## **1.0 INTRODUCTION**

From June 16 to June 28, 1995 a linecutting, mapping and soil and rock geochemistry programme was conducted by Hemlo Gold Mines Inc. on the Darb Northwest property.

The intent of this programme was to further delineate a subtle gold in soil geochemical anomaly identified in 1993 and partially followed up in 1994, and to determine, through geological mapping and rock geochemistry, the origin and structural controls of this anomaly.

### **1.1 Location and Access**

The Darb Northwest property is located approximately 20 km north-northeast of Smithers, B.C. on N.T.S. Mapsheet 94D/8 & 9 in the Omineca Mining Division.

Access to the survey area was achieved by helicopter based at Johanson Lake.

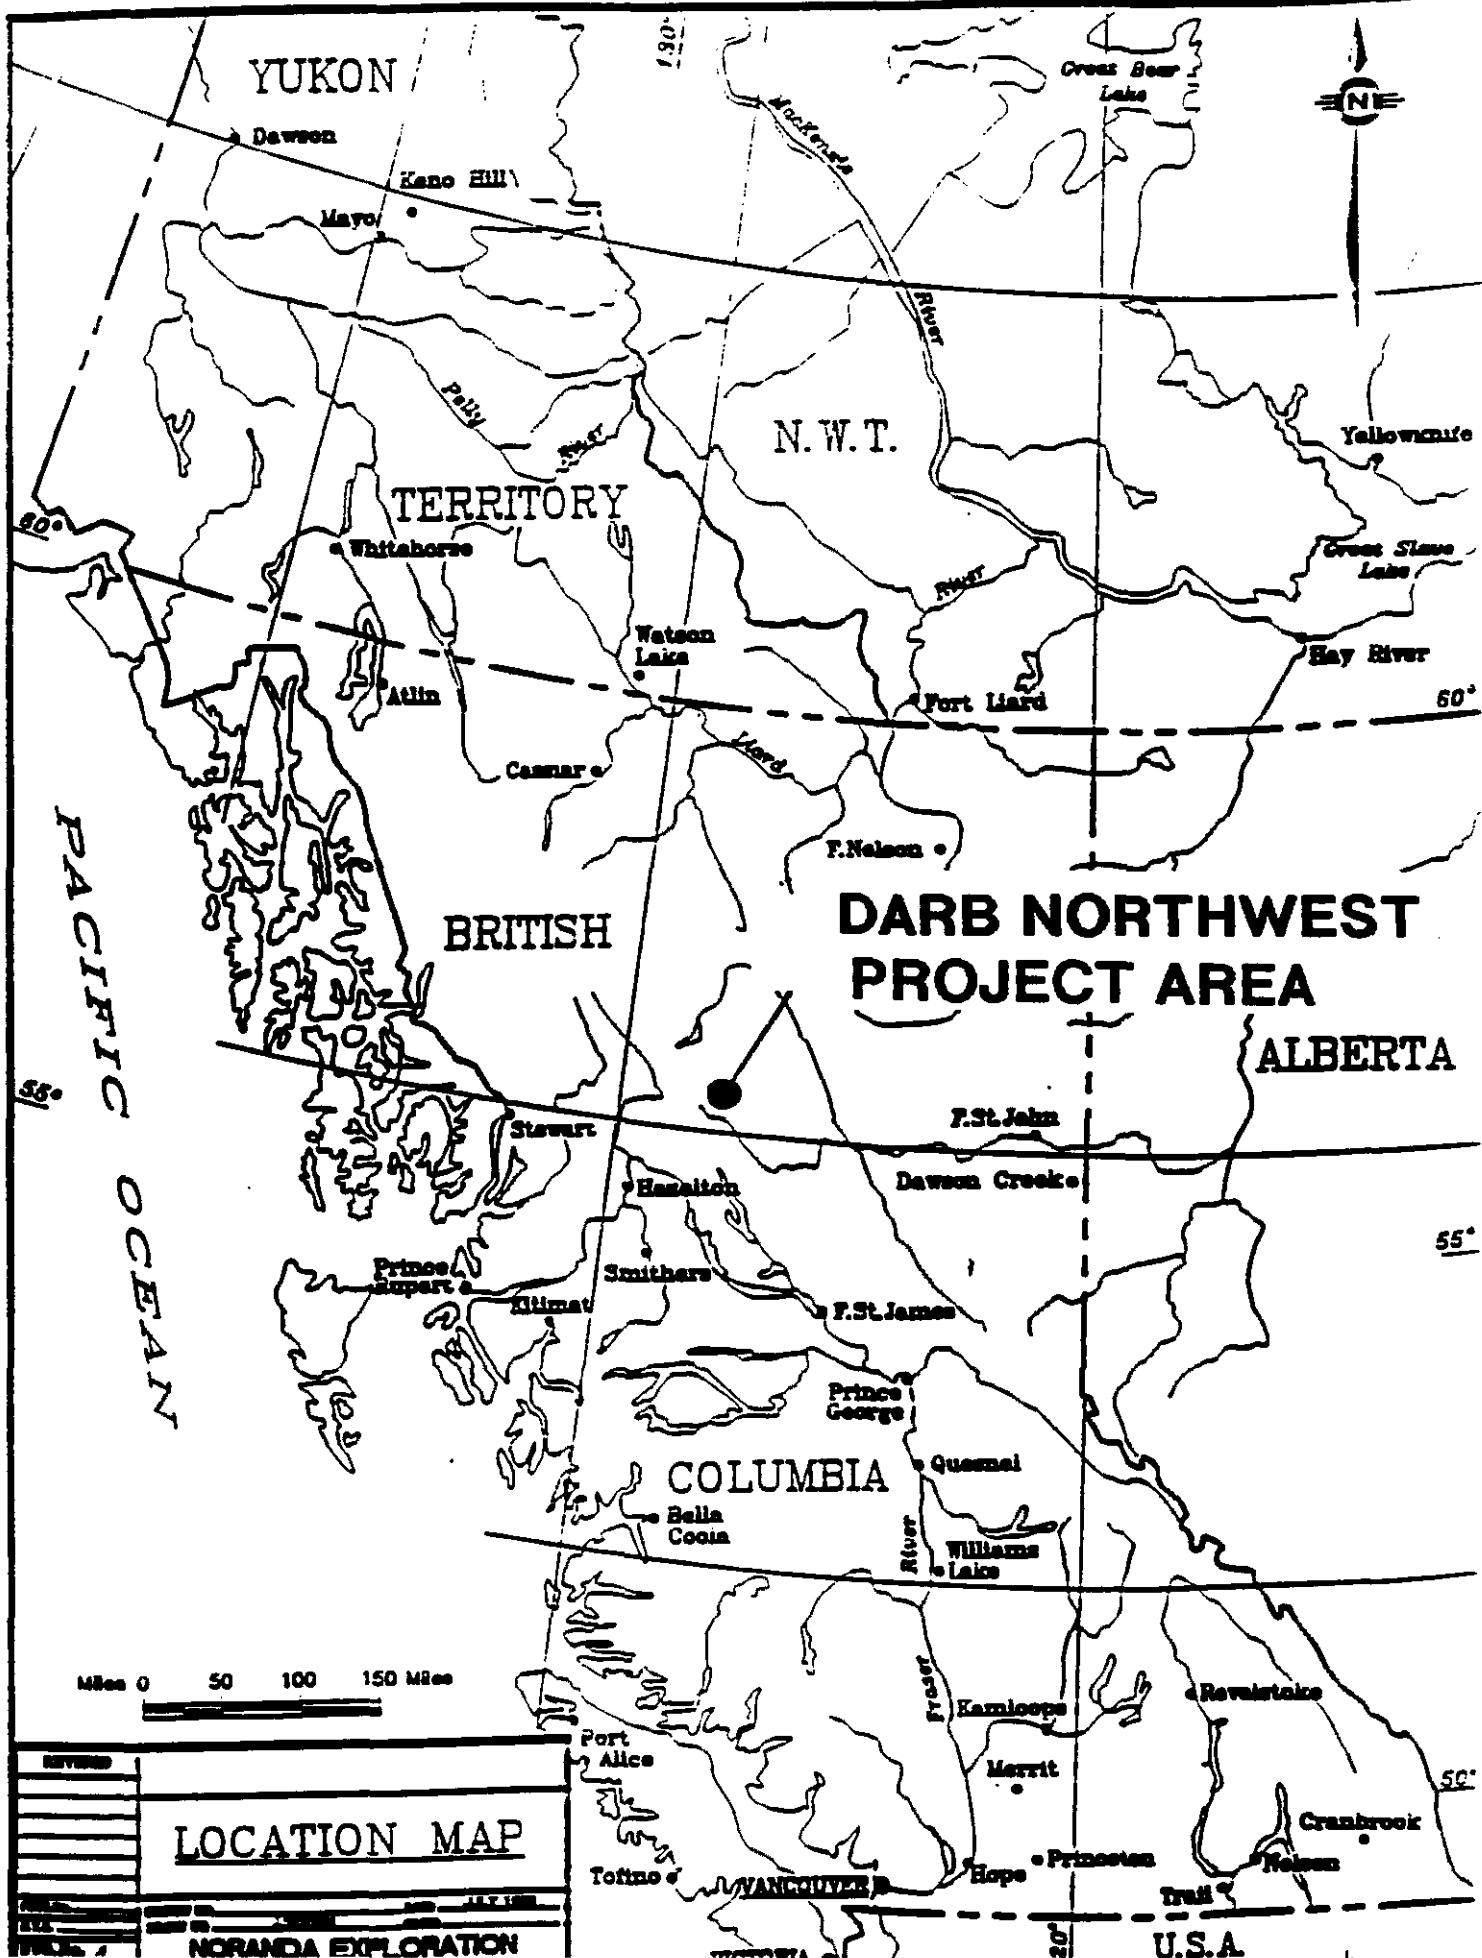

### **1.2 Topography and Physiography**

The Darb Northwest project area is situated within the Osilinka Ranges and is located approximately 9.0 km south of Johanson Lake. The survey area covers the northern flanks of the main Kliyul-Lay Creek glacial valley and is bisected by the north-south Doretelle fault and east-west Kliyul-Lay Creek fault. All of the gridded area is above treeline with elevations ranging from 1680 m to 1840 m. The entire survey area is drained by the headwaters of West Kliyul Creek.

### **1.3 History**

Below is a brief outline of documented work performed on the project area and surrounding localities in chronological order.

- 1949: Preliminary work on auriferous quartz veins conducted by Goldway Peak Mines Ltd. in the Goldway Peak area.
- 1970-1972: The Kliyul property was staked and geochemically and geophysically surveyed by Kennco Explorations. These surveys delineated a 2.5 km x 1.0 km I.P. chargeability anomaly and coincident (yet smaller) copper soil geochemical and magnetic anomalies.
- 1971-1972: Geological, geochemical and geophysical (magnetics) surveys were conducted by El Paso Mining and Milling Co. who discovered skarn zones along the sheared contact between ultramafics and volcanics on lower Kliyul Creek.

- 1973: Kliyul property optioned to Sumac Mines Ltd. who drilled 3 x-ray holes (no results available).
- 1973: San Jacinto Explorations Ltd. performed soil surveying near the gold/quartz veins on Goldway Peak.
- 1974: Sumac Mines drilled 6 'BQ' holes on the Kliyul property to test the West and East Zone copper soil anomalies and 5 'BQ' holes into the magnetic high. The latter drill holes intersected magnetite-copper-gold mineralization within a well fractured, sericite, chlorite, epidote, carbonate, quartz, pyrite skarn hosted by calcareous andesite tuffs and agglomerates and lesser dioritic units. A reserve of 2.5 million tons of 0.3% Cu and 0.03 opt Au was returned from this skarn zone.
- 1974-1975: BP Minerals Ltd. completed geological, geochemical and geophysical (mag/JEM) over the Bap mineral claims which overly intensely sheared, clay-sericite altered feldspar porphyry volcanics/intrusives and auriferous quartz veins.
- 1976: Maxmin (EM) surveying completed over the Bap claims by BP Minerals Ltd.
- 1981: Geological and geochemical surveying was completed by Dupont of Canada on the AS 1 claim near Goldway Creek.
- 1981: Kennco and Vital Pacific drilled 4 NQ holes (1978 feet) into the central skarn zone on the Kliyul property; all in a southerly direction.
- 1982: A trace element study was performed by BP Minerals on previously collected samples from the Bap claims.
- 1982: Further geochemistry was completed in the Goldway Peak area by Dermot Fahey and by Laramie Mining Corporation.
- 1983: A preparatory study to determine road access to Goldway Peak was undertaken by Laramie Mining Corporation
- 1984: BP Minerals relogged and sampled portions of available core and conducted geological mapping and geochemical sampling on the Kliyul property.
- 1984: Laramie Mining Corporation conducted mapping, geophysics (VLF) and sampling/assaying of their Goldway Peak Property.
- 1984: Mapping and geochemistry was completed in the lower Kliyul Creek area by BP Resources Canada, Ltd.

- 1984: After obtaining the KC 1 & 2 mineral claims and conducting preliminary sampling and prospecting, Golden Rule Resources Ltd. completed further geological, geochemical and geophysical (magnetics) surveys.
- 1985: Geological and geochemical surveying in the Goldway Peak area by BP Resources, Canada, Ltd. delineated auriferous quartz veins and fractures within quartz-carbonate-pyrite altered zones.
- 1985: Further geological, geochemical and geophysical work (magnetics, VLF) was performed by Golden Rule Resources Ltd. on the KC 1 & 2 claims.
- 1985-1986: Prospecting, mapping, trenching and sampling of the auriferous quartz veins in the Goldway Peak area continued with Laramie as the operator.
- 1986: Soil surveying was performed by Lemming Mining Resources for BP Resources on the Bap claims.
- Ritz Resources Ltd. for Goldnev Rule Resources Ltd. performed further geological, geochemical and geophysical (magnetics, VLF) work on the KC 1 & 2 claims.
- 1990: Placer Dome conducted linecutting, magnetometer and VLF-EM surveying, soil and rock sampling and prospecting on the Kliyul property in order to delineate magnetic anomalies similar to the known skarn zone, possible porphyry style mineralization and/or mineralized structures parallel to the large glacial valley.
- 1992: Noranda Exploration Company, Ltd. conducted 1:5,000 geological mapping on the Kliyul property, concentrating on alteration assemblages as well as rock and minor sampling.
- 1993: Noranda completed a 6 hole, 560 meter reverse circulation drill programme on the Kliyul main skarn zone. Results were encouraging enough to pursue options on surrounding properties which host similar stratigraphy, intrusives and mineralization. A helicopter-borne EM-Mag survey was also flown over the Darb property with minimal reconnaissance style sampling.
- 1994: Hemlo Gold Mines Inc. established 14.425 line kilometers of grid and collected 142 soil samples at 100 meter sample spacings.

#### **1.4    Claims**

The claims which comprise the Darb Northwest property are listed below with corresponding owner, expiry date and tenure numbers.

<b>CLAIM</b>	<b>TENURE NO.</b>	<b>UNITS</b>	<b>EXPIRY DATE</b>	<b>OWNER</b>
Jo 4	242396	20	July 13, 1998	Hemlo Gold Mines Inc.
Jo 5	242397	20	July 13, 1997	Hemlo Gold Mines Inc.
Jo 6	242398	18	July 12, 1998	Hemlo Gold Mines Inc.
Jo 7	242399	15	July 12, 1997	Hemlo Gold Mines Inc.
Jo 8	242400	20	July 12, 1997	Hemlo Gold Mines Inc.
*Yul 14	318891	1	July 6, 2005	Hemlo Gold Mines Inc.

\*This claim has been grouped with the above mentioned claims in order to keep the claim group contiguous. No assessment is being applied to the Yul 4 claim.

#### **1.5    Economic Potential**

The patchy nature of the gold in soil geochemical anomaly and low gold values in rocks suggest that limited potential exists on this property for fault controlled gold occurrences.

Further investigation is hampered by a 3-10 meter thick layer of glacial debris and meltwater deposited sediments in the area of the gold in soil geochemical anomaly.

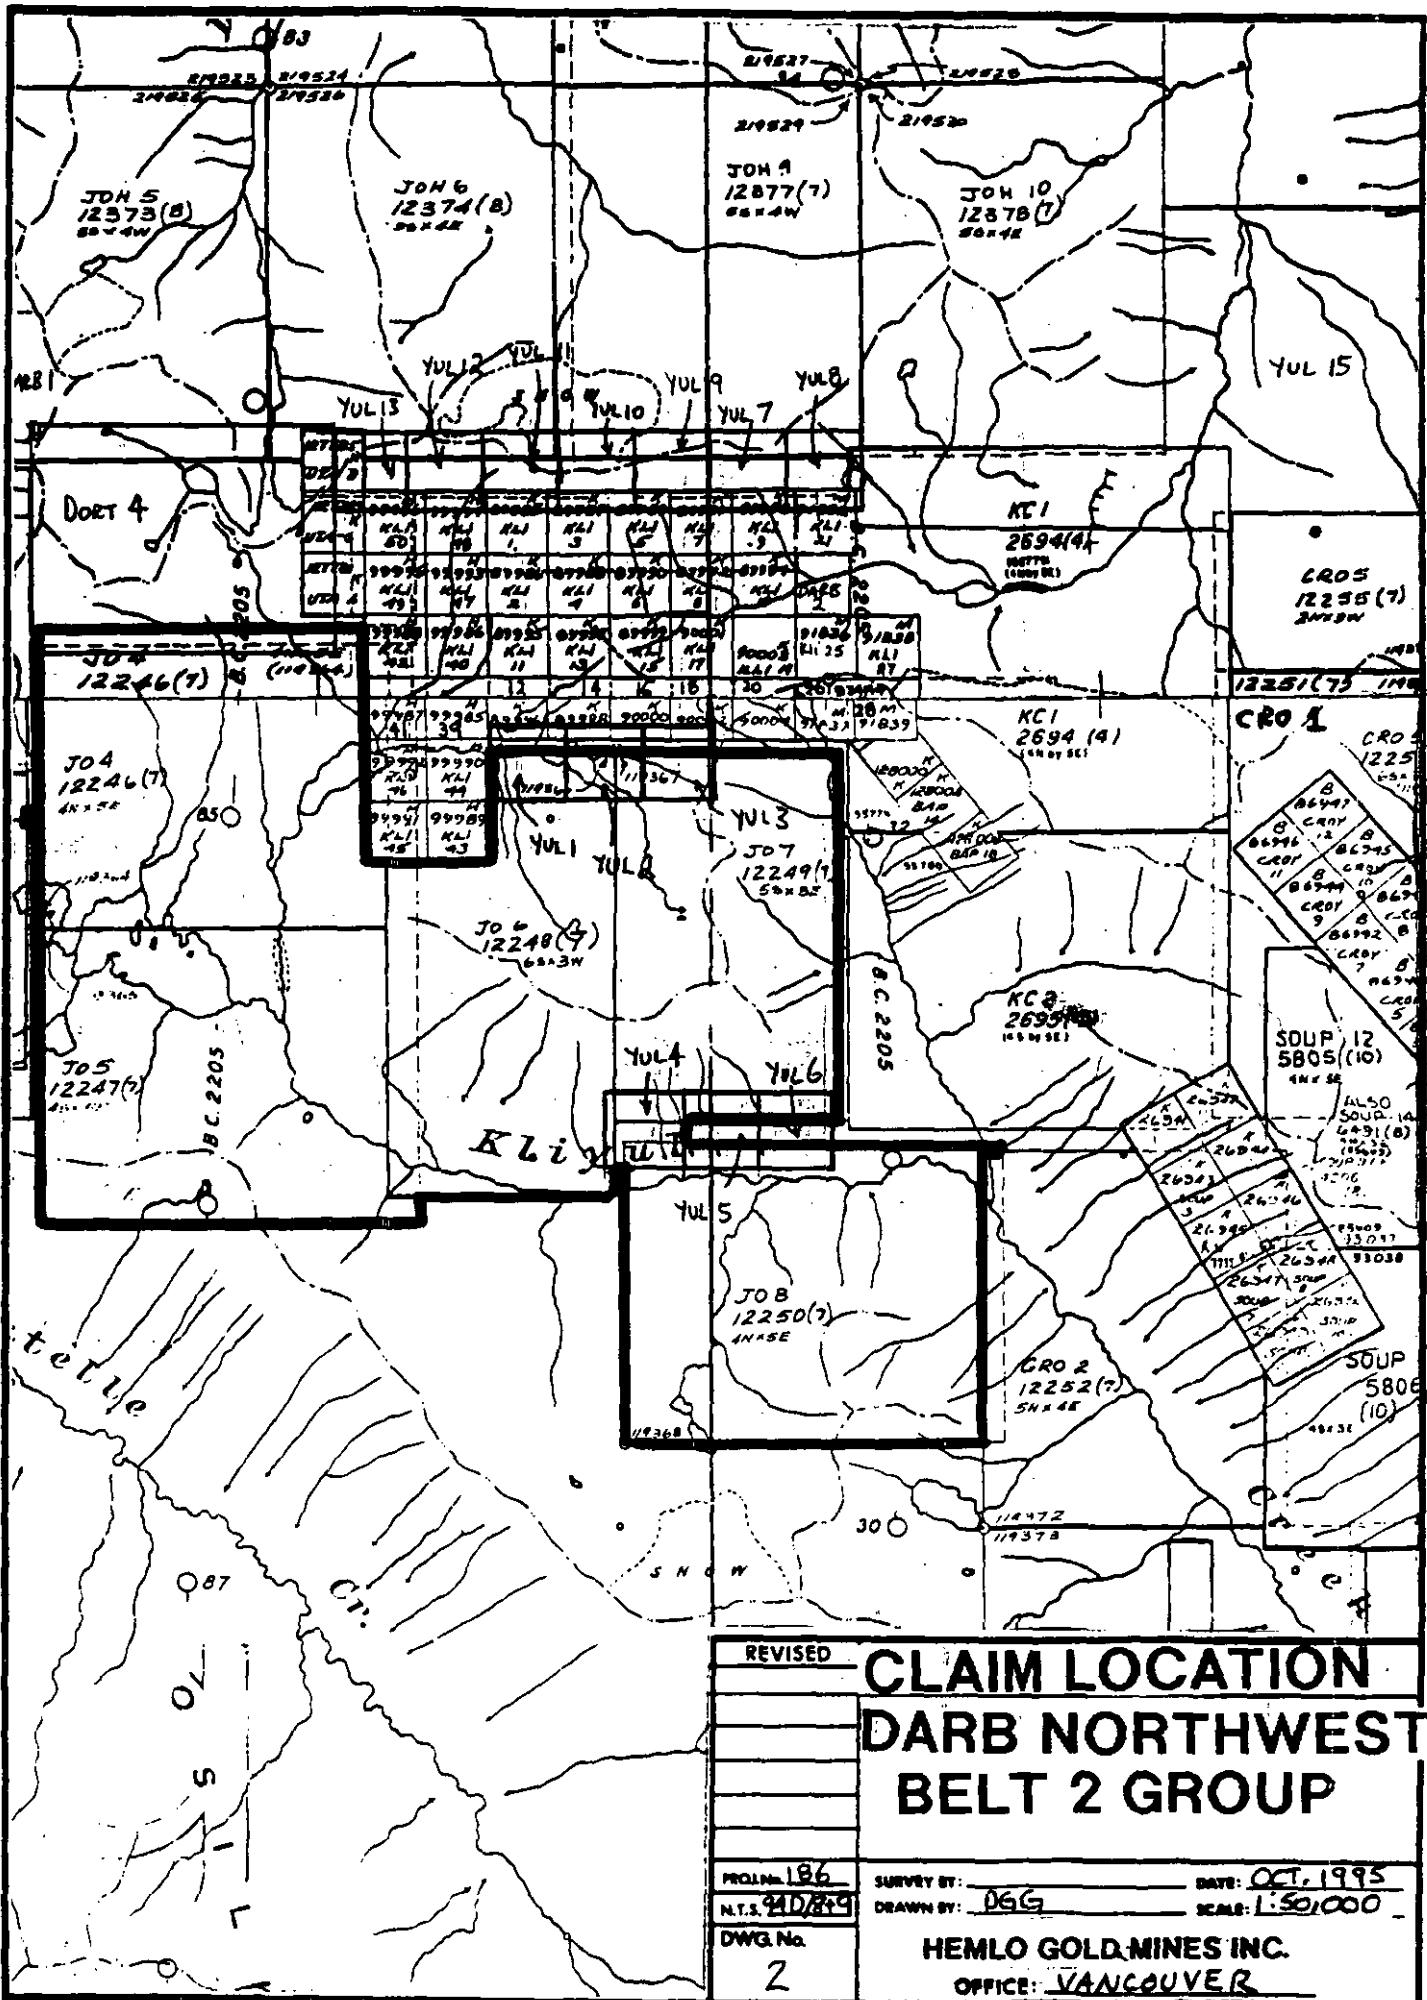

#### **1.6    Survey Control**

The surveying of the flagged and picketed grid lines was conducted with the aid of a compass and metric hipchain and were tied into topographic features such as lakes and drainages. All lines were slope corrected. A total of 12.025 line kilometers of grid was established in 1995.

#### **1.7    Sampling**

Soil samples were taken at 50 meter intervals along newly established, metrically chained grid lines and at 100 meter intervals along lines established in 1994 resulting in an overall sample density of 50 m intervals along 100 meter spaced grid lines.

Soils were collected at depths from between 5 and 80 centimeters and placed in brown kraft envelopes for drying, storage and shipping purposes and sent to Noranda Exploration Laboratory at Unit 1, 7550 - 76th Street, Delta, B.C. A total of 345 soil samples and 24 rock samples were collected.

Refer to Appendix I for laboratory analytical techniques and Appendix II for sample assay results and descriptions where applicable.

## 2.0 GEOLOGY

### 2.1 Regional Geology (See Drawing #3)

The Darb property is situated within the Intermontane Belt which is comprised of Upper Triassic to Lower Jurassic island arc volcanics, volcaniclastics and sediments of the Takla Group which hosts such Cu-Au porphyry deposits as Mt. Milligan and Kemess. The dominantly volcanic package has been intruded by Jura-Cretaceous aged diorites, monzonites and syenites associated with the Hogem Batholith.

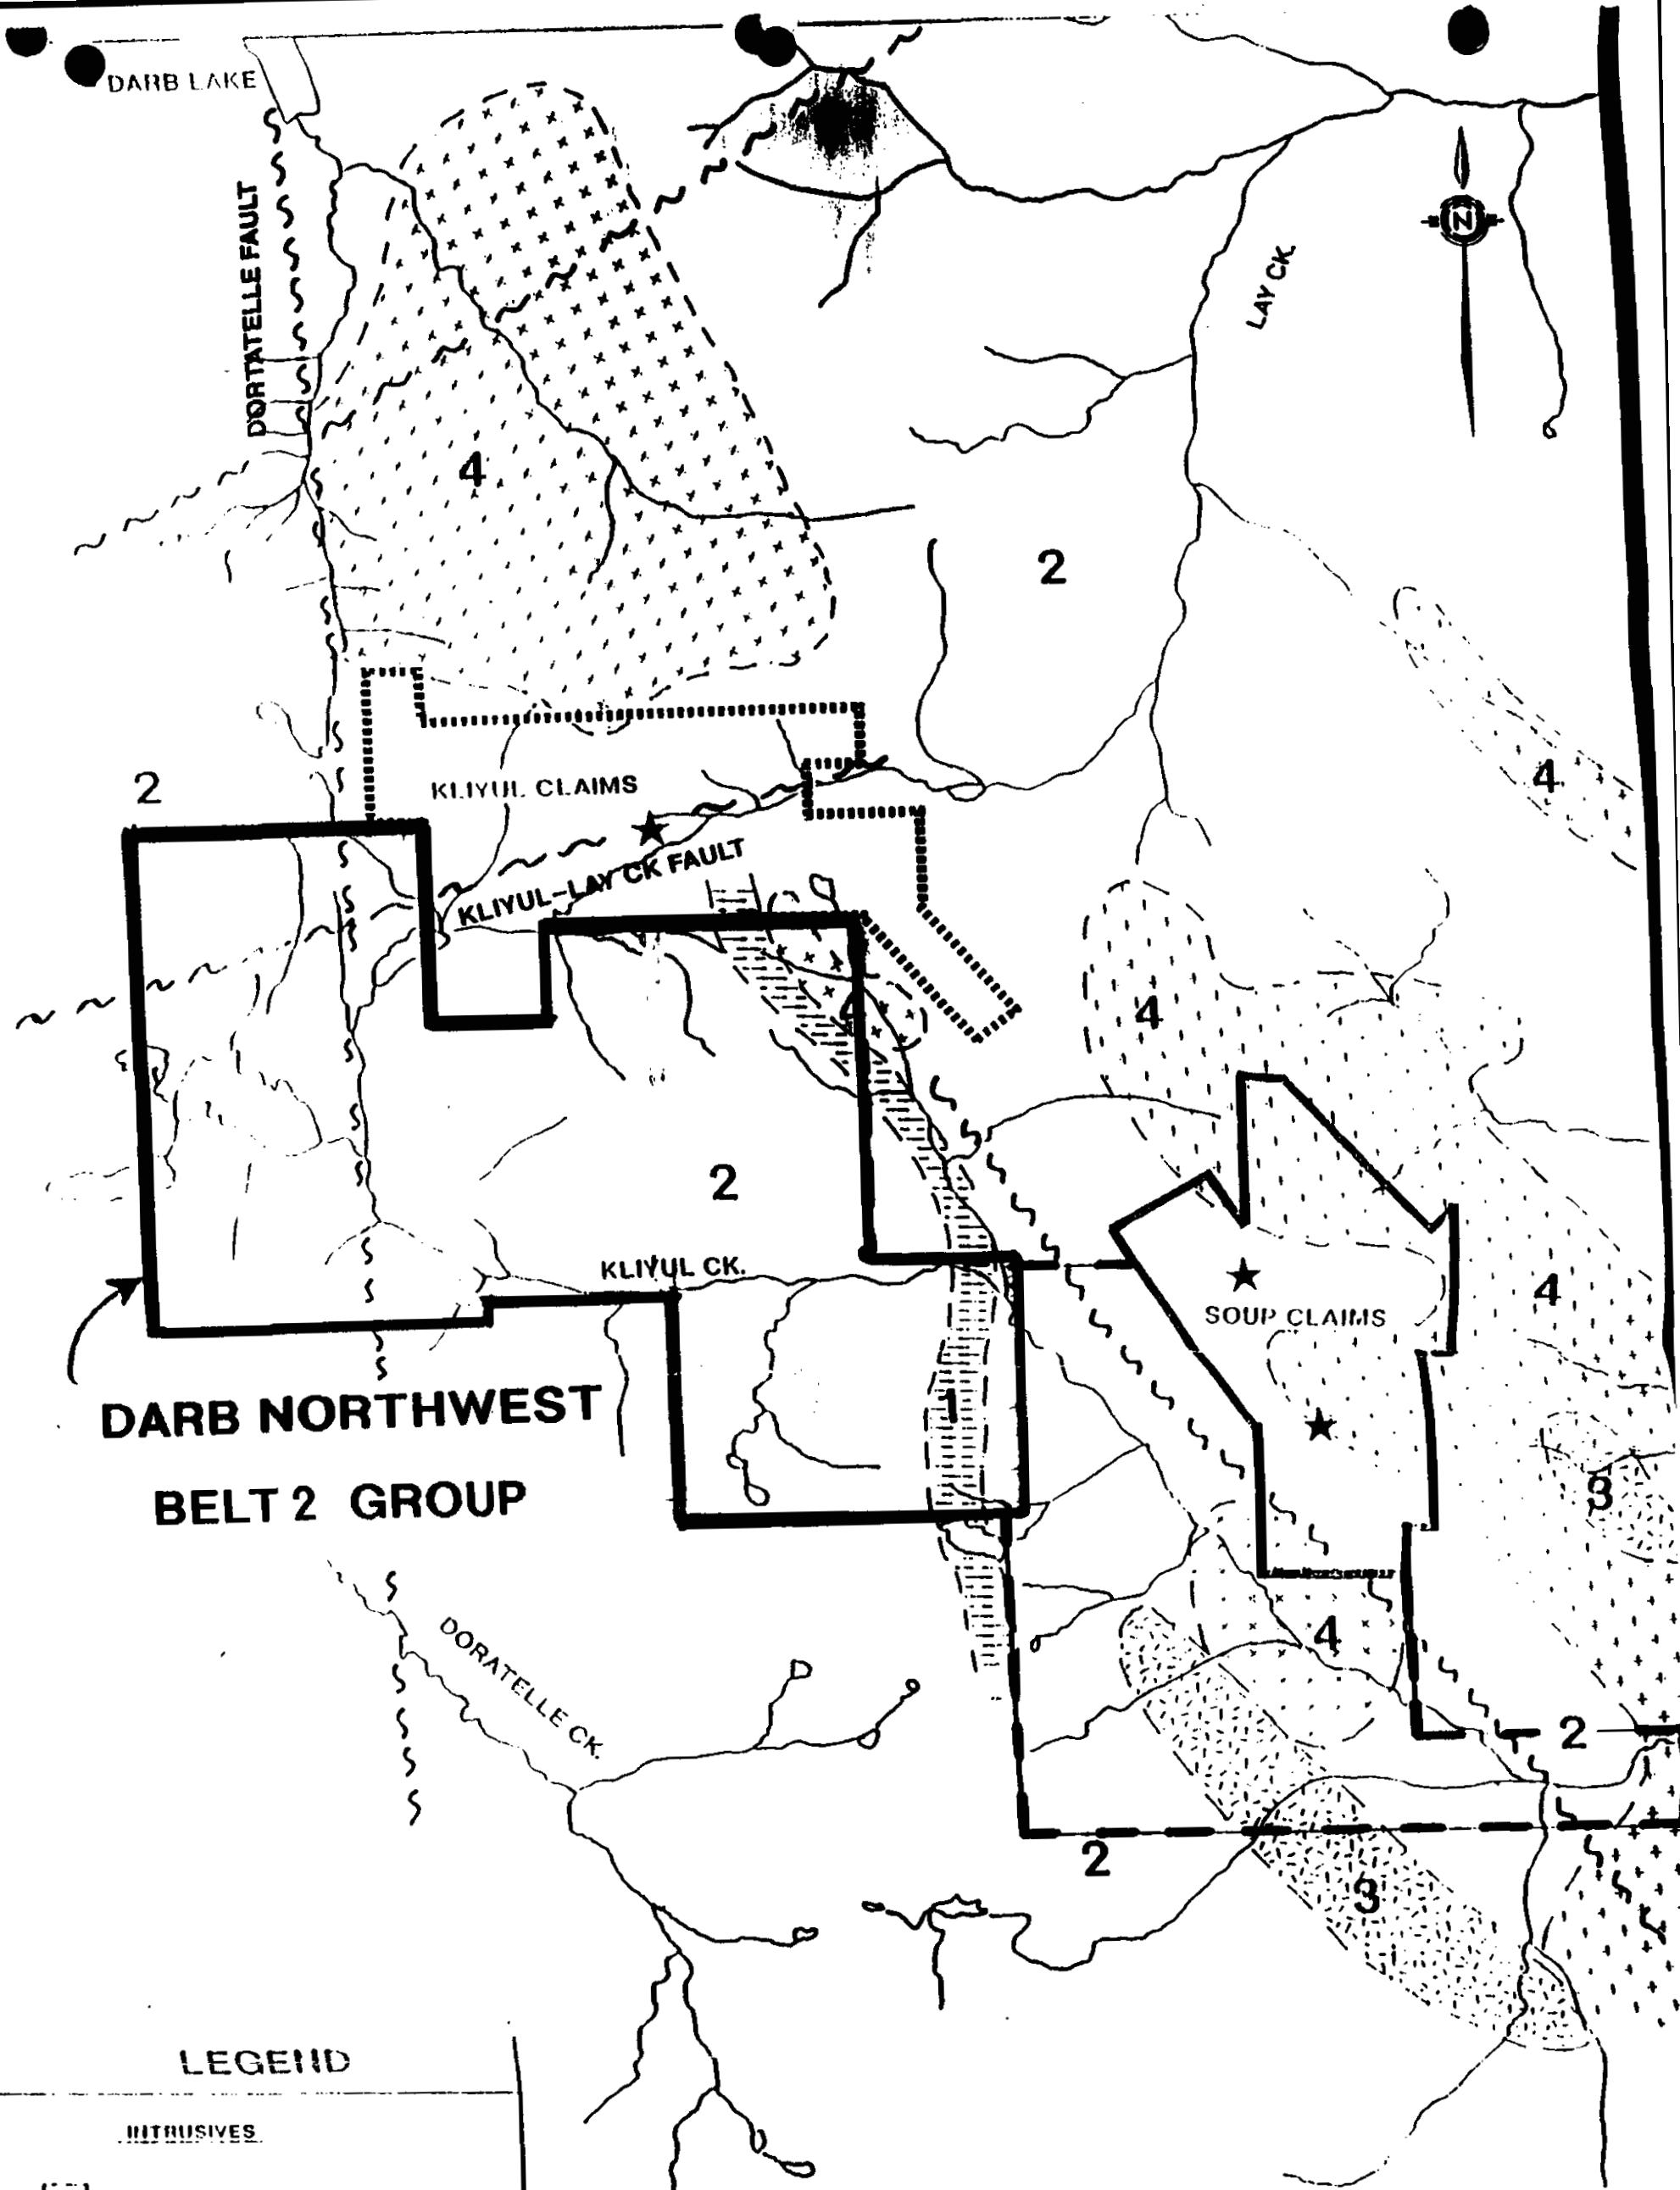

Prominent structural features in the area include NW, E-W, N-S and NNE-SSW trending fault systems.

### 2.2 Property Geology (See Drawing #4)

The Darb Northwest property consists of 6 fault bounded blocks, the NW, SW, N Central, S Central, SE, and SW blocks. Two steeply west dipping, south striking faults, the Doretelle Fault to the east and a minor(?) unnamed fault to the west, separate the central blocks from the east and west blocks. A probable west striking fault, the Kliyul-Lay Creek Fault divides the northern blocks from the southern. Outcrop on the property is generally limited; the sense of motion across the faults is unknown. The Kliyul-Lay Creek fault may or may not be offset by the south striking faults. Only the unnamed fault is seen in outcrop.

The northeast block consists mainly of a mixed unit of grey-green, gently north dipping andesite lapilli tuffs and greywacke sediments. A suspected fault trends northwest across the extreme northeast corner of the property separating this unit from pyritic dark grey andesites associated with the massive andesite assemblage to the east. Mineralization in the mixed unit is weak to nonexistent, consisting of 1-2% pyrite.

The southeast block consists of green lapilli tuffs with minor augite porphyry and may be steeply west dipping. Outcrop is extremely limited. Two diorite dykes are seen in previously sampled carbonate altered tuffs in the south adjacent to the Doretelle Fault, and a feldspar porphyry dyke is seen in the central part of the block in a creek exposure. Weak chloritic and sericitic(?) alteration are also seen.

## REGIONAL GEOLOGY

### KLIYUL CREEK AREA

The weak to moderately foliated steeply west dipping South-Central block consists of 2 units: one in the east of primarily grey andesite tuffs with minor green volcanic sediments and dark grey augite porphyry, and one to the west of mainly augite porphyry with lesser andesite tuffs. A small diorite intrusion lies adjacent to the Doretelle Fault and a diorite dyke is seen nearby in the andesites. Another lies to the west near the unnamed fault. 3% pyrite is seen throughout, and quartz veins are frequent in the andesite/sediment unit near the Doretelle Fault. These contain epidote and in 2 cases have flooded the host with silica. Veins are up to 1 meter wide and are near vertical, striking north sub-parallel to foliation and bedding. Widespread weak chloritic alteration and local moderate sericitic alteration are seen throughout this block.

The N-Central, NW, and SW blocks are composed of steeply west dipping foliated augite porphyry and andesite tuffs. Foliations also dip steeply to the west. The N-Central block is sporadically quartz veined as in the S-Central block, and contains diorite dykes and sills adjacent to the two N-striking faults. The NW and SW blocks lie mainly off the grid and were not mapped fully, but appear to be weakly mineralized with pyrite and local magnetite along the unnamed fault. A small gossan zone is also seen here. This fault appears to terminate the soil geochemical anomaly previously thought to be related to the west trending Kliyul-Lay Creek Fault.

### 3.0 GEOCHEMISTRY

A total of 345 soil samples were collected during this survey and of the elements analyzed for only gold revealed anomalous values which are plotted and contoured at 50 & 100 ppm contour intervals on Drawing #5.

Several patchy and irregular shaped 50 ppb gold in soil anomalies occur in a rough NE-SW trend from line 680E through 660E which parallels the valley floor. This trend also contains a smaller NNE-SSW pattern which mimics SSW flowing creeks (possible structures) that can be seen on line 665E/637N, line 667E/639N through line 671E/645N.

Contouring of the gold values at 100 ppb reveals increasingly smaller and less linear anomalies as seen from the 1994 soil survey which had a sample spacing of 100 meters.

No strong evidence of the postulated E-W trending, Kliyul-Lay Creek fault can be seen in the updated soil anomalies nor is there an apparent N-S component which was earlier thought to trace the Doretelle fault or a subparallel splay of the latter.

Twenty-four rock samples were taken during this programme with gold values ranging from 5 ppb to 35 ppb. The majority of these samples were taken from areas outside the soil geochemical anomalies as sparse to nonexistent outcrops were encountered within the anomalous regions.

#### **4.0 CONCLUSIONS**

1. The Darb Northwest property consists of 6 fault-bounded blocks of mixed sediments and volcanics with minor dioritic intrusions.
2. A 50 ppb gold in soil anomaly trends NE-SW and parallels the main valley floor. Superimposed on this anomaly are minor NNE-SSW gold in soil anomalies which appear restricted to small drainages which may reflect a common fracture/fault orientation.
3. Small >100 ppb gold anomalies are patchy and irregular and are limited in extent.
4. A strong glaciofluvial component is suspected for the origin of these anomalies.
5. Mineralization in rocks is generally weak and consists of 1-3% pyrite with gold values from 5 to 35 ppb. Several, short, fairly discontinuous, 1 m wide quartz veins were observed in the southern sections of the grid only.
6. Due to the suspected glaciofluvial origin to the soil anomalies and lack of mineralization and alteration seen, no further work is recommended in this area of the Darb Northwest property.

**APPENDIX I**

**LABORATORY ANALYTICAL TECHNIQUES**

## ANALYTICAL METHOD DESCRIPTIONS FOR GEOCHEMICAL ASSESSMENT REPORTS

The methods listed are presently applied to analyse geological materials by the Noranda Geochemical Laboratory at Vancouver.

### Preparation of Samples:

Sediments and soils are dried at approximately 80°C and sieved with a 80 mesh nylon screen. The -80 mesh (0.18 mm) fraction is used for geochemical analysis.

Rock specimens are pulverized to -120 mesh (0.13 mm). Heavy mineral fractions (panned samples \* from constant volume), are analysed in its entirety, when it is to be determined for gold without further sample preparation.

### Analysis of Samples:

Decomposition of a 0.200 g sample is done with concentrated perchloric and nitric acid (3:1), digested for 5 hours at reflux temperature. Pulps of rock or core are weighed out at 0.4 g and chemical quantities are doubled relative to the above noted method for digestion.

The concentrations of Ag, Cd, Co, Cu, Fe, Mn, Mo, Ni, Pb, V and Zn can be determined directly from the digest (dissolution) with a conventional atomic absorption spectrometric procedure. A Varian-Techtron, Model AA-5 or Model AA-475 is used to measure elemental concentrations.

### Elements Requiring Specific Decomposition Method:

Antimony - Sb: 0.2 g sample is attacked with 3.3 ml of 6% tartaric acid, 1.5 ml conc. hydrochloric acid and 0.5 ml of conc. nitric acid, then heated in a water bath for 3 hours at 95°C. Sb is determined directly from the dissolution with an AA-475 equipped with electrodeless discharge lamp (EDL).

Arsenic - As: 0.2 - 0.3 g sample is digested with 1.5 ml of perchloric 70% and 0.5 ml of conc. nitric acid. A Varian AA-475 equipped with an As-EDL is used to measure arsenic content in the digest.

Barium - Ba: 0.1 g sample digested overnight with conc. perchloric, nitric and hydrofluoric acid; Potassium chloride added to prevent ionization. Atomic absorption using a nitrous oxide-acetylene flame determines Ba from the aqueous solution.

Bismuth - Bi: 0.2 - 0.3 g is digested with 2.0 ml of perchloric 70% and 1.0 ml of conc. nitric acid. Bismuth is determined directly from the digest with an AA-475 complete with EDL.

Gold - Au: 10.0 g sample is digested with aqua regia (1 part nitric and 3 parts hydrochloric acid). Gold is extracted with MIBK from the aqueous solution. AA is used to determine Au.

Magnesium - Mg: 0.05 - 0.10 g sample is digested with 4 ml perchloric/nitric acid (3:1). An aliquot is taken to reduce the concentration to within the range of atomic absorption. The AA-475 with the use of a nitrous oxide flame determines Mg from the aqueous solution.

Tungsten - W: 1.0 g sample sintered with a carbonate flux and thereafter leached with water. The leachate is treated with potassium thiocyanate. The yellow tungsten thiocyanate is extracted into tri-n-butyl phosphate. This permits colourimetric comparison with standards to measure tungsten concentration.

Uranium - U: An aliquot from a perchloric-nitric decomposition, usually from the multi-element digestion, is buffered. The aqueous solution is exposed to laser light, and the luminescence of the uranyl ion is quantitatively measured on the UA-3 (Scintrex).

N.B.: If additional elemental determinations are required on panned samples, state this at the time of sample submission. Requests after gold determinations would be futile.

LOWEST VALUES REPORTED IN PPM:

Ag - 0.2	Mn - 20	Zn - 1	Au - 0.01
Cd - 0.2	Mo - 1	Sb - 1	W - 2
Co - 1	Ni - 1	As - 1	U - 0.1
Cu - 1	Pb - 1	Ba - 10	
Fe - 100	V - 10	Bi - 1	

**APPENDIX II**

**GEOCHEMICAL RESULTS & DESCRIPTIONS**

**NORANDA DELTA LABORATORY**  
**Geochemical Analysis**

Project Name & No.: DARB - 186 (HEMLO)  
Material: 95 Soils

Remarks: \* Sample screened @ -35 MBSH (0.5 mm)

o Organic, A Humus, S Sulfide

Geo.: G.G.  
Sheet: 1 of 3

Date received: JULY 14  
Date completed: JULY 18

LAB CODE: 9507-023  
R #34555/7/8/9

Au - silt & soil, 15.0 g sample digested with aqua-regia and determined by A.A. (D.L. 2 PPB); Rx, 10.0 g/AR/AA (DL 5 PPB)

ICP - 0.2 g sample digested with 3 ml HClO<sub>4</sub>/HNO<sub>3</sub> (4:1) at 203 °C for 4 hours diluted to 10 ml with water. Leeman PS3000 ICP determined elemental contents.

N.B. The major oxide elements and Ba, Be, Ce, La, Li, Ga are rarely dissolved completely from geological materials with this acid dissolution method.

**NORANDA DELTA LABORATORY**  
**Geochemical Analysis**

Project Name & No.: DARB - 186 (HEMLO)

Material: 242 Soils

Remarks: \* Sample screened @ -35 MESH (0.5 mm)

Geol.: G.G.

Sheet: 1 of 6

Date received: JUNE 27

Date completed: JULY 04

**LAB CODE:** 9506-028

R #34551-4/34578

Au - silt & soil, 15.0 g sample digested with aqua-regia and determined by A.A. (D.L. 2 PPB); Rx, 10.0 g/AR/AA (DL 5 PPB)

ICP - 0.2 g sample digested with 3 ml HClO<sub>4</sub>/HNO<sub>3</sub> (4:1) at 203 °C for 4 hours diluted to 10 ml with water. Leeman PS3000 ICP determined elemental contents.

N.B. The major oxide elements and Ba, Be, Ce, La, Li, Ga are rarely dissolved completely from geological materials with this acid dissolution method.

**NORANDA DELTA LABORATORY**  
**Geochemical Analysis**

Project Name & No.: DARB - 186 (HEMLO)  
 Material: 10 Rx

Geol.: G.G.  
 Sheet: 1 of 1

Date received: JUNE 27  
 Date completed: JULY 04

**LAB CODE:** 9506-028  
 R #34551-4/34578

Remarks: \* Sample screened @ -35 MESH (0.5 mm)

\*\* Organic, A Humus, S Sulfide

Au - silt & soil, 15.0 g sample digested with aqua-regia and determined by A.A. (D.L. 2 PPB); Rx, 10.0 g/AR/AA (DL 5 PPB)

ICP - 0.2 g sample digested with 3 ml HClO<sub>4</sub>/HNO<sub>3</sub> (4:1) at 203 °C for 4 hours diluted to 10 ml with water. Leeman PS3000 ICP determined elemental contents.

N.B. The major oxide elements and Ba, Be, Ce, La, Li, Ga are rarely dissolved completely from geological materials with this acid dissolution method.

**APPENDIX IV**

**STATEMENT OF QUALIFICATIONS**

## **STATEMENT OF QUALIFICATIONS**

I, D. Graham Gill of the City of Vancouver, Province of British Columbia, hereby certify  
that:

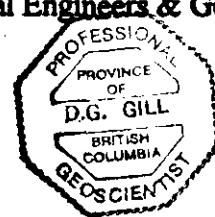

I am a geologist residing at 5442 - 7th Avenue, Delta, B.C.

I have graduated from the University of British Columbia in 1983 with a B.Sc. in geology.

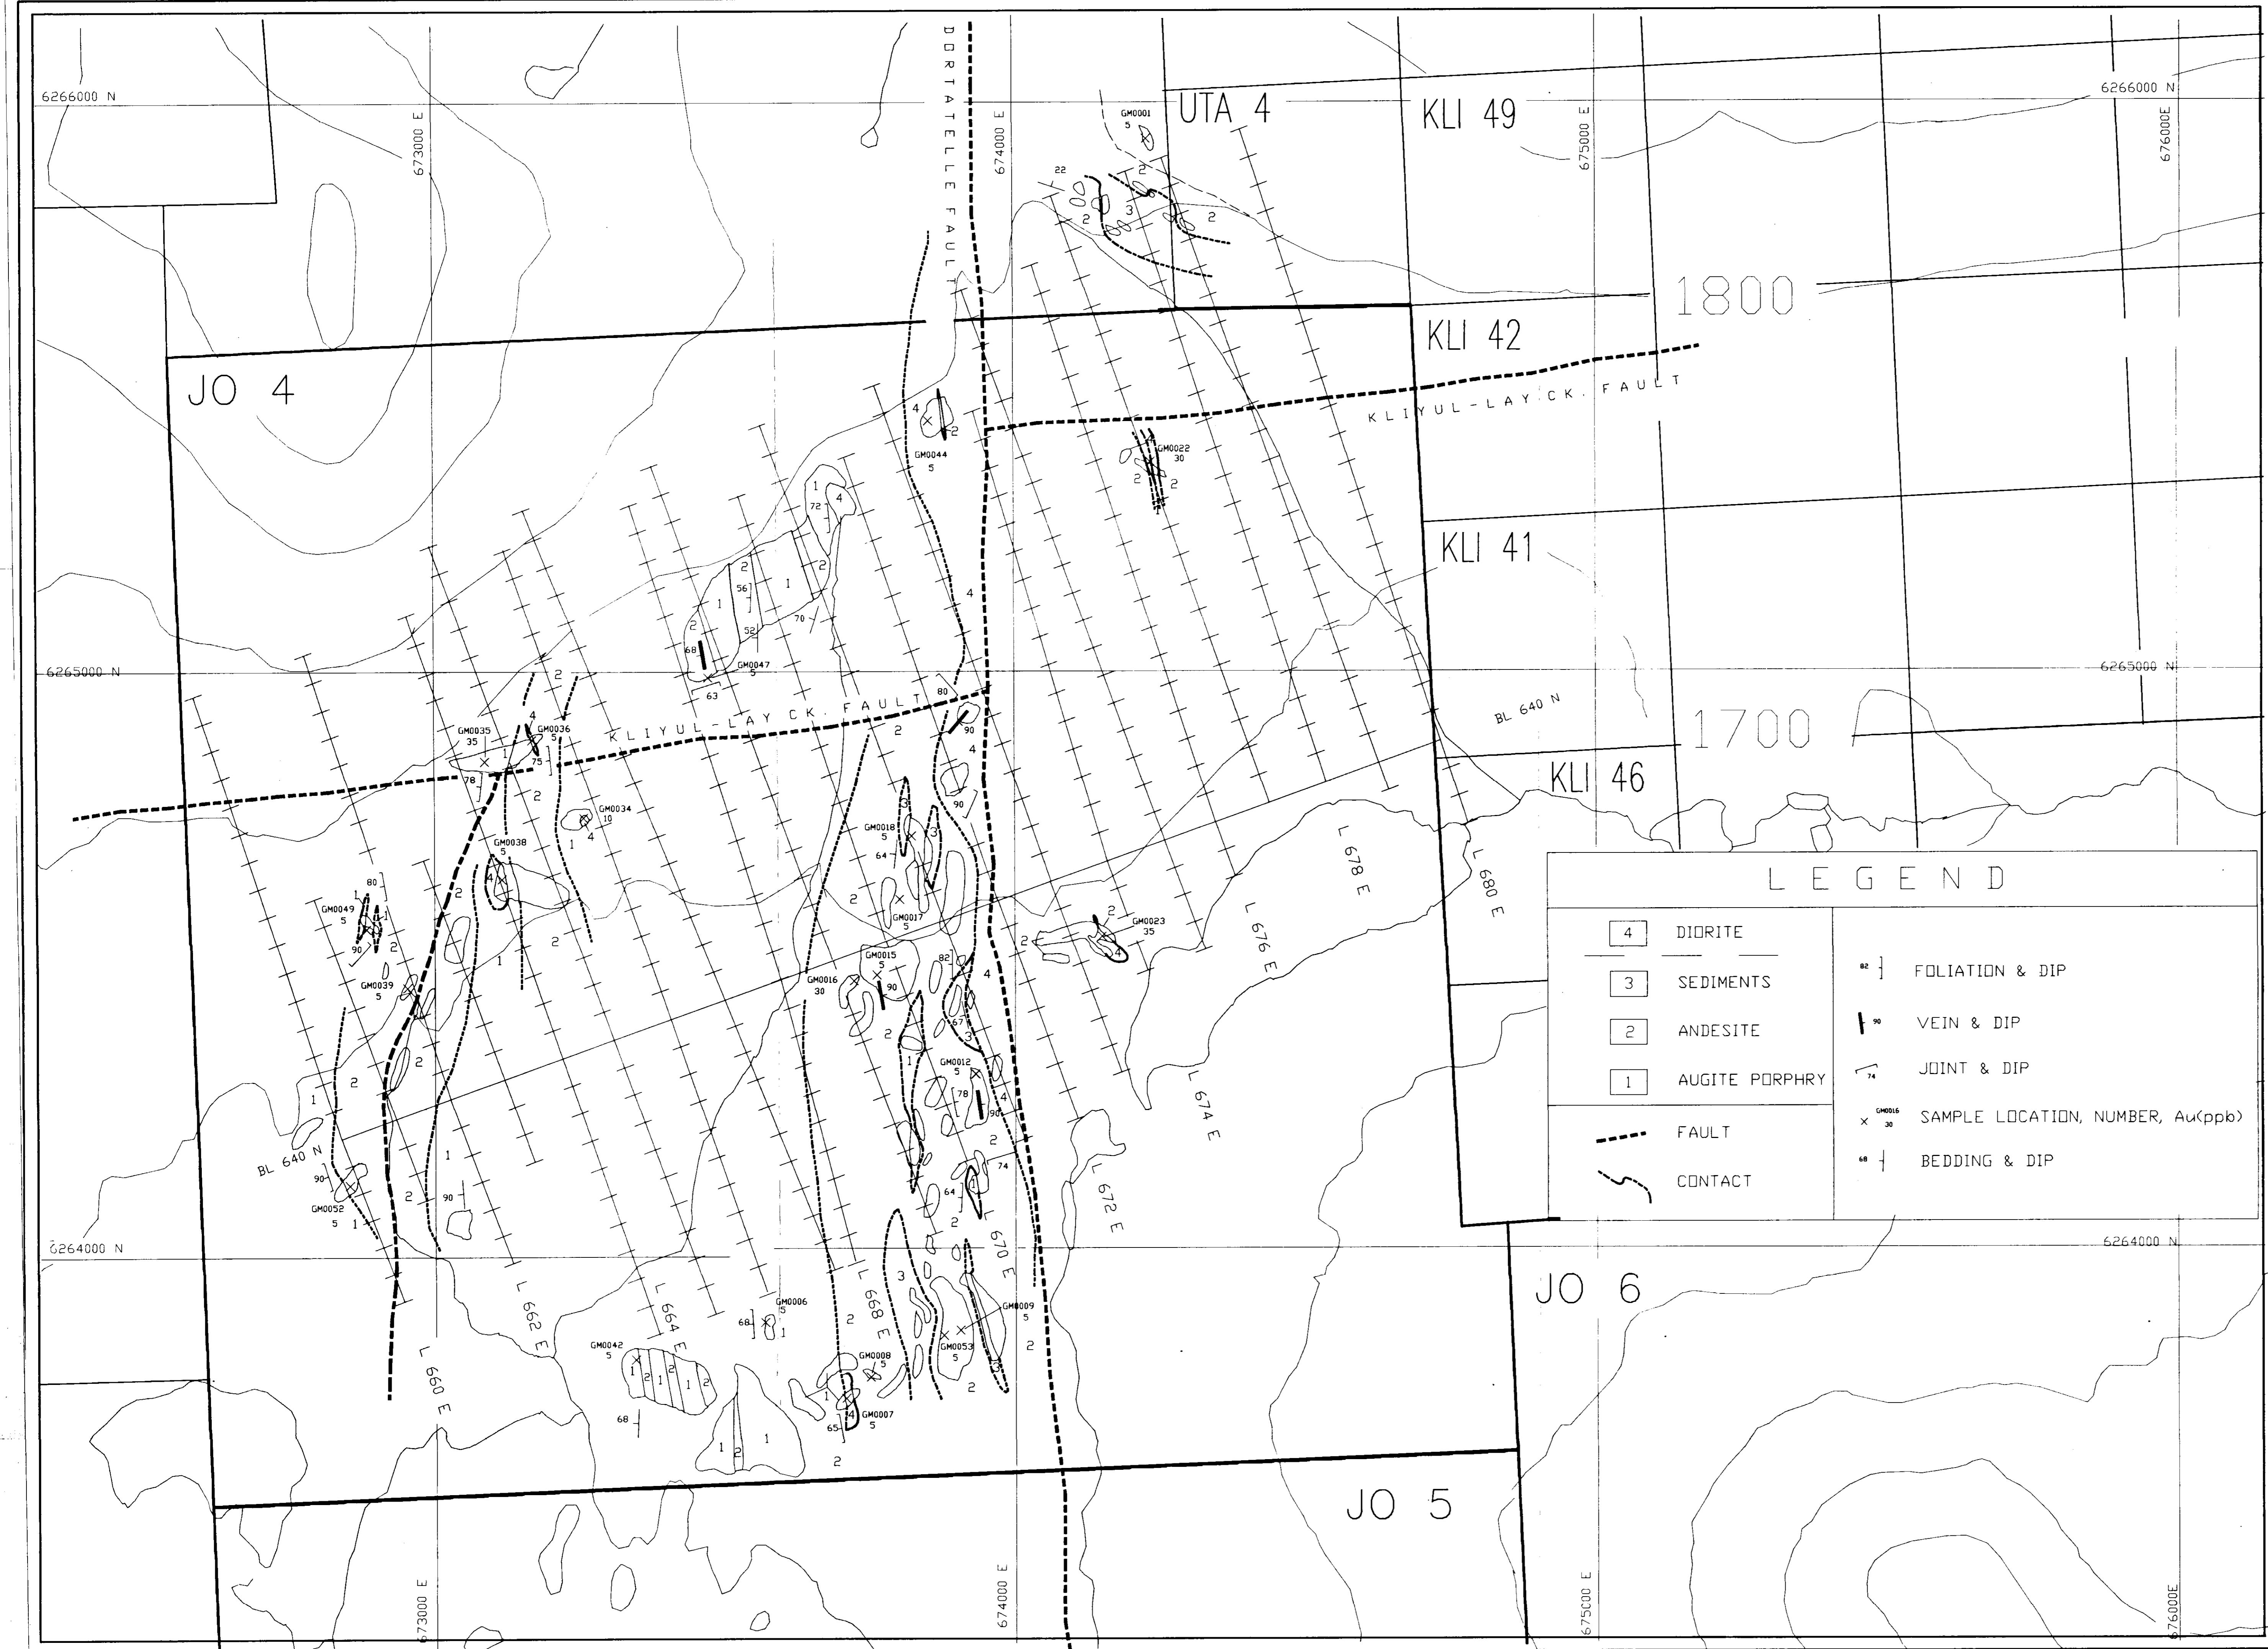

I have worked in mineral exploration since 1979.

I have been a temporary employee with Noranda Exploration Company, Limited since  
May, 1983 and a permanent employee since November 1987.

I am a member in good standing of the Professional Engineers & Geoscientist of British  
Columbia.
