GEOCHEMICAL REPORT

CHU PROPERTY, OMENICA M.D., B.C.

1.0 INTRODUCTION

1.1 General

A 4 man-day field program was conducted on the Chu, Chu 2 and Chu 3 Mineral Claims during the period August 14 to 31, 1994. Field work consisted of stream sediment and rock chip geochemical sampling. Sixteen stream sediment and 3 rock chip samples were taken. A total expenditure of \$3,600 was incurred (APPENDIX I).

1.2 Property Tenure

The Chu Mineral Claims are comprised of 3 contiguous mineral claims totaling 40 units owned by Orvana Minerals Corp. (Table 1, Figure 2).

1.3 Location, Access, Physiography and Climate

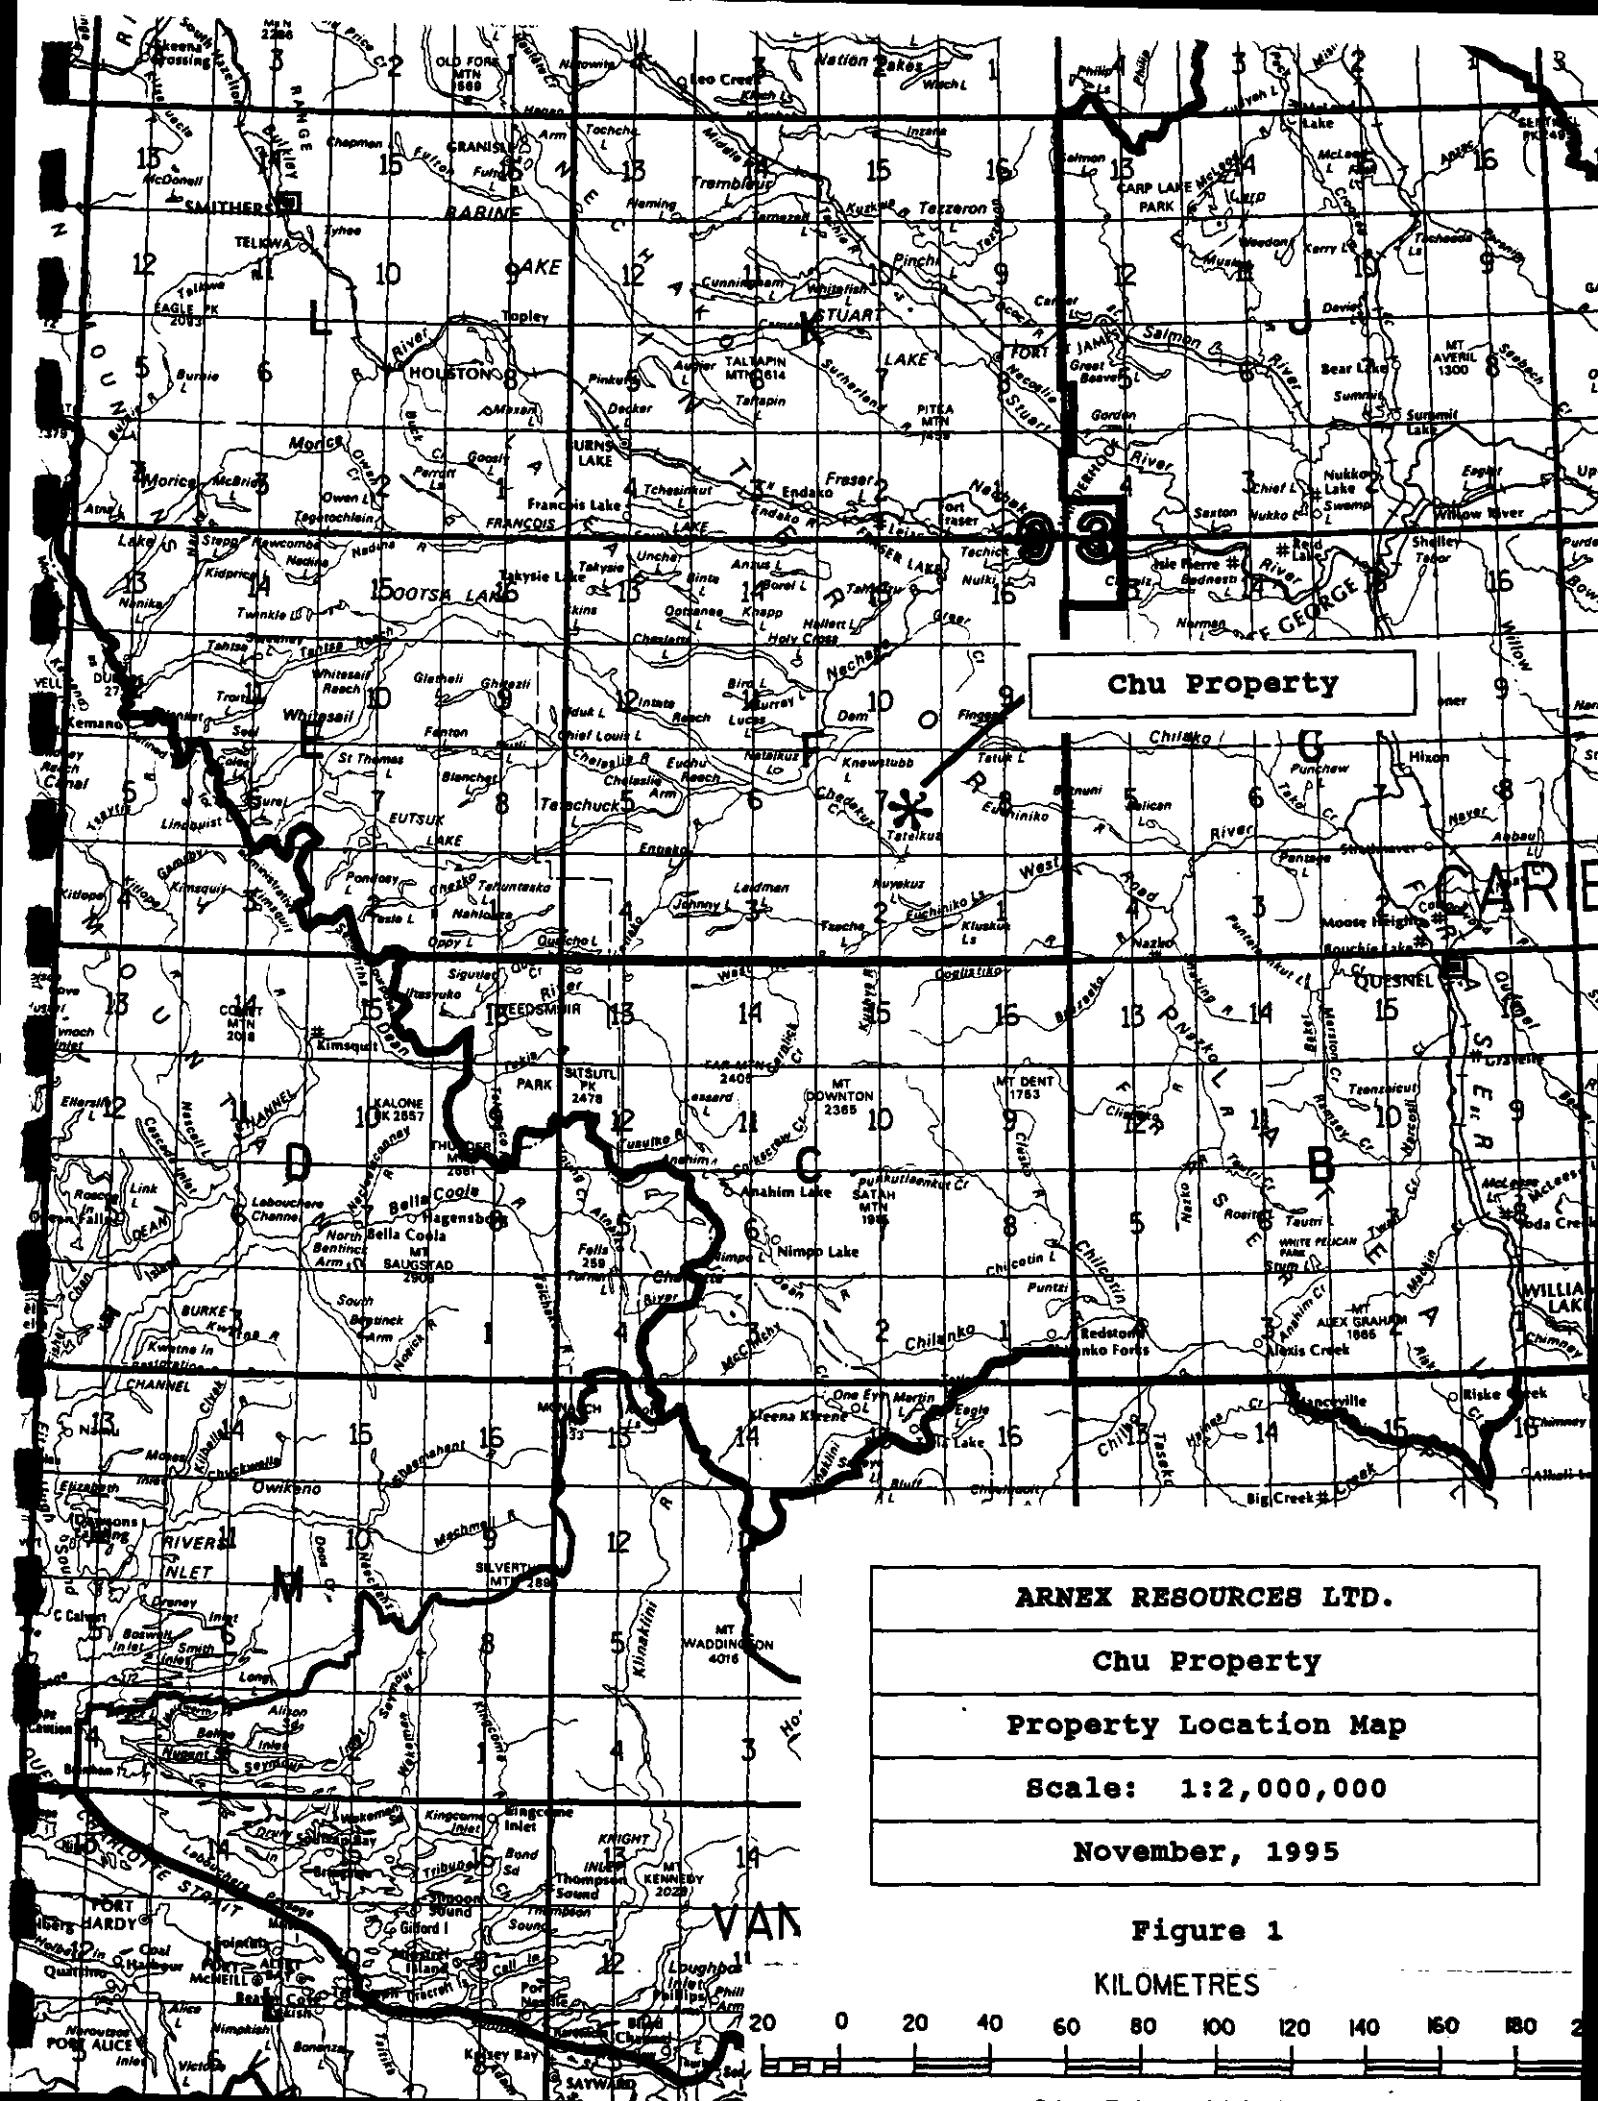

The Chu Mineral Claims are located approximately 5 km west of Chutanli Lake, approximately 100 km southwest of Vanderhoof B.C. (NTS 93F/7E, Figures 1 and 2). Access is via the Kluskus logging road network from Vanderhoof.

The property lies within the Nechako Plateau physiographic region where the topography is characterized by low relief, swampy lakes and poorly developed first and second order creek drainages. The Chu claims cover the height of land of a portion of the Nechako Range and moderate relief with local steep slopes is present on the property. The lower elevations of the property has been logged in recent years and young second growth forest is present. Climatic conditions are semi-arid to temperate with hot and dry weather in summer and cold temperatures and light to moderate snow cover in winter.

Table 1

Tan Claims - Mineral Tenure

Claim Name	Record #	No of Units	Expiry Date
Chu	331306	20	07/10/96
Chu 2	332289	12	02/11/96
Chu 3	332290	8	04/11/96

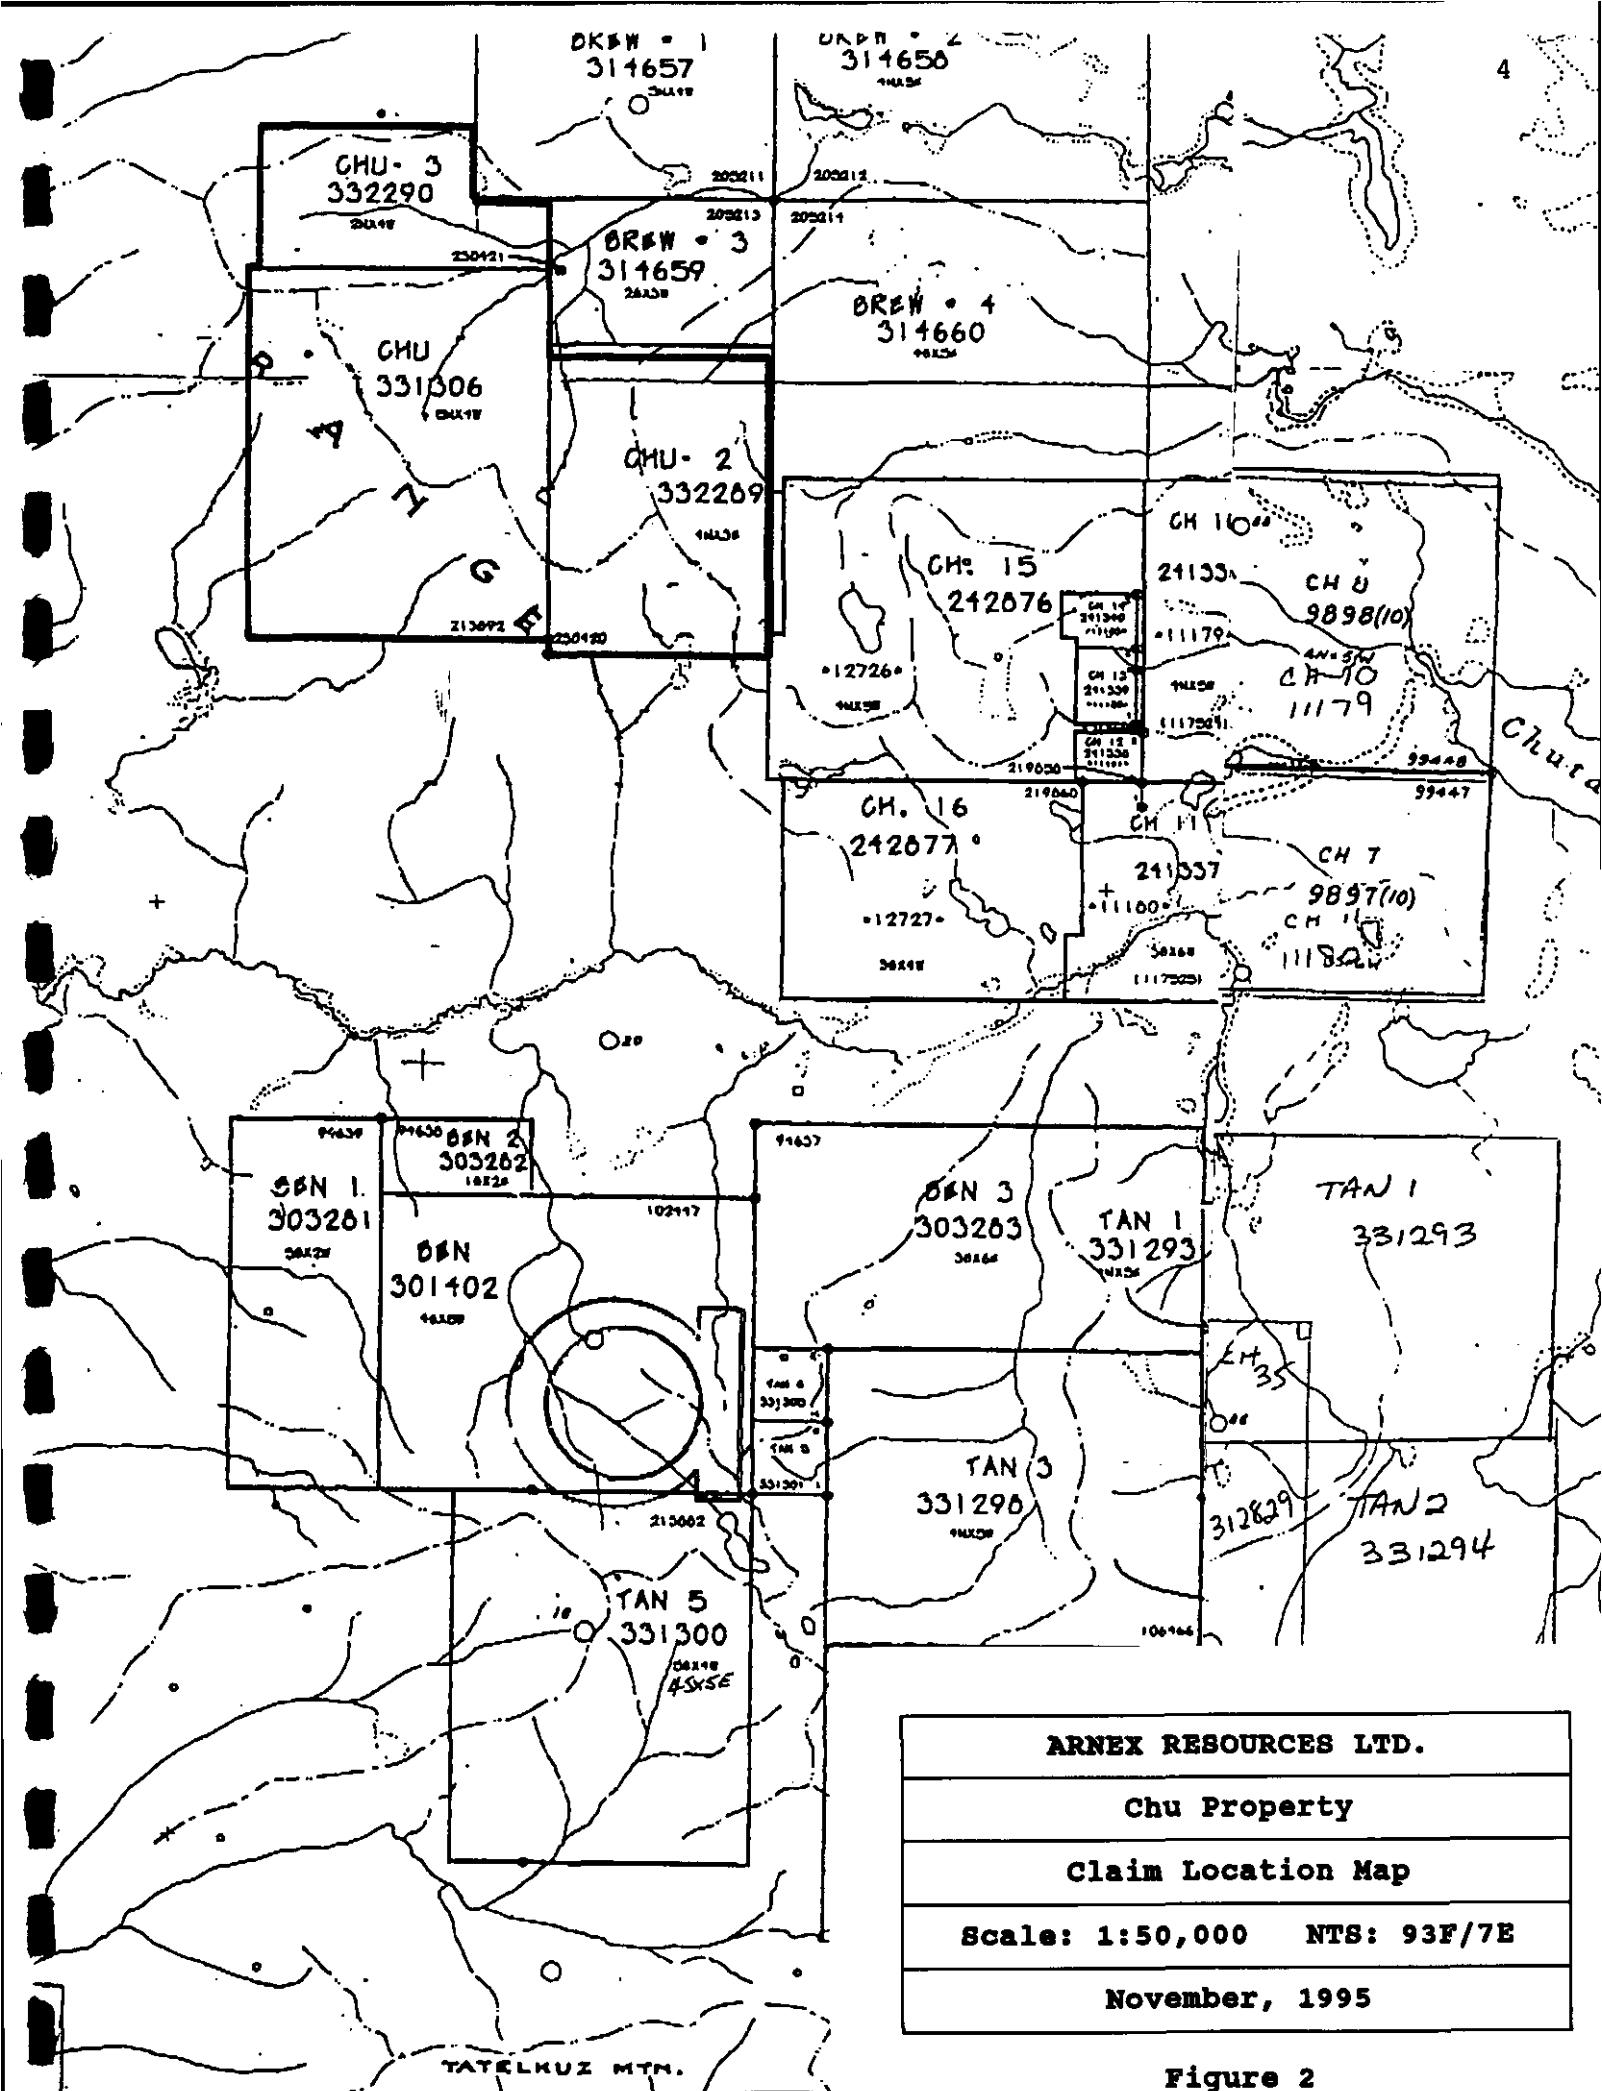

Figure 2

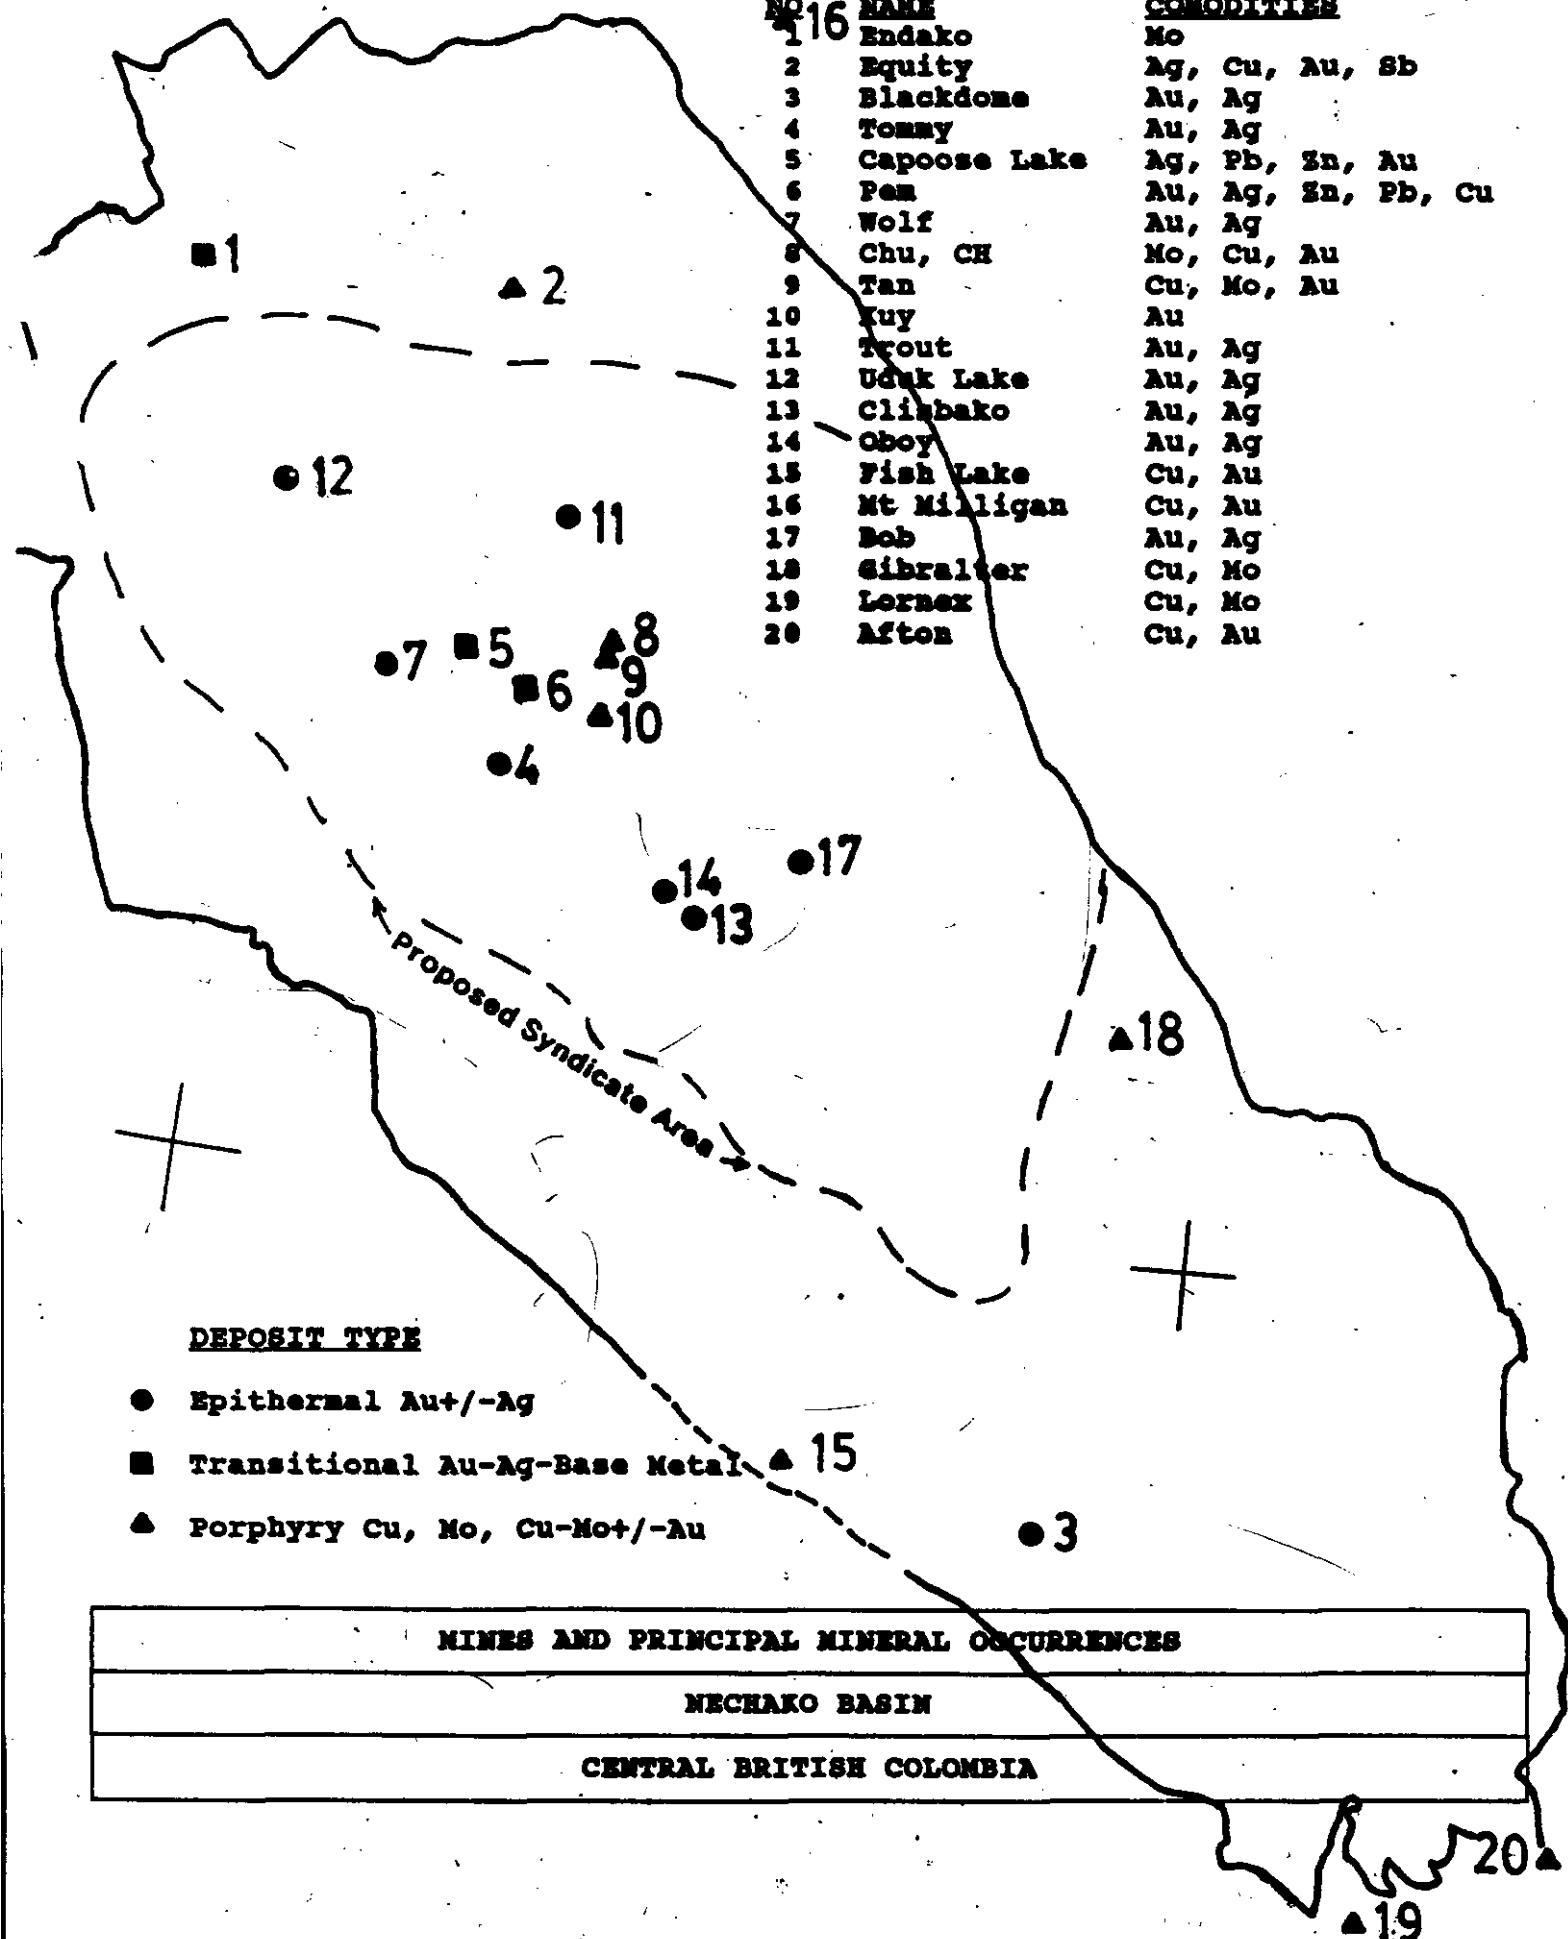

1.4 History

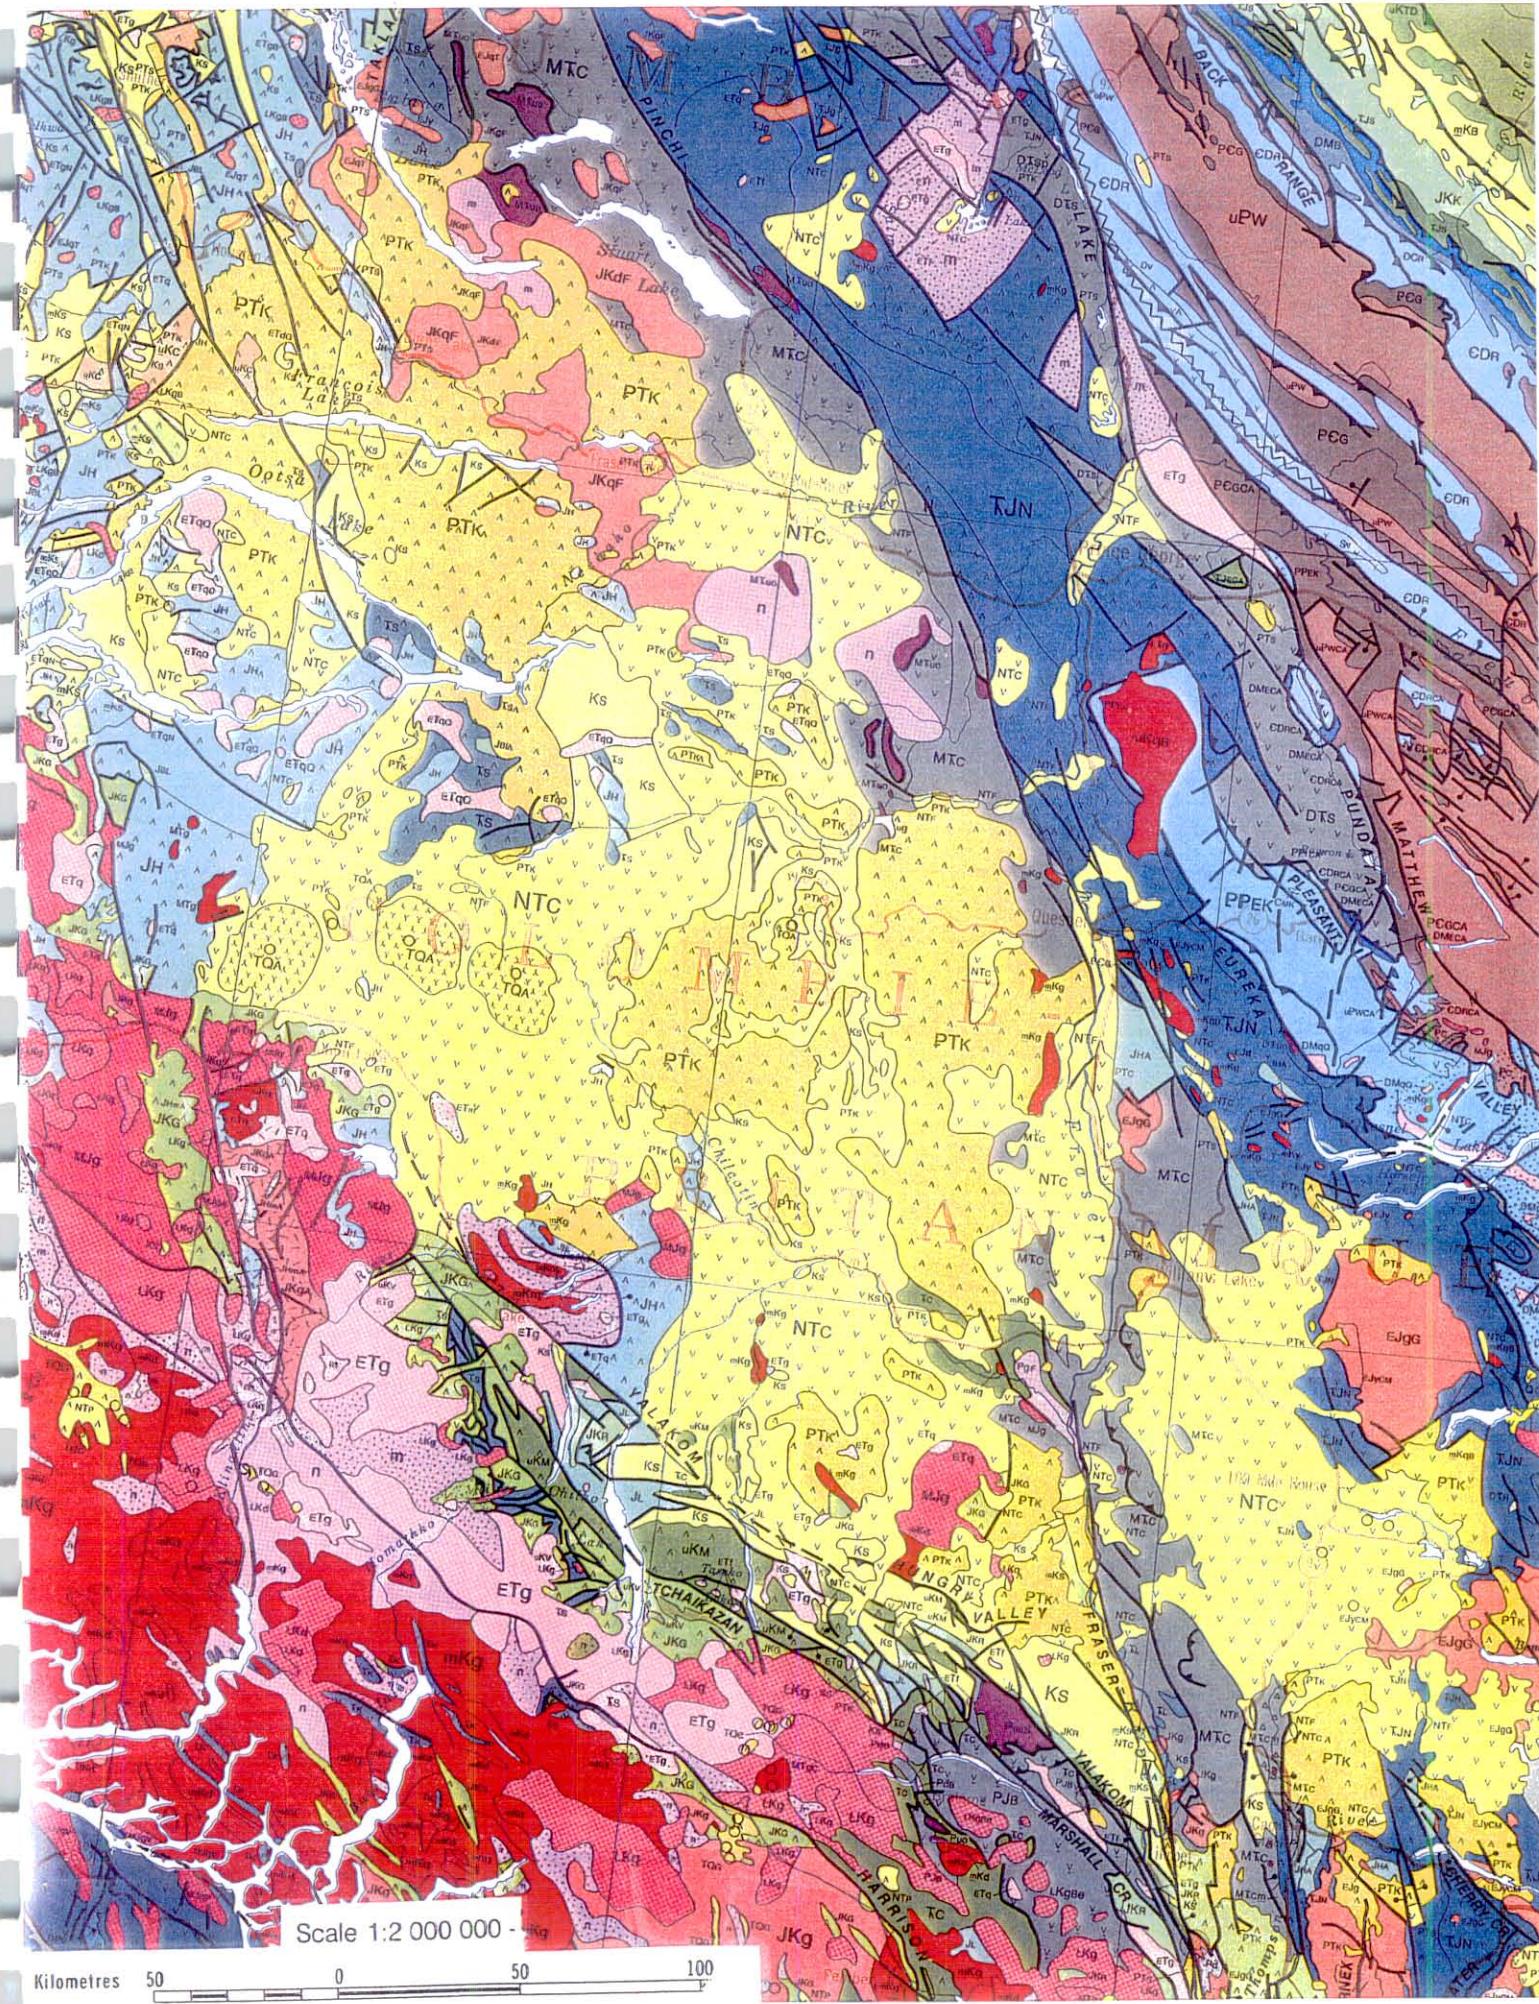

The Chu property was discovered in 1969 and prospecting, geochemical and geophysical surveys and shallow drilling were completed the ensuing year. Following the building of the Kluskus road in the mid 1970's, Assarco and Armco completed road building, surface exploration and 5796 m of drilling in 17 holes on the property. Few assay results are reported, however it appears from logs that significant widths (>25 m) of low grade Mo and Cu mineralization were intersected and a geological resource was established.

The Chu and Chu 2 and 3 claims were staked in by Arnex Resources Ltd. in October and November 1994 when the original Chu porphyry Mo property lapsed.

2.0 GEOLOGY

The region in which the Chu prospect occurs lies within the Intermountain tectonic belt. The area is predominantly underlain by Lower to Middle Jurassic volcanic and sedimentary rocks of the Hazelton Group (Figure 3). These assemblages are overlain by the Upper Cretaceous to Lower Tertiary Ootsa Lake Group and Miocene plateau basalts. Felsic plutons of probable Cretaceous? age intrude both Lower and Middle Jurassic Hazelton strata. Felsic intrusions of Tertiary age (49-52 mY) have recently been dated in the area by B.C.G.S. geologists.

The Chu property is located at the northern contact of the east-west trending Tatelkuz-Chutanli pluton (Quanchus intrusion). Extensive glacial till and outwash covers the lower elevations of the claim group. Extensive Quanchus "Tombstone" granite outcrops on the southwesterly slopes of the claims.

Work by previous operators identified an mineralized body with a strike length of approximately 800 m. Mineralization consists of stockwork pyrite and molybdenite within altered siliceous sediments adjacent to a granitic intrusive. Diamond drilling established a geological resource with a grade of approximately 0.1% Mo.

3.0 STREAM SEDIMENT AND ROCK CHIP GEOCHEMISTRY

3.1 Objective

The principle objective of the stream sediment program was to investigate if Mo anomalies occurred on the northeastern slopes of the Nechako Range adjacent to the mineralized zone which outcrops over the height of land on the southwestern slopes of the range. Anomalies from the northeastern slopes may indicate that the mineralized body projects through the range at depth and that a substantial resource may be present or that additional mineralized bodies are present.

3.2 Methodology

Stream sediment samples were collected from all tributaries of the northeastern drainage and also down slope from the mineralized body on the southwestern slope. Moss mat samples were taken whenever possible, however active stream sediments and sediments from dry run-off channels were also taken when no better material was available. Sample observations were recorded and are reported in Appendix III, Geochemical Data Sheets.

Stream Samples were dried and sieved to -80 mesh and analyzed by ICP-32 analytical techniques (See Sample Preparation, Analytical Techniques and Certificates of Analysis, Appendix IV).

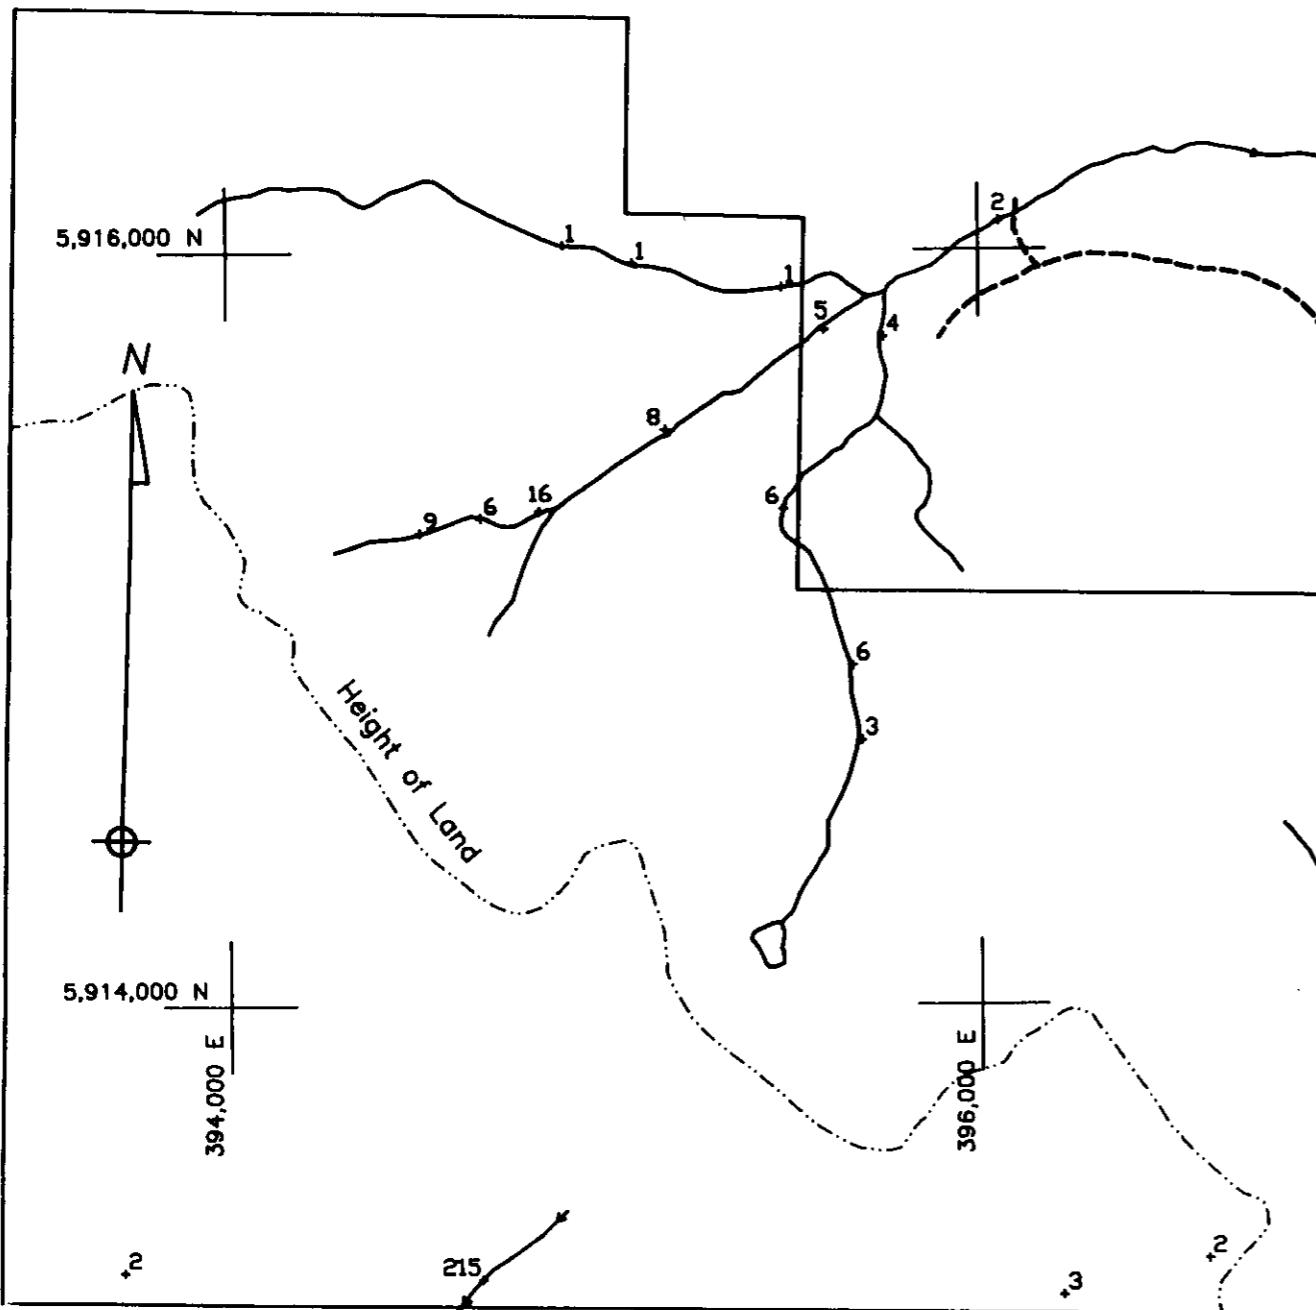

Rock chip samples of till clasts were taken and are reported as per Appendix III and IV.

3.3 Results

Sample locations and value plots for Mo are presented as Figures 4 and 5.

Stream sediment results indicate the following:

- The central tributary of the northeastern drainage is strongly anomalous in Mo at all sites sampled above the creek forks. The five sites sampled range in values from 5 to 16 ppm Mo,

+ silt sample
 - rock sample

Fig. 4

- The south tributary of the northeastern drainage is moderately anomalous in Mo with four sites returning values between 3 and 6 ppm,
- An extremely high value of 215 ppm Mo occurs in the northwestern creek drainage down slope from the mineralized zone,
- All Mo anomalies have generally low other base metal values. Mo anomalies do contain some elevated Ag, Co, V, As and Mn values.

Rock chip sampling of till clasts resulted in the following response:

- an altered biotite quartz monzonite clast at Rx 150421 contains weakly anomalous Au (150 ppb), Ag (1.4 ppm), Cu (415 ppm), Zn (2390 ppm) and Pb (132 ppm) but low Mo (2 ppm). Approximately 5% pyrite and magnetite was noted in this silicified, fine grained, subhedral hypidiomorphic granular till clast.

4.0 CONCLUSIONS

Stream sediment geochemistry indicates distinctly anomalous Mo values in the central and southern tributaries of the northeastern creek over the height of land from the drilled occurrence. These values indicate that the drilled zone projects through the mountain range or that additional mineralized occurrences are present on the northeastern slope.

A highly anomalous value of 215 ppm Mo from the drainage down slope from the mineralized body indicates stream sediment sampling to be an effective tool for detecting Mo occurrences of this nature.

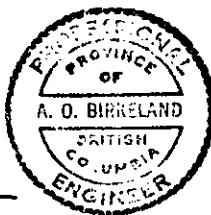

A weakly mineralized till clast was found in the most southeastern portion of the claim block. This silicified intrusive clast containing pyrite and modest precious and base metal values may indicate that a zoned mineralized porphyry system may be present and a Cu-Au rich phase may occur east of the known Mo occurrence.

More detailed geochemical sampling, prospecting and geological mapping is required to define the extent of Mo mineralization and to determine if a Cu-Au mineralized porphyry phase is present.

Dated in North Vancouver, British Columbia this 1 day of
November, 1995.

APPENDIX II

CERTIFICATE OF QUALIFICATION

I, ARNE O. BIRKELAND, DO HEREBY CERTIFY THAT:

1. I am a Geological Engineer in the employ of Arnex Resources Ltd. with offices at 4005 Brockton Crescent, North Vancouver, British Columbia.
2. I am a 1972 graduate of the Colorado School of Mines with a Bachelor of Science Degree in Geological Engineering.
3. I have been a registered Professional Engineer with the Association of Professional Engineers of British Columbia (Registration No. 9870) since 1975.
4. My primary employment since 1966 has been in the field of mineral exploration, namely as a Geological Engineer.
5. My experience has encompassed a wide range of geological environments and has allowed considerable familiarization with geophysical, geochemical and diamond drilling techniques.
6. I have conducted the exploration work on the property reported on herein. This report is based on data acquired and also draws from researched published information available on the area.

DATED at North Vancouver, British Columbia,

this 7 day of November, 1995

(AN) - ARNEX RESOURCES LIMITED

Project: CHU (SHIPMENT #4)
 P.O. #:

Samples submitted to our lab in Vancouver, BC.
 This report was printed on 21-AUG-95.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
205	3	Geochem ring to approx 150 mesh
226	3	0-3 Kg crush and split
3204	3	Save 1 Kg reject for 90 days
229	3	ICP - AQ Digestion charge

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
983	3	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
2118	3	Ag ppm: 32 element, soil & rock	ICP-AES	0.2	200
2119	3	Al %: 32 element, soil & rock	ICP-AES	0.01	15.00
2120	3	As ppm: 32 element, soil & rock	ICP-AES	2	10000
2121	3	Ba ppm: 32 element, soil & rock	ICP-AES	10	10000
2122	3	Be ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2123	3	Bi ppm: 32 element, soil & rock	ICP-AES	2	10000
2124	3	Ca %: 32 element, soil & rock	ICP-AES	0.01	15.00
2125	3	Cd ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2126	3	Co ppm: 32 element, soil & rock	ICP-AES	1	10000
2127	3	Cr ppm: 32 element, soil & rock	ICP-AES	1	10000
2128	3	Cu ppm: 32 element, soil & rock	ICP-AES	1	10000
2150	3	Fe %: 32 element, soil & rock	ICP-AES	0.01	15.00
2130	3	Ga ppm: 32 element, soil & rock	ICP-AES	10	10000
2131	3	Hg ppm: 32 element, soil & rock	ICP-AES	1	10000
2132	3	K %: 32 element, soil & rock	ICP-AES	0.01	10.00
2151	3	La ppm: 32 element, soil & rock	ICP-AES	10	10000
2134	3	Mg %: 32 element, soil & rock	ICP-AES	0.01	15.00
2135	3	Mn ppm: 32 element, soil & rock	ICP-AES	5	10000
2136	3	Mo ppm: 32 element, soil & rock	ICP-AES	1	10000
2137	3	Na %: 32 element, soil & rock	ICP-AES	0.01	5.00
2138	3	Ni ppm: 32 element, soil & rock	ICP-AES	1	10000
2139	3	P ppm: 32 element, soil & rock	ICP-AES	10	10000
2140	3	Pb ppm: 32 element, soil & rock	ICP-AES	2	10000
2141	3	Sb ppm: 32 element, soil & rock	ICP-AES	2	10000
2142	3	Sc ppm: 32 elements, soil & rock	ICP-AES	1	10000
2143	3	Sr ppm: 32 element, soil & rock	ICP-AES	1	10000
2144	3	Ti %: 32 element, soil & rock	ICP-AES	0.01	5.00
2145	3	Tl ppm: 32 element, soil & rock	ICP-AES	10	10000
2146	3	U ppm: 32 element, soil & rock	ICP-AES	10	10000
2147	3	V ppm: 32 element, soil & rock	ICP-AES	1	10000
2148	3	W ppm: 32 element, soil & rock	ICP-AES	10	10000
2149	3	Zn ppm: 32 element, soil & rock	ICP-AES	2	10000
