APPENDIX 7

Drill Logs and Assay Results

Cross-Sections

Drill Hole Trace Map

Drill Site Location Map

Lori Property DDH-95-1 Grid 2090N, 1915W

Azimuth 270°, Angle -10°, Depth 44.5 metres

0 - 11.1 m K-FELDSPAR PHYRIC GRANITE

Grey to rusty brown, medium to coarse grained, K-feldspar porphyritic; K-feldspars are rose pink, euhedral, zoned, 3-5 cm long, form 20-30% of the rock; mafic minerals, mostly biotite, 15-25%, locally in clusters 1-3 cm in diameter.
Structure: fracturing is moderate, commonly associated with rusty, Fe-oxide staining; dominant orientations:

1. 35° to c.a.
2. 65° to c.a.
3. 85° to c.a.

Alteration: rusty staining (Fe-oxides) over narrow intervals, some rusty stained fracture surfaces (after pyrite), local epidotization associated with narrow fractures filled with pyrite.
Mineralization: pyrite disseminations (0.2-0.5%), pyrite in 1-2 mm wide fractures trending 55, 65-70, and 80° to c.a.

0.0 - 1.4	moderately Fe-oxide altered granite
1.7 - 3.7	weak to moderate Fe-oxide staining
5.7 - 6.4	moderate fracturing and Fe-oxide alteration
7.3 - 10.1	several narrow, 5-10 cm wide rusty zones straddling the fractures, trend is 75-85° to c.a., few 1-2 mm wide pyrite veinlets at 65-70° to c.a., trace chalcopyrite

11.1 - 19.7 m MEDIUM-GRAINED GRANITE

The above porphyritic granite grades to medium grained granite with similar composition. Light grey to rusty brown, medium grained, grain size averages 1-2 mm; mafic minerals, mostly biotite, 5-10%.
Structure: fracturing is moderate, spacing is on average 10-15 cm, the dominant orientations are:

1. 45° to c.a.
2. 60° to c.a.
3. 70-75° to c.a.
4. 80-85° to c.a.

Alteration: Fe-oxide alteration, increases in intensity down the hole.
Mineralization: trace to 1% pyrite as fine disseminations and microfracture fillings, 1-3 mm wide veinlets, trace chalcopyrite and trace molybdenite? associated with pyrite in microfractures.

11.6 - 11.9	moderate Fe-oxide alteration

12.5 - 13.3	moderate Fe-oxide alteration, trace to 0.2% pyrite disseminations, trace chalcopyrite specks, trace molybdenite?, also 1-2 mm wide rusty fractures after pyrite
13.3 - 14.3	some rusty staining over 1 to 2 mm wide fractures and discontinuous rusty staining over <10 cm width, pyrite (to 0.5%) and chalcopyrite (trace) in 1-3 mm wide fractures trending 0-75 and 85° to c.a., pyrite also occurs as disseminations with trace fine specks of molybdenite?
14.3 - 15.8	trace to 0.5% pyrite and trace chalcopyrite? as disseminations and fracture fillings (1 mm wide) trending 60, 65-70 and 85° to c.a.
15.8 - 16.3	moderate Fe-oxide alteration, trace to 0.2% pyrite as disseminations, trace specks of molybdenite?
16.3 - 18.0	narrow to 10 cm wide sections of Fe-oxide alteration, trace to 0.5% pyrite as disseminations and microfracture fillings, up to 2 mm wide fractures with pyrite, trace molybdenite?, quartz and epidote veinlets trending at 65 degrees to c.a.
18.3 - 19.7	discontinuous zones of Fe-oxide staining centered on fractures, dominant trend is at 45, 70 and 85° to c.a., fracture frequency is every 2-5 cm, trace to 0.2% pyrite disseminations, rare pyrite veinlets trending at 75 and 85 degrees to c.a.

19.7 - 35.6 m FINE-GRAINED LEUCOCRATIC GRANITE

Buff to light grey to rusty brown, fine to locally medium grained, equigranular, leucocratic granite, less than 5% mafic minerals.

Structure: generally poorly competent core, extensive fracturing and brecciation, high fracture density, some faulting, dominant joint/fracture orientations:

1. 0° to c.a.
2. 40 to 45° to c.a.
3. 60° to c.a.
4. 70 to 75° to c.a.
5. 85° to c.a.

Alteration: bleached and crumbly rock over almost 70% of the interval, silicification and argillization, Fe-oxide alteration, locally epidotization usually associated with pyrite veining.

Mineralization: rare coarse blebs of molybdenite (3 mm long) at 19.7 m, trace fine disseminations of molybdenite?, trace to 0.3% pyrite as fine disseminations and in 1-2 mm wide microfractures trending at 75 to 85 degrees to c.a. and less commonly 45° to c.a.

19.7 - 22.7	highly fractured rock, intense Fe-oxide alteration, moderate silicification?, argillization of feldspars, trace to 1% pyrite as fine disseminations and microfracture fillings (1-2 mm wide) trending 45 and 65 to 75° to c.a.
23.1 - 23.2	crumbly, broken-up core, bleaching, argillized feldspars, some Fe-oxide alteration, narrow shear zone?, rusty specks and veinlets after pyrite
23.4 - 23.5	crumbly, broken-up core, bleaching, argillized feldspars, some Fe-oxide alteration, narrow shear zone?, rusty specks and veinlets after pyrite
23.6 - 25.1	shear/fault zone - crumbly, bleached core, argillic and Fe-oxide alterations
25.7 - 28.0	poorly competent core, fairly broken up but not as badly as above 23.6 - 25, some argillization and Fe-oxide alteration
28.0 - 30.8	broken up core but not crumbly, bleached, appears silicified and argillized, some rusty staining mostly on fracture surfaces (after pyrite)
31.3 - 31.9	broken-up interval
31.9 - 35.6	several less than 10 cm wide sections of broken core; moderate to locally intense fracturing, rusty staining is commonly centered on fractures, trace to 0.2% pyrite as disseminations and microfracture fillings

35.6 - 44.5 m K-FELDSPAR PHYRIC GRANITE

The same as described in 0.0 - 11.1 m.

Structure: Moderate to locally intense fracture orientations:
1. 40° to c.a.
2. 60° to c.a.
3. 65-70° to c.a.
4. 85° to c.a.

Alteration: discontinuous Fe-oxide alteration

Mineralization: rare pyrite (trace) as disseminations and fracture fillings

36.5 - 37.6	poorly competent, broken-up interval, narrow segments of intensively brecciated and Fe-oxide stained granite (shear zone?)
38.0 - 38.4	broken core, argillized and weakly Fe-oxide altered zone
42.4 - 44.5	fault zone- heavily broken up and crumbly core, intense Fe-oxide and chlorite alteration

44.5 m E.O.H.

The Fe-oxides are the result of alteration of pyrite by meteoritic waters.

Lori Property DDH-95-2 Grid 2090N, 1915W

Azimuth 315°, Angle -5°, Depth 30.0 metres

0 - 9.3 m K-FELDSPAR PHYRIC GRANITE

Grey to rusty brown, coarse to medium grained, porphyritic, K-feldspar phenocrysts, 3-5 cm long, form about 25-30% of the rock, 20% quartz, 30% K-feldspars, 25-30% plagioclase, 20-25% biotite.
Structure: moderate intensity of fracturing; dominant trends are:

1. 45° to c.a.
2. 55-65° to c.a.

Alteration: discontinuous patchy Fe-oxide alteration
Mineralization: trace pyrite, no other sulfides

0.0 - 1.8	broken up and Fe-oxide altered granite (close to surface weathering)
5.5 - 5.7	crumbly, shattered, heavily Fe-oxide stained interval; coarse to medium grained porphyritic granite grades to medium grained granite

9.3 - 21.0 m MEDIUM-GRAINED GRANITE

Medium to light grey to rusty brown, medium grained, equigranular granite, 5-7% mafic minerals, mainly biotite, grain size averages 1-2 mm. Contact with the above K-feldspar phyric granite is gradational.
Structure: moderate degree of fracturing, dominant orientations are:

1. 20-30° to c.a.
2. 45° to c.a.
3. 55° to c.a.
4. 70° to c.a.
5. 80-85° to c.a.

Alteration: appears to be locally bleached, possibly due to silicification, Fe-oxide altered especially on fracture surfaces, also weak argillization of feldspars.
Mineralization: trace to 0.5% pyrite disseminations and microfracture fillings, trace to <0.1% molybdenite mostly as coarse rosettes (2-10 mm long), as fine disseminations, pyrite ± molybdenite? in microfractures trending 55° to c.a.

9.3 - 11.2	moderate Fe-oxide alteration, trace to 0.2% pyrite and trace molybdenite, pyrite and molybdenite? in 1-2 mm fractures trending 55° to c.a.
11.2 - 15.8	trace to 0.4% pyrite as disseminations and microfracture fillings, trend is commonly 45, 70 and 85° to c.a., trace molybdenite? is associated with pyrite, epidote is sometimes present in microfractures

15.8 - 16.4	broken-up core, intense fracturing with associated Fe-oxide alteration
16.4 - 19.0	discontinuous, 25 cm wide intervals of Fe-oxide staining centered on fractures, trend is commonly 50-60° to c.a., to <0.1% coarse molybdenite rosettes (2-10 mm in length), also trace fine chalcopyrite? disseminations, 0.1-0.3% pyrite as disseminations and fracture fillings, trend is 60-65° to c.a.
19.0 - 21.0	trace pyrite disseminations

21.0 - 30.0 m FINE-GRAINED LEUCOCRATIC GRANITE

Buff to slightly light rusty brown, fine grained, equigranular.
Structure: weakly fractured, trends are:

1. 50-55° to c.a.
2. 70° to c.a.
3. 80° to c.a.

Alteration: rare Fe-oxide staining on fracture surfaces
Mineralization: trace pyrite disseminations

24.4 - 27.6	about 2.5 metres of core has not been recovered, broken-up/fault zone?
27.6 - 30.0	very poor core recovery, about 2.5 metres is missing, clay gouge/fault zone

30.0 m E.O.H.

The Fe-oxides are the result of alteration of pyrite by meteoritic waters.

Lori Property DDH-95-3 Grid 2090N, 1915W

Azimuth 225°, Angle -45°, Depth 30.0 metres

0 - 30.0 m K-FELDSPAR PHYRIC GRANITE

Medium grey to slightly rusty brown, medium grained, K-feldspar phyric (<10% - 30%); K-feldspars are rose pink and zoned, on average 3 cm long, groundmass is granitic consisting of 30% quartz, 20-25% K-feldspar, 30% plagioclase and 15-20% mafic minerals, dominantly biotite, biotite grains locally form 2-3 cm diameter aggregates.
Structure: weakly fractured, dominant fracture orientations are:

1. 15° to c.a.
2. 35° to c.a.
3. 45° to c.a.
4. 70° to c.a.

Alteration: weak, locally occurring Fe-oxide alteration, weakly chloritized biotite, rare epidotization
Mineralization: trace to 0.2% pyrite as disseminations and microfracture fillings, rare pyrite with quartz (to 1 cm wide veins) and trace chalcopyrite.

0.0 - 2.3	broken-up and slightly Fe-oxide stained rock (weathering surface)
3.7 - 3.8	1 cm wide quartz-pyrite (trace chalcopyrite) veinlet trending at 40° to c.a., rare epidote is associated with the veining
5.0 - 5.9	discontinuous, to 10 cm long intervals of Fe-oxide staining
12.5 - 12.8	broken-up, fractured Fe-oxide stained interval, fracturing is at 30° to c.a.
16.8 - 17.1	some crumbly, broken core, Fe-oxide alteration
17.4 - 17.5	rusty Fe-oxide stained, broken core, fracturing is at 70° to c.a.
17.8 - 17.9	broken-up and fractured core, some Fe-oxide staining, fracturing is at 60° to c.a.
22.0 - 22.5	fractured and broken core, some Fe-oxide staining
23.1 - 24.0	Fe-oxide stained and fractured granite, fracturing is dominantly at 0° to c.a.
27.8 - 27.9	broken core, slightly Fe-oxide stained

30.0 m E.O.H.

The Fe-oxides are the result of alteration of pyrite by meteoritic waters.

Lori Property DDH-95-4 Grid 2240N, 2005W

Azimuth 270°, Angle -45°, Depth 30.7 metres

0 - 13.2 m FINE-GRAINED GRANITE

Light to medium grey with abundant rusty brown Fe-oxide staining, equigranular, grain size averages <1 mm in length, several coarser (1-2 mm average grain size) intervals, mafic minerals, dominantly biotite, forms 5-8% of the rock.
Structure: moderately fractured, fracture orientations are:

1. 40 - 45° to c.a.
2. 70° to c.a.
3. 50° to c.a.

Alteration: pervasive silicification, localized and fairly extensive Fe-oxide alteration, and less common epidotization, chloritization and argillization.
Mineralization: pyrite, trace to 0.5% as disseminations and microfracture fillings (trend is 40° to c.a.), trace chalcopyrite in association with pyrite in microfractures (<1 mm wide), trace molybdenite? as fine disseminations, trace magnetite

0.0 - 0.6	from 0.2 to 0.4 metres, medium-grained granite, lower contact is fairly sharp at 35° to c.a., Fe-oxide staining
1.0 - 1.2	Fe-oxide alteration, pyrite + molybdenite? veinlets trending 40° to c.a.
1.7 - 2.1	Fe-oxide altered granite
2.1 - 6.2	Pyrite-molybdenite veinlets, <1 mm wide, trending 40° to c.a., abundant 10-40 cm wide intervals of Fe-oxide staining
6.2 - 8.8	slightly coarser grained than 0.0 - 6.2, extensive Fe-oxide alteration, some dark reddish brown hematite blotches and fracture fillings, lesser clay is associated with hematite on fracture surfaces
9.5 - 9.9	medium-grained, Fe-oxide altered granite, grain size averages 1-2 mm, both contacts are sharp at 80-85° to c.a.
11.7 - 12.2	medium-grained, Fe-oxide altered interval, similar to above; contacts are sharp at 70° to c.a.
12.5 - 13.2	several 1-2 mm wide pyrite-trace chalcopyrite? veinlets, trend is 40° to c.a., trace pyrite + molybdenite? disseminations, chloritized clusters of biotite

13.2 - 16.4 m MEDIUM-GRAINED GRANITE WITH PEGMATITE

Medium grey to rusty brown, Fe-oxide altered, medium to less commonly coarse-grained, pegmatitic intervals, inequigranular; mafic minerals, mostly biotite, to 10%

Structure: weakly brecciated
Alteration: common Fe-oxide alteration, chloritized mafics
Mineralization: trace -0.3% pyrite as fine specks and clusters, 0.5 cm in diameter.

14.0 - 14.1	pegmatite, Fe-oxide altered
14.6 - 15.2	abundant pegmatitic intervals, fairly intense Fe-oxide alteration
16.2 - 16.4	Fe-oxide stained pegmatite

16.4 - 30.4 m MEDIUM-GRAINED GRANITE

Grey to buff to rusty brown, medium-grained, equigranular, average grain size is about 1-1.5 mm; mafic minerals, biotite, forms about 10% of the rock, narrow sections of fine grained granite (10-15 cm wide) and medium/coarse-grained K-feldspar phyric granite.
Structure: weakly fractured, dominant trend is 45° and 60° to c.a.
Alteration: generally weak, local Fe-oxide alteration over narrow intervals
Mineralization: rare trace pyrite as disseminations and also as fracture fillings (trend is 45° to c.a.)

18.2 - 18.8	Fe-oxide staining
19.6 - 19.7	trace pyrite disseminations, Fe-oxide alteration
19.8 - 20.0	weak Fe-oxide staining
25.6 - 26.6	K-feldspar phyric, coarse-grained granite, contacts are not that sharp, roughly trending at 45° and 65° to c.a. (upper and lower, respectively)

30.4 - 30.7 m K-FELDSPAR PHYRIC GRANITE

Grey, coarse-grained, K-feldspar phyric, phenocrysts form about 20% of the rock, groundmass consists of 30% pink K-feldspars, 25% plagioclase, 25% quartz, 20% mafic minerals (biotite). Generally weakly fractured and altered with no sulphide mineralization.

30.7 m E.O.H.

The Fe-oxides are the result of alteration of pyrite by meteoritic waters.

Lori Property DDH-95-5 Grid 2240N, 2005W

Azimuth 225°, Angle -45°, Depth 31.1 metres

0 - 0.1 m MEDIUM-GRAINED GRANITE

Light grey, medium grained, equigranular, 5% biotite, trace pyrite. Medium grained granite grades gradually to a fine grained variety of similar composition.

0.1 - 10.3 m FINE-GRAINED, LEUCOCRATIC GRANITE

Medium grey, fine-grained, equigranular, leucocratic, on average less than 5% mafic minerals, mostly biotite.
Structure: weakly to locally moderately fractured, fracture orientation is generally:

1. 40-45° to c.a.
2. 50° to c.a.
3. 60° to c.a.

Alteration: possibly pervasive silicification, localized Fe-oxide alteration centered on fractures, rare chloritization and epidotization.
Mineralization: trace to 0.2% pyrite as fine disseminations, to 1 mm wide pyrite ± trace molybdenite? in veinlets, commonly trending 45-50° to c.a. and 60° to c.a., trace magnetite as disseminations and veinlets in association with pyrite

0.1 - 0.4	intense Fe-oxide alteration/surface weathering
2.0 - 2.3	trace -0.1% pyrite and trace molybdenite? as fine disseminations, moderate Fe-oxide alteration
2.8 - 3.2	Fe-oxide staining, to 0.1% pyrite, trace molybdenite?
4.2 - 4.3	some chloritization, trace molybdenite and 0.2% pyrite on fractures trending 45° to c.a.
5.2 - 5.3	rusty Fe-oxide alteration
6.2 - 7.0	some rusty Fe-oxide staining, dark brown, large blotches of hematite and Mn oxide?
7.6 - 8.1	two pyrite + molybdenite? veinlets trending 50° and 60° to c.a.
8.1 - 10.0	several, <10 cm wide segments of Fe-oxide alteration, trace to 0.3% pyrite disseminations and trace molybdenite (one rosette 0.5 cm long at 9.2 m), rare pyrite coating narrow fractures trending 60° to c.a.
10.0 - 10.3	silicified and chloritized section, number of <1 mm wide pyrite veinlets trending at 60° to c.a.

10.3 - 19.1 m DOMINANTLY FINE TO MEDIUM-GRAINED GRANITE

The above fine-grained granite grades, over 5 cm width, to medium-grained K-feldspar phyric granite. This unit consists dominantly of light grey fine to medium-grained granite with shorter intervals of coarse-grained pegmatite and medium to coarse-grained K-feldspar phyric granite. The grain size varies from <1 mm to about 1-1.5 mm, on average. The mafic minerals, dominantly biotite, form <5 to 10% of the fine to medium-grained granite. The mafic content is up to 20% in the K-feldspar phyric granite.
Structure: weakly fractured.
Alteration: localized Fe-oxide alteration, fine-grained intervals appear to be silicified.
Mineralization: trace to 0.1% pyrite, trace to 0.03% molybdenite as coarse (to 0.5 cm) rosettes.

10.3 - 10.7	medium-grained, K-feldspar phyric granite, K-feldspar are on average 1-2.5 cm long
11.2 - 12.0	swirling intensely Fe-oxide stained fine-grained granite in medium-grained and pegmatitic varieties, patches of dark brown hematite and Mn oxide
12.5 - 12.6	Fe-oxide altered pegmatitic interlayer
12.8 - 13.0	Pegmatite consisting of dominantly K-feldspar, plagioclase and quartz, trace pyrite
15.0 - 15.3	Fe-oxide altered fine to medium-grained granite, trace molybdenite (1 mm in length specks)
15.8 - 16.1	Fe-oxide alteration, 0.3% pyrite as dissemination and veinlets
16.9 - 19.1	Fe-oxide alteration, weak to moderate, over majority of this interval, to 0.1% pyrite as blebs and fine disseminations, coarse molybdenite rosettes (to 0.5 cm), trace to 0.03%

19.1 - 29.4 m MEDIUM-GRAINED GRANITE

Grey, medium-grained, equigranular granite, average grain size is 1-2 mm, 10-12% mafic minerals, dominantly biotite, short interval of coarse grained, K-feldspar phyric granite.
Structure: weakly fractured
Alteration: rare Fe-oxide alteration
Mineralization: absence of sulphides

20.3 - 21.6	medium to coarse-grained, K-feldspar phyric granite, weak Fe-oxide alteration, chloritized biotite

29.4 - 31.1 m K-FELDSPAR PHYRIC GRANITE

Grey to rusty brown, medium to coarse grained, grain size averages 3-4 mm, 25% K-feldspar phenocrysts in granitic matrix consisting of K-feldspar, plagioclase, quartz and biotite. Contact with the above unit is gradational.
Structure: weakly brecciated
Alteration: locally moderate Fe-oxide alteration
Mineralization: trace to 0.2% pyrite

31.1 E.O.H.

The Fe-oxides are the result of alteration of pyrite by meteoritic waters.

Lori Property DDH-95-6 Grid 2240N, 2005W

Azimuth 180°, Angle -45°, Depth 44.6 metres

0 - 13.9 m FINE-GRAINED GRANITE

Light grey to rusty brown, fine-grained with narrow intervals, to 40 cm wide, of medium-grained granite (average grain size 1-2 mm), mafic minerals, mostly biotite, 3-8%
Structure: weak to locally moderate intensity of fracturing, dominant orientations are:

1. 30° to c.a.
2. 45° to c.a.
3. 60° to c.a.

Alteration: dominantly Fe-oxide alteration, rare epidotization commonly associated with pyritic veinlets
Mineralization: trace to 0.1% pyrite as disseminations and in veinlets trending 45-50°, 60° and 70° to c.a., trace chalcopyrite, trace fine specks of molybdenite? and rare molybdenite and pyrite veins trending 45° to c.a., rare molybdenite flakes to 3 mm long at 11.2 metres

0.0 - 2.5	abundant Fe-oxide alteration, several to 40 cm wide sections of medium grained granite, to 1 mm wide pyrite veinlets trending 45-50°, 60° and 70° to c.a., trace molybdenite?
3.6 - 3.7	several 2 to 20 mm wide grey quartz ± pyrite ± trace chalcopyrite veins trending 55-65° to c.a., trace molybdenite?
4.6 - 4.7	several to 3 mm wide grey quartz-pyrite veinlets, trend is 60-70° to c.a.
4.8 - 7.4	slightly coarser, white feldspar-rich interval, average grain size 1.0 mm, common Fe-oxide staining, abundant to 1 mm wide rusty veinlets (after pyrite), trend is 60-65° to c.a., trace molybdenite? on fracture planes with pyrite, trend is 65° to c.a.
9.8 - 10.0	Fe-oxide alteration
10.4 - 11.4	interval of moderate Fe-oxide alteration, several pyrite and molybdenite veinlets, 1-2 mm wide, trending 45° to c.a., trace molybdenite flakes to 3 mm long
12.5 - 13.3	Fe-oxide staining, rare dark brown hematite patches, trace pyrite, mostly as disseminations

13.9 - 17.1 m K-FELDSPAR PHYRIC GRANITE

Grey, medium to locally coarse-grained, K-feldspar porphyritic; K-feldspars are rose pink, on average 1-3 cm long and form 30-35% of the rock. Matrix consists of K-feldspars (25%), plagioclase (30%), quartz (25%) and biotite (20%). Average grain size is 2-3 mm.
Structure: weakly fractured
Alteration: local, weak Fe-oxide staining
Mineralization: trace pyrite

17.1 - 27.6 m MEDIUM-GRAINED GRANITE

Gradational transition from above K-feldspar phyric granite to medium-grained, non-porphyritic variety. Grey, medium grained (grain size 1.5 - 2 mm), equigranular, mafic minerals 5-8%
Structure: very weakly fractured
Alteration: rare Fe-oxides coating fractures, some chloritization of biotite
Mineralization: rare pyrite as fine disseminations (trace)

27.1 - 27.3	clusters of chloritized biotite, Fe-oxide staining
27.3 - 27.4	pegmatitic phase

27.6 - 29.9 m K-FELDSPAR PHYRIC GRANITE

Gradational coarsening to K-feldspar phyric granite. The same as described in above 13.9 - 17.1 m.

29.9 - 44.6 m MEDIUM-GRAINED GRANITE

The same as described in above 17.1 - 27.6 m.

44.6 m E.O.H.

The Fe-oxides are the result of alteration of pyrite by meteoritic waters.

Lori Property DDH-95-7 Grid 2270N, 2218W

Azimuth 270°, Angle -80°, Depth 30.8 metres

0 - 12.0 m FINE-GRAINED LEUCOCRATIC GRANITE

Grey to rusty brown, fine-grained (average grain size is 0.5 - 1 mm) leucocratic; mafic minerals <3% (mostly biotite).
Structure: moderately to weakly fractured, dominant orientations are:

1. 25-30° to c.a.
2. 45° to c.a.
3. 85-90° to c.a.

Alteration: rusty, Fe-oxide staining, pervasive silicification, epidotization in areas of pyrite veining
Mineralization: trace to 0.3% pyrite in small blebs and microfracture fillings, trace to 0.02% molybdenite, 1-10 mm flakes/rosettes

0.0 - 2.5	broken-up core, fairly intense fracturing accompanied by extensive Fe-oxide alteration, trace to 0.1% pyrite ± epidote in small clusters, trace to 0.08% molybdenite, up to 1 cm long rosettes
2.5 - 5.7	brecciation is not as intense as in 0-2.5, fracture controlled Fe-oxide alteration, trace to 0.2% molybdenite flakes (to 1 cm long)
6.6 - 6.9	broken-up core, Fe-oxide altered, trace molybdenite, 2-3 mm specks, trace pyrite
7.5 - 7.9	broken-up core, fracture controlled Fe-oxide alteration
8.4 - 8.9	Fe-oxide alteration

12.0 - 30.8 m FINE TO MEDIUM-GRAINED GRANITE

Grey to locally rusty brown, fine to medium-grained (grain size average 1 to 2 mm); mafic minerals dominantly biotite <5%.
Structure: weakly brecciated, dominant trend is:

1. 25° to c.a.
2. 45° to c.a.
3. 60° to c.a.
4. 85° to c.a.

Alteration: some Fe-oxide alteration centered on fractures, local chloritization and epidotization
Mineralization: trace to 0.1% pyrite, trace molybdenite as rare 1-2 mm disseminations

13.6 - 14.0	broken core, Fe-oxide stained fracture surfaces

14.5 - 14.7	broken-up core, some Fe-oxide alteration
14.7 - 15.0	pinkish to buff pegmatitic zone consisting of quartz and feldspars
15.4 - 17.2	several to 10 cm wide areas of fracturing accompanied by fracture controlled Fe-oxide staining, trace pyrite as disseminations and microfracture fillings trending commonly 30° and 50° to c.a.
17.2 - 17.8	intense fracturing and associated Fe-oxide staining, to 0.1% pyrite
17.8 - 20.0	pyrite-chlorite stockwork, locally fairly intensely chloritized granite host
21.8 - 23.0	broken-up core at 5-10° to c.a., weak Fe-oxide staining on some fractures, trace pyrite, trace molybdenite up to 2 mm long disseminations
23.0 - 24.2	partly broken-up core, trend of fractures is at 10° to c.a.

30.8 m E.O.H.

Lori Property DDH-95-8 Grid 2270N, 2218W

Azimuth 270°, Angle -45°, Depth 30.8 metres

0 - 17.5 m FINE-GRAINED LEUCOCRATIC GRANITE

Light grey to rusty brown, fine grained (average grain size 0.5 mm), leucocratic, 3% mafic minerals-mostly biotite, locally granite is vuggy, vugs are often rusty and/or filled with pyrite.
Structure: moderate to locally intense fracturing from 0 to 7.5 m, below 7.5 m it is generally weaker, dominant trends are:

1. 30° to c.a.
2. 45° to c.a.
3. 60° to c.a.
4. 80° to c.a.

Alteration: pervasive silicification, intense Fe-oxide alteration over a large part of this interval, locally chloritization and argillization (feldspars), rare epidotization associated with pyrite
Mineralization: pyrite (trace to 0.5%) as fine disseminations, in clusters (to 0.5 cm in diameter), fracture fillings (1 mm wide) and filling vugs, trace to 0.1% molybdenite, 2-15 mm long flakes

0.0 - 3.3	poorly competent, broken-up core, intense Fe-oxide alteration, trace to 0.1% molybdenite (to 1.5 cm long rosettes), to 0.5% pyrite commonly in vugs
3.3 - 3.4	shattered, crumbly core, abundant argillization, Fe-oxide on fracture surfaces
3.4 - 6.4	broken-up interval, moderate fracturing with accompanied Fe-oxide alteration, trace to 0.08% molybdenite, 1-3 mm specks
7.0 - 7.3	broken core, dominantly at 0-10° to c.a., intense Fe-oxide alteration
8.7 - 11.0	trace to 0.01% molybdenite disseminations (1-5 mm flakes)
13.0 - 13.3	broken-up, poorly competent interval, fracture controlled Fe-oxide alteration
14.5 - 15.1	fairly intense fracturing with associated Fe-oxide alteration
15.7 - 16.1	abundant pyrite (1%) ± chlorite ± epidote veining, stockwork type, pyrite occurs also as disseminations
16.1 - 17.0	shear zone?/partly crumbly core, intense pyrite-chlorite and locally Fe-oxide alteration
17.0 - 17.5	pyrite-chlorite veining, similar to 15.7 - 16.1 m

17.5 - 30.8 m FINE TO MEDIUM-GRAINED GRANITE

Gradual coarsening in grain size and increase in mafic content. Grey to grey-green, locally rusty brown, fine to medium-grained (grain size averages 1-2 mm), mafic minerals, mostly biotite <3% to 7%. Generally equigranular.
Structure: moderately fractured, dominant orientations:

1. 45° to c.a.
2. 60° to c.a.
3. 85-90° to c.a.

Alteration: generally weak Fe-oxide alteration, moderate to 20 m depth, commonly chloritized and argillized fracture surfaces
Mineralization: trace to 0.5% pyrite

17.5 - 18.0	broken, poorly competent core, brecciated, Fe-oxide altered, at 17.6 m, 3-4% pyrite in large blebs and veinlets
18.3 - 19.0	broken-up core, moderate Fe-oxide alteration, argillization of feldspars
20.0 - 20.1	broken-up narrow interval, Fe-oxide stained, some argillization
21.8 - 22.0	poorly competent core, chlorite and clay altered fracture surfaces
25.5 - 25.7	broken core

30.8 m E.O.H.

Lori Property DDH-95-9 Grid 2270N, 2218W

Azimuth 315°, Angle -45°, Depth 44.5 metres

0 - 38.6 m FINE-GRAINED,LEUCOCRATIC GRANITE

Light grey to rusty brown, fine grained on average, sugary texture, some medium grained intervals with grey quartz (1-2 mm) forming clusters to 2 cm in length, leucocratic, mafic minerals, dominantly biotite (<3%), inequigranular.
Structure: moderately to locally strongly fractured and brecciated over entire zone, dominant fracture orientations are:

1. 30° to c.a.
2. 45° to c.a.
3. 70° to c.a.
4. 80° to c.a. fracture density is high.

Alteration: pervasive silicification, argillized feldspars in coarser grained sections, extensive Fe-oxide alteration, rare epidote associated with pyrite
Mineralization: trace to 1.0% pyrite as disseminations and fracture fillings, common rusty stained fracture surfaces (after pyrite), pyrite veinlets or coatings on fractures (trend 45 and 80° to c.a.) Abundant coarse molybdenite rosettes, 1-2.5 cm long, several sections with 0.5-1% over one metre length

0.0 - 3.8	some broken-up core, moderately to locally intensely fractured, abundant fracture controlled Fe-oxide alteration, to 0.5% pyrite, some fractures trending 45-50° and 80° to c.a.
6.8 - 7.0	broken core, moderate Fe-oxide alteration
7.7 - 7.9	broken core, Fe-oxide staining, 0.1% pyrite
8.8 - 9.0	coarse, to 1.5 cm in length, molybdenite rosettes (0.5 - >1.0%)
9.5 - 9.7	coarse molybdenite rosettes, to 1.0 cm long
10.4 - 10.6	coarse molybdenite rosettes, to 1.0 cm long
13.5 - 15.2	large molybdenite rosettes, to 1.5 cm long (0.3 - 0.5% over 1.0 m sampling interval)
15.0 - 15.3	extremely crumbly core/some fault gouge, intense argillization, 0.5% pyrite
15.3 - 16.0	pyritic (2-3%), chloritized and silicified granite, few pyrite (1 mm wide) veinlets trending 85° to c.a., trace molybdenite specks (0.5 - 1 mm in length)
16.0 - 20.8	heavily broken-up and Fe-oxide altered core, at least 1.5 m of core is missing, up to 0.2% of molybdenite as coarse, to 2 cm long rosettes over 0.5 m intervals, few 1-2 mm wide pyrite veinlets trending 80-85° to c.a.
20.8 - 27.6	broken-up core but not as heavily as the above 15.3 - 20.8 interval, Fe-oxide altered, especially fracture surfaces are covered with Fe-oxides

32.9 - 33.0	coarse, molybdenite rosettes, 0.1% pyrite
35.3 - 35.4	broken core with some clay gouge/narrow shear?, chlorite + epidote on fractures, 0.5% pyrite as disseminations and in fractures
37.9 - 38.1	large molybdenite rosettes, 2 cm long, (1-3%) 0.5% euhedral pyrite and epidote in medium to coarse grained quartz-rich granite

38.6 - 40.8 m MEDIUM-GRAINED GRANITE

A gradational transition to medium-grained granite. Pinkish grey, medium-grained, average grain size is 1-3 mm, 30% quartz, 62% K-feldspars and plagioclase, 8% biotite
Structure: weakly fractured, dominant trends:
1. 45° to c.a.
2. 60° to c.a.
Alteration: rare Fe-oxide coating fracture surfaces, local weak chloritization
Mineralization: trace pyrite

40.6 - 40.8	partly broken core, weak chloritization, Fe-oxide on fracture surfaces

40.8 - 44.5 K-FELDSPAR PHYRIC GRANITE

The above medium-grained granite grades to coarser, porphyritic variety. Coarse grained, grey-green, inequigranular, porphyritic, 25-40% rose-pink K-feldspar phenocrysts, matrix: 20% quartz, 80% K-feldspar and plagioclase; 20% biotite, often in large clusters (2-4 cm in diameter)

44.5 E.O.H.

Lori Property DDH-95-10 Grid 2270N, 2218W

Azimuth 0°, Angle -45°, Depth 21.9 metres

0 - 12.3 m FINE TO MEDIUM-GRAINED LEUCOCRATIC GRANITE AND LESSER PEGMATITE

Light grey to greenish grey to rusty brown, dominantly fine-grained (grain size <0.5 mm), leucocratic (mafic minerals <3%), medium-grained leucocratic granite (grain size averages 1-2 mm) and pegmatite (grain size >5mm). Generally mafic minerals form an average <3% to locally 5% of the rock.

Structure: moderate to locally intense fracturing with associated Fe-oxide alteration, dominant trends are:

1. 30° to c.a.
2. 45° to c.a.
3. 70° to c.a.
4. 85-90° to c.a.

Alteration: pervasive silicification, Fe-oxide alteration, local chloritization and epidotization

Mineralization: trace to 0.5% pyrite as fine disseminations, microfracture fillings and coarse blebs, 1-2 cm long, trace to 0.01% molybdenite as small flakes and rosettes (to 1 cm long)

0.7 - 1.0	broken-up and partly crumbly core, Fe-oxide stained pegmatite and medium-grained, mafic-rich (to 20%) granite
1.9 - 2.1	Fe-oxide altered, broken-up core, pegmatitic granite
2.9 - 3.1	pegmatite with few 1-2 mm long specks of molybdenite
3.5 - 3.6	broken core, Fe-oxide alteration
5.4 - 6.1	medium-grained interval, rare pyrite ± epidote veinlets trending 20° to c.a.
6.1 - 6.3	0.2% molybdenite rosettes, to 1 cm long
7.6 - 8.2	medium-grained, leucocratic, inequigranular, granite with several to 5 cm wide coarse grained, pegmatitic pockets, number of 1-10 mm specks of molybdenite (0.03%)
8.9 - 9.0	pegmatite with 1-2 cm long blebs of coarse, euhedral pyrite, also fine pyrite disseminations and microfracture fillings
9.0 - 9.6	broken-up, Fe-oxide altered interval, medium grained and pegmatitic granite, argillic alteration of feldspars
9.9 - 10.1	pyrite-chlorite stockwork, trace molybdenite specks (1-2 mm)
10.3 - 11.3	broken-up, fractured core, Fe-oxide altered, medium-grained granite with <5 cm wide coarse grained pegmatitic zones, trace molybdenite (1-2 mm specks)

12.3 - 21.9 m K-FELDSPAR PHYRIC GRANITE

The above fine to medium-grained granite grades gradually to grey, medium-grained, K-feldspar phyric granite. K-feldspars phenocrysts form about 30% of the rock, they are rose pink, some are zoned, to 3-4 cm long, groundmass consists of K-feldspars (25%), plagioclase (30%), quartz (25%) and mafic minerals, mostly biotite (20%), commonly in large clusters to 3 cm in diameter
Structure: weakly fractured
Alteration: rare Fe-oxide stained fracture surfaces, locally, also clay on fracture surfaces
Mineralization: very rare pyrite

21.9 E.O.H.

Lori Property DDH-95-11 Grid 2270N, 2218W

Azimuth 200°, Angle -45°, Depth 46.4 metres

0 - 17.2 m FINE TO MEDIUM GRAINED, LEUCOCRATIC GRANITE

Light grey to rusty brown, fine to medium grained, grain size varies from 0.5 mm to 1.5 mm on average, leucocratic, mafic minerals, biotite is about 3%. Medium grained granite is inequigranular; it is characterized by coarser (1.5-3 mm) quartz grains set in a fine grained granitic matrix (0.5 mm on average). Narrow intervals, to 3 m depth, are fairly vuggy. Vugs are commonly rusty and may be filled with pyrite, molybdenite and crystalline quartz.

Structure: generally weakly to locally moderately fractured (below 15.5 metres), dominant orientations:

1. 30° to c.a.
2. 45° to c.a.
3. 65-70° to c.a.
4. 85-90° to c.a.

Alteration: pervasive silicification, rare epidotization associated with pyrite veining, Fe-oxide staining (after pyrite)

Mineralization: trace to 0.3% pyrite, mostly as narrow, 1 mm wide veinlets and disseminations, molybdenite, trace to 0.2%, as 1 to 10 mm long flakes and rosettes, some of the best molybdenite concentrations are in vuggy granite

0.0 - 1.5	surface weathering/Fe-oxide staining
1.5 - 3.5	vuggy interval, some vugs are rusty and others are filled with ± pyrite ± molybdenite ± crystalline quartz, 0.2% molybdenite as 1-10 mm long flakes and rosettes, to 0.3% pyrite, rarely epidote associated with pyrite, few, 1-2 mm wide, quartz veinlets trending 35° to c.a.
5.5 - 6.5	some vuggy sections, vugs are often rusty, may be void or filled with pyrite, molybdenite and crystalline quartz, to 0.01% molybdenite, to 0.5% pyrite
7.8 - 8.0	broken core, vuggy, Fe-oxide altered granite
11.8 - 12.2	medium to coarse grained interval
12.6 - 13.2	fractured, Fe-oxide altered section dominant trend is 0° to c.a., some argillization, to 0.3% pyrite
14.4 - 17.2	broken, poorly competent core, Fe and Mn oxides on fractures

17.2 - 46.4 m MEDIUM GRAINED GRANITE, K-FELDSPAR PHYRIC GRANITE

Grey, medium grained, K-feldspar phyric (20 to 35%), feldspar are rose pink to grey, zoned and 0.5 cm to 3 cm long, set in granitic matrix: quartz (25%), K-feldspars (25%), plagioclase (30%) and mafic minerals, biotite (20%).

Structure: generally weakly fractured

Alteration: weak chloritization and lesser epidotization, some Fe-oxide stained fractures
Mineralization: to 1-2% pyrite disseminations, absence of molybdenite

22.1 - 26.5	poorly competent core, locally crumbly and clay altered, Fe-oxide, chlorite and clay on fracture surfaces
26.5 - 27.3	broken-up and crumbly core, some clay gouge
30.6 - 35.5	partly broken-up core, moderate chloritization and rare epidotization, locally important argillization, to 2% pyrite disseminations
36.6 - 38.2	chlorite-pyrite veining in fractured and moderately chloritized granite
42.4 - 43.7	partly broken, poorly competent core, chlorite and clay alteration, clay gouge at 43.5 - 43.6

46.4 E.O.H.

Lori Property DDH-95-12 Grid 2270N, 2218W

Azimuth 135°, Angle -45°, Depth 12.7 metres

0 - 12.7 m FINE TO MEDIUM GRAINED, LEUCOCRATIC GRANITE

Light grey to rusty brown, fine grained (average grain size < 1 mm) grades to medium grained granite down the hole (average grain size of the siliceous matrix is 0.5 to 1 mm with 30% grey quartz, 1-3 mm). Generally leucocratic, mafic minerals, mostly biotite <3 to locally up to 6%. From 8.3 to 12.7 m, granite contains a number of vuggy intervals (<10 cm long). Vugs are typically rusty, and may be void or filled with coarse molybdenite rosettes.

Structure: moderately to locally weakly fractured, dominant fracture orientations are:

1. 20-25° to c.a.
2. 40-45° to c.a.
3. 60° to c.a.
4. 70° to c.a.

Alteration: silicification, argillization of feldspars (in medium grained sections), Fe-oxide staining

Mineralization: trace to 0.1% pyrite, molybdenite (to 0.2%) as coarse rosettes and flakes in vuggy granite and less commonly in fractures

0.0 - 2.1	poorly competent, broken up core, Fe-oxide and lesser clay on fracture surfaces, trace to 0.1% pyrite
2.8 - 3.2	abundant rusty veinlets trending at 20-25° to c.a.
3.8 - 6.0	broken up core over large part of this interval; Fe-oxide staining, from 4.3 to 4.4 vuggy zone with molybdenite (to 0.5%) and pyrite fillings
6.4 - 6.6	several large (1.5 - 2.0 cm long) molybdenite rosettes
9.8 - 10.0	vuggy interval with 2-3% molybdenite filling cavities
10.8 - 11.0	the same as 9.8-10.0
11.0 - 11.5	broken up core, some vuggy sections with 0.3% molybdenite in cavities and veinlets
12.0 - 12.7	about 0.5 m of core is missing/fault zone

12.7 E.O.H. - the hole had to be abandoned; it caved in.

Lori Property DDH-95-13 Grid 2270N, 2218W

Azimuth 135°, Angle -60°, Depth 30.9 metres

0 - 26.4 m FINE GRAINED LEUCOCRATIC GRANITE

Light grey to rusty orange, fine grained (average grain size <1 mm), intercalations of medium grained granite with to 30% quartz (1-3 mm in diameter) in fine grained siliceous matrix. Typically leucocratic, <3% mafic minerals, mostly biotite. Several vuggy sections with good molybdenite mineralization, from 7 to 13 cm
Structure: moderately fractured to locally weakly, the dominant fracture trends are:

1. 30° to c.a.
2. 40-45° to c.a.
3. 60° to c.a.
4. 70° to c.a.

Alteration: pervasive silicification, argillization, Fe-oxide alteration, dominantly fracture controlled
Mineralization: trace to 0.3% pyrite as disseminations, blebs to 1-15 cm long, filling vugs (in areas of molybdenite mineralization) and rare microfracture fillings (to 1 mm wide), trace to 0.2% molybdenite commonly as coarse rosettes (to 1 cm long) filling vugs

0.0 - 0.5	broken up core, fractured, moderate Fe-oxide staining, some vuggy areas with pyrite filling cavities (to 1 cm in diameter)
1.0 - 2.9	5-20 cm wide intervals of Fe-oxide alteration associated with fracturing
4.0 - 4.3	vuggy, Fe-oxide altered granite, 0.1% molybdenite flakes (2-10 mm long)
4.5 - 6.6	broken up, poorly competent core, locally fairly intense fracturing and associated Fe-oxide and some clay alteration
6.6 - 8.4	interval with 20-25% grey quartz grains (1-3 mm), secondary?, from 7 to 7.2 m several 1.0 cm long molybdenite rosettes
11.2 - 13.0	bleached, silicified granite, several to 10 cm wide vuggy zones, some vugs are filled with molybdenite (to 0.1% over 1.0 m sample interval)
14.7 - 17.4	poorly competent core, fractured, dominantly at 20-25° to c.a., argillic alteration, to <0.1% molybdenite, coarse to 1 cm long, rosettes, rare Fe-oxide on fractures
18.0 - 18.9	partly broken up core, argillized granite, to 1 mm wide pyrite veinlets trending @ 20 and 60° to c.a., rare epidote on fractures
19.3 - 19.7	broken up and Fe-oxide stained interval, 1-3% pyrite disseminations, some argillization
20.3 - 21.1	pyrite ± chlorite, <1 to 2 mm wide veinlets trending at 35-45 and 60° to c.a.
22.0 - 22.5	partly broken up core, clays on fracture

surfaces

23.0 - 23.6	broken, poorly competent core, limonitized and argillized fracture surfaces, lesser chlorite
26.1 - 26.4	broken core, chloritized and argillized fractures

26.4 - 30.9 m FINE TO MEDIUM GRAINED GRANITE

Gradational transition to slightly coarser grained, more mafic-rich granite. Grain size averages 1.5-2 mm and mafic content 5-10%, mostly weakly chloritized biotite
Structure: weakly fractured to locally moderately
Alteration: fracture controlled chloritization, also chloritized mafic minerals (biotite), rare Fe-oxide stained fractures
Mineralization: trace pyrite

26.4 - 26.7	broken core, moderate chloritization

30.9 E.O.H.

Lori Property DDH-95-14 Grid 2265N, 2255W

Angle -90°, Depth 18.3 metres

0 - 10.1 m FINE GRAINED LEUCOCRATIC GRANITE

Light grey to rusty brown, fine grained, leucocratic, biotite forms on average 3%; below 8.0 m ± there is increase in mafic content to 10%

Structure: moderately to locally strongly fractured, dominant structural trend is:

1. 0° to c.a.
2. 20-25° to c.a.
3. 40-45° to c.a.
4. 60° to c.a.
5. 80-90° to c.a.

Alteration: silicification, mafic-rich interval shows moderate chloritization, Fe-oxide alteration, dominantly fracture controlled

Mineralization: trace to locally 1-3% pyrite as disseminations and less commonly fracture fillings

0.0 - 0.7	poorly competent core, silicified, pyrite (1-3%) + chlorite + Fe-oxide on fracture surfaces, dominant trends are 50 and 70° to c.a., pyrite also occurs as fine disseminations
0.7 - 0.9	broken up and partly crumbly core, medium grained granite with to 20% mafic minerals
0.9 - 2.0	broken up and brecciated core, extensive Fe-oxide alteration
3.0 - 7.6	poorly competent core over large part of this interval, fracture controlled Fe-oxide alteration, fracture orientations are typically 0° and 20-30° to c.a.
7.6 - 10.1	poorly competent, broken up core, common fracture orientations are 0 to 30° to c.a, Fe-oxide staining fractures, moderate chloritization of biotite and fracture surfaces, to 1% pyrite occurring mostly as fine disseminations

10.1 - 18.3 m FAULT ZONE - DYKE

Extremely broken up and shattered, dark green, medium grained, intermediate composition. Intensively chloritized and argillized. Well developed clay-gouge in the fault zone.

10.1 - 11.0	missing core

18.3 E.O.H.

Azimuth 125°, Angle -45°, Depth 30.0 metres

0 - 9.0 m FINE TO MEDIUM GRAINED, LEUCOCRATIC GRANITE

Light grey to rusty brown, fine to medium grained, average grain size is about 0.5 - 1.0 mm, inequigranular, low mafic component, mostly biotite (on average <3 to 5%).
Structure: moderately fractured, dominant fracture orientations are:

1. 0-10° to c.a.
2. 30° to c.a.
3. 40-45° to c.a.
4. 70-80° to c.a.

Alteration: bleaching - silicification, Fe-oxide alteration, rare argillization, mostly on fracture surfaces
Mineralization: trace to 2% pyrite as fine disseminations and microfracture fillings (trend 50° to 70° to c.a.), trace to <0.1% molybdenite as coarse (to 1 cm long) rosettes

0.0 - 1.0	poorly competent core, to 1-2% pyrite as fine disseminations; at 0.8-0.85, 1-10 mm long molybdenite flakes in grey quartz breccia
1.4 - 1.9	medium grained, K-feldspar phyric granite, to 15-20% biotite
2.5 - 2.6	broken up core, Fe-oxide and clay on fracture surfaces
5.4 - 6.6	poorly competent core, Fe-oxide stained fractures
6.6 - 9.0	several <10 cm wide intervals of 1-2% pyrite disseminations

9.0 - 30.0 m MEDIUM GRAINED GRANITE

Grey-green, medium grained (grain size averages 1-3 mm), rare coarse grained, K-feldspar phyric intersections, mafic minerals, mostly biotite about 7-10%
Structure: weakly to locally moderately and intensely fractured, fracture orientations are:

1. 30° to c.a.
2. 45-50° to c.a.
3. 70° to c.a.
4. 80-85° to c.a.

Alteration: generally weak, weak chloritization of mafic minerals, fracture controlled chloritization and argillization, Fe-oxide staining on fractures, rare epidotization
Mineralization: trace to 0.1% pyrite as disseminations, fracture fillings (trend 30° to c.a.) and lesser coarse blebs (1-2 cm long)

9.0 - 9.4	shattered, crumbly core, argillized and Fe-oxide altered
12.0 - 12.2	broken up core, clay and Fe-oxide alteration, trace pyrite disseminations

	12.8 - 13.3	the same as above, 12-12.2 m
	14.1 - 14.9	poorly competent, crumbly core, intensely argillized/shear zone?
	14.9 - 15.4	medium grained, K-feldspar phyric granite, argillized feldspars
	21.9 - 22.3	poorly competent, broken core, argillic alteration
	24.0 - 26.2	broken up core, Fe-oxide and argillic alteration
	26.0 - 26.2	the same as above, 24.0-26.2
	26.2 - 28.2	broken up core, argillized feldspars and fracture surfaces
30.0		E.O.H.

Lori Property DDH-95-16 Grid 2265N, 2285W

Azimuth 40°, Angle -45°, Depth 45.7 metres

0 - 40.4 m FINE GRAINED, LEUCOCRATIC GRANITE

Light grey to grey-green to rusty brown, fine grained, grain size averages <0.5 mm, typically equigranular sugary texture, low mafic component, biotite <3% to locally up to 5%.
Structure: from 0 to 13.0 m depth, moderately to strongly fractured, below 13.0 m it is moderately to weakly fractured, dominant trends are:

1. 0° to c.a.
2. 30° to c.a.
3. 45° to c.a.
4. 70-80° to c.a.

Alteration: pervasive silicification, abundant Fe-oxide alteration, lesser fracture controlled chloritization and argillization (green clay mineral)
Mineralization: trace to 2% pyrite, typically as fine disseminations and microfracture fillings, molybdenite, trace to 0.1% occurs as to 1 cm long rosettes

0.0 - 1.8	intensely broken up and fractured core, intense Fe-oxide staining, to 2% pyrite as disseminations and fracture fillings
1.8 - 2.0	medium grained, K-feldspar phyric granite, 1-2% pyrite disseminations, several 1-2 mm specks of molybdenite
2.0 - 6.3	poorly competent, broken core over large part of this interval, moderate to locally intense fracturing accompanied by Fe-oxide alteration, trace molybdenite (1-2 mm specks)
8.2 - 9.0	crumbly, intensely broken core/fault zone?, Fe-oxide and clay on fractures
9.5 - 9.7	broken core, to 0.5% pyrite
11.3 - 13.0	poorly competent core, to 0.1% pyrite, pyrite veinlets trend 20° and 50° to c.a., Fe-oxide, green clay and lesser chlorite on fractures
21.0 - 27.0	trace to 0.05% molybdenite flakes, 1-5 mm long, trace to 0.5% pyrite disseminations, from 25.0 to 27.0 m, host is silicified, fine grained granite with up to 15% quartz grains, 1-3 mm in diameter (secondary?), some argillization
27.0 - 27.1	crumbly core, strongly argillized
27.1 - 33.0	several <10 cm wide sections of broken core, green clay on fractures, 1-5 mm flakes of molybdenite (trace to 0.03%), host is granite with 15-20% secondary? grey quartz grains
34.0 - 35.1	trace molybdenite flakes (1-3 mm)
38.0 - 38.1	broken up core, fracture controlled Fe-oxide and clay alteration, at 38.1 m molybdenite flakes (0.1%)

	39.7 - 39.9	broken interval, clay and Fe-oxide alteration
	39.9 - 40.0	0.1% small flakes of molybdenite (1-2 mm), trace pyrite
	40.0 - 40.4	broken, poorly competent core, grey-green clay on fracture surfaces

- between 38.0 - 40.4 m, there is about 1.0 m of core missing

40.4 - 45.7 m K-FELDSPAR PHYRIC GRANITE

Grey-green, medium grained, K-feldspar phyric, phenocrysts form about 30-40% of the rock, they are rose pink, sometimes zoned, 1-3 cm long, matrix consists of quartz (20-23%) K-feldspars and plagioclase (65%) and mafic minerals dominantly biotite (15-18%).
Structure: moderately to locally intensely fractured
Alteration: weak chloritization and argillization
Mineralization: trace pyrite

	41.4 - 42.7	heavily broken up core, some clay gouge (from 41.4 to 42.0)/fault zone
	43.2 - 44.4	broken core, clay altered fractions

45.7 E.O.H.

Lori Property DDH-95-17 Grid 2266N, 2285W

Azimuth 340°, Angle -45°, Depth 28.3 metres

0 - 19.9 m FINE TO MEDIUM GRAINED, LEUCOCRATIC GRANITE

Light grey to rusty brown, fine to medium grained, average grain size of fine grained granite is 0.5 mm, the medium grained variety is characterized by 20-25% grey quartz (1-3 mm) in fine grained granitic matrix. Generally leucocratic, mafic minerals, biotite on average <3%

Structure: moderately fractured, dominant structural trends are:

1. 25-30° to c.a.
2. 40-45° to c.a.
3. 70° to c.a.
4. 85° to c.a.

Alteration: silicification, fracture-controlled argillization, also some argillization of feldspars, Fe-oxide staining, below 15.0 m chloritized and argillized (green clay) fracture surfaces

Mineralization: trace to locally 1% pyrite, dominantly as fine disseminations and microfracture fillings, trace to 0.2% molybdenite as coarse to 1.5 cm long rosettes, molybdenite also occurs as fine flakes filling microfractures (to 1 mm wide) and disseminations

0.0 - 1.2	poorly competent and intensely Fe-oxide and lesser Mn-oxide stained core, abundant secondary grey quartz, to 3 mm long grains, 0.1% molybdenite as fine flakes in microfractures trending 0-10° to c.a. and also as to 1 cm long rosettes
2.0 - 6.3	poorly competent, broken core over large part of this section, intense Fe-oxide staining, from 3.8 to 4.9 moderate argillization of feldspars and fracture surfaces, trace to 0.1% pyrite, trace to 0.05% molybdenite as 1-2 mm disseminations and fracture fillings and also to 10 mm long rosettes
6.3 - 6.9	well argillized interval, trace molybdenite
6.9 - 13.0	several, <10 cm wide sections of broken core Mn and Fe-oxides and green clay altered fracture surfaces, trace to 0.2% molybdenite, dominantly as to 1 cm long rosettes, rare molybdenite on fractures trending 30° to c.a.
15.0 - 19.9	large part of this section consists of broken up core, chlorite and clay alteration associated with fracturing, to 1% pyrite as microfracture fillings and fine disseminations, trace to 0.05% molybdenite, mostly as fine disseminations

19.9 - 28.3 m K-FELDSPAR PHYRIC GRANITE

Grey-green, medium to coarse grained, K-feldspar phyric, rose-pink and zoned phenocrysts, these form 40% of the rock. Matrix consists of quartz (20%), K-feldspar and plagioclase (65%) and mafic minerals, biotite (15%).
Structure: moderately fractured
Alteration: pervasive chloritization, fracture-controlled argillization

20.1 - 20.2	broken up core
21.0 - 25.9	number of <10 - 30 cm wide zones of broken core with chlorite and clay on fracture surfaces
27.4 - 28.3	broken up and locally crumbly, heavily clay altered zone/fault zone?

28.3 E.O.H.

Lori Property DDH-95-18 Grid 2265N/2255W

Azimuth 80°, Angle -45°, Depth 31.4 metres

0 - 12.8 m FINE TO MEDIUM GRAINED, LEUCOCRATIC GRANITE

Grey to rusty brown, fine to medium grained, grain size varies from about 0.5 mm to 1.5-2 mm, generally low mafic component, mostly biotite, <3 to 8%.
Structure: moderately to heavily fractured and Fe-oxide altered over the entire interval, dominant orientations are:

1. 0-5° to c.a.
2. 20-30° to c.a.
3. 40-45° to c.a.
4. 60° to c.a.

Alteration: silicification, argillization (feldspars & fracture surfaces), rare chloritization, intense Fe-oxide staining
Mineralization: to 2-4% pyrite as disseminations and fracture fillings (trend 30 and 60° c.a.), rare molybdenite in microfractures and vugs (<0.05%)

0.0 - 2.3	heavily broken-up and intensely Fe-oxide and clay altered granite, to 3% pyrite as disseminations and fracture filling trending 5-10°, 30 and 60° to c.a.
2.3 - 2.5	vuggy interval, 3-4% pyrite and 0.1% molybdenite in cavities and microfractures
2.5 - 3.0	to 4% pyrite in microfractures, trace molybdenite as disseminations
3.8 - 5.0	poorly competent to locally crumbly, intensely argillized, medium grained granite, fracture controlled Fe-oxide alteration
5.8 - 7.5	broken-up core, poorly competent, Fe-oxide and some clay on fracture surfaces, 70% core recovery
8.3 - 12.8	poorly competent, broken-up core over almost entire interval, well developed fracture controlled Fe-oxide and clay alteration/fault zone?

12.8 - 31.4 m MEDIUM GRAINED GRANITE

Grey to grey-green, medium grained, grain size averages 1.5 - 2 mm, inequigranular, mafic minerals, mostly biotite 5%.
Structure: weakly fractured
Alteration: chlorite, epidote and clay altered fracture surfaces, lesser Fe-oxide
Mineralization: none, trace pyrite

25.0 - 25.3	crumbly core, intense clay and lesser chlorite and Fe-oxide altered
25.8 - 27.0	broken-up and partly shattered interval, clay and lesser Fe-oxide alteration
29.1 - 29.6	broken core with fracture controlled argillization
31.0 - 31.4	the same as 29.1 - 29.6

31.4 m E.O.H.

Lori Property DDH-95-19 Grid 2289N, 2222W

Angle 90°, Depth 80.5 metres

0 - 11.9 m K-FELDSPAR PHYRIC GRANITE

Grey-green, medium grained, K-feldspar phyric, phenocrysts form 10-40% of the rock, they are typically grey-green to rose pink and 1-3 cm long, on average, matrix consists of quartz (20%) K-feldspar and plagioclase (65-75%) and mafic minerals, mostly biotite (5-15%). Biotite sometimes occurs in clusters 1-2 cm in diameter

Structure: moderately to weakly fractured, dominant trends are:

1. 30° to c.a.
2. 40-45° to c.a.
3. 60° to c.a.
4. 80-85° to c.a.

Alteration: weak fracture-controlled chloritization and Fe-oxide staining, also rare argillized fractures

Mineralization: trace to 1% pyrite as disseminations, small blebs (<0.5 cm in diameter) and fracture filling (40° and 55-60° to c.a.), molybdenite filling fractures (trace) trending at 30-35° to c.a. and also as 0.5-1 cm long rosettes

0.0 - 3.9	Fe-oxide stained fracture surfaces, trace to 0.5% pyrite disseminations and fracture fillings
3.9 - 4.0	broken core with associated argillization and lesser limonitic staining
4.0 - 4.7	trace molybdenite rosettes and molybdenite veinlet trending 35° to c.a.
7.8 - 8.1	broken core with Fe-oxide staining
11.1 - 11.9	partly broken up interval, to 1% pyrite as disseminations and microfracture fillings, some chloritization

11.9 - 31.7 m FINE GRAINED, LEUCOCRATIC GRANITE

Transition from above medium grained, K-feldspar phyric granite to fine grained leucocratic granite is a breccia zone consisting of medium grained granitic clasts in fine grained groundmass. Trace molybdenite flakes and to 0.5% pyrite are also present. Light grey, fine grained (average grain size <0.5 mm), 15-25% coarser quartz grains (1-2 mm), leucocratic, mafic minerals, dominantly biotite <3%.

Structure: weakly to locally strongly fractured, dominant orientations are:

1. 20-30° to c.a.
2. 60° to c.a.
3. 80° to c.a.

Alteration: pervasive silicification, lesser fracture-controlled argillization and Fe-oxide alteration

Mineralization: trace to <0.1% molybdenite as 1-10 mm long flakes, disseminations and rare microfracture fillings, trace to 1-2% pyrite

11.9 - 14.0	breccia zone; fine and medium grained angular clasts in fine grained, siliceous matrix, trace to 0.01% molybdenite as 1-3 mm flakes, to 1% pyrite as disseminations and microfracture fillings
14.0 - 17.0	several narrow <10 cm wide vuggy intervals, trace to <0.1% molybdenite filling cavities and also as 1-3 mm disseminations and to 1 cm long rosettes, to 1% pyrite
17.0 - 17.2	broken core, argillized fracture surfaces, to 0.1% molybdenite
17.2 - 23.1	trace to <0.1% molybdenite as fine disseminations and to 1 cm long rosettes
23.1 - 24.1	broken up core, argillized and weakly Fe-oxide stained fractures
24.0 - 24.4	the same as above 23.1 - 24.1
27.1 - 27.6	vuggy interval, vugs are strongly argillized and/or void
29.3 - 29.5	broken core, fracture-controlled argillic alteration

31.7 - 47.6 m FINE TO MEDIUM GRAINED GRANITE

Gradual coarsening to grey medium grained granite. Average grain size is 1-3 mm. Inequigranular. Mafic content, mostly biotite is 3-7%.

Structure: typically weakly fractured, fracture orientations are:

1. 20-30° to c.a.
2. 45° to c.a.
3. 60° to c.a.
4. 80-85° to c.a.

Alteration: silicification, fracture-controlled argillization and chloritization

Mineralization: trace to 0.01% molybdenite disseminations, trace to 0.5% pyrite as fine disseminations and fracture fillings

35.3 - 35.4	pegmatitic zone consisting of white quartz, feldspar, sericite, chlorite and trace molybdenite
35.5 - 37.6	molybdenite rosettes (0.2%)
33.1 - 40.1	intensely broken-up core, argillized and partly chloritized fracture surfaces

47.6 - 50.0 m MEDIUM GRAINED ± K-FELDSPAR PHYRIC GRANITE

Grey, medium grained, ± K-feldspar phyric (rare, <10% of the rock) granite. Matrix consists of quartz (20%), K-feldspar and plagioclase (65-70%), and biotite (10-15%). Generally weakly fractured and altered.

Alteration: weak fracture controlled argillization and chloritization
Mineralization: none

50.0 - 62.5 m K-FELDSPAR PHYRIC GRANITE

Gradational transition to slightly coarser granite with more abundant K-feldspar phenocrysts. Grey, medium to coarse grained, K-feldspar phyric granite, K-feldspar phenocrysts are typically rose pink and light grey, occasionally zoned and form up to 25-30% of the rock. Matrix is granitic consisting of quartz, K-feldspar, plagioclase and locally weakly chloritized biotite (10-18%). Generally weakly fractured and altered.

62.4 - 62.5	Crumbly, argillized granite at the contact with the medium grained, non-porphyritic variety.

62.5 - 69.4 m MEDIUM GRAINED GRANITE

Grey to pinkish-grey, medium grained, average grain size (1.5 - 2 mm), equigranular, leucocratic, biotite (<3%).
Structure: moderately fractured, dominant trend is 0-15° to c.a. and 30° to c.a.
Alteration: generally weak
Mineralization: none

64.0 - 65.5	Broken core, fracturing trend is at 0-10° to c.a., argillized fracture surfaces (green clay)
68.0 - 69.4	the same as above, 64-65.5

69.4 - 80.5 m K-FELDSPAR PHYRIC GRANITE

Grey, medium to coarse grained, K-feldspar phyric, K-feldspar are rose pink, on average 1-3 cm long and form about 30-50% of the rock. Groundmass consists of quartz (20%), K-feldspar and plagioclase (60-70%) and mafic minerals, mostly biotite (10-20%). Biotite sometimes occur in aggregates 3-8 cm long. Generally weakly fracture below 76.4 m moderate fracturing accompanied by significant chloritization and fracture-controlled argillization.

69.4 - 69.8	the contact zone with the above medium grained granite is a fault-contact consisting of heavily crushed core with intense argillization/clay gouge
72.9 - 73.1	broken core, some argillic alteration
74.2 - 74.3	the same as 72.9 - 73.1
76.4 - 77.9	poorly competent core over part of this interval, breccia zone, moderate chloritization and argillization, some clay gouge
78.7 - 80.5	poorly competent core, chloritized and argillized

80.5 m E.O.H.

Lori Property **DDH-95-20** **Grid 2289N, 2222W**

Azimuth 0°, Angle -45°, Depth 76.8 metres

0 - 18.3 m **K-FELDSPAR PHYRIC GRANITE**

Grey to grey-green, medium to coarse grained, average grain size 3-4 mm, porphyritic, <10 - 30% rose pink and light grey K-feldspar phenocrysts, 1-3 cm long, groundmass consists of quartz (20%), K-feldspar and plagioclase (60-70%) and biotite (10-20%). Rare pegmatitic pockets dominantly comprising of quartz and feldspars

Structure: generally weakly fractured, dominant structural trends are:

1. 20° to c.a.
2. 30° to c.a.
3. 45-50° to c.a.
4. 80-85° to c.a.

Alteration: some silicification and quartz veining, fracture-controlled Fe-oxide staining and lesser argillization and chloritization

Mineralization: trace to 0.3% molybdenite, mostly as fracture fillings trending at 20 and 45° to c.a., trace to 1% pyrite as disseminations and fracture fillings

0.0 - 0.4	broken core, Fe-oxide altered
1.3 - 1.7	broken core with associated rusty Fe-oxide staining
1.7 - 1.8	narrow pegmatite zone, few specks of molybdenite (trace)
3.8 - 3.9	molybdenite on fracture trending 20° to c.a., trace to 0.1% pyrite as fine disseminations and fracture fillings
5.6 - 5.7	trace molybdenite on fracture surface trending 20° to c.a., trace to 0.1% pyrite as fine disseminations and fracture fillings
6.7 - 6.9	broken and Fe-oxide stained interval, to 1% pyrite
7.0 - 10.1	trace molybdenite as fine flakes in silicified granite
10.1 - 10.3	grey quartz breccia, upper contact is fuzzy and lower one trends at 45° to c.a., lower contact is marked by molybdenite and pyrite veinlets along the contact (0.2-0.3%)
14.1 - 15.1	poorly competent core, to 0.5% pyrite disseminations, abundant clay and Fe-oxide alteration
15.8 - 17.1	partly broken core, clay, limonite and Mn oxide on fractures

18.3 - 21.4 m PEGMATITE

Light grey to pinkish grey, coarse grained, consisting of white and pinkish grey quartz (50%), feldspar (48%), <2% chloritized biotite, trace molybdenite and pyrite. Both contacts are somewhat irregular. Several <10 cm wide sections of medium grained granite.

21.4 - 31.8 m K-FELDSPAR PHYRIC GRANITE

Similar to described above 0-18.3 m
Alteration: fracture-controlled argillization and Fe-oxide staining, some silicification
Mineralization: trace molybdenite disseminations (1-3 mm flakes), to 0.5% pyrite as disseminations and fracture fillings

21.4 - 22.7	silicified interval at the lower contact of high silica pegmatite
23.5 - 23.7	broken-up core, Fe-oxide and clay altered fracture surfaces
24.5 - 25.6	few, 1-3 mm specks of molybdenite
27.8 - 28.0	the same as above, 23.5 - 23.7
28.6 - 29.2	broken interval, Fe-oxide and clay on fractures
30.8 - 30.9	crumbly, intensely argillized granite

31.8 - 43.9 m FINE AND MEDIUM GRAINED LEUCOCRATIC GRANITE

Light grey to pinkish grey, grain size varies from <0.5 mm to about 2 mm, leucocratic, <3% mafic minerals, mostly biotite. The upper contact with K-feldspar phyric granite is fairly sharp at 45° to c.a.
Structure: moderately fractured, fracture orientations are:

1. 20° to c.a.
2. 45-50° to c.a.
3. 60° to c.a.
4. 70-75° to c.a.

Alteration: silicification?, fracture-controlled Fe-oxide and lesser argillic alteration
Mineralization: trace molybdenite as coarse, to 1.0 cm long rosettes

32.1 - 32.3	poorly competent core, weak Fe-oxide staining
32.8 - 33.3	broken core, limonitic fracture surfaces
40.8 - 40.9	molybdenite rosette, 1 cm long (trace)
41.4 - 41.5	crumbly, argillized and Fe-oxide altered granite
41.6 - 41.9	chloritized interval, to 1% pyrite

42.7 - 42.9	medium grained, K-feldspar phyric granite, clay, limonite and lesser epidote on fractures

43.9 - 47.5 K-FELDSPAR PHYRIC GRANITE

Similar to 0-18.3, described above. The contact with the above fine to medium grained granite consists of broken-up, argillized altered and lesser limonitized rock.

Structure: poorly competent, extremely fractured, dominant fracture orientations are:

1. 50° to c.a.
2. 40° to c.a.

Alteration: clay, chlorite and lesser Fe-oxide
Mineralization: none

43.9 - 44.6	extensively broken-up core, abundant clay and lesser chlorite, and limonite on fracture surfaces/fault zone?
44.9 - 47.5	poorly competent core, argillized and chloritized fractures

47.5 - 67.0 FINE TO MEDIUM GRAINED GRANITE

Light grey-green to pinkish grey, fine to medium grained, grain size varies from <0.5 mm to about 2 mm, low mafic component, biotite forms on average <3 to 5% of the rock
Structure: moderately to weakly fractured, dominant fracture orientations are:

1. 0-5° to c.a.
2. 45° to c.a.
3. 55-60° to c.a.

Alteration: silicification?, fracture controlled argillic, lesser chlorite and Fe-oxide alteration
Mineralization: trace to 0.1% molybdenite as <1 to 3mm specks and veinlets, <1mm wide, trending 45° to c.a.

47.9 - 48.1	poorly competent, Fe-oxide altered core
54.0 - 54.1	1-2 mm specks of molybdenite, trace
57.0 - 57.1	pulverized interval with clay gouge
58.4 - 60.7	broken up core, locally crumbly and shattered, clay and rare chlorite on fracture surfaces, dominant trend is 0-5° to c.a.
60.7 - 62.0	partly broken core, argillized fracture surfaces, trace to 0.5% pyrite, trace molybdenite disseminations, and fracture fillings trending 45° to c.a.

62.5 - 63.8	broken up interval, to 1% pyrite as disseminations and fracture fillings, fracture-controlled argillic and chlorite alteration
64.0 - 65.6	trace to 0.1% molybdenite as 1-2 mm disseminations
65.6 - 67.0	broken and partly crumbly core, argillized fracture surfaces

67.0 - 76.8 K-FELDSPAR PHYRIC GRANITE

Gradual coarsening to medium to coarse grained, grey, K-feldspar phyric granite. K-feldspar phenocrysts are rose pink, 1-3 cm long and form <5 to 30% of the rock. Matrix consists of quartz, K-feldspar, plagioclase and biotite (8-15%)

Structure: moderately fractured, dominant fracture orientations are:

1. 0-10° to c.a.
2. 45° to c.a.
3. 65-70° to c.a.

Alteration: fracture controlled argillization and lesser chloritization

Mineralization: trace pyrite

67.5 - 68.9	poorly competent interval, locally crumbly, fracture-controlled argillization and rare chloritization, trace to 0.1% pyrite disseminations
73.4 - 73.9	partly broken-up core
75.0 - 76.8	partly broken-up interval, fracture trends are 0-10° and 65-70° to c.a. clay, lesser chlorite and epidote on fractures, to 0.3% pyrite.

76.8 m E.O.H.

Discovery Consultants

Azimuth 90°, Angle -45°, Depth 69.6 metres

0 - 5.8 m **K-FELDSPAR PHYRIC GRANITE**

Grey to rusty brown, medium grained, grain size averages 3-4 mm, porphyritic, K-feldspar phenocrysts are rose pink to grey, 2-4 cm long and form about 20% of the rock. Groundmass consists of quartz (20%), K-feldspar and plagioclase (65%) and weakly chloritized biotite (15%).
Structure: moderately fractured, dominant joint trends are:

1. 15-20° to c.a.
2. 30° to c.a.
3. 60° to c.a.
4. 80° to c.a.

Alteration: Fe-oxide stained fracture surfaces
Mineralization: trace molybdenite on fractures trending 15-20° to c.a. and 60° to c.a.

0.0 - 0.9	trace molybdenite and limonite coating fractures trending 15-20 and 60° to c.a.
2.1 - 4.5	broken-up core, Fe-oxide altered fracture surfaces, there is about 1.0 m of core missing from 2.1 to 6.5 metres

5.8 - 51.4 m LEUCOCRATIC **FINE GRAINED AND LESSER MEDIUM GRAINED, GRANITE**

Light grey to rusty brown, fine grained, leucocratic, mafic minerals, biotite, forms on average <3% to 5% of the rock.
Structure: moderately fractured, dominant fracture trends are:

1. 20-25° to c.a.
2. 30-40° to c.a.
3. 70-75° to c.a.

Alteration: pervasive silicification, fracture-controlled argillization, also locally argillized feldspar, Fe-oxide alteration, dominantly fracture controlled, rare chloritization
Mineralization: trace to 0.3% molybdenite as 1mm to 10mm long flakes, trace to 1% pyrite as disseminations and fracture fillings

7.0 - 8.0	several grey, 1-3 mm wide quartz veinlets, trending 30 and 50° to c.a. trace pyrite
9.5 - 10.2	broken core, Fe-oxide stained fractures
14.8 - 17.3	poorly competent and brecciated core over large part of this interval, abundant rusty specks (after pyrite) and Fe-oxide stained

	fracture surfaces, dominant trends are: 25-30° and 40-45° to c.a., to 1% pyrite as fine disseminations and <1-2mm wide veinlets trending to 50° and 60° to c.a.
17.3 - 17.4	to 0.1% molybdenite flakes, 2-4 mm long in vuggy, Fe-oxide altered granite, to 1% pyrite disseminations
18.2 - 18.5	some broken and extensively Fe-oxide stained core, to 1-2% pyrite disseminations
23.1 - 23.2	trace molybdenite, 2mm long flakes, to 0.1% pyrite
23.3 - 23.6	broken core, Fe-oxide and clay on fracture surfaces
28.7 - 28.8	Fe-oxide stained interval, trace molybdenite disseminations
31.5 - 31.6	trace to 0.1% molybdenite disseminations, 1-2mm flakes
32.5 - 33.0	to 0.2% molybdenite disseminations
33.0 - 34.5	15-20% secondary grey quartz, 1-2 mm, trace to 0.1% molybdenite, 2-15mm long rosettes
35.7 - 38.0	rare pyrite and molybdenite veinlets, 1-2 mm wide trending 45-50° to c.a., molybdenite also occurs as coarse, 1-1.5cm, rosettes (0.08-0.15%), locally chloritized fractures
39.4 - 42.0	to 0.3% molybdenite disseminations, 1-3 mm long, also molybdenite in fractures trending 50° to c.a.
42.0 - 42.6	Silicified granite, vugs are void and or filled with pyrite, molybdenite and epidote?, rare pyrite-molybdenite veinlets trending 50° to c.a., to 0.5% pyrite, to 0.4% molybdenite
43.5 - 43.6	vuggy granite, to 0.1% molybdenite filling vugs
44.0 - 44.9	poorly competent, broken-up, vuggy interval, fracture controlled argillization, trend is 45-50° to c.a., vugs are filled with clay material
45.1 - 46.0	broken-up core, argillized fracture surfaces
47.2 - 48.0	partly broken-up core, fracture orientations are 0-5° and 45° to c.a.
48.9 - 49.0	some molybdenite disseminations (trace)
50.5 - 50.6	molybdenite disseminations, 1-2 mm long (trace - 0.1%)

51.4 - 65.6 MEDIUM GRAINED GRANITE

Grey, medium grained, grain size varies from 1-2.5 mm, inequigranular, mafic component, mostly biotite is 5-10%
Structure: weakly to moderately fractured, fracture orientations are:

1. 30° to c.a.
2. 45-50° to c.a.
3. 75-80° to c.a.

Alteration: fracture-controlled chloritization and locally argillization and epidotization, also some chloritized biotite
Mineralization: trace molybdenite disseminations, trace to 2% pyrite as disseminations and fracture fillings

55.8 - 57.2	partly broken core, clay altered fracture surfaces
58.7 - 59.6	moderately fractured interval, fractures are healed with chlorite and pyrite, 1-2% pyrite disseminations
61.1 - 64.2	narrow, 10-20cm wide zones of fractured core, chlorite and pyrite healing fractures

65.6 - 69.6 K-FELDSPAR PHYRIC GRANITE

Medium grey, medium grained, K-feldspar phyric granite, K-feldspar phenocrysts are light grey, to 2 cm long and form <10% of the rock. Biotite is about 10-15%. Weakly fractured and altered. Mineralization none.

69.6 m E.O.H.

Lori Property **DDH-96-5-22** **Grid 2289N, 2222W**

Azimuth 045°, Angle -45°, Depth 66.4 metres

0 - 66.4 m **K-FELDSPAR PHYRIC GRANITE**

Grey to slightly rusty grey, medium to coarse grained, K-feldspar phyric, phenocrysts are rose pink and grey, on average 1-3 cm long and form <20 to 35% of the rock. Mafic minerals, mostly biotite is 10-15%. Biotite sometimes occurs in clusters 2-5 cm in diameter.

Structure: moderately fractured, dominant fracture/joint trends are:

1. 20° to c.a.
2. 40° to c.a.
3. 60° to c.a.
4. 80° to c.a.

Alteration: fracture-controlled chloritization, moderate argillization in areas of more intense brecciation, and lesser Fe-oxide and epidote alteration.

Mineralization: to 0.5% pyrite as disseminations and fracture fillings, rare molybdenite veinlets trending 40° to 60° to c.a. and disseminations

0.0 - 1.1	broken-up and fractured core, fracture controlled Fe-oxide staining
3.3 - 3.4	to 0.3% pyrite disseminations , trace chalcopyrite on fractures trending 50° to c.a.
4.9 - 5.0	molybdenite and pyrite veinlet, 1-1.5 mm wide, trending 60° to c.a.
5.3 - 6.9	trace molybdenite on fracture trending 40° to c.a.
7.6 - 7.8	broken-up core
9.2 - 9.3	trace molybdenite disseminations
11.0 - 11.9	shattered core with clay gouge/narrow fault zone?
15.2 - 15.6	broken-up interval, abundant clay and lesser Fe-oxide on fracture surfaces
17.6 - 17.9	pegmatitic granite consisting of quartz, feldspars and chloritized biotite (<3%)
19.2 - 20.5	poorly competent core, Fe-oxide and clay covered fractures
22.7 - 22.9	broken-up section, fracture-controlled argillization
23.7 - 23.9	the same as 22.7 - 22.9
25.6 - 25.8	pegmatite, 50% quartz, 48% feldspars and 2% chloritized hornblende?

29.2 - 29.5	poorly competent core, chlorite and clay altered fracture planes
30.9 - 31.1	the same as above 29.2 - 29.5
34.6 - 34.9	partly broken-up interval, fracture-controlled argillization and lesser chloritization
49.3 - 50.2	heavily broken-up core with intense argillic alteration, some chlorite on fractures

66.4 m E.O.H.

DISCOVERY CONSULTANTS

D. Duba, Geologist

Lori Property DDH-96-5-23 Grid 2289N, 2222W

Azimuth 295°, Angle -45°, Depth 48.8 metres

0 - 48.8 m K-FELDSPAR PHYRIC GRANITE

Grey-green, medium to locally coarse grained, average grain size varies from 3 mm to >5 mm, porphyritic, K-feldspar phenocrysts are typically pinkish grey, zoned, 2-3 cm, long and form <10 to 35% of the rock. Groundmass consists of quartz (25%) K-feldspar and plagioclase (60-65%) and biotite (10-15%). Biotite is weakly chloritized and may form clusters 1-3 cm in diameter.
Structure: weakly to locally moderately fractured, dominant fracture orientations are:

1. 0-5° to c.a.
2. 25-30° to c.a.
3. 40-50° to c.a.
4. 70° to c.a.

Alteration: rare localized silicification, weak Fe-oxide staining mostly confined to fracture surfaces, rare fracture-controlled chloritization and epidotization
Mineralization: trace to 0.1% molybdenite as disseminations (1-3 mm flakes) and also rare coarse rosettes, trace to 0.5% pyrite as disseminations and fracture fillings trending 50° to 70° to c.a., trace chalcopyrite.

0.0 - 4.8	discontinuous, dominantly fracture controlled and lesser disseminated Fe-oxide alteration, partly broken up core, trace molybdenite, trace to 0.3% pyrite, trace chalcopyrite on fractures trending 70° to c.a.
4.8 - 5.1	narrow zone of silicification, 25-30% secondary quartz, trace molybdenite flakes , <1-2 mm
5.8 - 6.3	weakly silicified interval, some fracturing accompanied by Fe-oxide staining, trace molybdenite, to 0.3% pyrite as disseminations and blebs, 0.5-1 cm in diameter.
8.0 - 8.1	rare, coarse molybdenite rosette (trace), 1 cm long
8.5 - 8.6	trace pyrite and trace molybdenite on fractures trending at 70° to c.a. and as disseminations in silicified granite
12.6 - 12.9	broken-up core, trace pyrite, chloritized biotite, Fe-oxide and lesser epidote on fractures
13.5 - 13.9	poorly competent interval, chlorite and Fe-oxide alteration

15.4 - 15.6	broken core, fracture-controlled chlorite and Fe-oxide alteration
17.1 - 17.5	poorly competent core, clay and lesser Fe-oxide on fractures
18.0 - 18.6	broken-up and locally crumbly rock, strong argillization
24.3 - 24.5	the same as above 15.4 - 15.6
26.5 - 27.4	broken up, poorly competent core, trace to 0.1% pyrite disseminations, clay on fracture surfaces trending 65-70° to c.a.
27.4 - 28.3	heavily broken up interval, partly silicified, fairly intense argillization and lesser chloritization, to 0.1% molybdenite, 0.1-0.5% pyrite disseminations, quartz+clay veinlets, to 1 mm wide, trending 50° to c.a.
29.4 - 29.7	partly broken core, silicified, quartz+pyrite veining, trace molybdenite, argillized and chloritized fracture surfaces
34.9 - 35.3	2 to 15 cm wide melanocratic bands consisting of up to 80% fine grained, chloritized biotite
36.4 - 36.5	irregular to 1 mm wide molybdenite veinlets and few small flakes (trace to 0.1%)
40.3 - 40.4	one molybdenite rosette, to 1.5 cm long (trace)
40.6 - 42.2	weakly silicified interval, moderately chloritized matrix, weakly developed alignment of mafic minerals, mostly biotite, trace to 0.1% molybdenite disseminations
42.2 - 44.9	weakly schistose, trend 20-25° to c.a.
44.9 - 48.8	extremely shattered core with abundant clay gouge/fault zone.

48.8 m E.O.H.

Angle -90°, Grid 2330N 2227W, Depth 123.1m

0 - 20.1m FINE GRAINED, LEUCOCRATIC GRANITE

Light grey to rusty brown, fine to locally medium grained, grain size varies from <0.5 mm to 1-1.5 mm. Low mafic component, on average <3% (mostly biotite).
Structure: moderately fractured, dominant orientations are:

1. 25-30° to c.a.
2. 40-45° to c.a.
3. 60° to c.a.
4. 80° to c.a.

Alteration: pervasive silicification, fracture-controlled argillization, Fe-oxide staining
Mineralization: trace pyrite disseminations

0.0 - 0.8	broken-core, Fe-oxide staining
2.7 - 3.0	crumbly core, intense argillization, Fe-oxide specks (after pyrite) and fracture coatings
3.5 - 10.3	discontinuous, to 20-25 cm wide zones of broken core, fracture-controlled argillic and Fe-oxide alteration, some pyrite + chlorite veinlets trending 25-30° to c.a.
11.5 - 12.4	medium grained granite, upper contact zone consists of broken-up and Fe-oxide altered core, lower contact trends at 60° to c.a.
12.6 - 18.8	several, 10-20 cm wide intervals of medium grained granite, contacts are somewhat fuzzy
18.8 - 19.5	Fe and Mn oxides on fractures trending 20-30° and 80° to c.a., also Fe-oxide disseminations
19.5 - 20.1	poorly competent core, argillized and Fe-oxide stained fractures

20.1 - 37.5m K-FELDSPAR PHYRIC GRANITE

Grey, medium to coarse-grained, porphyritic, K-feldspar phenocrysts are rose pink, locally zoned, 1-3 cm long and may form 10-35% of the rock. Biotite, dominant mafic interval, is on average 10-15%
Structure: moderately to locally strongly fractured, dominant directions are:

1. 30° to c.a.
2. 40-45° to c.a.
3. 55-60° to c.a.
4. 85° to c.a.

Alteration: fracture-controlled argillization and chloritization

Mineralization: trace pyrite

20.1 - 20.6	heavily broken-up contact with the above fine-grained, leucocratic granite, intense argillization, some Fe-oxide staining
21.6 - 23.6	broken-up core, abundant clay on fracture surfaces trending 40-50° to c.a.
23.8 - 24.6	intensely broken up core, heavily chloritized
28.3 - 33.3	discontinuous, narrow sections, to 30 cm wide of broken core with clay covered fracture planes.

37.5 - 58.1m MEDIUM GRAINED GRANITE

Gradational transition to medium grained, non-porphyritic granite, grey to pinkish grey, equigranular, medium grained, grain size averages 1.5-2 mm, low mafic content, biotite, about <3 to 5%

Structure: moderately fractured, fracture orientations are:

1. 20-25° to c.a.
2. 45-60° to c.a.
3. 80° to c.a.

Alteration: argillized and locally chloritized fracture surfaces, Fe-oxide staining, mostly fracture-controlled, also weakly argillized feldspars

Mineralization: trace molybdenite as fine disseminations, trace to 0.1% pyrite as fine disseminations and fracture fillings

41.2 - 41.3	broken-up core, argillized feldspars and fracture surfaces
45.6 - 45.7	trace fine molybdenite disseminations, to 0.1% pyrite
49.5 - 50.0	fine grained granite, poorly competent, fracture controlled Fe-oxide alteration
51.3 - 54.1	poorly competent, broken-up core, Fe-oxide and lesser chlorite and clay on fractures, to 0.1% pyrite
55.9 - 58.1	common disseminated and fracture-controlled Fe-oxide staining

58.1 - 66.6m FINE GRAINED, LEUCOCRATIC GRANITE WITH LESSER MEDIUM GRAINED GRANITE AND PEGMATITE

Light grey to rusty brown, fine grained, leucocratic, biotite <5%, intersections of lesser medium grained granite (grain size averages 1-2 mm) and pegmatite (>5 mm). Medium grained granite is similar to the described above 37.5-58.1. Pegmatite consists

of quartz (45%), pink and grey feldspars (53%) and 2% chloritized biotite.
Structure: moderately to locally strong fracturing dominant orientations are:

1. 25-30° to c.a.
2. 40-80° to c.a.
3. 80-85° to c.a.

Alteration: silicification?, clay and locally abundant Fe-oxide in areas of intense brecciation
Mineralization: to 1% pyrite as disseminations and fracture filling

58.1 - 58.6	fracture controlled and disseminated Fe-oxide
58.6 - 59.4	medium grained granite
60.0 - 62.1	broken-up core, to 1% pyrite as veinlets and disseminations, strong Fe-oxide staining and clay on fracture surfaces
62.6 - 63.2	several to 25 cm wide pegmatitic zones

66.6 - 76.3m MEDIUM GRAINED GRANITE

The same as described in 37.4 - 58.1
Alteration: localized fracture-controlled argillization and lesser chloritization and epidotization
Mineralization: trace to 0.5% pyrite disseminations

41.3 - 71.6	poorly competent interval, argillized and chloritized fracture surfaces
75.0 - 76.2	partly broken-up core; argillized and chloritized fractures

76.3 - 83.7m K-FELDSPAR PHYRIC GRANITE AND MEDIUM GRAINED GRANITE

Grey, K-feldspar phyric, medium grained granite is intercalated with non-porphyritic medium grained variety. Porphyritic granite consists of 10-30% pink, K-feldspar phenocrysts, 2-3 cm long set in a matrix of quartz (25%), K-feldspar and plagioclase (60%) and biotite (15%). Average grain size of medium grained granite is 2 mm and mafic component is about 5-8% (mostly biotite).
Structure: weakly to moderately fractured, dominant fracture orientations are:

1. 0-5° to c.a.
2. 20-30° to c.a.
3. 40-50° to c.a.

Alteration: fracture controlled argillization and chloritization
Mineralization: to 0.5% pyrite as disseminations and fracture fillings trending 40° to c.a.

76.3 - 76.6	up to 15% chloritized biotite in K-feldspar phyric granite
77.4 - 78.6	to 20-25% chloritized biotite, chlorite-rich veinlets, healing fractures to 1% pyrite disseminations, blebs and veinlets
81.6 - 83.3	poorly competent core, argillized and chloritized fracture surfaces trending at 0 and 25-30° to c.a.

83.7 - 100.0m MEDIUM GRAINED GRANITE

The same as described in 37.5 - 58.1
Alteration: fracture-controlled argillization and chloritization, rare Fe-oxide staining fractures
Mineralization: trace pyrite disseminations

83.7 - 84.9	heavily broken-up to crumbly, intensely argillized interval
89.5 - 91.3	fracture-controlled and disseminated Fe-oxide staining
98.1 - 100.0	fractured interval trend is 0-5° to c.a, chloritized fracture surfaces

100.0 - 123.1m K-FELDSPAR PHYRIC GRANITE

Grey, medium grained, porphyritic, K-feldspar phenocrysts are pink, zoned, 1.5-3 cm long and form 25-50% of the rock, groundmass consists of quartz (25%), K-feldspar and plagioclase (60%) and biotite (15%)
Structure: heavily fractured/fault zone from 100.0 to 112.6, the rest of the interval is moderately fractured, dominant fracture orientations are:

1. 0-10° to c.a.
2. 20-25° to c.a.
3. 30° to c.a.
4. 40° to c.a.

Alteration: intense chlorite and lesser argillic alteration in the fault zone
Mineralization: trace to 0.1% molybdenite

100 - 106.3	heavily broken-up core/fault zone, intense chloritization and lesser argillization, slickensides on chloritized fracture surfaces
106.3 - 112.6	intensely broken-up, continuation of above fault zone, fracture-controlled argillization, weak chloritization
119.7 - 120.2	completely pulverized rock to sand
120.2 - 120.5	broken core, argillized fracture surfaces

122.7 - 123.1 the same as 120.2 - 120.5

Lori Property **DDH-96-6-25** **Grid 2330N, 2227W**

Azimuth 340°, Angle -45°, Depth 97.2m

0 - 28.5 m **FINE GRAINED, LEUCOCRATIC GRANITE**

Light grey to rusty brown, fine grained, leucocratic, mafic minerals, biotite, <3%.
Structure: moderately to strongly fractured, fracture orientations are:

1. 30° to c.a.
2. 45-50° to c.a.
3. 65-70° to c.a.

Alteration: pervasive silicification, fairly strong argillization, rare quartz veining, extensive disseminated and fracture controlled Fe-oxide and lesser Mn-oxide alteration.
Mineralization: to 1% pyrite as disseminations and fracture fillings, trace to 0.1% molybdenite in fractures trending 60° to c.a.

1.5 - 6.3	heavily broken-up core, strong Fe-oxide staining fracture controlled and disseminated, some Mn-oxide on fractures, fairly intense argillization
6.8 - 7.5	the same as above 1.5 - 6.3
7.5 - 8.0	some, irregular, to 2mm wide quartz veinlets, strong Fe-oxide and lesser Mn-oxide alteration
8.8 - 9.0	crumbly core, intense limonitic and argillic alteration
10.8 - 12.3	broken up core, argillized, some Fe-oxide staining
13.3 - 13.4	intensely broken-up, crumbly core, intense argillization and Fe-oxide staining
13.4 - 13.5	to 0.1% molybdenite and 0.3% pyrite on fractures trending 60° to c.a.
15.3 - 15.6	crumbly, shattered core, intensely argillized and Fe-oxide altered
17.4 - 17.8	the same as above 15.3 - 15.6, to 1% pyrite disseminations
18.1 - 19.5	heavily broken-up core, strong argillic and Fe-oxide alteration
22.8 - 25.1	trace molybdenite? disseminations, to 0.5% pyrite as fine disseminations and fracture fillings, trending 60-70° to c.a., fairly intense argillization
25.1 - 25.3	medium grained, equigranular granite, gradational contacts
28.0 - 28.3	the same as above 25.1 - 25.3

28.3 - 72.6 m MEDIUM GRAINED GRANITE

Light grey, medium grained, grain size averages 1.5-2mm, equigranular, mafic minerals, mostly biotite, forms about 3% of the rock. Occasionally narrow sections of fine grained, leucocratic variety occur within the medium grained granite.
Structure: moderately fractured, dominant fracture orientations are:

1. 25-30° to c.a.
2. 45-50° to c.a.
3. 70° to c.a.

Alteration: argillized feldspars and fracture surfaces, some fracture-controlled Fe and Mn oxides, also disseminated Fe-oxide alteration
Mineralization: trace pyrite

28.5 - 28.7	fine grained, Fe-oxide stained fractures and rusty specks (after pyrite)
29.6 - 29.9	the same as above 28.5 - 28.7
31.5 - 32.0	poorly competent core, abundant clay on fracture surfaces
32.8 - 34.0	broken-up core, clay and lesser Fe and Mn oxides on fractures
34.4 - 39.0	heavily broken-up core over large part of this interval, argillic and lesser Fe and Mn oxide alteration
40.5 - 41.0	broken interval, fracture-controlled argillization, weak Fe-oxide staining
41.2 - 43.2	partly broken-up core, few to 30 cm wide section of intensely brecciated granite with accompanied strong argillic alteration
44.8 - 45.1	broken core, clay and Mn oxide on fractures
45.9 - 46.5	the same as above 44.8 - 45.1
48.1 - 49.4	poorly competent core, fracture-controlled argillic alteration
50.6 - 50.9	broken core, Fe-oxide as disseminations and on fractures, also fracture-controlled clay alteration
51.2 - 51.7	the same as above 50.6 - 50.9
61.1 - 61.6	crumbly, broken-up core, strong argillization
62.9 - 64.9	partly broken-up interval, green clay on fractures
69.4 - 69.8	poorly competent core, fracture controlled clay and Fe-oxide alteration

72.6 - 97.2 m FINE GRAINED, LEUCOCRATIC GRANITE

Sharp contact with the above medium grained granite at 65° to c.a. The same as described at 0-28.5 metres. Narrow sections of medium grained variety with similar composition occurring throughout this interval

Structure: moderately fractured, dominant fracture/joint trends are:

1. 20-30° to c.a.
2. 45-50° to c.a.
3. 40° to c.a.
4. 80° to c.a.

Alteration: silicification?, fracture-controlled argillization and Fe-oxide staining, some chloritization, mostly fracture-controlled, also chloritized mafics

Mineralization: trace to 0.1% pyrite, trace to 0.1% molybdenite disseminations, trace magnetite

72.6 - 74.0	partly broken core, Fe-oxide stained fractures trenching at 30 and 70° to c.a.
74.0 - 74.6	medium grained, leucocratic granite
75.0 - 75.8	the same as 74.0 - 74.6
75.8 - 76.6	broken core, clay and lesser Fe-oxide on fractures
80.7 - 81.7	poorly competent and also locally crumbly core with intense argillic alteration, to 0.1% pyrite disseminations
81.8 - 82.1	trace to 0.1% molybdenite disseminations, to 0.3% pyrite
82.1 - 83.4	medium grained granite, irregular somewhat fuzzy contacts
83.8 - 85.3	chloritized biotite and chloritized fracture surfaces, to 0.1% pyrite disseminations, trace molybdenite fine specks?
85.3 - 86.4	broken up core, argillized and weakly chloritized fracture planes
83.7 - 86.5	medium grained granite
89.6 - 89.7	trace molybdenite disseminations and to 1 mm wide veinlets
90.2 - 90.5	broken core, to 0.1% pyrite as disseminations and blebs to 0.5cm long, Fe-oxide stained fractures
93.5 - 93.8	chloritized mafic-rich interval, trace pyrite disseminations
95.5 - 96.1	brecciated interval with fractures healed by clay, rare fracture-controlled chlorite and epidote

96.1 - 97.2 poorly competent core, extensively fractured, fractures are healed by clay and lesser chlorite

97.2 m E.O.H.

DISCOVERY CONSULTANTS

D. Duba, Geologist

Lori Property **DDH-96-6-26** **Grid 2330N, 2227W**

Azimuth 270°, Angle -45°, Depth 79.1m

0 - 12.3 m **FINE GRAINED, LEUCOCRATIC GRANITE**

Light grey to rusty grey, fine grained, leucocratic, biotite forms on average <3% of the rock
Structure: moderately fractured, dominant structural trends are:

1. 20-25° to c.a.
2. 45-50° to c.a.
3. 60° to c.a.
4. 75-80° to c.a.

Alteration: pervasive silicification, fracture-controlled argillization, fracture-controlled and disseminated Fe-oxide, locally argillized feldspars
Mineralization: trace molybdenite as fine specks, trace to 0.5% pyrite disseminations and fracture fillings trending 60° to c.a.

0 - 5.2	trace molybdenite? as fine disseminations, to 0.3% pyrite as disseminations and fracture fillings trending 65° to c.a., disseminated and fracture-controlled Fe-oxide staining
5.2 - 6.8	partly broken core, argillized feldspars and fracture surfaces, Fe-oxide as disseminations and coating fractures
6.8 - 12.3	partly broken core over the entire interval, abundant Fe-oxide alteration, argillized feldspars and fracture surfaces, to 0.3% pyrite, trace molybdenite specks

12.3 - 62.2 m MEDIUM GRAINED GRANITE

Light grey, medium grained, equigranular, average grain size is 1-2mm, leucocratic, biotite forms <3 to 5% of the rock. Rare, narrow intersections of K-feldspar phyric granite.
Structure: moderately to strongly fractured, dominant fracture orientations are:

1. 20-30° to c.a.
2. 45-50° to c.a.
3. 70° to c.a.
4. 80-85° to c.a.

Alteration: argillization of feldspars and fracture surfaces, some fracture-controlled chloritization and Fe-oxide staining
Mineralization: trace to 1% pyrite disseminations

13.6 - 25.5	poorly competent, broken-up core, to locally extremely crumbly, heavily argillized, locally Fe and lesser Mn oxides on fractures
25.5 - 28.1	medium grained, K-feldspar phyric, phenocrysts form about 25-30% of the rock, biotite is 10-15%, chloritized fracture surfaces, partly broken-up interval (27.0-27.6).
31.5 - 31.6	crumbly, intensely argillized granite
36.4 - 36.6	broken-up core, argillized and Fe-oxide altered fractures
37.0 - 37.2	the same as above 36.4 - 36.6
40.1 - 40.4	broken core, clay and chlorite on fractures
42.3 - 44.5	roughly 1.0m of core is missing from 43.0 to 44.5; Partly broken core, chloritized biotite, disseminated and fracture-controlled limonite
46.7 - 62.2	extremely brecciated and shattered core from 46.9 to 53.5 and from 61.4 - 62.2, pulverized to sand/fault zone, intense argillic and lesser, locally developed chloritic alteration, to 1% pyrite disseminations

62.2 - 79.1 m K-FELDSPAR PHYRIC GRANITE

Grey-green, medium to coarse grained, grain size varies from 2-3mm to >5mm, porphyritic, K-feldspar phenocrysts are rose pink and grey, 1-3 cm in length and form 25-40% of the rock, matrix consists of quartz, feldspar and mafic minerals (mostly biotite, 15-20%).
Structure: moderately to strongly fractured, dominant structural trends are:

1. 20° to c.a.
2. 40-45° to c.a.
3. 70° to c.a.

Alteration: argillic and chloritic alteration in areas of intense brecciation
Mineralization: trace to 0.1% molybdenite as coarse rosettes, trace to 1% pyrite disseminations

64.6 - 71.7	fault zone-about 80% of this interval consists of intensely broken up core, several sections are extremely crumbly and heavily argillized, also chloritized mafic minerals and fracture surfaces: 64.7-65.0, 67.3-68.4

DISCOVERY CONSULTANTS

D. Duba, geologist

Lori Property DDH-96-6-27 Grid 2330N, 2227W

Azimuth 90°, Angle -45°, Depth 93.0m

0 - 28.7 m FINE GRAINED, LEUCOCRATIC GRANITE

Light grey to rusty brown, fine grained, grain size averages <1mm, leucocratic, mafic mineral (biotite) is <3%
Structure: fairly strongly fractured from 0 to 16.0 metres, dominant fracture orientations are:

1. 0° to c.a.
2. 25-30° to c.a.
3. 40-45° to c.a.
4. 65-70° to c.a.

Alteration: pervasive silicification, extensive disseminated and fracture-controlled Fe-oxide staining, locally argillized feldspars, and fracture surfaces
Mineralization: trace to 0.5% pyrite disseminations, rare trace molybdenite disseminations

0 - 16.0	extensively broken-up core over majority of this interval, argillized feldspars, locally fracture-controlled argillization and Fe-oxide staining, common disseminated Fe-oxide (after pyrite); there is about a 1 metre of core missing between 0-3.5 metres, and also there are another 2.5 metres missing between 8.0-11.5 metres.
17.1 - 17.4	poorly competent core, argillized and Fe-oxide stained fractures
20.8 - 22.2	several, to 30cm wide, intersections of medium grained granite, partly broken-up, argillized and Fe-oxide altered fractures
25.1 - 28.7	increased mafic content to locally 5-10%, chloritized biotite, trace to 0.5% pyrite disseminations, locally strong brecciation with fractures healed by chlorite and lesser

epidote?, trace molybdenite specks, small vugs 1-3mm in diameter at 28.6 - 28.7, the contact zone with the medium grained granite below

28.7 - 76.0 m MEDIUM GRAINED GRANITE WITH LESSER FINE GRAINED GRANITE

Grey, medium to fine grained, grain size varies from <0.5mm to 1.5mm, mafic component, mostly biotite is <3% to 7%. Also rare intercalations of medium grained K-feldspar phyric granite.
Structure: weakly fractured, fracture orientations are:

1. 15-20° to c.a.
2. 45-50° to c.a.
3. 75° to c.a.

Alteration: locally argillized fracture surfaces, some Fe-oxide disseminations and fracture staining
Mineralization: trace to 0.1% pyrite as disseminations and fracture fillings trending 45° and 70-75 to c.a.

30.1 - 30.3	broken-core, Fe-oxide stained fractures
33.2 - 34.4	medium to coarse grained, K-feldspar phyric granite
35.0 - 36.0	fine grained silicified? granite, trace to 0.1% pyrite as disseminations and fracture fillings trending 45° and 70-75° to c.a.

36.0 - 77.3 m K-FELDSPAR PHYRIC GRANITE

Grey, medium to coarse grained, porphyritic, K-feldspar phenocrysts are rose pink, zoned and 0.5-3cm long, form on average <10 to 40% of the rock. Matrix is granitic in composition and comprises of quartz (20%), feldspars (K-feldspar and plagioclase 65%) and biotite (15%)
Structure: weakly fractured, dominant trends are:

1. 0-10° to c.a.
2. 25-30° to c.a.
3. 45° to c.a.
4. 55-60° to c.a.
5. 80° to c.a.

Alteration: fracture-controlled argillization and lesser chloritization, limonitization on fractures and as disseminations
Mineralization: trace pyrite disseminations

36.5 - 36.9	poorly competent core, clay and limonite on fractures trending 0 to 15° to c.a.

42.1 - 42.2	broken core, pegmatitic zone consisting of quartz and feldspar, argillized fracture surfaces
42.7 - 45.1	several, to 40 cm wide, sections of broken and crumbly core, argillized and chloritized, also Fe-oxide stained
59.9 - 60.3	crumbly, argillized interval, some limonitic staining
63.1 - 64.1	poorly competent core, argillized feldspars and fracture surfaces, weak Fe-oxide staining
65.6 - 66.0	the same as 63.1 - 64.1
66.4 - 67.2	partly broken core, argillized fracture surfaces
70.9 - 73.4	pinkish grey, medium grained, equigranular non-porphyritic granite, 3% biotite, weakly chloritized, 72.4-72.5 crumbly, heavily argillized interval
73.4 - 74.1	broken core, argillized and weakly Fe-oxide stained fractures

77.3 - 93.0 m MEDIUM GRAINED GRANITE

Grey-green, medium to locally coarse grained, grain size is variable from 1.5mm to about 5mm, rare K-feldspar phyric sections, biotite forms <5 to 12%. Some secondary? bluish-white quartz (5-10%).
Alteration: chloritized mafic minerals (mostly biotite) and fracture surfaces, silicification - quartz veining
Mineralization: trace pyrite as disseminations and coarse blebs

80.2 - 81.7	medium to coarse grained, K-feldspar phyric granite, trace pyrite
82.0 - 83.0	rare milky quartz veinlets and to 8% secondary quartz, 1-3mm in diameter, to 10-12% extensively chloritized biotite and fracture surfaces, trace pyrite disseminations
86.1 - 86.7	abundant chlorite on fracture surfaces

93.0 m E.O.H.

DISCOVERY CONSULTANTS

D. Duba, Geologist

Lori Property **DDH-96-6-28** **Grid 2330N, 2227W**

Azimuth 160°, Angle -45°, Depth 96.6m

0 - 13.0 m FINE GRAINED, LEUCOCRATIC GRANITE

Light grey to rusty brown, fine grained to locally medium and coarse grained, pegmatitic; grain size varies from <1mm to >5mm, low mafic component, biotite is <3%
Structure: moderately fractured, dominant fracture orientations are:

1. 0-10° to c.a.
2. 30° to c.a.
3. 40-45° to c.a.
4. 70° to c.a.

Alteration: pervasive silicification, fracture-controlled clay, Fe-oxide and intense lesser Mn oxide alteration, common Fe-oxide disseminations, rare quartz veining
Mineralization: trace to 0.5% pyrite as disseminations and microfracture fillings

0 - 2.4	poorly competent core, fairly strong fracture-controlled Fe-oxide, some Mn oxide on fractures
2.4 - 5.6	the same as above 0 - 2.4
6.2 - 7.0	intense Fe-oxide staining, rare 1-2mm wide quartz veinlets trending 60° to c.a.
10.2 - 11.1	medium grained granite, abundant disseminated Fe-oxide
11.1 - 13.0	pegmatitic intersections consisting of quartz and feldspar, intense Fe-oxide staining, trace pyrite

13.0 - 27.1 m K-FELDSPAR PHYRIC GRANITE

Medium grey, medium to coarse grained, grain size varies from 2mm to >5mm, porphyritic, K-feldspar phenocrysts are generally rose pink, 0.5-2cm long and form to 25% of the rock. Groundmass is granitic in composition consisting of quartz, K-feldspar, plagioclase and biotite (10-15%).
Structure: generally weakly fractured, locally moderately, dominant joint orientations are:

1. 30-35° to c.a.
2. 60° to c.a.
3. 70-80° to c.a.

Alteration: fracture-controlled argillization and Fe-oxide staining, rare epidotization which is associated with pyrite veining, rare to 2mm wide quartz veinlets
Mineralization: pyrite veinlets trending 70-75° to c.a., to 0.1% molybdenite

15.4 - 15.8	broken-core, argillized fracture surfaces
16.3 - 16.9	the same as above 15.4 - 15.8
18.3 - 18.8	pyrite-epidote veinlets, 1-3mm wide trend 70° to c.a., rare to 2mm wide quartz veinlets, trend is 75° to c.a.
18.8 - 19.0	pegmatite consisting of quartz (58%), plagioclase (40%), chloritized biotite (2%) and pyrite blebs
19.8 - 20.0	broken core at 0° to c.a., clay on fractures
24.7 - 25.4	the same as 19.8 - 20.0
25.3 - 27.1	broken core at the contact with medium grained, non-porphyritic granite, argillized fracture surfaces, to 0.1% molybdenite

27.1 - 34.3 m MEDIUM GRAINED GRANITE WITH LESSER FINE GRAINED LEUCOCRATIC GRANITE

Grey, fine to medium grained, grain size varies from <0.5mm to 2mm, biotite is <3% - 5%
Structure: weakly fractured
Alteration: silicification?, fracture-controlled Fe-oxide staining and argillic alteration
Mineralization: to 0.5% pyrite disseminations, trace molybdenite?

27.1 - 27.6	poorly competent core, argillized fracture planes
27.9 - 32.3	fine grained, leucocratic variety, upper contact is sharp at 85° to c.a., to 0.5% pyrite disseminations, trace molybdenite specks?, Fe-oxide stained fractures
34.2 - 34.3	broken, Fe-oxide altered interval

34.3 - 44.6 m K-FELDSPAR PHYRIC GRANITE

The same as described above in 13-27.1
Alteration: generally weak, argillized fracture surfaces, rare Fe-oxide staining
Mineralization: trace molybdenite, 1-3mm flakes

34.3 - 34.5	broken core, fracture-controlled

	argillization
34.7 - 35.2	poorly competent interval, clay and Fe-oxide on fracture surfaces
37.8 - 38.9	broken, locally heavily shattered core, argillized feldspars and fracture surfaces
40.1 - 40.2	trace molybdenite, to 3mm flakes
41.3 - 44.5	more than 50% of this interval consists of broken core, abundant clay covered fracture surfaces, weak limonitic staining

44.6 - 56.7 m MEDIUM GRAINED GRANITE WITH LESSER FINE GRAINED GRANITE

Grey to greyish pink, medium grained to locally fine grained, grain size varies from <1mm to 1.5-3mm. Biotite forms <3% of the unit.

Structure: moderately fractured, dominant fracture orientations are:

1. 0-15° to c.a.
2. 20-25° to c.a.
3. 45° to c.a.
4. 65-70° to c.a.

Alteration: silicification?, fracture-controlled argillic and rare chlorite alteration

Mineralization: trace molybdenite disseminations, trace pyrite

44.6 - 47.0	poorly competent core, clay covered fracture surfaces (from 45.7 to 47.0), fine grained leucocratic granite
47.0 - 48.2	trace molybdenite disseminations in fine grained, silicified granite
48.2 - 49.8	extremely broken-up and crumbly zone, argillic and lesser chlorite alteration, trace pyrite disseminations, fine grained granite
50.2 - 56.7	presence of pistachio green mineral (clay mineral?) from 43.1 to 56.7; about 2.5 metres of core are missing

56.7 - 72.3 m K-FELDSPAR PHYRIC GRANITE

Grey to grey-green, medium grained, porphyritic, K-feldspar phenocrysts are rose pink to grey, sometimes zoned, 0.5 to 3 cm long and form on average 20 to 46% of the rock. Groundmass is granitic in composition consisting of quartz, K-feldspar, plagioclase and biotite (15-20%). Biotite may occur in clusters 1-3cm in diameter

Structure: weakly to moderately fractured
Alteration: from 56.7 to about 65 metres pistachio green mineral in the matrix, chloritized fracture surfaces, below 65 metres commonly chloritized and lesser argillized fracture surfaces
Mineralization: trace to 0.5% pyrite as disseminations and fracture fillings

56.7 - 65.0	number of 30 cm wide sections of broken core, abundant chloritized fracture surfaces, presence of pistachio green mineral in matrix (<5-20%), trace to 0.5% pyrite as disseminations and microfracture fillings
65.0 - 65.9	broken core, intense fracture-controlled chlorite and weak argillic alteration

72.3 - 82.6 m MEDIUM GRAINED GRANITE

Sharp contact with the above K-feldspar phyric granite at 70° to c.a. Grey to pinkish grey, medium grained, average grain size is 1-2mm, equigranular, mafic minerals, biotite is 3%. Rare K-feldspar phyric granite intercalations. Weakly fractured and altered. Mineralization weak.

72.3 - 73.3	Coarse grained, K-feldspar phyric granite
82.2 - 82.6	fine grained, melanocratic granite (82.2-82.3), fine grained, leucocratic granite, to 0.3% pyrite disseminations and 1-2mm wide veinlets trending 50° to c.a. (82.3-82.6)

82.6 - 96.6 m K-FELDSPAR PHYRIC GRANITE

Similar to the described above 56.7-72.3
Structure: weakly fractured
Alteration: fracture-controlled argillic alteration
Mineralization: trace pyrite disseminations

96.6 m E.O.H.

DISCOVERY CONSULTANTS

D. Duba, Geologist

Lori Property **DDH-96-6-29** **Grid 2330N, 2227W**

Azimuth 200°, Angle -45°, Depth 71.6m

0 - 14.2 m FINE GRAINED, LEUCOCRATIC GRANITE

Light grey to rusty brown, fine grained, leucocratic, low mafic content, mostly biotite which forms on average <3% of the rock
Structure: weakly to moderately fractured, dominant fracture orientations are:

1. 10-15° to c.a.
2. 30° to c.a.
3. 45-50° to c.a.
4. 70° to c.a.

Alteration: pervasive silicification, intense fracture-controlled and disseminated Fe-oxide, fracture-controlled argillic alteration, rare to 1mm wide quartz veinlets trending 45° to c.a.
Mineralization: trace to 0.5% pyrite as fine disseminations and microfracture fillings, trace molybdenite disseminations

0 - 9.0	partly broken-up, poorly competent core, extensive disseminated and fracture-controlled Fe-oxide staining, rare, to 1mm wide, grey quartz veinlets trending 45° to c.a, to 0.5% pyrite disseminations and veinlets trending 45-50° to c.a., rare fine molybdenite disseminations (trace)
11.0 - 13.0	several, to 25cm wide, sections of medium grained granite
13.8 - 14.1	pinkish-grey, medium grained granite

14.2 - 21.8 m K-FELDSPAR PHYRIC GRANITE

Grey, medium to coarse grained, porphyritic, K-feldspar phenocrysts are rose pink, 1-3cm long and form <10 to 35% of the rock. Granitic matrix consists of quartz (20%), K-feldspar and plagioclase (65%) and biotite (15%).
Structure: weakly fractured, dominant joint/fracture trends are:

1. 45° to c.a.
2. 55-60° to c.a.
3. 70° to c.a.
4. 85° to c.a.

Alteration: localized, rare silicification/quartz veining which has associated trace molybdenite mineralization, some clay, Fe-

oxide and minor chlorite on fracture surfaces, rare epidote in selvages of quartz veinlets
Mineralization: trace molybdenite flakes (1-3mm), to 0.5% pyrite as disseminations, fracture fillings and blebs to 1.5 cm in diameter

20.1 - 20.2	irregular, to 0.7 cm wide quartz vein, trace molybdenite flakes (1-3 mm long) and trace pyrite, vein is rimmed by epidote

21.8 - 34.8 m MEDIUM GRAINED GRANITE WITH LESSER FINE GRAINED, AND K-FELDSPAR PHYRIC GRANITE

Grey, dominantly medium grained (1-1.5 mm on average), leucocratic with biotite forming 3% of the rock. Intersections of light grey, leucocratic granite and medium to coarse grained, K-feldspar phyric variety.
Structure: weakly to moderately fractured
Alteration: fracture-controlled clay, Fe-oxide and minor chlorite alteration
Mineralization: trace pyrite disseminations

23.5 - 25.7	partly broken-up core, fracture-controlled clay and lesser chlorite alteration, moderate disseminated and fracture-controlled Fe-oxide staining
29.7 - 31.9	medium to coarse grained K-feldspar phyric granite
32.6 - 32.7	fine grained, leucocratic granite
33.2 - 33.5	the same as above 32.6-32.7, fairly sharp lower contact with medium grained granite at 60° to c.a.
34.0 - 34.8	poorly competent interval, clay, chlorite and Fe-oxide covered fracture surfaces

34.8 - 41.8 m FINE GRAINED GRANITE

Grey-green, fine grained, grain size varies from <0.5mm to 1.5mm. Leucocratic, mafic minerals, mostly biotite is 3%
Structure: generally weakly fractured, dominant trends are:
1. 20-25° to c.a.
2. 40-50° to c.a.

Alteration: argillized and lesser chloritized and Fe-oxide stained fractures, also locally green clay mineral on fractures
Mineralization: trace pyrite, fine trace molybdenite disseminations

35.8 - 36.3	trace molybdenite disseminations

41.8 - 57.0 m MEDIUM GRAINED GRANITE WITH LESSER FINE GRAINED LEUCOCRATIC GRANITE

Grey, to pinkish grey, medium grained, grain size averages 1-2mm, biotite forms 3-5% of the rock, on average. Narrow intercalations of fine grained, leucocratic granite.
Structure: moderately to weakly fractured, dominant fracture orientations are:

1. 20-25° to c.a.
2. 45° to c.a.
3. 60° to c.a.

Alteration: fracture-controlled argillic and rare chlorite and epidote alteration, locally argillized feldspars
Mineralization: to 0.5% pyrite as disseminations and fracture fillings, rare trace molybdenite specks in fine grained leucocratic intersections

45.0 - 45.6	melanocratic interval with up to 15-18% chloritized biotite, to 2% pyrite, common epidotization associated with weakly developed vuggy texture
47.8 - 47.9	narrow melanocratic zone with 15% fine grained chloritized biotite, to 1% pyrite
48.6 - 48.7	pegmatitic bands consisting of quartz and feldspar
49.8 - 51.4	fine grained, leucocratic granite, trace molybdenite specks
51.6 - 52.0	trace molybdenite disseminations
54.9 - 55.3	poorly competent core, argillized
55.3 - 57.0	gradual increase in grain size and mafic component, to 10-15% biotite

57.0 - 71.6 m K-FELDSPAR PHYRIC GRANITE

Grey-green, medium to coarse grained, porphyritic, K-feldspar phenocrysts are rose-pink, zoned, <1 to 4 cm long and may form <10 to 25% of the rock. Granitic matrix consists of quartz, K-feldspar and plagioclase and biotite (12-15%). Weakly altered and fractured. No sulphide mineralization.

68.0 - 68.8	abundant "green mineral" in matrix
68.8 - 71.6	fault zone/ extremely shattered, clay and chlorite altered zone.

71.6 m **E.O.H.**
