**GEOLOGICAL, GEOCHEMICAL AND GEOPHYSICAL REPORT
JASPER PROPERTY, VICTORIA MINING DIVISION**

1.0 INTRODUCTION

1.1 General

A 123 man-day field exploration program was conducted by Arnex Resources Ltd. on the Jas 1-31 and Jasmin 1-7 Mineral Claims during the period December, 1995 to June, 1996. The field work consisted of grid linecutting, geologic mapping in selected areas over a 1,000 Ha area, rock chip sampling, grid soil geochemical sampling, and stream sediment sampling. Fifty three rock chip and 84 soil and stream sediment samples were taken and analyzed by Chemex Labs.

Orthophoto mosaic and topographic base maps were compiled by Eagle Mapping Services Ltd. at scales of 1:5,000, 1:2,500 and 1:1,000 for selected areas of the property (Figures 4-9).

In addition, geophysical surveys were conducted by S J Geophysics Ltd and are appended in a report titled Magnetometer, VLF-EM, Horizontal Loop EM and Induced Polarization Test Surveys on the Jasper Property.

A total expenditure of \$89,729 was incurred (APPENDIX I). The work was conducted under Annual Work Approval Number NAN-96-0800949-15.

1.2 Property Tenure

The Jasper Claim group consists of the Jas 1 to 31 and Jasmin 1-7 Mineral Claims which total 116 units (Table 1, Figure 2). The property is 100% owned by Inspiration Mining Corporation of Vancouver, B.C.

1.3 Location and Access

The Jasper Property is located in BCGS Map Sheet 092C 088 (NTS 92C/15, Figures 1 and 2). The Jasper property lies along Four Mile Creek and extends over the height of land to the tributaries of Jasper Creek. Logging road access is via Port Alberni or Cowichan Lake. J Branch road accesses the northern portion of the property and Caycuse main the southern portion.

Steep, incised drainages with rugged relief to approximately 300 meters (m) characterizes the physiography of the area. Much of the region has been logged in recent years and young second growth forest is present over most of the claims. Climatic conditions are temperate.

1.4 History

The Jasper Property consists of three former Minfile occurrences known from north to south as the Jasper 1 (092C 080), Tam 16 (092C 081) and Pan-Easy (092C 088) prospects. The Tam and Easy properties were previously staked by Hudson Bay Mining and Smelting who conducted geological mapping, soil and rock chip geochemistry and an IP geophysical survey in 1970 and 1971. Also in 1971, Marshall Creek Copper conducted an extensive soil sampling program on the Pan, Easy and Tam properties. It is reported that Noranda conducted a regional magnetic survey during this era, but no information regarding the results were filed as a matter of public record.

The next period of exploration activity occurred in 1980 and 1981 when Malibar Mines conducted soil sampling on the Jasper property. In 1984 a prospecting program was carried out by Ron Bilquest followed by a geological, soil and VLF-EM program by Falconbridge in 1985. Asamara then conducted a brief geology, soil sampling and EM program in 1987.

The properties were then allowed to lapse and were relocated by Arne O. Birkeland in the summer and fall of 1994. A detailed geologic mapping and sampling program was then carried out by the author in August, 1994 on the J Branch Main Showing. A subsequent Geological and Geochemical Program was carried out during 1995. The property was optioned to Consolidated Taywin

Resources Inc., now Inspiration Mining Corporation in December, 1996 who are the current owners.

2.0 GEOLOGY

2.1 Regional Geology

Vancouver Island lies within the Canadian Cordillera within terrain classified as Wrangellia. Central and western Vancouver Island is predominantly underlain by Paleozoic and Mesozoic strata intruded by Jurassic and Tertiary Intrusions (Fig 3).

The Jasper property is hosted in a belt of rocks mapped as lower Jurassic Bonanza group which trends southeasterly from Nitinat Lake through Gordon River, south of Cowichan Lake.

The Bonanza Group in this vicinity consists of a variety of maroon to grey-green, feldspar phryic basalt and andesite flows, dacite and felsic lapilli tuff containing various minor gabbro, andesite and dacite dykes. There is a lack of lithologic continuity and distinct marker beds are absent. In the basal part of the sequence, sedimentary rocks are found interbedded with lapilli and crystal tuffs and a sub-aqueous environment is indicated.

Several granodiorite Island Intrusion stocks occur in the area. The coeval stocks are regular to elongated in shape with steep

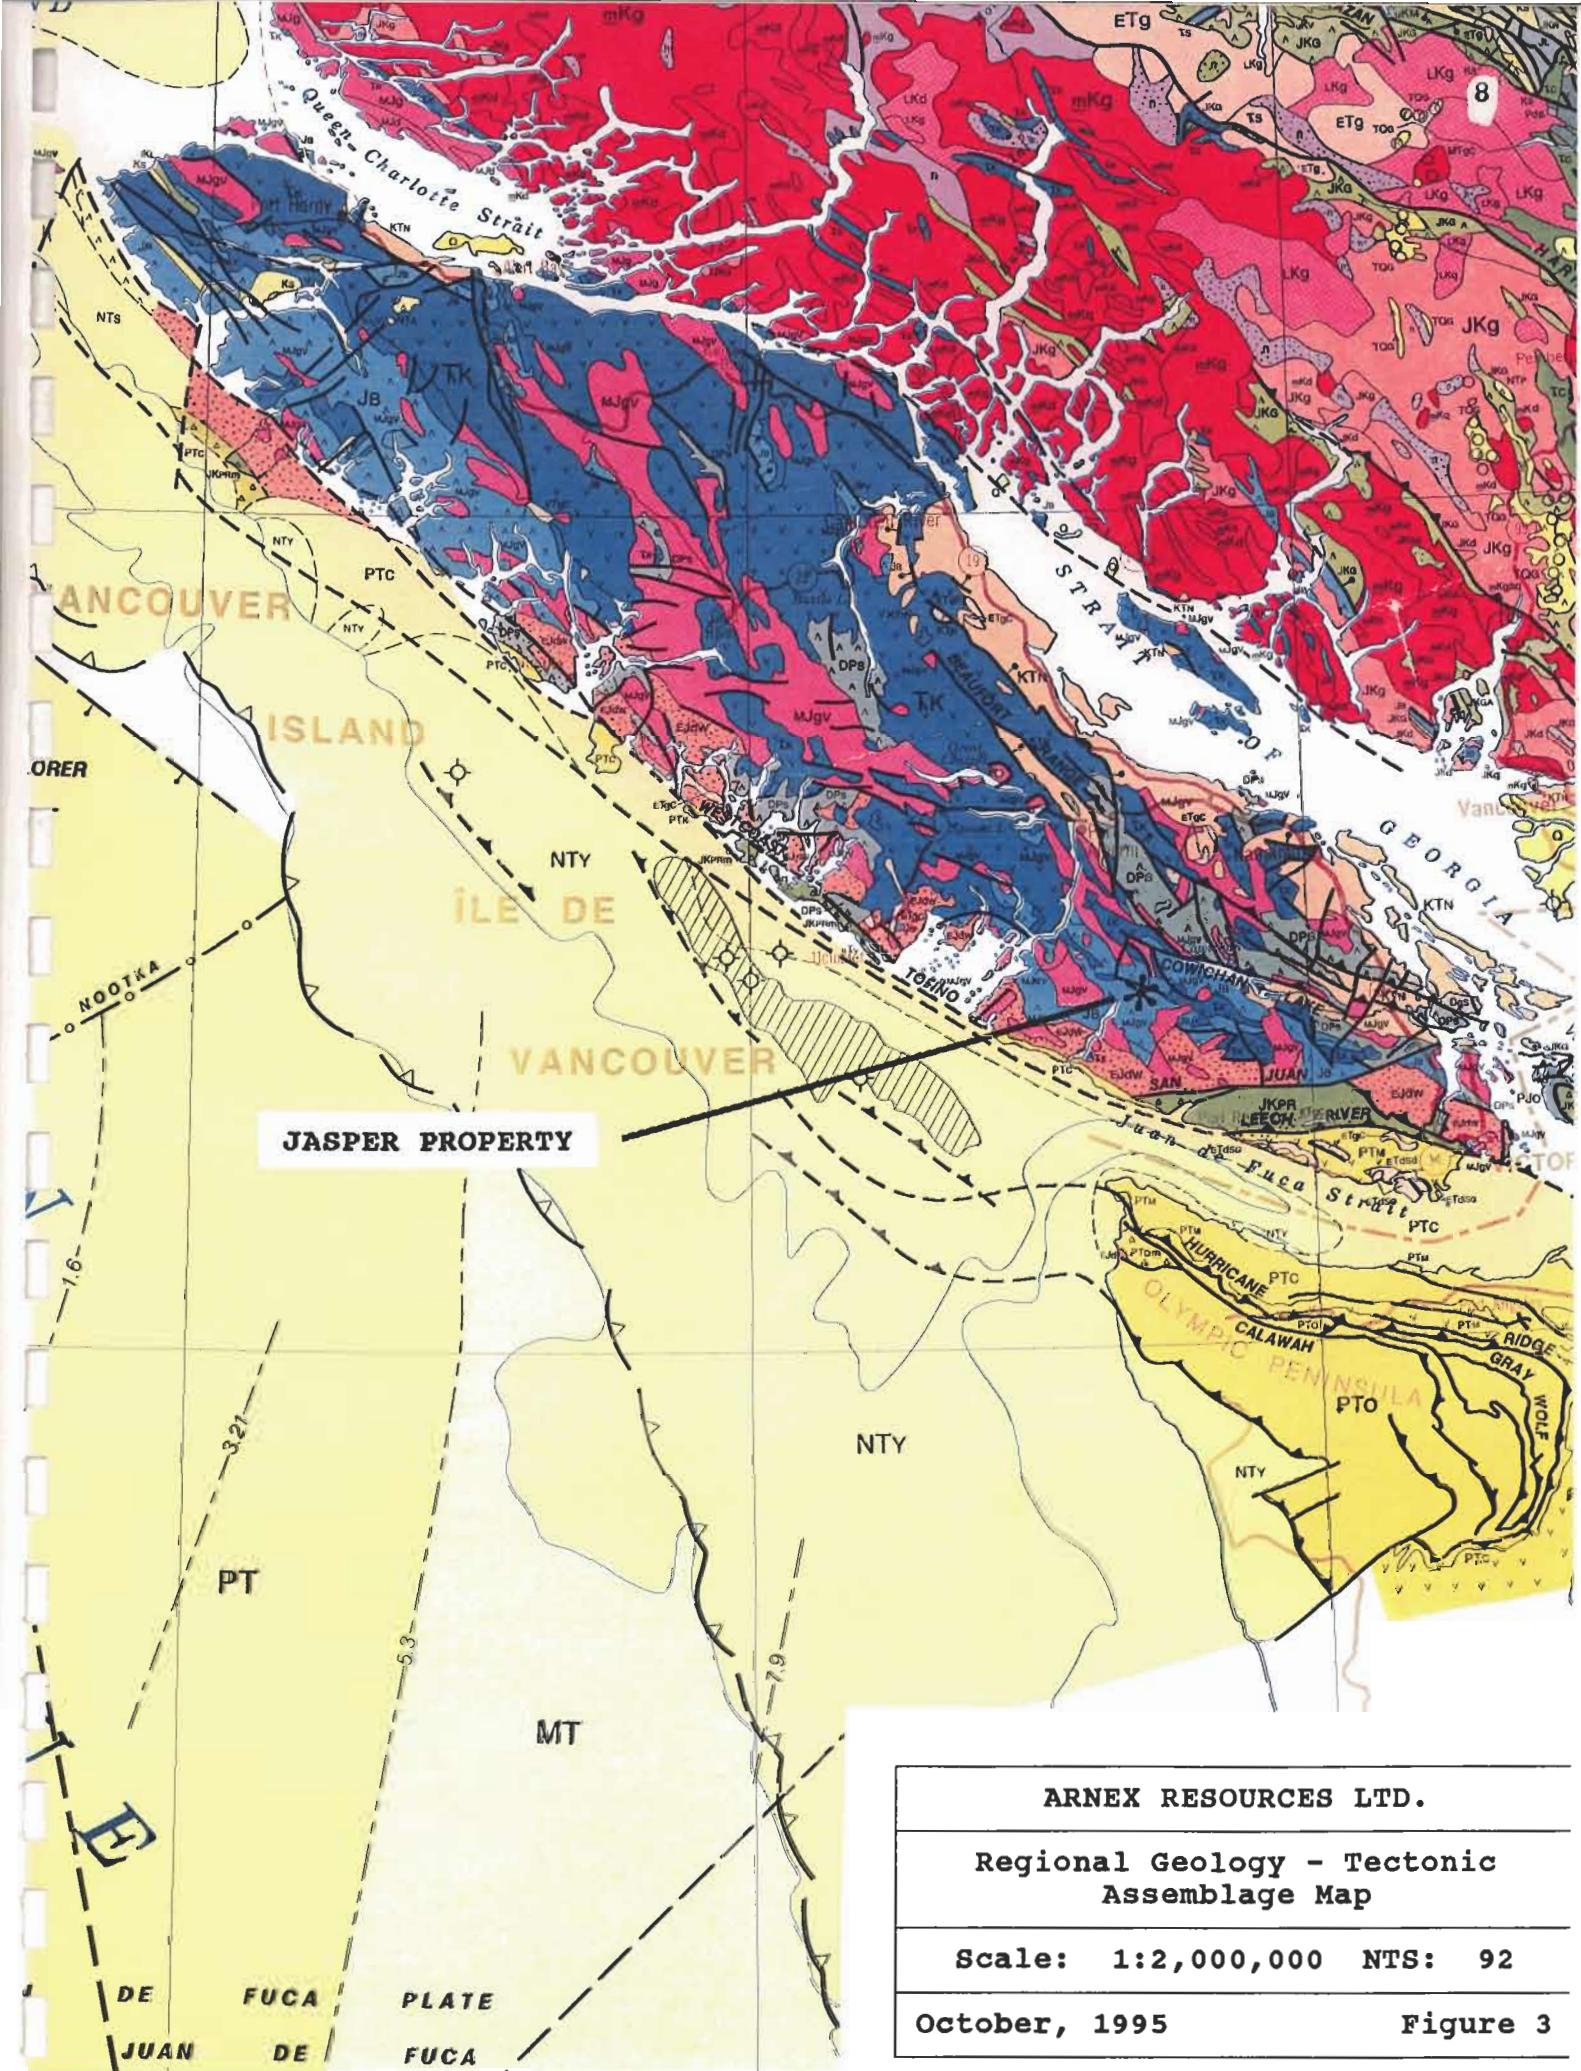

sides. The major lithology is granodiorite to quartz-diorite and most of the stocks are rich in mafic inclusions, particularly in marginal zones where magmatic intrusive breccias are developed. Stocks are rounded in outcrop shape.

Numerous RGS anomalies and Minfile occurrences are present in the general Nitinat - Cowichan area and both porphyry and VMS style mineralization has been reported by BCGS geologists. Porphyry style Cu-Mo occurrences are commonly associated with high level sub-volcanic dykes and sills. The Debbie - Lizard - Thistle VMS belt occurs in the northern portion of the region hosted in rocks mapped as Sicker Group. Massey and Friday note VMS stratigraphic mineral potential where reported "sulfidic argillites are found interbedded with tuffs" in the basal part of the Bonanza sequence in the Alberni - Cowichan area.

2.2 Property Geology

Geological mapping was conducted in selected areas and is presented at scales of 1:5,000 and 1:2,500 as Figures 10 to 15.

The Jasper property is underlain by mafic to felsic volcanic rocks which have been previously mapped as Bonanza group. The central part of the property is underlain by a north-south trending sequence of intermediate flows and flow breccias which are flanked to the east by mafic flows (Figures 10 - 15). A wedge shaped body of felsic flows overlies the mafic rocks to the

east. Felsite dykes intrude the intermediate and mafic volcanics and are likely feeders to the younger felsic flows. Often the intermediate and mafic flows and flow breccias are massive and bedding orientation is impossible to determine. Local foliation is oriented north-south.

Lithologic descriptions for the map units for Figures 10 - 15 are as follows:

Map Unit 1. Mafic Volcanics

A thick monotonous massive mafic volcanic assemblage appears to be the lowest stratigraphic unit on the property. The sequence is made up of thick featureless flows and minor flow breccias. The rocks are dark green in color, are fine grained and are locally feldspar phyrric. Epidote and hematite alteration is often present as well as quartz and calcite stringers and veins. Remnant pillow structures and calcite clots (occurring at the interstices of pillows) are evidence of a subaqueous depositional environment.

Massive and pillow flows are mapped as unit 1a, agglomerate and breccia as map unit 1b, and undifferentiated tuffs as unit 1c.

Map Unit 2. Intermediate Volcanics

Map Unit 2 consists of a thick succession of andesitic to dacitic flows and flow breccias. The rocks are light green to light grey in colour and are predominantly fine grained in the featureless flows. Flow breccias are often dacitic in composition and contain angular heterolithic fragments to 30 cm in size.

Massive and brecciated feldspar porphyry are mapped as unit 2a, dacitic flows as unit 2b and intermediate tuffs as unit 2c.

Map Unit 3. Felsic Volcanics

The felsic volcanic unit occurs to the east of the Main Showing area extending in a southerly direction to the vicinity of the Pan showing. The unit consists of a pale apple green to creamy grey, very fine grained (glassy) rhyolite, commonly with conchoidal fracture. Flow banded textures are locally common.

The felsic volcanic package is mapped as unit 3a, massive commonly banded flows, 3b, agglomerate and 3c, agglomerate.

Map Unit 4. Argillite

The argillite unit has only been found locally on the road to the east of the Main Showing. Large blocks of subcrop consist of

medium to thick bedded, dark grey, very fine grained agrillite. The beds are locally calcarious and/or graphitic.

Map Unit 5. Hematite Breccia

The hematite breccia unit occurs in the spur road to the northeast of the Main Showing and on the lower J Branch road. The unit consists of rouge, friable poorly consolidated agglomerate of subrounded mafic volcanic clasts in a hematitic matrix.

Map Unit 6. Mafic Dykes

Hornblend porphyry dykes are mapped in the southern portions of the property. The dykes contains light to medium grey, fine grained andesitic matrix with coarse euhedral hornblend and felspar porphyroblasts. Minor argillic alteration and pyrite mineralization occurs at the dyke margins.

As an overview, the geological mapping has revealed the following:

- The Main Showing is hosted in chloritized mafic volcanics near the contact with a rhyolite flow complex. The contact between the mafic and felsic volcanics appears stratabound with the Four Mile Alteration Zone.

- Mapping in the upper Camp Creek road area encountered a siliceous tuff or exhalite which is at the contact of the rhyolite flow complex (south portion Fig 14, north portion of Fig 15).

2.3 Structure and Alteration

A late major fault suture cuts Vancouver Island from the mouth of the Carmanah River on the west coast to Qualicum Beach on the east coast. Four Mile Creek and the J Branch Main Showing on Jasper Ridge occur along the major fault structure. A north trending gossanous alteration zone with a strike length greater than 5 km lies along the fault from the Caycuse Creek drainage in the south to the Nitinat Valley in the north. The alteration zone is characterized by moderate to intense argillization and silicification accompanied by ubiquitous pyrite flooding. Coincidental narrow fault and fracture zones often emanate as a conjugate set at right angles to the main north trending fault system.

Recent mapping in Jasper Creek revealed a number of northwest trending fault and fracture zones characterized by silicification, pyrite, ankerite and argillic alteration (Figure 10).

In addition recent mapping at the Easy showing area (south portion Fig 15) confirms the presence of a +100 m wide and +300 m

long silicified pyritic argillic alteration zone. Pyritic breccia occurs as two outcrop showings south of the Easy gossan zone.

2.4 Mineralization

At least six high-grade Cu, Zn +/- Pb sulphide showing areas have been identified on the property to date (Figure 27) and are summarized as follows:

<u>Jasper, Main J-Branch Showing</u>	>2%Cu, >3%Zn, + Ag in 2 lenses 0.8-1.3 m x 44 m
<u>Quartz breccia gold vein</u>	rock chip 19 g/t Au, soil to 120 ppb
<u>Tam 16 showing area</u>	rock chip Cu>4%
<u>Upper Camp Creek Showings</u>	8.9% Cu/0.4 m, 2.6 ppm Ag/1.1 m
<u>Pan Road Showings</u>	>2%Cu, >22%Zn, >17%Pb over 1.8 m width
<u>Polymetallic Shear Zone</u>	885 ppb Au, 3030 ppm Zn, 3.6 ppm Ag, 584 ppm Pb

Easy Showings

rock chip >5%Cu, 8 g/t Ag

over 1.1 m width

In the northern portion of the property at the J-Branch Main Showing at the Jasper Minfile Occurrence, a previous assessment report described two massive sulphide lenses averaging 0.8 to 1.3 m true width and separated by 3 to 5 m of altered mafic volcanic which are traceable in outcrop in road-cuts over a strike length of +44 m. Representative continuous chip sampling returned weighted grades of over 2% Cu and 3% Zn over true widths of up to 2.7 m.

The best showing sampled to date in the south map sheet occurs at the Pan Road Showing (see Figure 5 and Figure 10). A weighted average interval over 1.99 m width returned values of 4.59% Cu, 17.37% Zn and 0.89% Pb with precious metal credits. A showing approximately 100 m to the south returned 2.13% Cu, 22.3% Zn and 17.2% Pb over 1.86 m.

For the work conducted in the current assessment period, Sample Locations for rock chip sampling are plotted at scales of 1:2,500 and 1:5,000 on Figures 21 to 26. Anomalous results are plotted for all samples on Figures 16 to 20. Sample descriptions are contained in Appendix III, Geochemical Data Sheets and Results are contained in Appendix IV, Analytical Results and Certificates.

Massive sulphide float boulders and new mineralized showings were discovered by following up of previous anomalous results and are summarized as follows:

Jasper Creek Showings

Anomalous Cu-Zn-Ag values are associated with narrow veinlets containing massive pyrite in Jasper Creek (Fig 16). Veinlets and chloritized mafic volcanic host rocks suggest stringer style mineralization is present. A 0.3 m angular massive sulphide float boulder, probably originating from the nearby canyon wall on the north side of the creek, contained crudely banded pyrite and chalcopyrite and returned values of >1% Cu and 120 ppb Au.

Upper Camp Creek Road Showings

Several new showings were discovered by prospecting the roadcuts of Upper Camp Creek (south portion of Fig 19, north portion of Fig 20). Both footwall stringer zone mineralization and massive sulphide float boulders are present. Two massive pyrite - chalcopyrite lenses are present at the lower switchback at an elevation of 550 m and returned assays of up to 8.9% Cu with anomalous Zn - Au - Ag over a 0.4 m width (Fig 19). The lenses strike southeasterly, stratabound with the silicified tuff or silica exhalite as described by geological mapping.

Approximately 100 m away on strike on the upper switchback at the 600 m level, seven narrow massive polymetallic sulphide showings occur over an additional strike length of 100 m (Fig 20). Best results include 2.3% Cu over 0.7 m and 1% Cu over 0.8 m and anomalous Zn, Au (to 136 ppb), and Ag.

Approximately 200 m further along the general south east trend, a narrow 1 m wide massive pyrite showing contains anomalous Ba, Ag, Pb, and + Mo. Narrow polymetallic massive sulphide showings are indicated over a total strike length of at least 400 m oriented stratabound to the felsic volcanic sequence and the main Four Mile Alteration Zone.

Pan Showing Area

Two narrow massive pyrite - chalcopyrite lenses occur at the 465 m elevation level on the spur road 100 m east of the Pan Road Showing and probably represent the strike extension of the Pan zone. Values of 1% Cu over 0.2 m with anomalous Zn, Au, Ag, and Mo are present. Sampling from the massive sulphide lense at the Pan Road Showing returned assays of 0.5% Cu, 10.2% Zn, 12.6% Pb and 45 ppb Au over a true width of 0.8 m.

Easy Showing Area

Narrow pyrite breccia zones were mapped at the Easy showing area approximately 400 m of the Pan showings (Fig 20). Best results

include 318 ppm Cu and 446 ppm Zn over 0.3 m. A massive sulphide float boulder contained 1.8% Cu from the same area.

3.0 SOIL AND STREAM SEDIMENT GEOCHEMISTRY

Over 4,000 soil samples located on three principle grids are reported to have been taken historically on the property, including soil sampling on the J-Branch Main Showing. Previous soil sampling has established that coincident anomalous Cu-Zn +\-\ Ag-Au values occur over a considerable portion of a +4 km strike length of the main Four Mile Alteration Zone.

3.1 Procedure

Conventional B horizon soil samples were taken on the cut grid at the Jasper J Branch Main Showing to "fill in" grid sampling conducted by a previous program. Stream sediment samples (moss mats where possible) were taken in Jasper Creek, Zinc Creek and Easy Creek.

Sample observations were recorded and are reported in Appendix III, Geochemical Data Sheets.

Soil and Stream Samples were dried and sieved to -80 mesh and analyzed by ICP-32 analytical techniques (See Sample Preparation, Analytical Techniques and Certificates of Analysis, Appendix IV).

3.2 Results

Analytical Results and Analytical Certificates are appended as Appendix IV. Soil and Stream Sediment Locations and Results are appended as Figures 21 to 26. Anomalous Results are plotted on Figures 16 to 20.

Strongly anomalous values were encountered from the soil grid at the Main Showing (Fig 18). Values of up to 224 ppm Cu and 368 ppm Zn occur within a previously established minimum 300 m long anomaly. Values of up to 576 ppm Cu and 382 ppm Zn are present along strike below J Branch Main road at the 570 m elevation level.

Values of up to 153 ppm Cu and 120 ppm Ba also occur in the southern portion of the grid.

A cluster of anomalies occurs at the northwestern most extent to the grid. Values of up to 145 ppm Cu, 876 ppm Zn and 0.6 ppm Ag are present in four strongly anomalous sites over 100 m.

Stream sediment sampling in Zinc Creek down drainage from the soil anomalies returned highly anomalous values of up to 215 ppm Cu and 1545 ppm Zn.

Stream sediment sampling in Jasper Creek also returned significant results (Fig 16). Au is anomalous at 5 sample sites with Cu - Zn values as high as 103 and 218 ppm respectively.

A stream sediment at Easy Creek returned strongly anomalous values of 268 ppm Cu and 162 ppm Zn (Fig 20).

4.0 GEOPHYSICAL SURVEYS

Geophysical Test Surveys were conducted by S J Geophysics and are reported as Appendix VI. In summary, weak HLEM and Induced Polarization chargeability anomalies are present associated with the J Branch Main Showing. The anomalies are also present on lines further to the south. Both HLEM and chargeability I.P. anomalies are also present in the headwaters of Zinc Creek at the northwestern most extent of the grid.

5.0 CONCLUSIONS AND RECOMMENDATIONS

A northerly trending extensive argillic pyritic alteration zone with a strike length >5 km extends up the drainage of Four Mile Creek and crosses the height of land at the Main Showing and extends northwesterly down Zinc Creek. The change in strike of the zone after it crosses the ridge top is thought to be because the zone has a moderate westerly dip. Within the alteration zone, four documented Minfile occurrences are present which have seen historical geological, geochemical and prospecting programs

conducted with encouraging results and seven mineralized showing areas are known to exist. The most important showing areas are discussed in order from north to south as follows:

J Branch Main Showing Area - Cut Grid

At the J Branch Main Showing, two massive sulphide lenses approximately of 0.8 m to 1.2 m (up to 2.7 m) width grading +2% Cu and + 3% Zn outcrop over a strike length of 44 m. Grid soil sampling has defined a Cu - Zn +/- Au - Ag soil anomaly over a >100 m strikelenngth. Coincident HLEM and I.P. Chargeability anomalies also occur and define the trend of the Main Zone mineralization. Diamond drilling on three section lines at 25 m intervals is recommended at the Main Zone. Stratigraphic holes are also recommended across the alteration zone where the coincident geochemical - geophysical anomalies occur.

Anomalous Cu - Zn - Au - Ag soil and stream sediments occur in the headwaters of Zinc Creek. This area lies at the northwestern extent of the cut grid. It is recommended that the grid be expanded in this area and that the soil and geophysical survey coverage be completed in this area. Detailed prospecting and mapping should also be done following up the results of the soil and geophysical surveys. Drilling is recommended contingent on positive results.

It is also recommended that the grid be extended to the south to include the Tam showing area as geochemical and geophysical anomalies are open along strike on this trend.

More detailed prospecting and mapping should be conducted along Jasper Creek to locate the source of the massive sulphide float boulder as well as to follow up the anomalous geochemistry.

Upper Camp Creek Road Area

Several massive sulphide showings and float occurrences were discovered by the current assessment exploration program over a strike length in excess of 400 m. The zone appears stratabound to a rhyolite unit and a possible silic exhalite or silic tuff. Both the nature of the mineralization and the geologic setting are possibly suggestive of a volcanogenic model for original sulphide deposition. Recent faulting and the severe alteration overprinting associated with the Four Mile Alteration Zone have remobilized some sulphides but a well mineralized trend is readily apparent. It is recommended that a cut grid be established and that soil and geophysical surveys be conducted followed by detailed prospecting and mapping.

Pan Showing Area

At the Pan Road Showing, an average weighted interval over a 0.8 m width returned assays of 0.5% Cu, 10.2% Zn and 12.6 % Pb.

Detailed prospecting and soil sampling should be conducted along the trend between the Pan Road showing and the upper spur road showings.

Easy Showing Area

Pyritic breccia and a float boulder containing 1.8% Cu were found in the Easy Showing area. Work by previous operators reported showings, soil and geophysical anomalies and drilling was recommended. It is recommended that all historical data be compiled and a cut grid be completed in key areas and drill targets be re-established. Drilling is recommended contingent on positive results.

It is concluded that the property offers excellent exploration potential based on the large scale size of the hydrothermal system, positive geochemical responses from areas tested to date and the presence of high grade outcrop showings in several localities. Additional exploration work is warranted.

Dated in North Vancouver, British Columbia this 31st day of
July, 1996.

APPENDIX II

CERTIFICATE OF QUALIFICATION

I, ARNE O. BIRKELAND, DO HEREBY CERTIFY THAT:

1. I am a Geological Engineer in the employ of Arnex Resources Ltd. with offices at 4005 Brockton Crescent, North Vancouver, British Columbia.
2. I am a 1972 graduate of the Colorado School of Mines with a Bachelor of Science Degree in Geological Engineering.
3. I have been a registered Professional Engineer with the Association of Professional Engineers of British Columbia (Registration No. 9870) since 1975.
4. My primary employment since 1966 has been in the field of mineral exploration, namely as a Geological Engineer.
5. My experience has encompassed a wide range of geological environments and has allowed considerable familiarization with geophysical, geochemical and diamond drilling techniques.
6. I have conducted the exploration work on the property reported on herein. This report is based on data acquired and also draws from researched published information available on the area.

DATED at North Vancouver, British Columbia,

this 31st day of July, 1996

Arne O. Birkeland

CERTIFICATE

A9612710

(AN) - ARNEX RESOURCES LIMITED

Project:
 P.O. #:

Samples submitted to our lab in Vancouver, BC.
 This report was printed on 4-MAR-96.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
205	33	Geochem ring to approx 150 mesh
226	33	0-3 Kg crush and split
3202	33	Rock - save entire reject
229	33	ICP - AQ Digestion charge

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
983	33	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
2118	33	Ag ppm: 32 element, soil & rock	ICP-AES	0.2	200
2119	33	Al %: 32 element, soil & rock	ICP-AES	0.01	15.00
2120	33	As ppm: 32 element, soil & rock	ICP-AES	2	10000
2121	33	Ba ppm: 32 element, soil & rock	ICP-AES	10	10000
2122	33	Be ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2123	33	Bi ppm: 32 element, soil & rock	ICP-AES	2	10000
2124	33	Ca %: 32 element, soil & rock	ICP-AES	0.01	15.00
2125	33	Cd ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2126	33	Co ppm: 32 element, soil & rock	ICP-AES	1	10000
2127	33	Cr ppm: 32 element, soil & rock	ICP-AES	1	10000
2128	33	Cu ppm: 32 element, soil & rock	ICP-AES	1	10000
2150	33	Fe %: 32 element, soil & rock	ICP-AES	0.01	15.00
2130	33	Ga ppm: 32 element, soil & rock	ICP-AES	10	10000
2131	33	Hg ppm: 32 element, soil & rock	ICP-AES	1	10000
2132	33	K %: 32 element, soil & rock	ICP-AES	0.01	10.00
2151	33	La ppm: 32 element, soil & rock	ICP-AES	10	10000
2134	33	Mg %: 32 element, soil & rock	ICP-AES	0.01	15.00
2135	33	Mn ppm: 32 element, soil & rock	ICP-AES	5	10000
2136	33	Mo ppm: 32 element, soil & rock	ICP-AES	1	10000
2137	33	Na %: 32 element, soil & rock	ICP-AES	0.01	5.00
2138	33	Ni ppm: 32 element, soil & rock	ICP-AES	1	10000
2139	33	P ppm: 32 element, soil & rock	ICP-AES	10	10000
2140	33	Pb ppm: 32 element, soil & rock	ICP-AES	2	10000
2141	33	Sb ppm: 32 element, soil & rock	ICP-AES	2	10000
2142	33	Sc ppm: 32 elements, soil & rock	ICP-AES	1	10000
2143	33	Sr ppm: 32 element, soil & rock	ICP-AES	1	10000
2144	33	Ti %: 32 element, soil & rock	ICP-AES	0.01	5.00
2145	33	Tl ppm: 32 element, soil & rock	ICP-AES	10	10000
2146	33	U ppm: 32 element, soil & rock	ICP-AES	10	10000
2147	33	V ppm: 32 element, soil & rock	ICP-AES	1	10000
2148	33	W ppm: 32 element, soil & rock	ICP-AES	10	10000
2149	33	Zn ppm: 32 element, soil & rock	ICP-AES	2	10000

(AN) - ARNEX RESOURCES LIMITED

Project:
 P.O. #:

Samples submitted to our lab in Vancouver, BC.
 This report was printed on 4-MAR-96.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
209	2	High grade assay ring
1364	2	High grade crush and split
3202	2	Rock - save entire reject
233	2	Assay AQ ICP digestion charge

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

CERTIFICATE

A9612491

(AN) - ARNEX RESOURCES LIMITED

Project: JASPER
 P.O. #:

Samples submitted to our lab in Vancouver, BC.
 This report was printed on 29-FEB-96.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
209	2	High grade assay ring
208	1	Assay ring to approx 150 mesh
226	3	0-3 Kg crush and split
3202	3	Rock - save entire reject
233	3	Assay AQ ICP digestion charge

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
202	28	save reject
201	28	Dry, sieve to -80 mesh
229	28	ICP - AQ Digestion charge

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

(AN) - ARNEX RESOURCES LIMITED

Project: JAS
 P.O. #:

Samples submitted to our lab in Vancouver, BC.
 This report was printed on 16-MAY-96.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
205	4	Geochem ring to approx 150 mesh
226	4	0-3 Kg crush and split
3202	4	Rock - save entire reject
229	4	ICP - AQ Digestion charge

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
983	4	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
2118	4	Ag ppm: 32 element, soil & rock	ICP-AES	0.2	200
2119	4	Al %: 32 element, soil & rock	ICP-AES	0.01	15.00
2120	4	As ppm: 32 element, soil & rock	ICP-AES	2	10000
2121	4	Ba ppm: 32 element, soil & rock	ICP-AES	10	10000
2122	4	Be ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2123	4	Bi ppm: 32 element, soil & rock	ICP-AES	2	10000
2124	4	Ca %: 32 element, soil & rock	ICP-AES	0.01	15.00
2125	4	Cd ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2126	4	Co ppm: 32 element, soil & rock	ICP-AES	1	10000
2127	4	Cr ppm: 32 element, soil & rock	ICP-AES	1	10000
2128	4	Cu ppm: 32 element, soil & rock	ICP-AES	1	10000
2150	4	Fe %: 32 element, soil & rock	ICP-AES	0.01	15.00
2130	4	Ga ppm: 32 element, soil & rock	ICP-AES	10	10000
2131	4	Hg ppm: 32 element, soil & rock	ICP-AES	1	10000
2132	4	K %: 32 element, soil & rock	ICP-AES	0.01	10.00
2151	4	La ppm: 32 element, soil & rock	ICP-AES	10	10000
2134	4	Mg %: 32 element, soil & rock	ICP-AES	0.01	15.00
2135	4	Mn ppm: 32 element, soil & rock	ICP-AES	5	10000
2136	4	Mo ppm: 32 element, soil & rock	ICP-AES	1	10000
2137	4	Na %: 32 element, soil & rock	ICP-AES	0.01	5.00
2138	4	Ni ppm: 32 element, soil & rock	ICP-AES	1	10000
2139	4	P ppm: 32 element, soil & rock	ICP-AES	10	10000
2140	4	Pb ppm: 32 element, soil & rock	ICP-AES	2	10000
2141	4	Sb ppm: 32 element, soil & rock	ICP-AES	2	10000
2142	4	Sc ppm: 32 elements, soil & rock	ICP-AES	1	10000
2143	4	Sr ppm: 32 element, soil & rock	ICP-AES	1	10000
2144	4	Ti %: 32 element, soil & rock	ICP-AES	0.01	5.00
2145	4	Tl ppm: 32 element, soil & rock	ICP-AES	10	10000
2146	4	U ppm: 32 element, soil & rock	ICP-AES	10	10000
2147	4	V ppm: 32 element, soil & rock	ICP-AES	1	10000
2148	4	W ppm: 32 element, soil & rock	ICP-AES	10	10000
2149	4	Zn ppm: 32 element, soil & rock	ICP-AES	2	10000

LIST OF ABBREVIATIONS

<u>Symbol</u>	<u>Description</u>
ank	- ankerite alteration and veining
arg	- argillic alteration
alt	- alteration
bx	- breccia
ch(for)-chlorite, chloritic alteration	
cpy	- chalcocite
diss	- disseminated
epi	- epidote
FZ	- fault zone
gal	- galena
min	- mineralization (metallic)
prop	- propylitic alteration
py	- pyrite
Q	- quartz
QV	- quartz vein
sil	- pervasive silicification
stwk	- stockwork
sph	- sphalerite

SYMBOLS

- Geological Contact - defined, approximate, assumed.
 - X Outcrop - large, small
 - Fault - defined, approximate, assumed
lateral movement, and throw (dot indicates down)
 - Reverse / thrust fault - defined, approximate, assumed
 - Air photo linear
 - Bedding, upright, overturned
 - Vein

INTRODUCTION

Magnetic, very low frequency electromagnetic (VLF-EM), Horizontal Loop EM, and Induced Polarization (IP) test surveys were completed on the Jasper Property for Arnex Resources Ltd. by SJ Geophysics Ltd.. The Jasper Property is located 12km south west of Cowichan Lake in the Victoria Mining Division of B.C., NTS 92C/15

The purpose of the test surveys was to aid in the mapping of local geology and to search for possible massive sulphide mineralization. The IP was performed to search for a possible disseminated sulphide halo surrounding the massive sulphide showing.

This report is meant to be an addendum to a more complete property and geological report prepared by Arnex Resources Ltd. personnel therefore location maps and overview of the geology are omitted from this report.

FIELD WORK AND INSTRUMENTATION

The Magnetometer, VLF-EM survey, and Horizontal Loop EM (HLEM) test surveys were completed during the period December 17 - 22, 1995, which comprised of 4 data acquisition days and 2 mob/demob days. The geophysical crew consisted of Zoran Dujakovic (Geophysicist) and André Savard. Data acquisition, field processing and presentation were performed by Zoran Dujakovic (Geophysicist). The HLEM was tested on one short line but the bush was considered to be too dense to collect reliable data. It was decided to cut lines in the spring and complete the survey.

An EDA OMNI PLUS combined proton precession magnetometer and VLF-EM system were used for field data acquisition. An EDA OMNI IV proton precession magnetometer was used as a base station which recorded data in thirty second intervals. The VLF-EM survey used a signal from Seattle (24.8 kHz, NLK) and Hawaii (23.4 kHz, NPM). The VLF-EM data was acquired facing north-east.

The HLEM equipment used for the survey was an Apex Parametrics MaxMin I-10 using a 100m and 50m coil separation with the frequencies shown on the plots.

A HLEM survey and possible IP survey were attempted in February 1996. The survey commenced on February 21 and was cancelled on February 26. This included 3 mob days and 2 survey days. It started snowing the day the crew arrived on the job site and it was decided after two days that it was not viable to continue. Enough HLEM data was collected to determine if the survey using a 100m coil separation worked.

The HLEM equipment used for the survey was an Apex Parametrics MaxMin I-9 using a 100m and 50m coil separation with the frequencies shown on the plots.

An Induced Polarization surveying was performed, using 25 metre long dipoles, along 25 metre spaced, flagged lines during the period of April 28 to May 5, 1996. This period included 2 mob days, 1 breakdown day and 4 survey days. The crew drove into the area via logging roads from west of Duncan and stayed in tents and campers near the property.

The equipment used for the IP survey was a VP3000 time domain transmitter, with a cycle time of 2 seconds on and 2 seconds off, and an Androtex time domain receiver. The delay time of the receiver was set at 80, 80, 80, 80, 160, 160, 160, 320, 320 and 320 millisecond each. A pole-dipole array with an "a" spacing of 25m along with an N=1 to 6 was used for the survey. The apparent resistivity was calculated using the recorded transmitter current and the nominal dipole spacing (25 metres) at each measurement location.

All the data was down loaded to a computer in the evening. The chargeability, for time windows 3 and 6, and the calculated apparent resistivity were plotted as pseudosections, on a colour dot matrix printer. The results were discussed in the field with the project geologist.

The data was re-plotted on a colour inkjet plotter in Vancouver for final presentation and interpretation.

DATA PRESENTATION

The IP chargeability time channels 3 and 6 along with the apparent resistivity of the data are presented as 3 pseudosections in appendix II. The filtered IP plan maps pseudosections of total chargeability and apparent resistivity, the magnetic, VLF-EM, HLEM data and compilation map are presented on the following plates:

INTERPRETATION

The magnetics and VLF-EM were surveyed on 7 lines covering approximately 500m of strike length. The HLEM and IP were only surveyed on three lines for a strike length of 100m. Therefore the compilation is broken into two separate maps with the magnetic and VLF-EM compilation shown on Plate G4 and the HLEM and IP compilation shown on Plate G8.

MAGNETICS and VLF-EM

The total magnetic variation in the survey area is approximately 100nT. The baseline appears to mark a sharp contact in the rock type with the majority of the variation in the magnetic intensity being east of the baseline. The exception is open magnetic anomaly on the western end of line 4700N.

A weak magnetic anomaly appears to follow the baseline from 4700N to 4900N where it appears to merge with the stronger and more distinct anomaly approximately 25m to 50m to the east. There are a number of parallel anomalies to the east of this main structure.

There are a number of weak and medium strength VLF-EM anomalies as shown on the compilation map. None of the anomalies are very distinct which may be due to the poor direction to both VLF-EM stations. The main anomaly appears to be a linear anomaly located approximately 50m to the west of the magnetic contact. A second possibly good anomaly is located on line 5000N at 240E. It is not clear if this is a bad reading or if the sign of the data is reversed. It is very easy to reverse the sign of the data due to the bad angle of Seattle with the grid. This area was not covered by the HLEM due to topography and thick bush.

HLEM

The horizontal loop was completed on three lines before continual snowfall forced us to cancel the remainder of the survey. Because of the bad weather conditions it was impossible to collect proper inphase data. The quality of the quadrature data is very good and indicated that the inphase data is likely not very important. A weak HLEM anomaly is located on line 5000N at the base line. A second weak anomaly is located on the western end of line 5050N.

A short survey over the anomaly on line 5000N was completed in May with a 50m coil separation. The separation showed the centre of the anomaly to be located at

approximately 12.5W. The higher amplitude of the anomaly compared to the 100m coil separation suggests that there is no depth extent to the conductor.

INDUCED POLARIZATION

The IP survey was completed over the same lines as the above HLEM survey. The chargeability background is very low to the east of the baseline which confirmed the change in geology as indicated by the magnetic data.

The highest chargeability anomaly is located at approximately 25W on line 5000N and coincides with the weak HLEM anomaly. The IP also indicates that the depth extent of this anomaly is likely not very deep. The anomaly is located directly to the west of a near surface resistivity high and is associated with a resistivity low. This anomaly does appear to continue weakly to line 4960N and 5000N as does the resistivity high directly to the east of this anomaly.

The anomaly located on the western end of all the lines and especially line 4950N is likely a better anomaly and appears to have better depth extent. Not sufficient data is available to interpret this anomaly

RECOMMENDATIONS

The geophysical data should be compiled with the geological mapping and sampling to enhance the existing geophysical interpretation and to determine which anomalous features are significant, especially the IP anomalies on the western end of the grid, the HLEM anomaly on the western end of line 5050N, and the VLF-EM anomaly on the eastern end of line 5000N. The grid should be extended in these area if the geology is favourable.

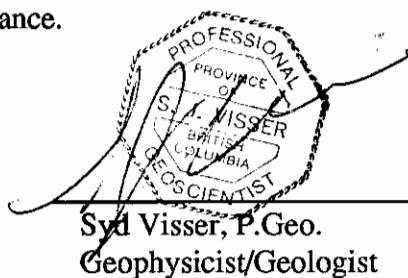

It is recommended to use a portable VLF-EM transmitter if any further VLF-EM is done in this area to maximise coupling with the possible conductors.

CONCLUSION

The magnetic and IP data indicate that there is a change in the geology from the western half of the survey area to the eastern half. The magnetic susceptibility increases and the background chargeability decreases to the east of the baseline.

There is an HLEM and IP chargeability anomaly located at the baseline on 5000N. Both the HLEM and the IP indicated that the good part of the anomaly has no apparent depth extent or strike length.

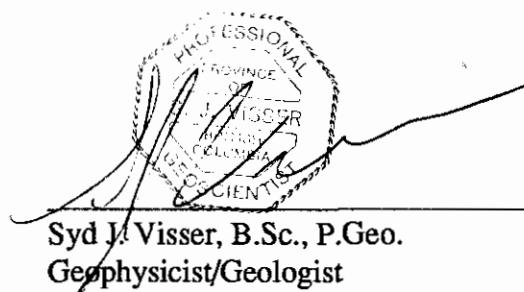

The VLF-EM anomaly located on the eastern end of line 5000N and the IP anomalies located on the western end of the survey should be closely correlated to any geological and geochemical data to determine their significance.

STATEMENT OF QUALIFICATIONS

I, Syd J. Visser, of 11762 - 94th Avenue, Delta, British Columbia, Canada, hereby certifie that:

- 1) I am a professional Geoscientist registered in British Columbia.
- 2) I am a graduate of the University of British Columbia, 1981, where I obtained a B.Sc. (Hon.) Degree in Geophysics and Geology.
- 3) I am a graduate of Haileybury School of Mines, 1971.
- 4) I have been engaged in mining exploration since 1968.

Syd J. Visser, B.Sc., P.Geo.
Geophysicist/Geologist
