flow banding on a millimetre scale is common. Flow breccias were seen in the west-central Norgate grid area. Rhyolite fragmental units locally contain bluish- or watery-grey quartz eyes 2 to 3 millimetres across. Clasts within the fragmentals range up to 25 centimetres across. At 2170E/3530N subround felsic clasts average 5 to 8 centimetres across; here the rock is 70% clasts and 30% matrix.

Rhyolite flows usually have a smooth, weathered surface, and fragmentals a rougher, scalloped weathered surface.

Finely disseminated flakes of sericite occur throughout most of the rhyolite at Dragon property. In most places sericite forms from 1 to 2% of the rock volume. Medium- to fine-grained rhyolite at one site has up to 5% honey-coloured sericite flakes to 1 millimetre across; this rock also has up to 5% pyrite.

Local maroon, dusty, disseminated hematite is found within the matrix of fragmental rhyolite.

Siliceous rhyolite at 2320E/3510N (Figure 5) contains watery-grey, rounded quartz "clasts" 10 to 15 millimetres across. This rock is cut by a breccia dyke which is itself cut by late fractures striking 087°, dipping 67° south; the late fractures and the breccia dyke are crosscut by a later aplite dyke.

Some bands of felsic tuff at Norgate grid area contain up to 50% cordierite as ovoid masses 5 to 10 millimetres diameter; the cordierite weathers out as knobs a few millimetres high on outcrop surfaces. Cordierite is not as abundant within more mafic volcanics in this area. It is uncertain whether or not the cordierite has formed as a result of contact metamorphism adjacent to an underlying intrusion, or as a result of syngenetic hydrothermal alteration. These tuffs locally contain 2 to 3% disseminated pyrite.

Cordierite prisms occur in a mafic lapilli fragment within a boulder of rhyolite lapilli tuff in the central Norgate grid area. Faint green chlorite clots occur in an aphanitic felsic rock at 4150E/3490N in Norgate grid area; this rock also contains red hematite and epidote along fractures.

Black, very fine biotite flakes are locally disseminated within rhyolite at Dragon property. In places this black biotite appears altered to sericite. Purplish, fine-grained biotite was found in fragmental(?) rhyolite near a contact with limestone; this may indicate hornfelsing has occurred. Purplish brown biotite was found at another place in dacite-rhyolite lapilli tuff.

Medium-grained rhyolite or rhyo-dacite at 2245E/3500N in Norgate grid area is spotted by chlorite clots up to a few millimetres across.

Generally rhyolite contains only local traces of pyrite, though up to 2% finely disseminated pyrite is common. Pyrite veinlets are relatively rare. Rhyolite rarely contains up to 5% pyrite. Six to eight percent sooty to finely disseminated pyrite occurs at one site at Norgate grid area. Irregular pyrite masses to 12 millimetres

across occur within rhyolite in a few places. Local patches of orange to orange-brown limonite a few centimetres wide are common on weathered rhyolite outcrop surfaces.

- **Dacite**

Dacite at the Dragon property is generally medium-grained. At western Norgate grid area the unit has off-white, subhedral plagioclase phenocrysts averaging 2.5 millimetres across in a fine-grained matrix with green chlorite after hornblende(?). This rock is locally magnetic.

- **Andesite**

Andesite lapilli tuff at Norgate grid area contains intermediate and felsic lapilli. The matrix is possibly crystal tuff; it contains clots of dark green chlorite after hornblende(?). Small, brown garnets are present within this rock, which has a light brown, weathered surface. Quartz lenses with epidote selvages and local 1% pyrite occur along fracture surfaces.

Andesite locally contains 1 to 2% finely disseminated pyrite.

The andesite is locally moderately magnetic. It locally contains up to 5% bright, black, finely disseminated biotite flakes.

- **Gabbro and Basalt**

Basalt at the Dragon property is fine-grained, dark greenish-grey to black, massive and often moderately magnetic. It generally contains say 5% subhedral plagioclase phenocrysts to 1 millimetre; plagioclase locally comprises up to 10 and 25% of the unit volume. Basalt has locally up to 5 or 8% biotite as finely disseminated black flakes. Dark chlorite clots to 3 millimetres across locally comprise up to 4% of the rock volume.

Gabbro at the Dragon property area is generally dense, fine-grained, massive and is often magnetic.

Abundant exposures of fine-grained gabbro and basalt occur in the eastern Norgate grid area (Figure 5). The extent and stratigraphic position of these mafic rocks have yet to be determined. These rocks may belong to the lower part of the Sicker Group, or possibly they may be part of an Island Intrusion.

3.3 Structure

The stratified rocks at the Dragon property generally strike north-northeasterly and dip at moderate to shallow angles to the west. As Karmutsen Formation rocks overlie the older Sicker Group rocks in a few places, the strata have not been overturned.

The stratified rocks near Leighton Peak dip relatively steeply westwards; perhaps they were disrupted during the emplacement of the diorite-gabbro Island Intrusion on the west side of the peak. There has been little disruption or alteration of Sicker Group rocks resulting from the intrusive events at the Dragon property.

Many of the creek and river valleys at the Dragon property are occupied by steeply dipping faults. These faults trend northeasterly to easterly. Faults are relatively late, and have displaced late intrusive dykes.

A relatively late, healed, easterly trending fault has been mapped along Norgate Creek (Figure 5). The rocks on the south side of this fault have been down-dropped, resulting in an apparent left-lateral displacement across the fault.

A fault striking 146° and dipping 88° northeast at 2795E/3805N at Norgate grid area is marked by 10 centimetres of pale grey, clayey gouge. Moderately abundant orange to red limonite coats weathered fracture surfaces within a couple of metres of this fault.

A weak, north-trending fabric is present at many locales in the Norgate grid area.

3.4 Mineralization

Only sparsely mineralized rocks were found during this phase of geological mapping and prospecting. However, the Falls Showing and other areas at higher elevations were not examined because of extensive snow cover.

Intense pyrite mineralization and wall rock alteration have occurred in the central part of the Norgate grid area (Figure 5). Quartz veins are also relatively abundant. This altered rock may possibly be part of a footwall stringer zone related to a volcanogenic massive sulphide occurrence.

Disseminated pyrite, pyrrhotite, sphalerite and galena were found in silicified rhyolite lapilli tuff-agglomerate stratigraphically above, and west of, the zone of intense pyrite mineralization. The interval with pyrite, pyrrhotite, sphalerite and galena is stratigraphically below the Falls and North showings on the northern side of the Leighton Peak ridge (Figure 5). Select samples (943104, 943105) of the mineralized

rock assayed up to 0.7% zinc, 0.46% lead, 49.0 g/t silver and 1.4 g/t gold (Figure 5; Appendix C).

Several boulders of silicified(?) rhyolite lapilli tuff were found in a creek draining the Leighton Peak ridge about 4 kilometres east of the Falls Showing area (Figure 5). These rocks contain 2 to 5% massive pyrite clasts; no other sulphides were seen in the clasts. Sample 943115 of this material contains 28 ppm zinc and 21 ppm copper. A similar sulphide clast-bearing rock unit, the "ore-clast breccia," occurs 21 to 91 metres stratigraphically above ore-bearing rhyolite beds at Myra Falls. At Myra Falls the sulphide clasts contain chalcopyrite and sphalerite as well as pyrite.

Occasional skarns are found along the limestone/intrusion contact at the Dragon property. These skarns locally contain pyrrhotite, chalcopyrite and sphalerite. Rock sample 943164 is grossular garnet skarn 8 by 80 centimetres along a feldspar porphyry dyke/limestone contact in the Kla-anch Creek area of the northeastern Dragon property. This rock contains 4,170 ppm copper, 324 ppm zinc and 2.8 ppm silver (Figure 3; Appendix D).

3.5 Interpretation

Disseminated pyrite, pyrrhotite, sphalerite and galena occur within silicified rhyolite lapilli tuff stratigraphically below the Falls Showing. A geochemical lead-in-soil anomaly occurs in this area. The zone of intense pyrite mineralization which stratigraphically underlies this occurrence could possibly be part of a feeder stockwork zone associated with a volcanogenic massive sulphide deposit. A pyrite stringer zone has been recognized below the H-W orebody at Myra Falls (Walker, 1985).

The silicified(?) rhyolite lapilli tuff boulders found about 4 kilometres east of the Falls Showing area contain 2 to 5% pyrite clasts. The massive pyrite source for these clasts is within a stratigraphic interval below the tuff. Although no other sulphides were seen within the pyritic clasts, the presumed occurrence of massive sulphide is encouraging. A similar type of rock, the "ore clast breccia," is found at Myra Falls.

4.0 GEOCHEMICAL SURVEY

4.1 Scope of Sampling

All bedrock and float mineralized with significant amounts of sulphide was sampled and analyzed for precious and base metals as part of the geological mapping and prospecting program.

As outcrop is covered by overburden in most low-lying areas on the property, geochemical soil sampling was done to detect any possible buried sulphide mineral occurrences.

Stream sediment samples were taken to provide geochemical data in areas where soil sampling was limited, especially in the northern part of the property where sampling and mapping were done in a reconnaissance fashion.

4.2 Sample Analysis

Eighty-six rocks, 76 stream sediments and 1,481 soils collected during the 1995 work program were analyzed for selected elements by Chemex Labs Ltd., 212 Brooksbank Avenue, North Vancouver, British Columbia. Rock sample descriptions are in Appendix A. Sample locations and results are plotted on Figures 7 to 15b. Certificates of analysis and an outline of the analytical procedures used form Appendices C, D and E. Statistical analyses of soils and stream sediments form part of Appendices D and E, respectively. The -80 mesh size fraction of the soils and stream sediments was analyzed.

4.3 Results and Interpretation

4.3.1 Lithogeochemistry

Selected rocks contain up to 0.7% zinc, 0.46% lead, 49.0 g/t silver and 1.4 g/t gold (Appendix B). However, most sulphide-bearing rocks sampled have low base and precious metal content.

Rock sample 943164 is a grab of mineralized grossular garnet skarn 8 by 80 centimetres along a feldspar porphyry dyke/limestone contact.

4.3.2 Whole Rock Geochemistry

Whole rock analyses were performed on 52 volcanic rocks from the Dragon property (Appendix B). The results of earlier lithogeochemical sampling by Noranda showed that rocks collected near the Falls Showing and in the Norgate grid area are enriched in K_2O and depleted in Na_2O.

1995 whole rock sample analyses also shows that the rocks were enriched in K_2O and depleted in Na_2O at Norgate grid area.

4.3.3 Soil Geochemistry

Soils from the Dragon property contain up to 1.2 ppm silver, 370 ppm zinc, 316 ppm lead and 429 ppm copper (Appendix B).

Geochemical soil anomalies are found in several parts of the Norgate grid area.

There are lead- and zinc-in-soil anomalies at east-central Norgate grid area shown on Figures 7 and 8. The Sicker Group rocks underlying these anomalies are stratigraphically below the horizon containing the Falls and North showings. Therefore, more than one interval within the stratigraphic sequence contains base metals.

There is a copper-in-soil anomaly along the base of the slope on the northern side of the Leighton Peak ridge (Figure 9). The source of this anomaly is unknown; it may be a skarn associated with the presumed nearby contact between Sicker Group rocks and intrusive diorite. The soils collected upslope from this anomaly have background levels of copper so the possible bedrock source area for the anomaly is somewhat restricted.

No geochemical soil anomalies were found at Much grid area (Figures 11, 12 and 13).

4.3.4 Stream Sediment Geochemistry

Stream sediments (moss-mat samples) from the Dragon property contain up to 25 ppb gold, 214 ppm zinc, 1,400 ppm lead and 196 ppm copper (Appendix D).

Copper and zinc stream sediment geochemistry results are plotted on Figures 14a, 14b, 15a and 15b. These results show that the sediment in the stream draining the Falls Showing area (sample ST-38) contain anomalous concentrations of copper and zinc.

Stream sediments from areas of Karmutsen Formation rocks often contain anomalous copper concentrations. Copper minerals sometimes occur within amygdules in Karmutsen Formation basalt on Vancouver Island; these occurrences are anomalous but subeconomic.

5.0 CONCLUSIONS AND INTERPRETATION

The main area of Sicker Group rocks on the Dragon property is along the ridge east of Leighton Peak. Elsewhere the Sicker Group is mostly limited to small areas of Buttle Formation limestone.

More than one interval within the stratigraphic sequence contains base metals.

Boulders of silicified(?) rhyolite lapilli tuff were found about 4 kilometres east of the Falls Showing area, on the south side of the Leighton Peak ridge (Figure 5). These rocks contain 2 to 5% pyrite clasts; no other sulphides were seen.

Moss-mat stream sediment sampling is a viable exploration technique at the Dragon property area.

The copper-in-soil anomaly along the base of the slope on the northern side of the Leighton Peak ridge has an unknown source. The possible bedrock source area for the anomaly is restricted. As this anomaly is near the presumed contact between Sicker Group rocks and diorite of the Island Intrusions, it could be skarn-related rather than due to volcanogenic massive sulphide mineralization.

6.0 RECOMMENDATIONS

A two-phase work program with an approximate cost of $120,000 is recommended for the Dragon property. The main target areas are along the ridge of Sicker Group rocks extending easterly from Leighton Peak.

A limited amount of geological mapping and rock sampling should be completed in areas of interest not examined during spring 1995 because of snow cover at higher elevations. This work should better define the volcanic stratigraphy, and also better define mineralized and altered horizons.

In particular, the stratigraphic interval containing the Falls and North showings should be examined in detail and compared with the mineralized stratigraphic horizons down-section to the east.

The source of the silicified(?) lapilli tuff containing pyrite clasts at eastern Norgate grid area should be found. This stratigraphic interval warrants further sampling and mapping.

The contact between Sicker Group rocks and Island Intrusions in the eastern Norgate grid area should be delineated to determine the amount of favourable stratigraphy present in this area.

The boundaries and character of the mafic rock body in the lower part of eastern Norgate grid area should also be defined. This work should determine if the mafic rock is part of the Sicker Group, or part of a later Island Intrusion.

Geochemical soil sampling should also be done to extend coverage into selected parts of Norgate grid area. The geochemical anomaly at the western side of the clearcut area and the coincident mineralized float should be followed up by more prospecting and hand trenching.

The copper-in-soil anomaly along the base of the slope on the northern side of the Leighton Peak ridge should be investigated to determine its source.

Induced polarization surveying could be done to investigate the source of the geochemical soil anomalies in the Norgate grid area. Induced polarization surveying could also trace sulphide-bearing target units here.

Diamond drilling will be required to test targets resulting from the above work. Assuming two holes about 180 metres in length are completed in the Falls Showing area, and another at Norgate grid area, the cost of the proposed work is estimated to be $120,000.

7.0 STATEMENT OF EXPENDITURES

	Cost ($)
Phase I	
Accommodation, meals	5,150.00
Materials and supplies	1,049.00
Equipment and instrument rentals	350.00

9.0 STATEMENT OF QUALIFICATIONS

I, David J. Pawliuk, of Nanoose Bay, in the Province of British Columbia, hereby certify that:

1. I reside at RR 2, Box 133, Garry Oaks, Nanoose Bay, British Columbia, V0R 2R0.

2. I received a B.Sc. in Geology from the University of Alberta, Edmonton, Alberta in 1975.

3. I am registered as a Professional Geoscientist with the Association of Professional Engineers and Geoscientists of the Province of British Columbia.

4. I am registered as a Professional Geologist with the Association of Professional Engineers, Geologists and Geophysicists of the Province of Alberta.

5. I have practised geology in Canada since 1975.

DATED this 16th day of August, 1995 at Vancouver, British Columbia.

David J. Pawliuk, B.Sc., P.Geo.

9.0 STATEMENT OF QUALIFICATIONS

I, Murray I. Jones, of the Municipality of Surrey, in the Province of British Columbia, hereby certify that:

1. I am registered as a professional geoscientist with the Association of Professional Engineers and Geoscientists of the Province of British Columbia (registration #20063), residing at 8606 - 144A Street, Surrey, British Columbia, V3S 2Y2 with a business address at #904 - 1055 Dunsmuir Street, P.O. Box 49066, The Bentall Centre, Vancouver, British Columbia, V7X 1C4.

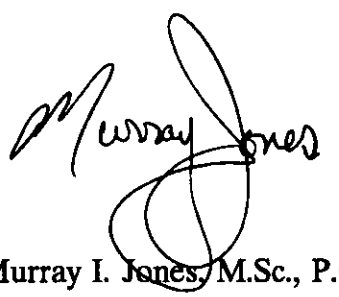
2. I graduated with a B.Sc. (Honours) in Geology from the University of British Columbia, Vancouver, B.C. in 1982 and with a M.Sc. in Geology from the University of Ottawa, Ottawa, Ontario in 1992.

3. I am an associate member of the Geological Association of Canada.

4. I have practised geology in Canada from 1979 to 1995.

5. I directly performed or supervised the work which is described in this report.

DATED this 16th day of August, 1995 at Vancouver, British Columbia.



Murray I. Jones, M.Sc., P.Geo.

APPENDIX A

ROCK SAMPLE DESCRIPTIONS

APPENDIX A

ROCK SAMPLE DESCRIPTIONS

Sample No.	Description
943051	Grab, 3275N/2075E, Norgate area. Argillite at limestone contact in roadcut with approx. 2% f. diss. py and some calc-silicate minerals. Lmnt on wx'd sfc.
943052	Grab for whole rock analysis, 3915E/3505N. Felsic fragmental(?) with qtz eyes and ser. Abund. feldspar.
943053	Grab for whole rock analysis, 4150E/3490N. Light greenish-grey, aphanitic felsic rock with faint clots of green chl and qtz eyes 2-3 mm. Local lmnt, abundant hem and local epidote.
943054	Whole rock, 4825E/3500N. Rhyolite lapilli tuff with 5% feldspar phenos av. <1 mm, max. 2 mm.
943055	Whole rock along creek. Fine-grained rhyolite with local tr diss py. Medium green, f. diss chl throughout; very fine flakes of black biotite present. Rhyolite cut by ands dyke; old Noranda(?) flagging above dyke.
943056	Whole rock upstream of 943055. Dacite-rhyolite lapilli tuff with 3% feldspar grains; mottled greenish-white and purplish-brown (prob. biotite hornfels).
943057	Grab. Rhyolite with py upstream of 943056.
943058	Grab, 3645N/2741E. Medium- to fine-grained massive rhyolite with local 5% f. diss py and up to 5% pale honey-coloured sericite flakes to 1 mm.
943059	Whole rock, 2620E/3465N. Medium-grained felsic crystal tuff(?) with 10% elongate plag phenos to 2 mm. Av. 1%, locally 5% f. diss py, also as occasional vlts. Hairline to 5 mm wide, steeply dipping felsic vlts present.
943060	Whole rock, 2632E/3460N; from roadcut next to 943061.
943061	Whole rock of cordierite-rich felsic tuff(?) band 1.3 m wide. 50% cordierite weathered-out as pale brown ovoid knobs weathered out 5 mm above outcrop surface. 2 to 3% diss py.

943062	Whole rock, 3455N/2665E.
943063	Grab, 2671E/3288N.
943064	Grab, 2775E/3390N. Basalt.
943065	Whole rock; dacite tuff.
943066	Grab, 3572N/2690E. Bleached felsic volcanic with 4% diss, pale coloured py.
943067	Grab of po-py-aspy(?)-cp(?) bearing float in creek.
943068	Grab, 2550E/3727N. Rhyolite/rhyo-dacite with diss py and po(?).
943069	Grab, 3799N/2595E. Light greenish-grey, fine-grained, hard, siliceous rhyolite tuff(?) with 2 to 4% f. diss py and local traces po. Wkly alt'd rock.
943070	Grab, 2790E/3820N. Pale yellowish-cream coloured, soft, intensely altered rhyolite(?) float. Friable rock; near source. Rock fine- to medium-grained, sugary, granular, with 0.5% sericite flakes. 1 to locally 5% finely diss py in fresher portions of bldr; no other sulphides seen. Lmnt on wx'd fracture surfaces. Bldr 4 x 2 x >1 m; grab from several places.
943071	Grab 10 m upstream of 943070 above. Similar rock to 943070 except it is a little more competent, possibly silica cemented; altd rhyolite with py.
943072	Grab, 1815E/3315N. Siliceous rhyolite(?) band 18 cm wide contains 3% diss and vlt py, say 1% po and cp(?) traces.
943073	Grab of siliceous rhyolite (tuff(?)) beds 5 and 15 cm wide that contain py and po as above and local tr cp.
943074	Grab, 3700E/4390N. Feldspar-quartz porphyry(?) with 1% py and cp(?).
943075	Grab, 4870E/3600N. Somewhat altered, coarse-grained felsic lapilli tuff with lapilli to 20 mm across. 2% py.
943101	Whole rock, 3400N/2750E. Mafic-intermed., fine-grained, homogeneous, non-magnetic dyke cutting felsic tuffs.
943102	3220E/3310N. Rhyl lapilli tuff close to gabbro contact.

943103	2470E/3610N. Grab of strongly altd felsic volc from canyon; fault-controlled alteration(?).
943104	2470E/3615N. Grab of qtz stockwork in strongly altd volcanic with 5% py and sph(?).
943105	2468E/3620N. Grab of siliceous felsic volcanic with 3-5% py and tr sp.
943106	3615N/2375E, Norgate area. Whole rock of rhyolite or dacite flow(?) with high bio-muscv content.
943107	1300E/3390N. Whole rock of mafic dyke or flow(?), locally brecciated and serpentinized.
943108	Grab, 1290E/3380N. Skarn(?), mafic dyke in dacite lapilli tuff(?); dense rock with po and tr cp.
943109	Grab, 3395E/4200N. Felsic volc(?) or altd diorite(?), lapilli fragments visible; light grey; 1-3% diss pyrite.
943110	Whole rock of quartz-feldspar porphyry dyke(?) or rhyolite flow-tuff.
943111	Whole rock of 943110 dyke(?) wallrock 5 m above 943110. Rock felsic crystal lapilli tuff with quartz eyes.
943112	Whole rock of dacitic tuff with largely feldspathic matrix; hornfels colour; no sulphides seen.
943113	Whole rock, 4990E/3425N. Rhyolite lapilli tuff with quartz eyes in matrix; 10-20% clasts.
943114	Whole rock, 4650N/3410E. Rhyolite lapilli tuff/andesite with abundant py in matrix and clasts.
943115	Grab; large bldr of siliceous lapilli tuff with py clasts to 20 mm.
943116	Whole rock; homogeneous rhyolite lapilli tuff, light grey to brownish, 2-3% py. CL 750-200 m E.
943117	Whole rock; rhyolite lapilli tuff, hornfels, patchy biotite, 2% py/po. CL 750-655 m E.

943118	Whole rock; CL 750-870 m E; diorite at 060° fault, dior locally chl and carb-altd.
943119	Whole rock; CL 750-850 m E; light grey-blue lapilli tuff with feldspar phenos.
943120	Whole rock; Much North Road; feldspar porphyry flow or tuff, locally lapilli-size clasts, py along fractures.
943121	Grab; dark, fine-grained mafic(?) silicified(?) volc with 2-3% disseminated py and tr cp; ep along fractures.
943122	Grab; dark, sulphide-rich rock with 5-8% py, 1% cp, sp(?) on Dragon 3.
943123	Grab; cherty, silicified rock with 3-5% streaky, layered po and cp.
943124	Whole rock; brecciated, wkly veined rhyolite(?) across creek from limey sediments.
943125	Whole rock; feldspar-quartz porphyry with mafic lapilli(?) or xenoliths(?).
943126	Whole rock, Much Grid area. Dark brown fresh sfc, light green wx'd sfc, fine-grained, tuff bed with minor felsic lapilli.
943127	Whole rock; massive, feldspar phyric flow overlying layered tuff.
943128	Whole rock; feldspar-quartz porphyry with 15-20% feldspars, 50% quartz in light green matrix. Falls East area, at ST-34 site.
943129	Whole rock; light bluish green-grey, feldspathic layered volcanic with fine-grained and porphyritic layers. Falls East area.
943130	Whole rock; altered rhyolite or silicified limestone(?) near intrusive contact; pink garnet(?) or poss. K-spar, muscovite, chlorite. North side of South Muchalat River.
943131	Whole rock; rhyolite or chert below Karmutsen Formation; light blue, lmnt along fracts. At ST-29 site.
943132	Whole rock; Karmutsen Formation massive hornfels basalt with poss. layering; wkly magnetic; dark green. Kla-anch area.

943133	Grab; upper(?) Sicker lapilli tuffs and argillite below Karmutsen; py and po along fractures.
943134	Whole rock; poss. rhyolite; whitish to grey mottled, local qtz vlts; argillaceous(?).
943135	Whole rock; lapilli tuff/agglomerate with strong qtz-bio hornfels, minor po, py.
943136	Whole rock; dark mafic volcanic with feldspar phenos, and abundant qtz vlts. At ST-54 site.
943137	Whole rock; ash or xtal rhyolite tuff, homogeneous, wk fabric.
943138	Whole rock; layer in rhyolite with 1-2% diss po, py; dark purplish-brown to tan; silicified(?); intermediate hornfelsed rock(?).
943139	Whole rock; felsic tuff with abundant feldspar phenos in a light grey to tan matrix.
943140	Whole rock; fractured and brecciated massive rhyolite flow; interlayered with ash tuff and cherty tuff.
943141	Whole rock; aphanitic cherty tuff possibly with no internal structure.
943142	Whole rock; large block of rhyolite flow-breccia with porphyritic blocks in aphanitic, cherty matrix; 90% matrix, 10% clasts in sample.
943143	Whole rock; homogeneous, diorite(?) with abundant feldspar; possibly andesite-dacite in fine-grained matrix.
943144	Grab; limonitic outcrop at base of slope; collected by Jim Snell.
943151	Grab of limonitic, silicified felsic volcanic with po, gn, py. Locally to 3% po and 0.5% gn; tr py. Sample from 4 sites within 2 m of contact with diorite (60%)-gabbro (40%) intrusive. Healed, silicified tectonic breccia or healed fault along contact.
943152	Whole rock, 7530N/6470E. Light greenish-grey, medium-grained feldspar porphyry with local perv. ep within 10 cm of fractures. Subhedral feldspar phenos say 15%, av. 1.5 mm length.

943153 Whole rock of light brownish-grey, fine-grained sugary rhyolite tuff. No sulphides seen.

943154 Whole rock of argl/gwke(?), 6325E/7410N. Rock very fine-grained, dark brownish-grey; no sulphides seen.

943155 Whole rock of somewhat porphyritic rhyolite flow(?) with local siliceous spherules.

943156 Whole rock, 7410N/5695E. Rhyolite lapilli tuff(?).

943157 Grab, 8200N/5760E. From 6 sites over 1 m^2. Dark brownish-grey cherty argillite 90%, medium-grained rhyolite tuff 10% as interbands to 20 cm thick. Traces diss po in argillite. Py vlts to 1 x 10 mm, py also local diss traces. Lmnt on wx'd outcrop sfc.

943158 Whole rock, 8215N/5615E. Fine-grained gabbro(?) with euhedral plagioclase laths, similar in appearance to andesite; prob. near feldspar porphyry contact.

943159 Whole rock; intermed. greenish-grey volcanic (andesite(?)) with local traces disseminated pyrite and occasional quartz veinlets. Rock more silicified and bleached towards centre of creek; poss. shear underlying creek. 120 m upstream of 8200N/5625E.

943160 Grab of argillite with po, py. N of creek.

943161 Whole rock, 8990N/5670E. Light chalky-grey wxing, light grey fresh sfc, fine-grained ash tuff with traces diss py; orange lmnt on wx'd sfc; siliceous; weak N-trending fabric.

943162 Grab of light green, fine-grained rhyolite with 2-3% py, occ. splash cp at both sides of bridge.

943163 Grab of garnet skarn with epidote and orange lmnt, blue manganese oxides.

943164 Select sample of po-cp-sp massive sulphide band 8 x 80 cm along margin of feldspar porphyry dyke in contact with Buttle Formation limestone. Dyke/limestone contact discrete but more irregular than other dyke contacts seen on the Dragon property. Approx. 8 m along strike from Noranda sample site 9 (1(?)) 572N.

943165 Grab of silicified, ep-altd andesite(?) with 3-5% v. f. diss py.

943166 Grab of quartz eye rhyolite(?) tuff, prob. somewhat silicified, with limonite; loc'n approx 10 m N of creek.

943167 Whole rock. Dark green-grey, fine- to medium-grained, wkly chl-altd, massive, non-magnetic. Gabbro nearby; unsure if basalt is xenolith of finer-grained part of flow.

943520 Grab, 8270N/5500E. Argillite with 5% combined, finely disseminated pyrite and pyrrhotite; moderately magnetic, medium brownish-grey, locally cherty.

CERTIFICATE A9515987

(GP) - WESTMIN RESOURCES LTD.

Project: 6004
P.O. # :

Samples submitted to our lab in Vancouver, BC.
This report was printed on 3-MAY-95.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
205	21	Geochem ring to approx 150 mesh
226	21	0-3 Kg crush and split
3204	21	Save 1 Kg reject for 90 days
285	21	ICP - HF digestion charge

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
983	2	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
578	21	Ag ppm: 24 element, rock & core	AAS	0.2	200
573	21	Al %: 24 element, rock & core	ICP-AES	0.01	25.0
565	21	Ba ppm: 24 element, rock & core	ICP-AES	10	10000
575	21	Be ppm: 24 element, rock & core	ICP-AES	0.5	1000
561	21	Bi ppm: 24 element, rock & core	ICP-AES	2	10000
576	21	Ca %: 24 element, rock & core	ICP-AES	0.01	25.0
562	21	Cd ppm: 24 element, rock & core	ICP-AES	0.5	500
563	21	Co ppm: 24 element, rock & core	ICP-AES	1	10000
569	21	Cr ppm: 24 element, rock & core	ICP-AES	1	10000
577	21	Cu ppm: 24 element, rock & core	ICP-AES	1	10000
566	21	Fe %: 24 element, rock & core	ICP-AES	0.01	25.0
584	21	K %: 24 element, rock & core	ICP-AES	0.01	10.00
570	21	Mg %: 24 element, rock & core	ICP-AES	0.01	15.00
568	21	Mn ppm: 24 element, rock & core	ICP-AES	5	10000
554	21	Mo ppm: 24 element, rock & core	ICP-AES	1	10000
583	21	Na %: 24 element, rock & core	ICP-AES	0.01	10.00
564	21	Ni ppm: 24 element, rock & core	ICP-AES	1	10000
559	21	P ppm: 24 element, rock & core	ICP-AES	10	10000
560	21	Pb ppm: 24 element, rock & core	AAS	2	10000
582	21	Sr ppm: 24 element, rock & core	ICP-AES	1	10000
579	21	Ti %: 24 element, rock & core	ICP-AES	0.01	10.00
572	21	V ppm: 24 element, rock & core	ICP-AES	1	10000
556	21	W ppm: 24 element, rock & core	ICP-AES	10	10000
558	21	Zn ppm: 24 element, rock & core	ICP-AES	2	10000

CERTIFICATE A9515417

(GP) - WESTMIN RESOURCES LTD.

Project: DRAGON
P.O. # :

Samples submitted to our lab in Vancouver, BC.
This report was printed on 24-APR-95.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
201	141	Dry, sieve to -80 mesh
285	141	ICP - HF digestion charge

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
578	141	Ag ppm: 24 element, rock & core	AAS	0.2	200
573	141	Al %: 24 element, rock & core	ICP-AES	0.01	25.0
565	141	Ba ppm: 24 element, rock & core	ICP-AES	10	10000
575	141	Be ppm: 24 element, rock & core	ICP-AES	0.5	1000
561	141	Bi ppm: 24 element, rock & core	ICP-AES	2	10000
576	141	Ca %: 24 element, rock & core	ICP-AES	0.01	25.0
562	141	Cd ppm: 24 element, rock & core	ICP-AES	0.5	500
563	141	Co ppm: 24 element, rock & core	ICP-AES	1	10000
569	141	Cr ppm: 24 element, rock & core	ICP-AES	1	10000
577	141	Cu ppm: 24 element, rock & core	ICP-AES	1	10000
566	141	Fe %: 24 element, rock & core	ICP-AES	0.01	25.0
584	141	K %: 24 element, rock & core	ICP-AES	0.01	10.00
570	141	Mg %: 24 element, rock & core	ICP-AES	0.01	15.00
568	141	Mn ppm: 24 element, rock & core	ICP-AES	5	10000
554	141	Mo ppm: 24 element, rock & core	ICP-AES	1	10000
583	141	Na %: 24 element, rock & core	ICP-AES	0.01	10.00
564	141	Ni ppm: 24 element, rock & core	ICP-AES	1	10000
559	141	P ppm: 24 element, rock & core	ICP-AES	10	10000
560	141	Pb ppm: 24 element, rock & core	AAS	2	10000
582	141	Sr ppm: 24 element, rock & core	ICP-AES	1	10000

CERTIFICATE A9515985

(GP) - WESTMIN RESOURCES LTD.

Project: 6004 MOSS
P.O. # :

Samples submitted to our lab in Vancouver, BC.
This report was printed on 4-MAY-95.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
201	27	Dry, sieve to -80 mesh
222	27	Drying charge (0-3 Kg)
229	27	ICP - AQ Digestion charge

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
983	27	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
100	0	Au ppb: Fuse 10 g sample	FA-AAS	5	10000
2118	27	Ag ppm: 32 element, soil & rock	ICP-AES	0.2	200
2119	27	Al %: 32 element, soil & rock	ICP-AES	0.01	15.00
2120	27	As ppm: 32 element, soil & rock	ICP-AES	2	10000
2121	27	Ba ppm: 32 element, soil & rock	ICP-AES	10	10000
2122	27	Be ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2123	27	Bi ppm: 32 element, soil & rock	ICP-AES	2	10000
2124	27	Ca %: 32 element, soil & rock	ICP-AES	0.01	15.00
2125	27	Cd ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2126	27	Co ppm: 32 element, soil & rock	ICP-AES	1	10000
2127	27	Cr ppm: 32 element, soil & rock	ICP-AES	1	10000
2128	27	Cu ppm: 32 element, soil & rock	ICP-AES	1	10000
2150	27	Fe %: 32 element, soil & rock	ICP-AES	0.01	15.00
2130	27	Ga ppm: 32 element, soil & rock	ICP-AES	10	10000
2131	27	Hg ppm: 32 element, soil & rock	ICP-AES	1	10000
2132	27	K %: 32 element, soil & rock	ICP-AES	0.01	10.00
2151	27	La ppm: 32 element, soil & rock	ICP-AES	10	10000
2134	27	Mg %: 32 element, soil & rock	ICP-AES	0.01	15.00
2135	27	Mn ppm: 32 element, soil & rock	ICP-AES	5	10000
2136	27	Mo ppm: 32 element, soil & rock	ICP-AES	1	10000
2137	27	Na %: 32 element, soil & rock	ICP-AES	0.01	5.00
2138	27	Ni ppm: 32 element, soil & rock	ICP-AES	1	10000
2139	27	P ppm: 32 element, soil & rock	ICP-AES	10	10000
2140	27	Pb ppm: 32 element, soil & rock	ICP-AES	2	10000
2141	27	Sb ppm: 32 element, soil & rock	ICP-AES	2	10000
2142	27	Sc ppm: 32 elements, soil & rock	ICP-AES	1	10000
2143	27	Sr ppm: 32 element, soil & rock	ICP-AES	1	10000
2144	27	Ti %: 32 element, soil & rock	ICP-AES	0.01	5.00
2145	27	Tl ppm: 32 element, soil & rock	ICP-AES	10	10000
2146	27	U ppm: 32 element, soil & rock	ICP-AES	10	10000
2147	27	V ppm: 32 element, soil & rock	ICP-AES	1	10000
2148	27	W ppm: 32 element, soil & rock	ICP-AES	10	10000
2149	27	Zn ppm: 32 element, soil & rock	ICP-AES	2	10000
