Appendix "C"	Crone Surface Pulse Electromagnetic Survey Report as prepared by Jim Hawkins of Scott Geophysical Ltd.

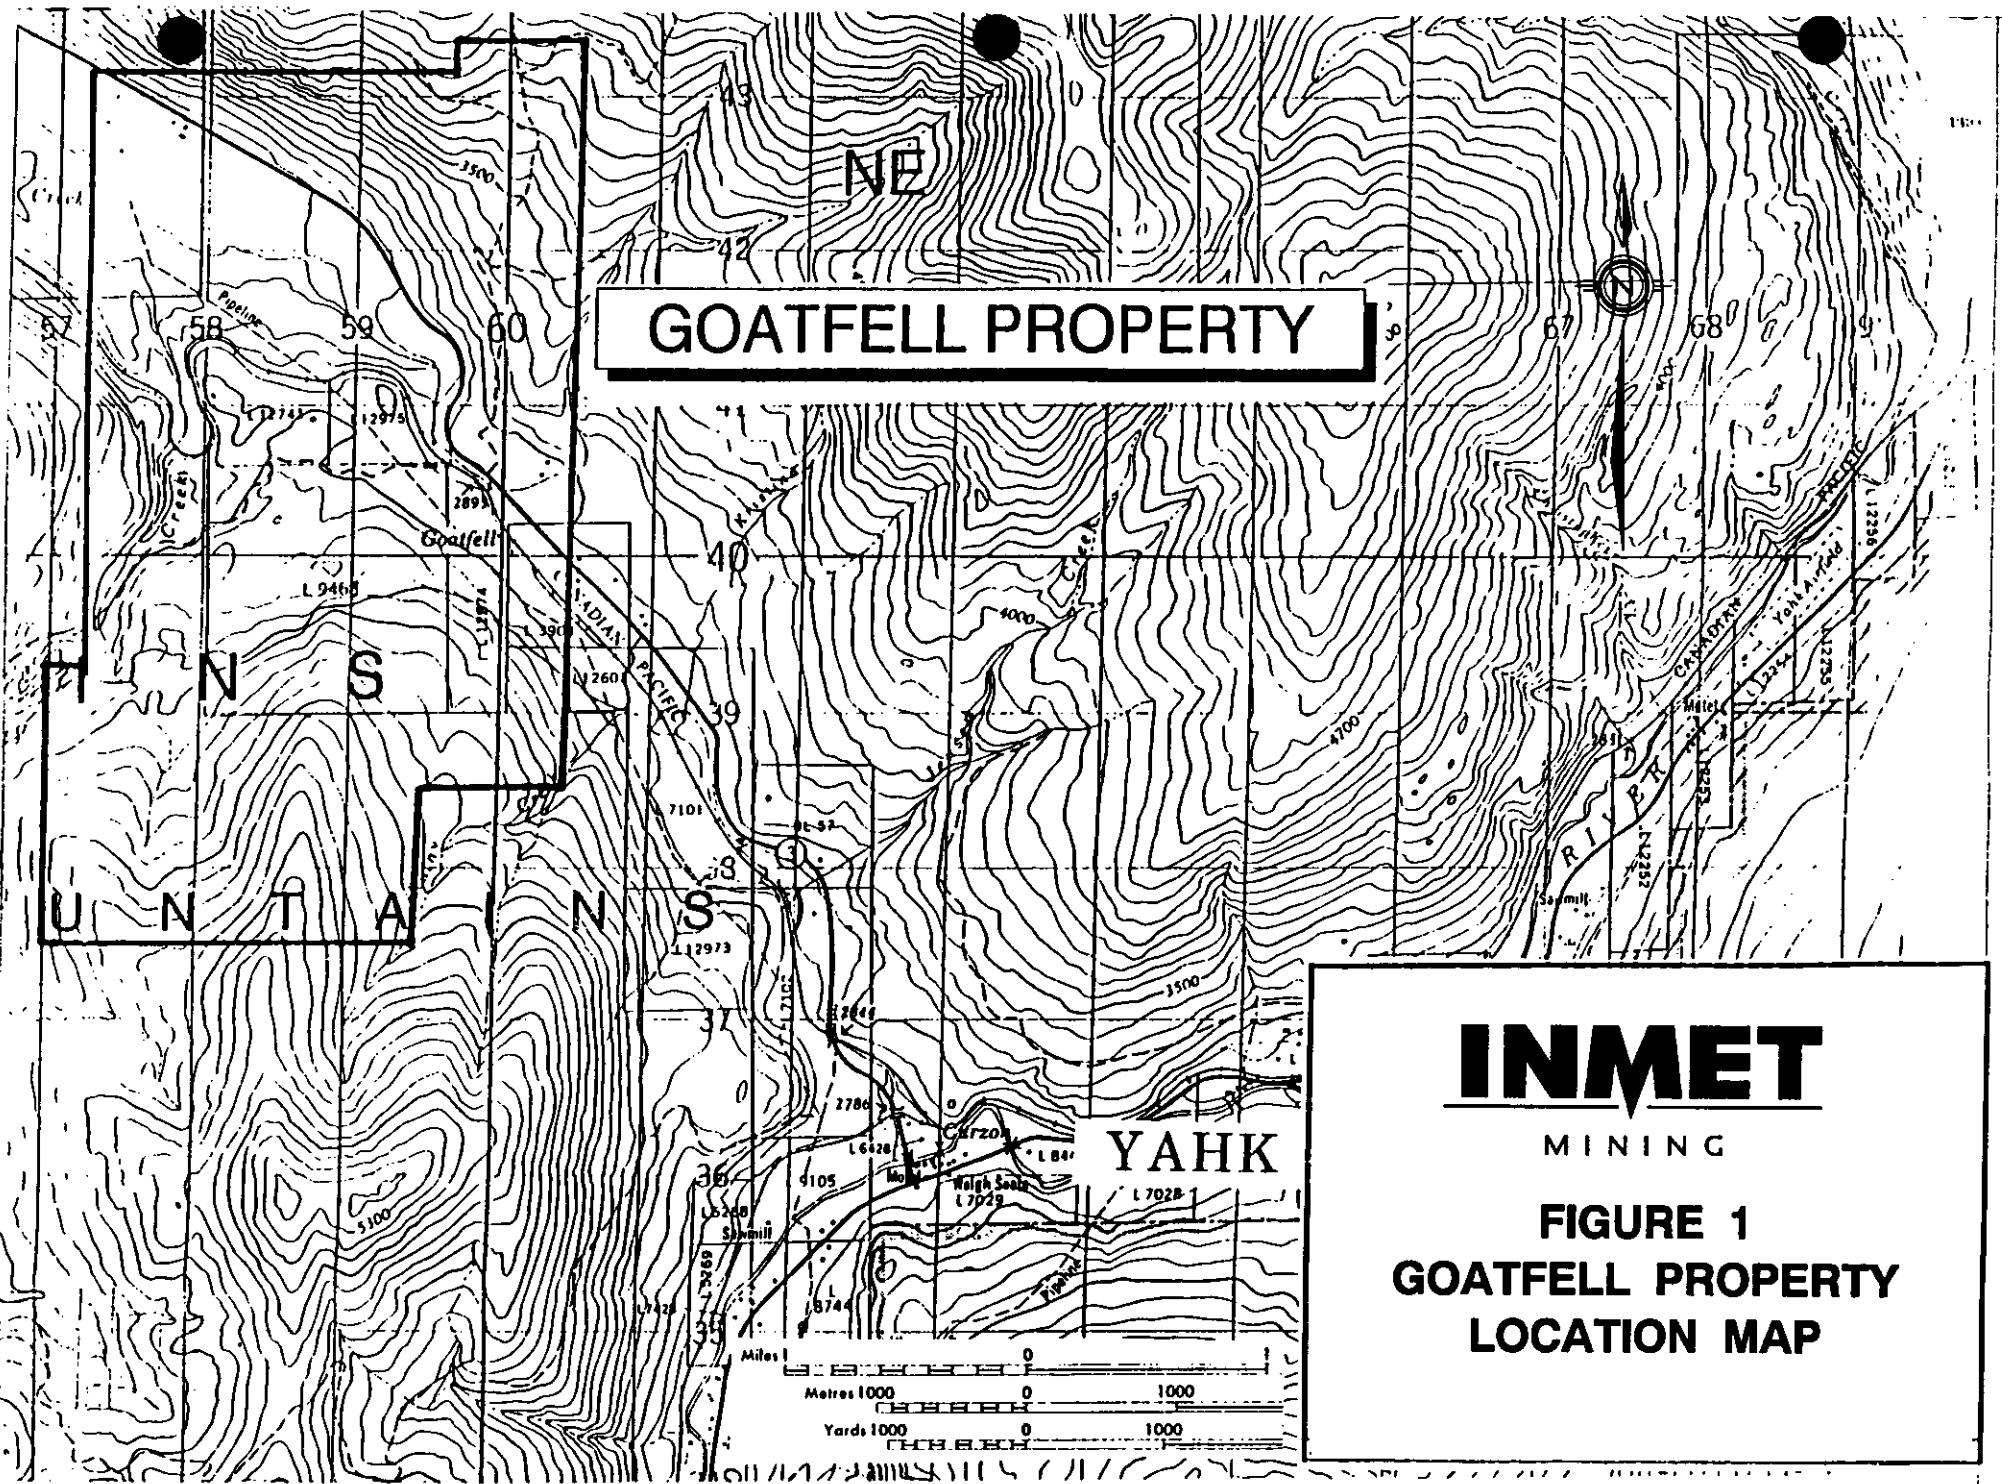

Introduction

A surface Crone Pulse E.M. Survey was conducted on the Goatfell Property, located near Yahk, British Columbia by Scott Geophysics Ltd. for Inmet Mining Corporation. A total of ten Loops with approximate dimensions of 1 km by 1 km were surveyed. The horizontal (dBx/dt) and vertical (dBz/dt) components of the secondary magnetic fields were measured at 50 meter station intervals on lines with 200 meter separations. The survey was conducted between May 29 th. and June 13 th.

Location and Access

The Goatfell property is located approximately 10 km northwest of the town of Yahk, British Columbia (Figure 1). The property is located on N.T.S. Map sheet 82F/1, and straddles the Fort Steele and Nelson Mining Divisions.

Access to the property is via Highway 3 that cuts across the northern portion of the property. At the present time there is an excellent network of Forestry, logging and private roads throughout most of the property. These roads are driveable using a two wheel drive vehicle, however four wheel drive is recommended. In addition to the excellent road network there is a natural gas pipeline corridor and the CPR branch line that connects Creston and Cranbrook present on the property.

Property -- Claim Status

The Goatfell Property consists of 25 claims totaling 83 units (Figure 2). Inmet Mining Corporation entered into an option agreement to earn an interest in the property from White Knight Resources Ltd. The Goatfell Property contains the following claims:

Claim Name	Record No.	Units	Mining District	Expiry Date	New Expiry Date
Goat 1	4007	20	Nelson	January 29, 1999	January 29, 2002
Goat 2	4008	20	Nelson	January 29, 1999	January 29, 2001
Goat 3	3286	20	Fort Steele	February 7, 1999	February 7, 2001

Property -- History

In 1984, a tourmalinized outcrop of middle Aldridge sediments exposed in the CPR right of way was staked by Gordon Leask. During 1985 and 1986 prospecting and geological mapping was conducted on the property by Gordon Leask.

The property was optioned to Chevron Minerals Ltd. in 1987. Chevron formed a joint venture with Formosa Resources Corporation to explore the property. Chevron acted as the operator to the joint venture. Between 1987 and 1990 Chevron completed Transient EM-37, magnetometer and VLF geophysical surveys in addition to geological mapping and soil geochemical surveys. A total of 2,005

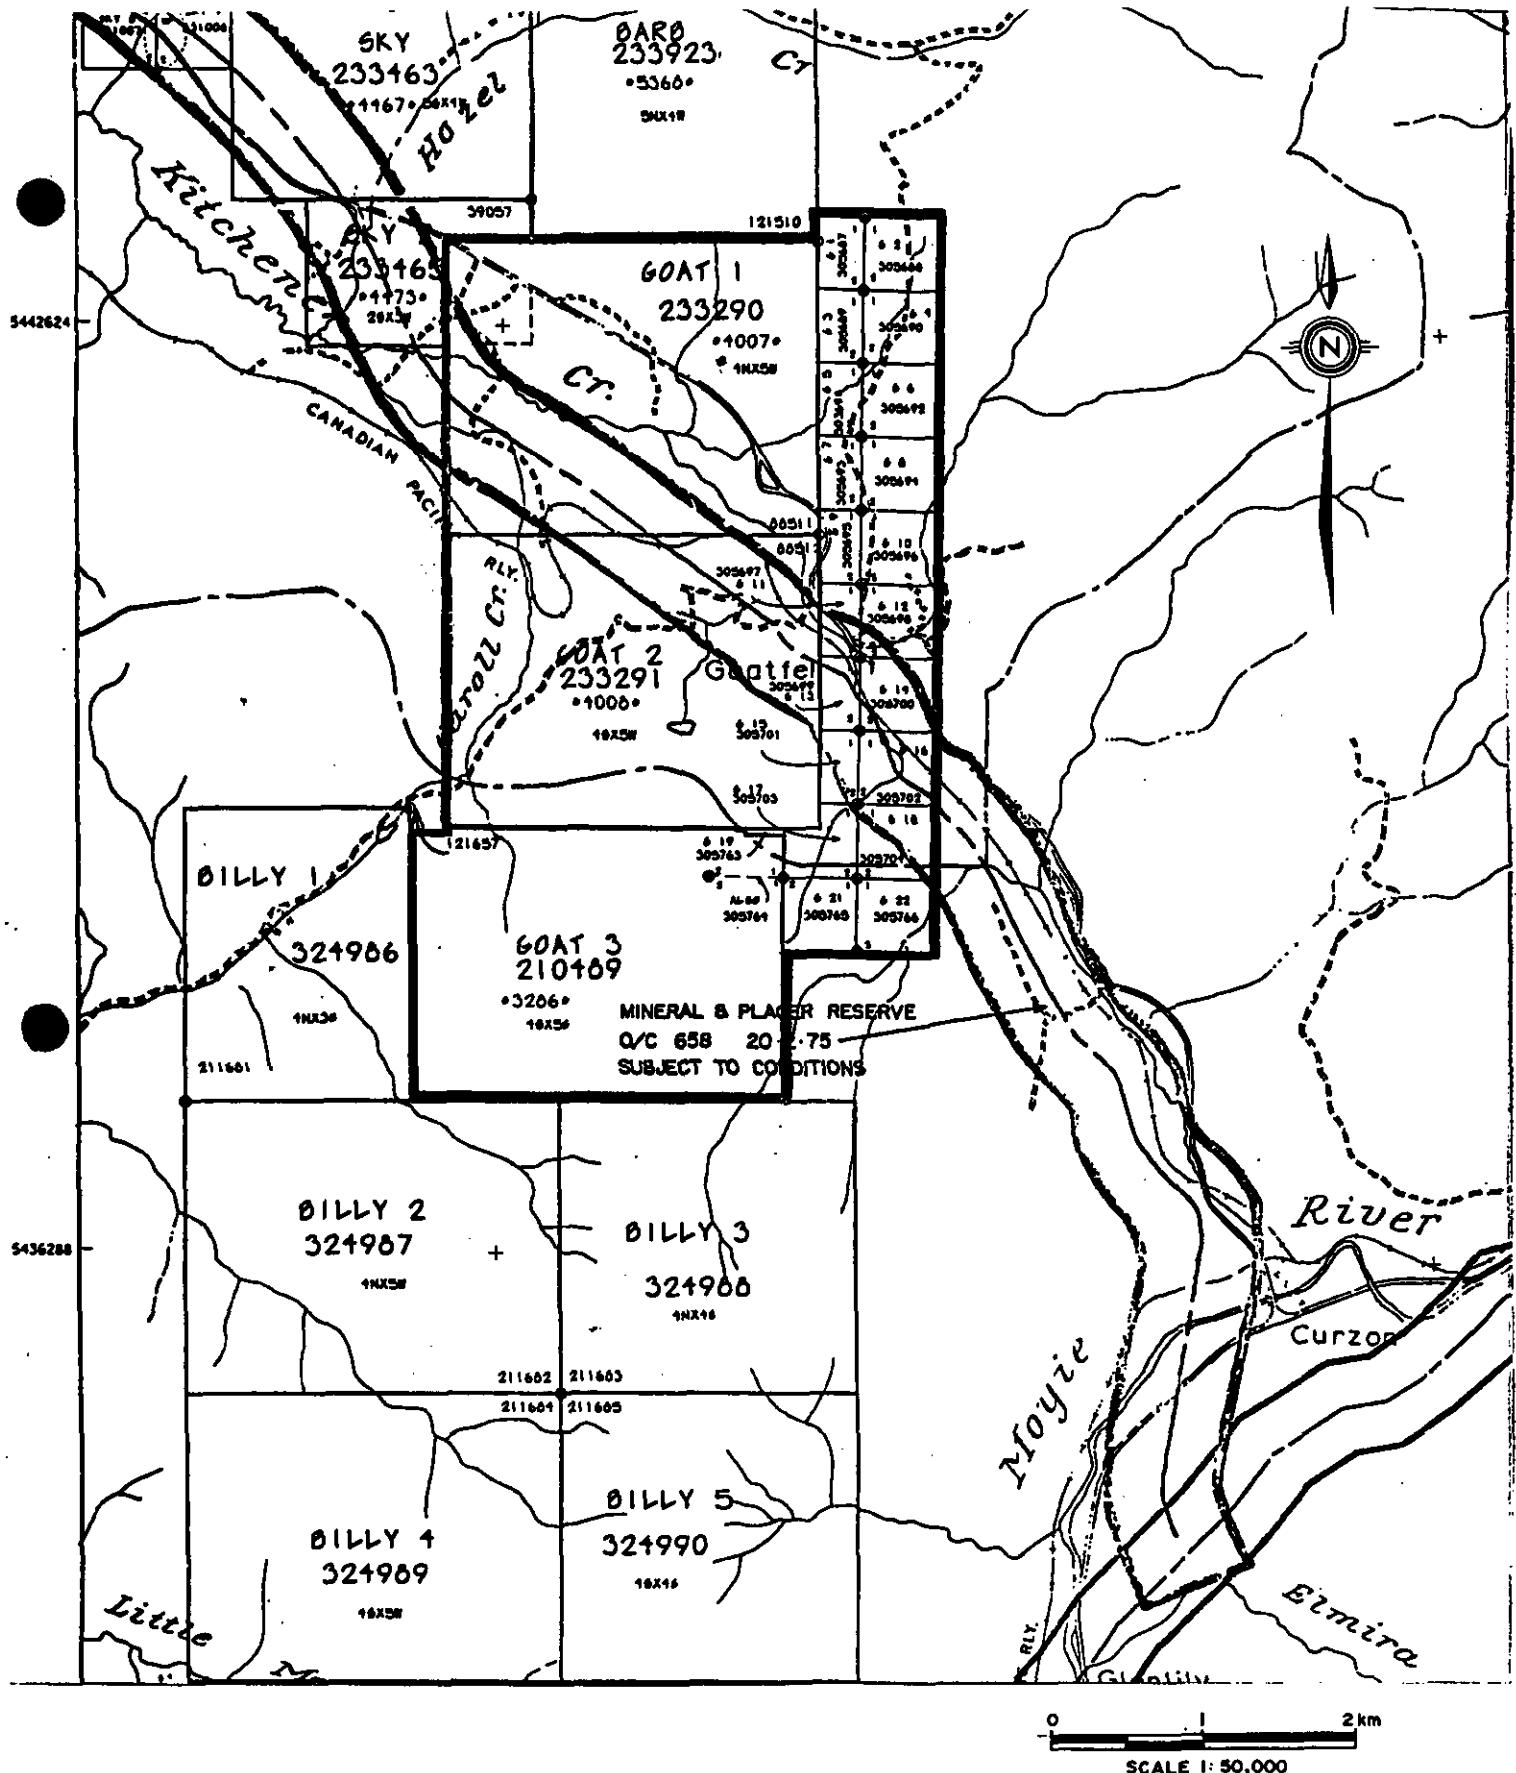

FIGURE 2
GOATFELL PROPERTY
CLAIM MAP

meters of diamond drilling was completed in four drill holes. The property was returned to Gordon Leask and associates during the latter part of 1990.

During 1991 Gordon Leask and associates carried out a program consisting of prospecting, geologic mapping, and soil geochemistry. The property was optioned to Goldpac Investments Ltd. in 1992. Goldpac Investments Ltd. returned the property back to the vendor in 1993.

The property was optioned to Inmet Mining Corporation from White Knight Resources Ltd. in 1995.

Regional Geology

The Goatfell property is situated in the western part of the Foreland Thrust and Fold Belt, on the west flank of the Purcell Anticlinorium. The Purcell Anticlinorium is a north dipping structure that has the Proterozoic age Aldridge and Creston Formations of the Belt-Purcell Supergroup exposed in its core. The Aldridge Formation consists of a thick sequence of turbidites (Lower, Middle and Upper divisions) that have been intruded by semi-conformable gabbroic sills known as the Moyie Intrusions. The Creston Formation overlies the Upper Aldridge Formation, and consists of a thick sedimentary sequence dominated by quartzite, siltstone and argillites.

Major structures in the Purcell Anticlinorium are a series of northeast trending faults. These are the Moyie and St. Mary faults, which divide the Aldridge package into three structural blocks. To the east the Anticlinorium is cut by the Gold Creek and Rocky Mountain Trench faults.

The Aldridge Formation is host to several sediment hosted massive sulphide deposits. The most significant of which is the world class Sullivan deposit. Other known stratiform deposits include the Kootenay King and North Star Deposits.

Property Geology

The Goatfell property is underlain by the Proterozoic age Aldridge (Middle) and Creston Formations of the Belt-Purcell Supergroup (Figure 3). The Middle Aldridge is represented by a thick succession of turbidite beds composed of grey quartzite, greywacke, siltstone and argillite. The Creston Formation consists of variably colored quartzite, siltstone and argillites.

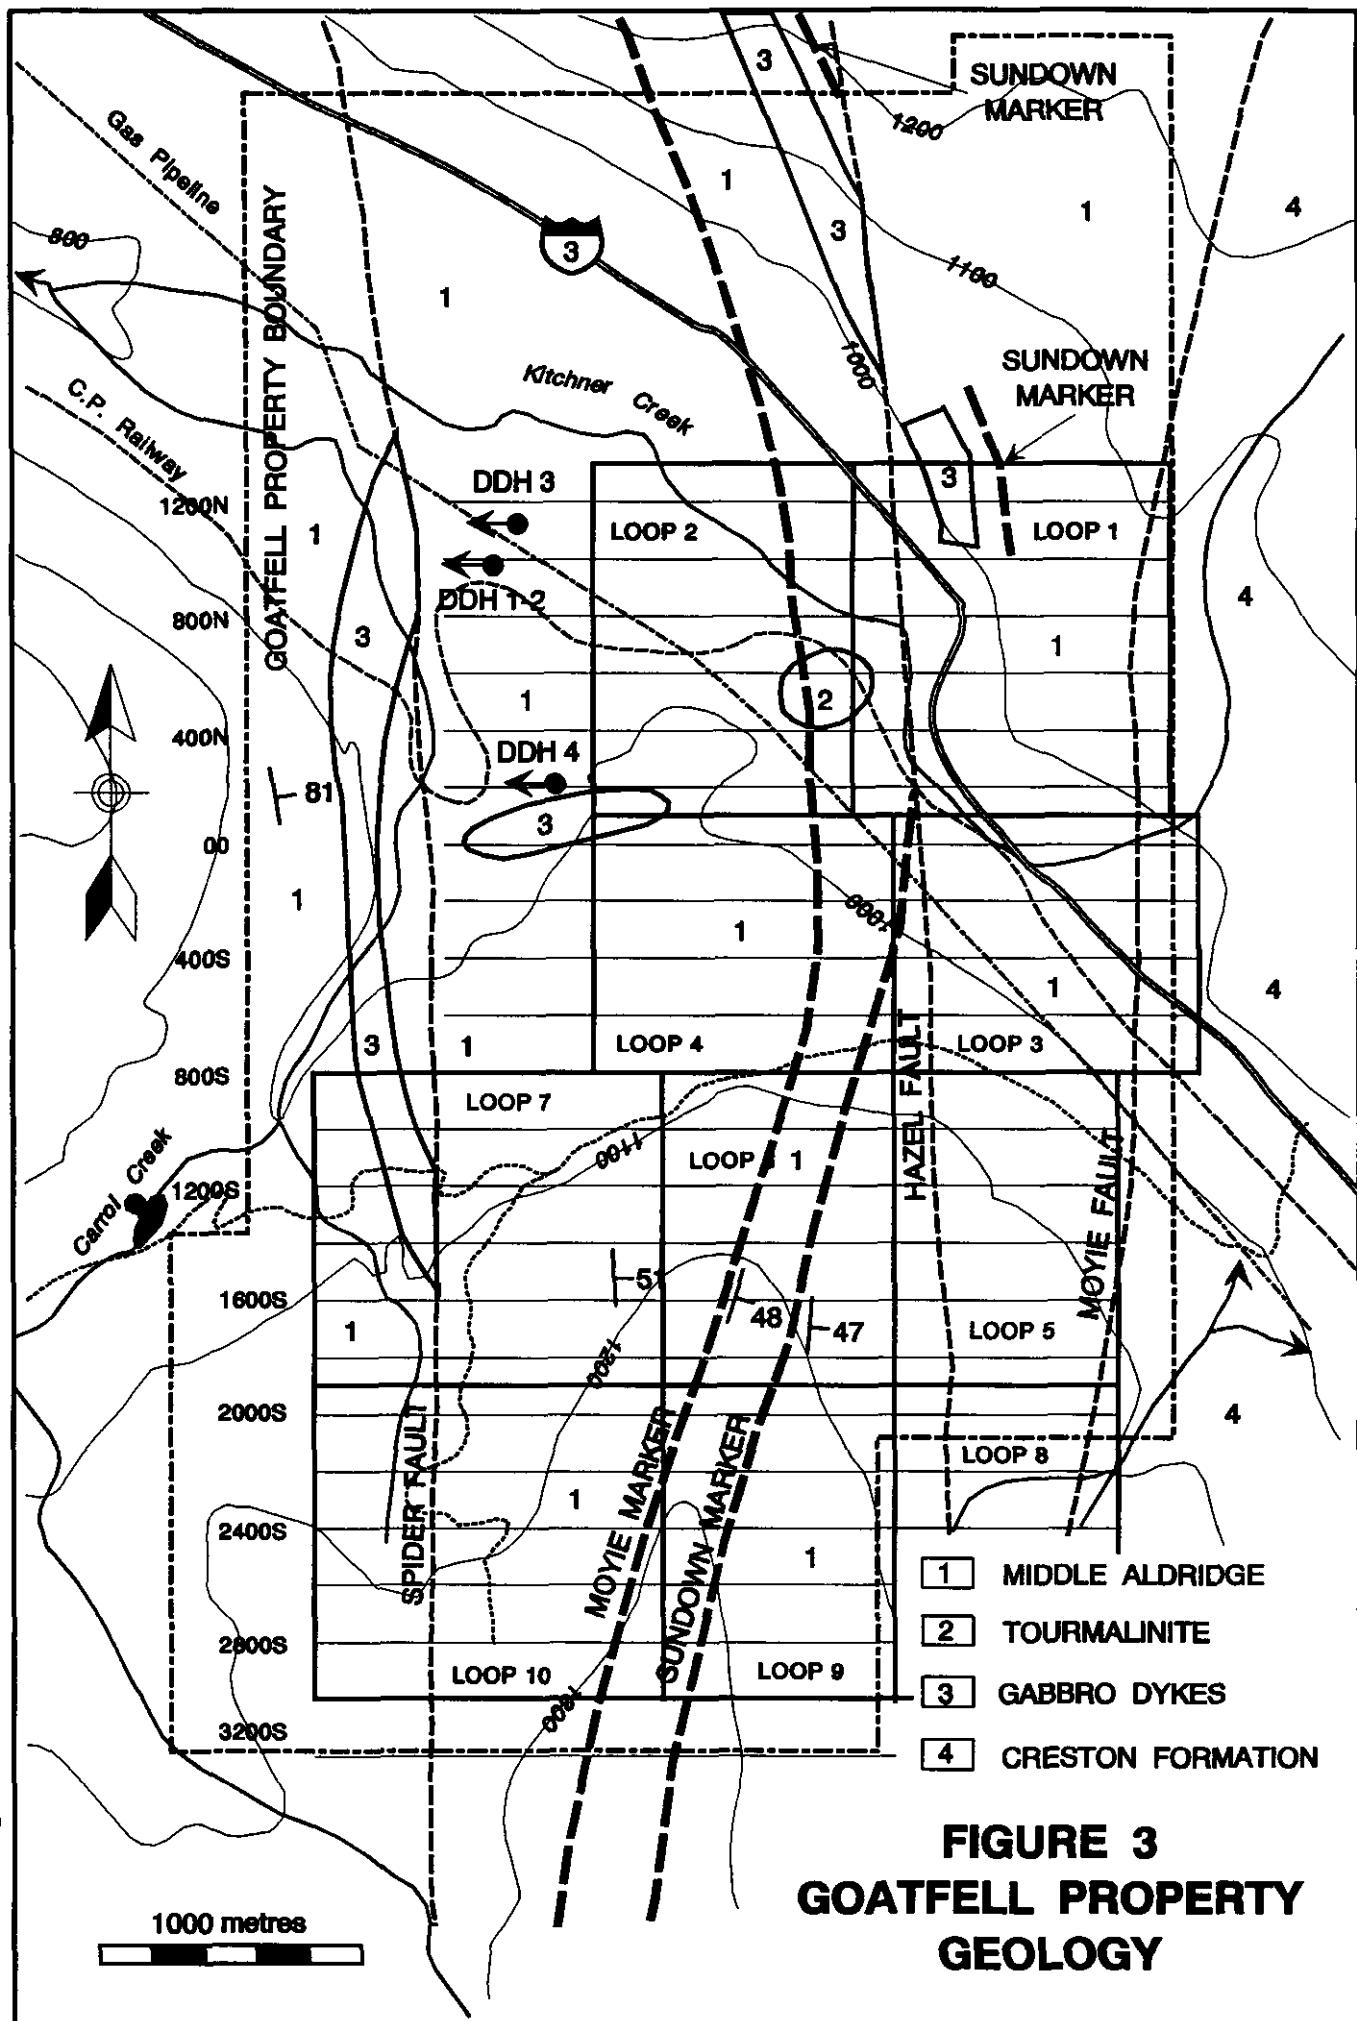

FIGURE 3

GOATFELL PROPERTY GEOLOGY

The Middle Aldridge sediments are intruded by Moyie dykes and sills. The dykes and sills vary from meta-gabbro to meta-diorite and are fine to coarsely crystalline in nature.

There are three major north trending structures present on the property. These are the Moyie, Hazel and Spider Creek faults. The Moyie fault separates the Middle Aldridge sediments from the Creston Formation rocks. The Hazel and Spider Creek faults occur within the Middle Aldridge sediments.

The most significant tourmaline alteration present on the property is located on the CPR right-of-way. This outcrop is oval shaped and is approximately 500 by 300 meters in size. Tourmaline alteration varies from less than 1% fine disseminated needles to 100% tourmaline replacement. Boulders of tourmaline altered sediments can be found on virtually every road cut on the property.

1995 Work Program

Inmet Mining Corporation optioned the Goatfell property from White Knight Resources Ltd. in 1995. A Crone Pulse EM Survey was planned to cover areas of stratigraphy known to contain the Moyie Time Horizon. The Moyie Time Horizon occurs approximately 800 meters stratigraphically above the Sullivan Time Horizon. Massive sulphide mineralization discovered on the Kid-Star property is believed to occur proximal to the Moyie Time Horizon. The Kid-Star property is located approximately nine kilometers northwest of the Goatfell property.

A total of 38.50 kilometers of cut line grid and 9.70 kilometers of flagged grid were established prior to the geophysical survey commencing. Work on the cut and flagged line grid commenced on May 6, 1995 and was completed May 29, 1995.

Scott Geophysics Ltd. was contracted to complete a surface Crone Pulse E.M. Survey on the property. A total of ten Loops (Figure 4) with approximate dimensions of 1 km by 1 km were surveyed. The horizontal (dB_x/dt) and vertical (dB_z/dt) components of the secondary magnetic fields were measured at 50 meter station intervals on lines with 200 meter separations.

Conclusions

The Crone Pulse EM Survey failed to locate any significant geophysical anomalies, within the survey area. A more detailed Loop by Loop breakdown of the results can be found in Appendix "C," Crone Surface Pulse Electromagnetic Survey Report, prepared by Jim Hawkins of Scott Geophysical Ltd.

Recommendations

Do to the lack of any significant geophysical anomalies in the survey area no further work is recommended.

Invoice: PEM Survey, Goatfell Property, B.C. (9521I01)

Field work on the above survey is now complete and the following charges are due per our agreement of May 3, 1995. The airfreight from Toronto and Brad Malpage's airfare will be invoiced via Crone Geophysics.

Fixed fee (preparations and testing - sec 9.1) \$ 500.00

Daily charges per sections 9.2 and 9.3:

Geophysicist (JHawkins), vehicle, equipment:

May 29, June 13 (mob/demob)	2 travel days @ 775	1550.00
May 30-June 12 (PEM survey)	14 survey days @ 1150	16100.00

Technician (BMalpage), 2nd vehicle and receiver:

May 29, June 13 (mob/demob)	2 travel days @ 475	950.00
May 30-June 12 (PEM survey)	14 survey days @ 575	8050.00

Expenses (sec 9.4)

Per attached expense summary	(2305.63 - 120.41 GST)	2185.22
Plus 10 percent		218.52
Per attached expense summary	(2393.84 - 142.13 GST)	2251.71
Plus 10 percent		225.17

For field assistants (sec 9.6)

Scott Benson: May 29-June 13	16 days @ 150	2400.00
Brendon Miller: May 29-June 13	16 days @ 150	2400.00

For additional presentation (sec 9.6)

JHawkins (June 15): Geophysicist	1 day @ 400	400.00
Transfer maps to vellums, copies		250.00

Total SCOTT charges: \$37480.62

Plus GST (registration no. 104754106) @ 7 percent \$2623.64

TOTAL THIS INVOICE: \$40104.26

Regards,

Alan Scott

STATEMENT OF QUALIFICATIONS

Statement of Qualifications

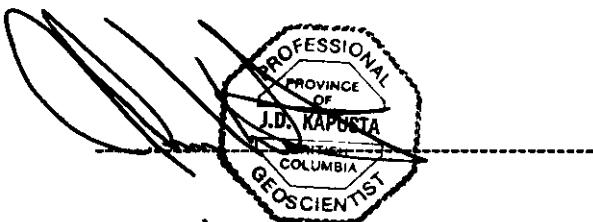

I John D. Kapusta, do hereby certify that:

I am a resident of British Columbia, residing at 7260 Gilhurst Crescent, Richmond, V7A1N9.

I am a graduate of the University of Manitoba, 1981 with a B.Sc. degree in Geology, and have practiced my profession on a full time basis since 1981.

I am a fully qualified geologist, registered as a Professional Geoscientist with the Association of Professional Engineers and Geoscientists of the Province of British Columbia.

I have been employed by Inmet Mining Corporation as a full time employee since 1988.

John Kapusta -- Project Geologist

1. INTRODUCTION

A surface Crone Pulse EM survey was performed on the Goatfell Property, near Creston, B.C., by Scott Geophysics Ltd. on behalf of Inmet Mining Corp. The field work was done within the period of May 29 to June 13, 1995.

The Crone Pulse EM survey consisted of ten loops approximately 1 km x 1 km in size on the Goatfell Property. The horizontal (dB_x/dt) and vertical (dB_z/dt) components of the secondary magnetic field were measured at a 50 metre station interval on lines 200 metres apart.

This report presents the results of the survey and describes the instrumentation and procedures used on the survey.

2. PERSONNEL

Jim Hawkins, Geophysicist, was the party chief on the survey and acted as one of the operators of the PEM receiver. Brad Malpage of Crone Geophysics acted as technical advisor and operated the second PEM receiver. Two Scott Geophysics assistants, Scott Benson and Brendon Miller acted as loop layers. John Kapusta, Project Geologist, was the Inmet representative for the survey.

3. INSTRUMENTATION AND PROCEDURES

A Crone 20 channel digital PEM receiver and a Crone 4.8 kilowatt PEM transmitter were used on the surface Crone PEM surveys.

A single turn of 10 gauge wire, or two 12 gauge, approximately 1 km x 1 km was laid around the areas of interest and lines were surveyed within the transmitter loop, and 500 metres west of the loop edges, to get the optimum coupling. The dB_x/dt and dB_z/dt components were recorded every 50 metres, with closer readings taken to detail any anomalies.

Time reference between the receiver and transmitter was maintained by crystal clocks.

The receiver/transmitter settings were constant for the entire survey, namely; Ramp - 1.5 msec, Time Base - 16.6 msec, Current - 12 to 16 amps (peak to peak), and Stacking - 512.

The survey data was archived, processed, and plotted using a Toshiba T3200SX microcomputer running Crone PEM and proprietary software.

4. DISCUSSION OF RESULTS

Please refer to Loop Compilation Maps in rear map pockets for overall loop layout, and individual loop Stacked Profile Maps. Cultural objects such as gas pipelines, railroads, etc. are noted on the Crone profiles at rear of the report.

Loop #1

The data collected on Loop #1 was greatly affected by cultural objects, such as the railroad, gas pipeline, and power line. Even though BC Gas turned off the rectifiers on the two gas pipelines in the area at our request, they still corrupted large amounts of the survey coverage.

No significant anomalies, other than cultural effects, appear to be present on any of these lines (see plots at end of this report).

Loop #2

Loop #2 was also greatly affected by the same cultural objects. For this reason, and the fact that the three northern lines and all western line extensions were not cut in very bad bush, some line sections were not surveyed. Coverage was such to ensure that no significant anomalies were missed. The southern loop edge was mistakenly laid down Line 0N, so Line 100N was surveyed to compensate.

No significant anomalies, other than cultural effects, were found on these lines.

Loop #3

Loop #3 was also greatly affected by the gas pipeline, railroad, and powerline. No significant anomalies, other than cultural effects, were found.

Loop #4

The northern edge of Loop #4 was mistakenly laid down Line 0N, so only four lines were surveyed from Loop #4. The western extensions of these lines were not cut.

No significant anomalies were detected.

Loop #5

A two station anomaly in the horizontal component is apparent on the extreme eastern end of Line 1800AS. There is no apparent north-south extension. There appears to be a general increase in amplitude from west to east, indicating a possible "charged body" off the survey area to the east.

Loop #6

No significant anomalies were detected on these lines.

Loop #7

Significant chainage errors resulted in what appears to be quite different line coverage, although all lines were surveyed from loop edge to loop edge. No significant anomalies were detected.

Loop #8

No significant anomalies were detected on these lines.

Loop #9

No significant anomalies were detected on these lines.

Loop #10

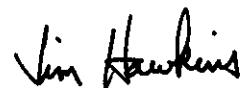

This portion of the grid was very confused, with lines suddenly jogging over up to 100 metres when you crossed the baseline. The results are plotted on an idealized grid, as little sense could be made of the real grid. No significant anomalies were detected on these lines.

5. RECOMMENDATIONS

Little or no significant anomalies that are not the result of cultural effects were found on the survey.

A detailed interpretation of these results, and correlation to geological and geochemical data, is required before any specific recommendations could be made.

Respectfully submitted,

Jim Hawkins, P. Geoph.

Statement of Qualifications

for

Jim Hawkins, Geophysicist

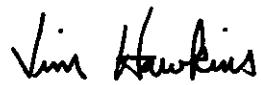

of

762 Dehart Road
Kelowna, B.C. V1Y 8R3

I, Jim Hawkins, hereby certify the following statements regarding my qualifications, and my involvement in the program of work described in this report.

1. The work was performed by individuals sufficiently trained and qualified for its performance.
2. I have no material interest in the property under consideration in this report, nor in the company on whose behalf the work was performed.
3. I graduated from the University of Western Ontario with a Bachelor of Science degree (Geophysics) in 1977.
4. I am a licensee of the Association of Professional Engineers, Geologists, and Geophysicists of Alberta (P. Geoph.).
5. I have been practicing my profession as a Geophysicist since 1977.

Respectfully submitted,

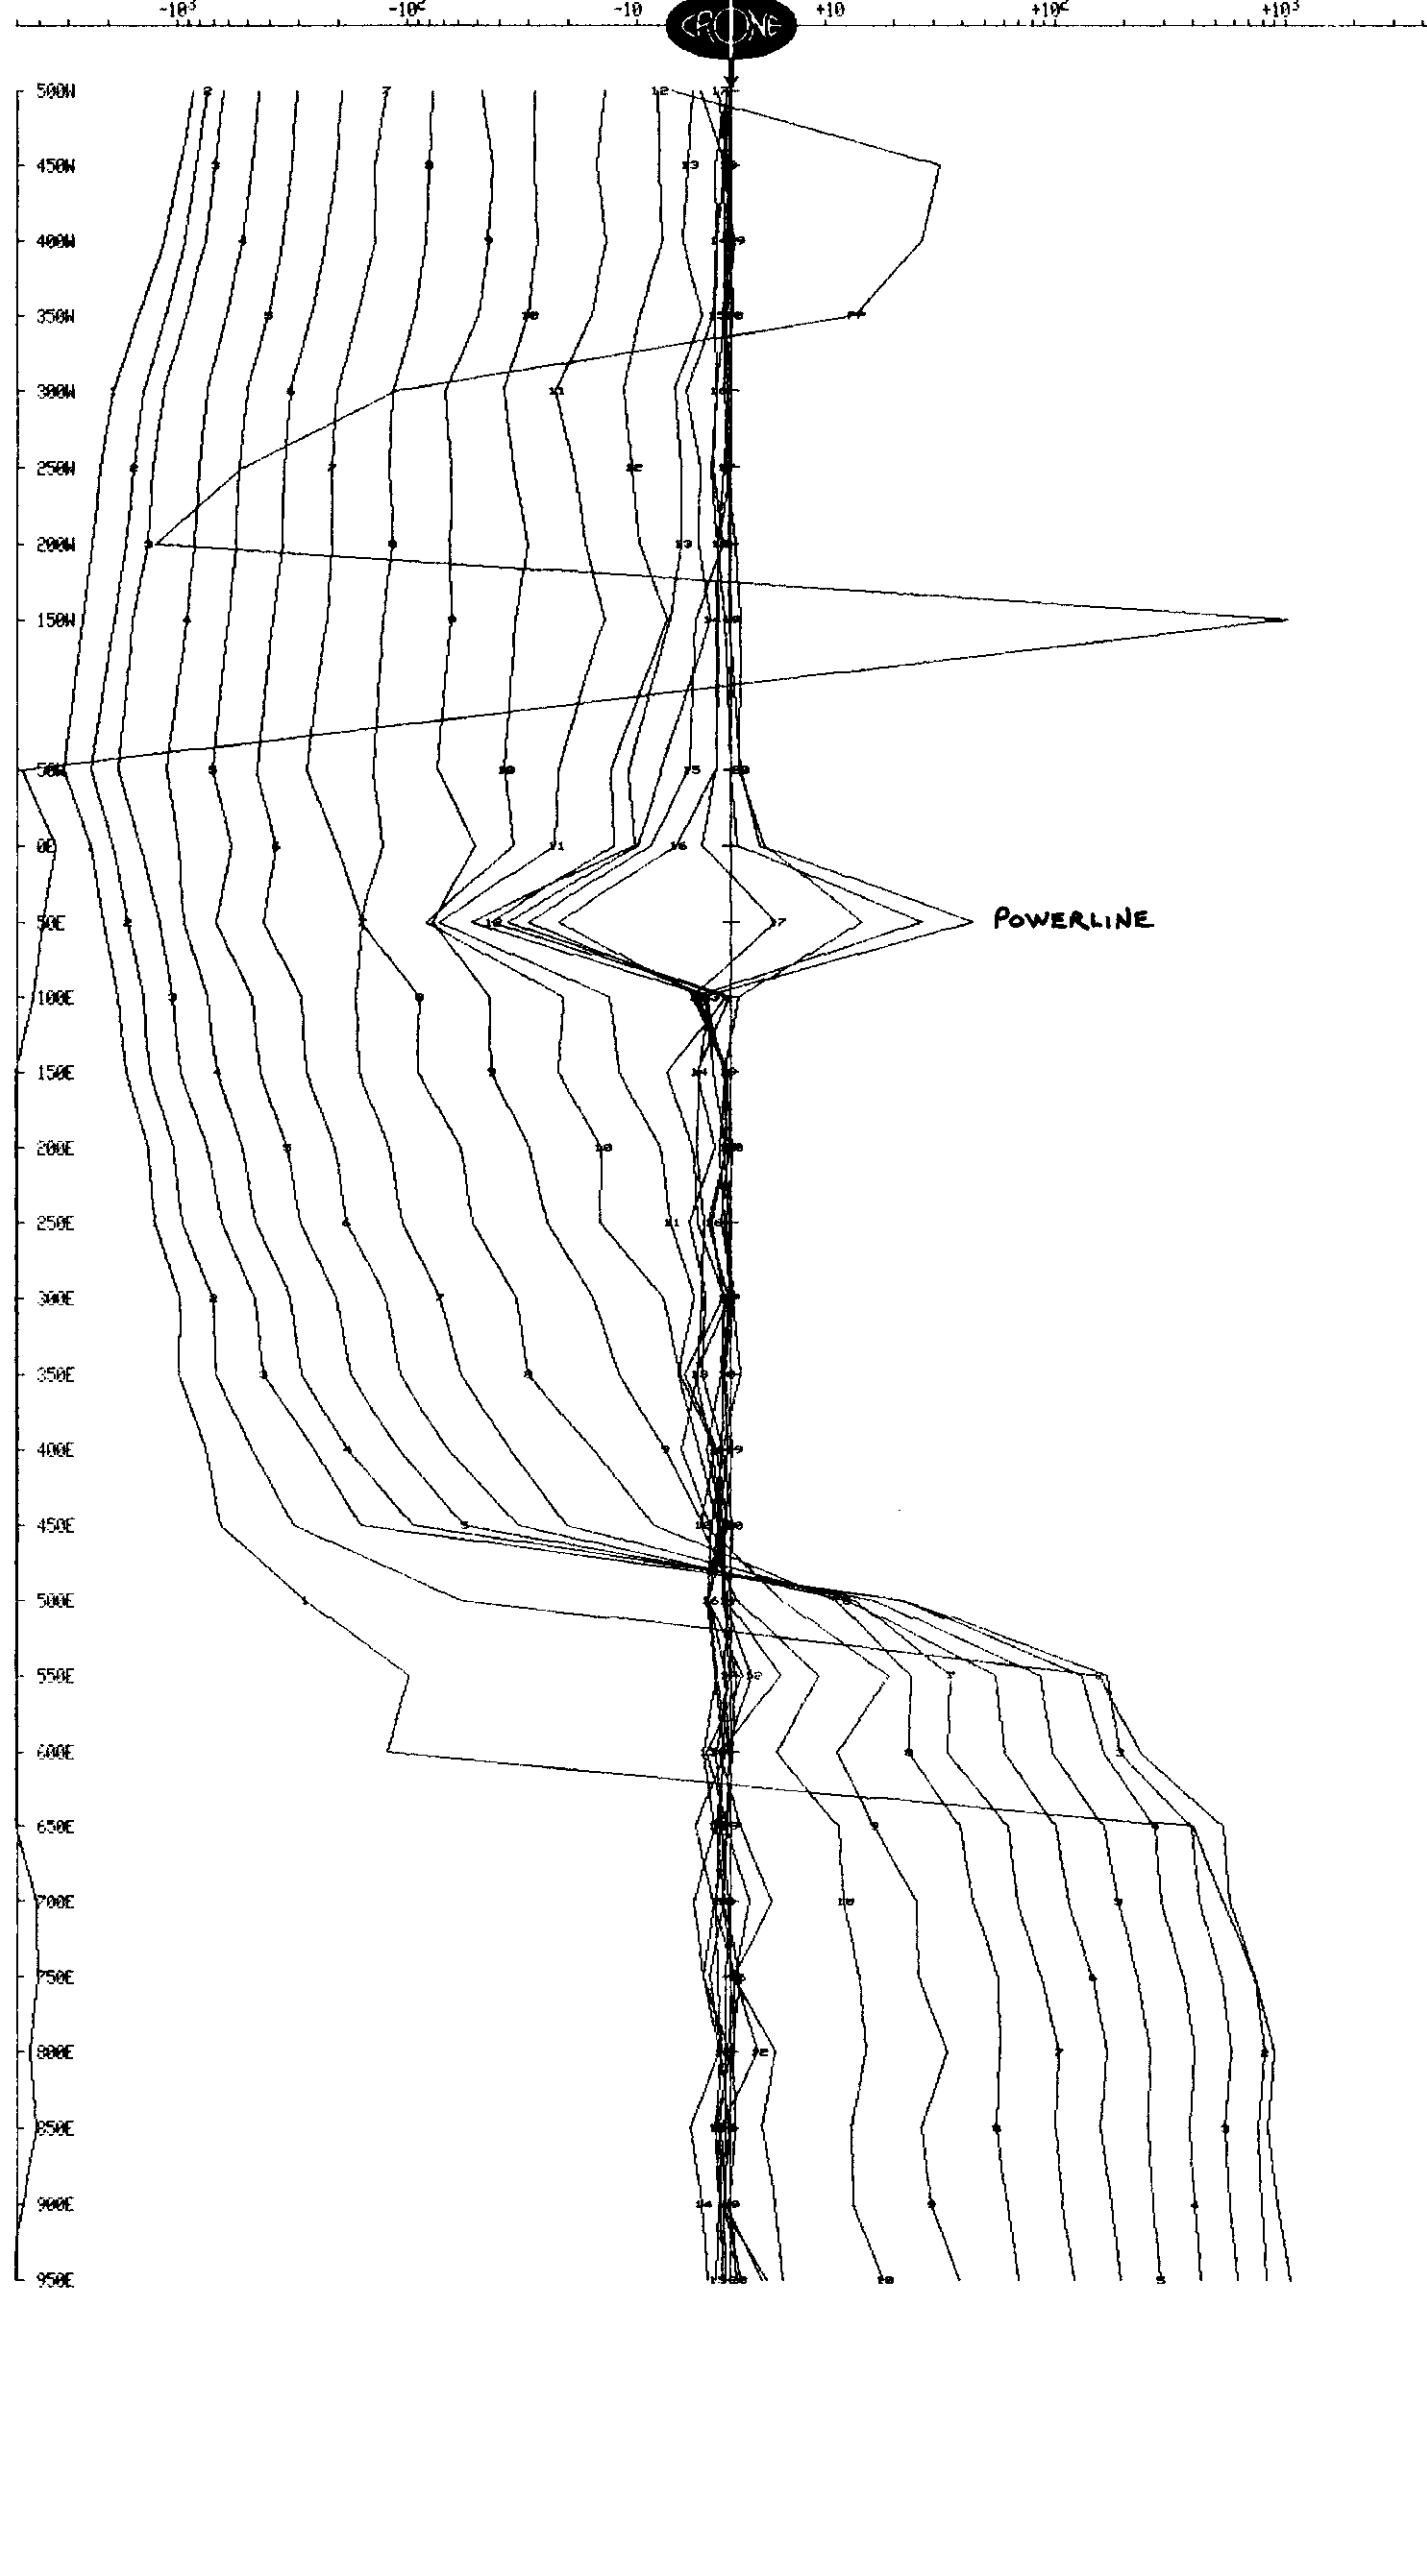

Jim Hawkins, P. Geoph.
