## EXECUTIVE SUMMARY

The purpose of this report is to document work conducted on the Lahte Creek Gold property in June and August of 1995 for assessment requirements.

The Lahte property is a gold and base metal prospect located 55 km southeast of Stewart, British Columbia and consists of 148 claim units. Logging roads from the Lavender mainline come to within 8 km of the property. The property is underlain by Jurassic Hazelton Group volcanics and Triassic Stuhini Group sediments that are locally intruded by Jurassic(?) intermediate intrusions that are locally highly altered and pyritic. The eastern portion of the property is underlain by fine-grained clastics of the Cretaceous Bowser Group.

Limited prospecting and sampling has identified a large sheared intermediate intrusion interpreted as similar to the intrusions at Red Mountain. This intrusion is pyritic and returned local anomalous gold (0.32 g/t Au) and elevated base metals (1000 ppm Zn). The northern portion of the property hosts a number of gossans from which gold up to 1.01 g/t was returned based on limited sampling.

It is recommended that additional lithogeochemical sampling be conducted in the area of the altered/sheared intrusion and in the northern portion of the property in gossans associated with the projection of a barite-sericite schist unit.

## **1.0 Purpose**

This report is to document fieldwork conducted on the Lahte Creek Property for assessment requirements.

## **2.0 Background**

### **2.1 Introduction**

The Lahte Creek Property is a Au-Ag "Red Mountain-type" prospect consisting of 148 claim units. The claims were staked based on anomalous Au (224, 229ppb) from a government silt geochem RGS survey released on June 2<sup>nd</sup>, 1995. Pre-release compilation of existing silt geochem data indicated a favourable environment based on highly anomalous As-Zn-Cu-Hg silt geochem and a geological setting similar to that at the Red Mountain Au Deposit. The property is underlain by Late Triassic to Early Jurassic mafic to intermediate volcanics and sediments and by Late Jurassic to Early Cretaceous sediments. These rocks are cut by feldspar porphyry intrusives (Jurassic?) and by felsic hornblende porphyry dykes of probable Tertiary age. Gold mineralization from outcrop is locally associated with carbonate alteration (up to 0.32g/t Au) in the west central area and with a barite-Zn-Pb section of stratigraphy (up to 1.01g/t Au) in the NW portion of the claims.

### **2.2 Location and Access**

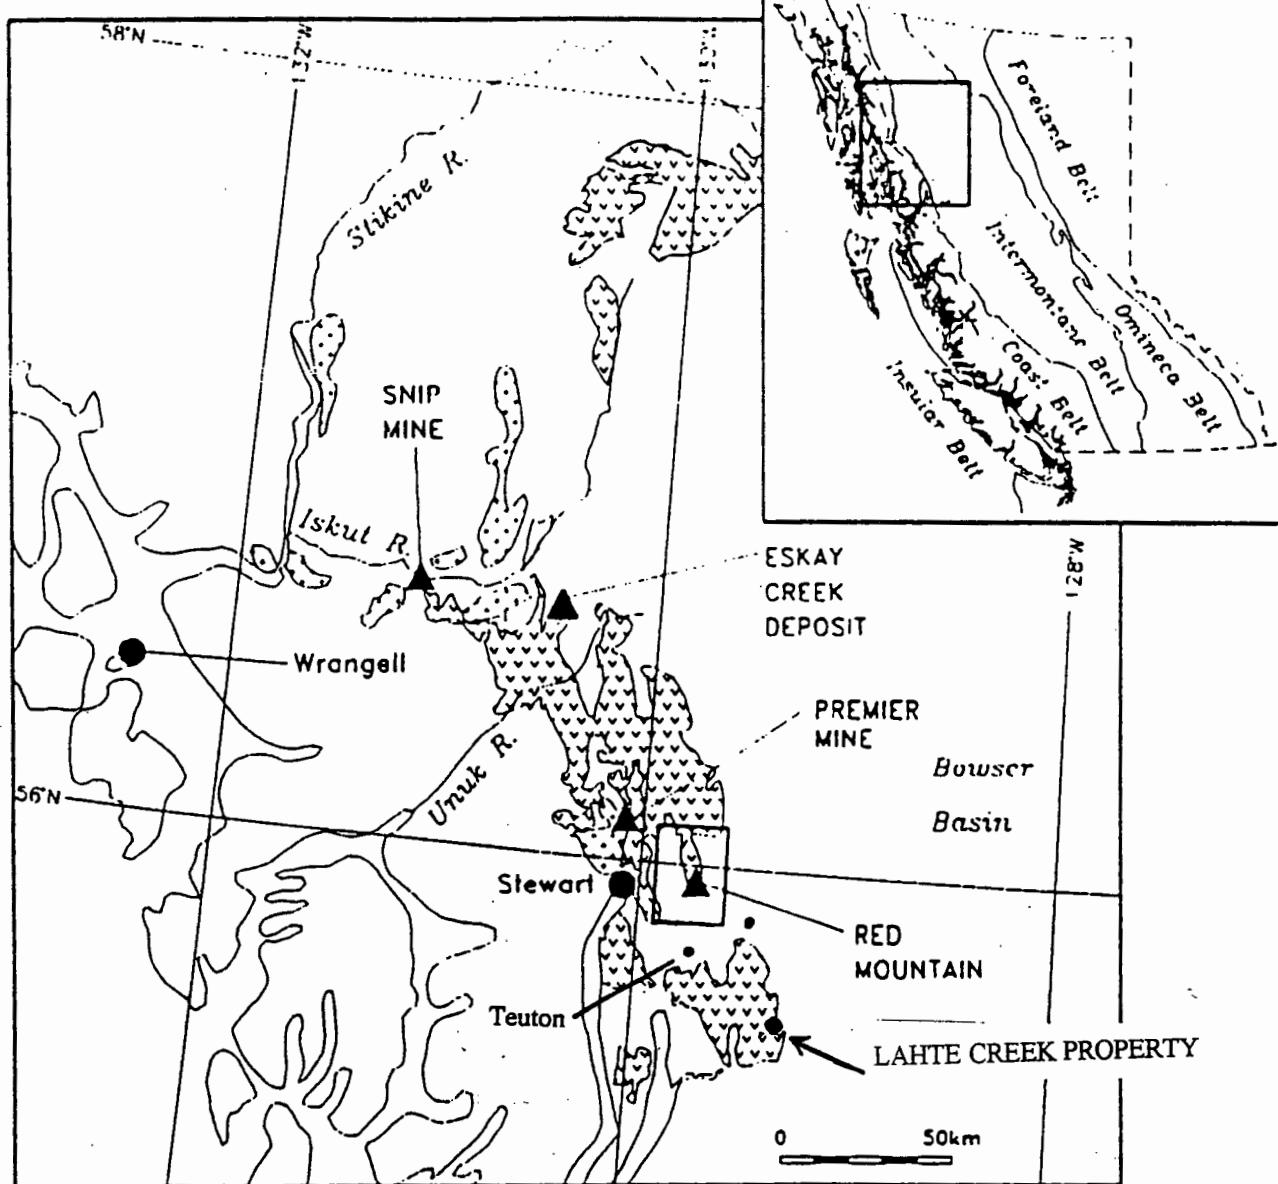

The Lahte Creek gold property is located 55 km southeast of Stewart 45 km south-southwest of the Meziadin logging camp and 155 km northwest of Smithers, B.C. (Skeena Mining Division; NTS 103P/11; Figure 1). A logging road off the Lavendar mainline comes within 8 km of the property. The property is easily accessed by helicopter from Meziadin or Stewart.

### **2.3 Tenure**

The claims are held by L. Warren and L. Hewitt and beneficially owned by Rubicon Minerals Corporation (Figure 2). The claims are in good standing until June 1997 once assessment credits have been applied. There are no underlying agreements on the property. Pertinent claim data are listed below.

**Table 1 Claim Tenure**

CLAIM NAME	# UNITS	TENURE NO.	EXPIRY DATE
Lah-1	20	336796	June 2/1997
Lah-2	18	336659	June 7/1997
Lah-5	20	336661	June 7/1997
Lah-6	20	336662	June 7/1997
Lah-7	18	336663	June 9/1998

Early Jurassic intrusions

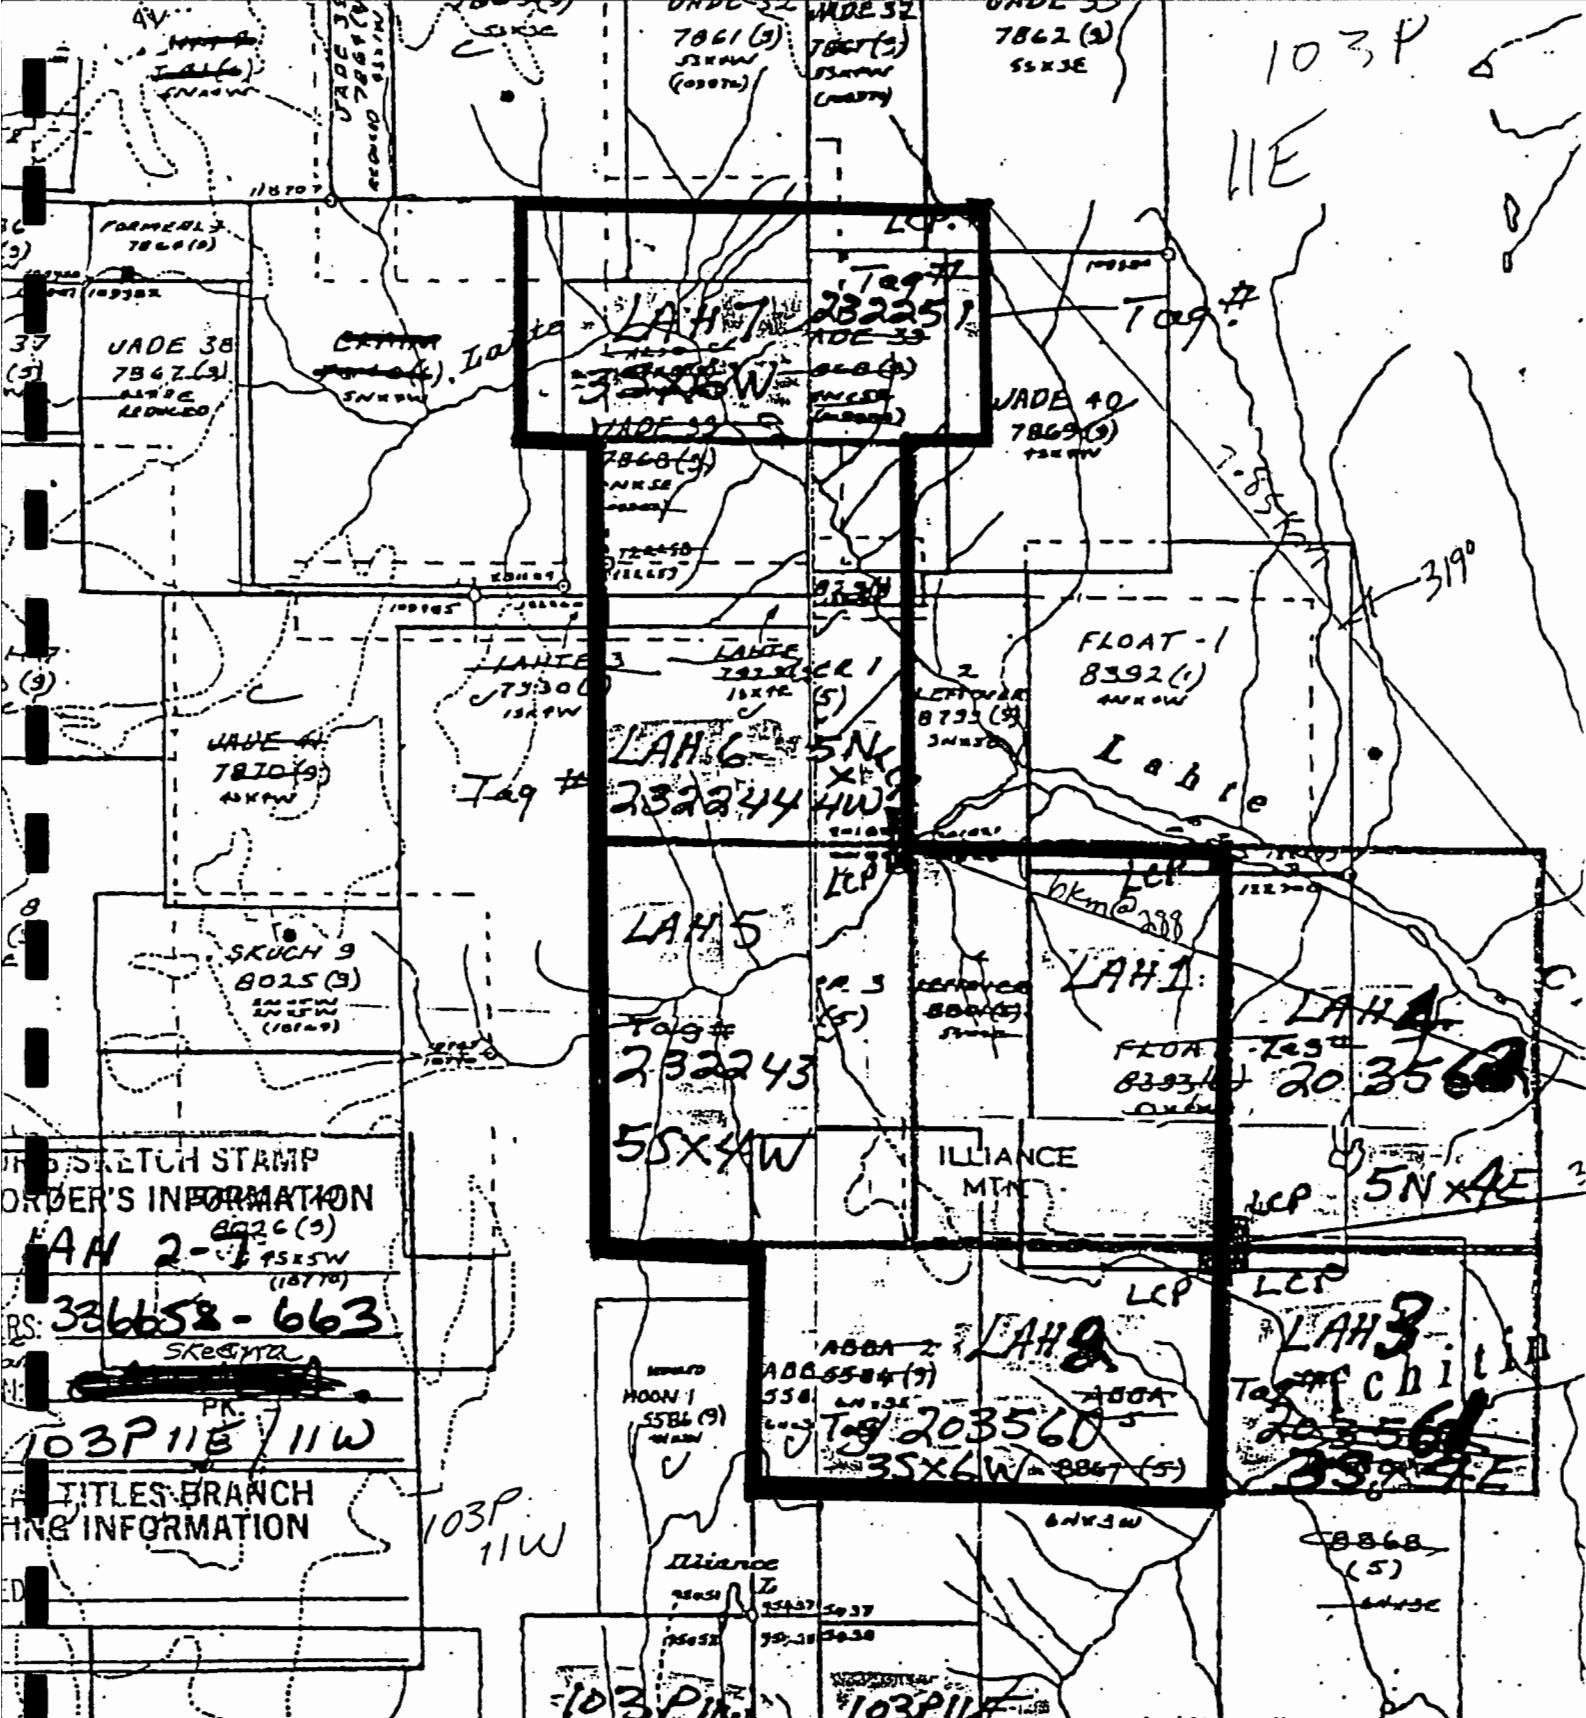

Hazelton Group volcanic rocks

Triassic to Jurassic sedimentary rocks

(1:50,000 scale)**

## **2.4 Previous Work**

In 1981, Hudson Bay Exploration and Development Co. Ltd., as part of a base metal VMS exploration program, collected soils (52; on 2 N-S contour lines, 200m apart on the SE portion and just east of the Lah-6 claim), prospecting, rock sampling (2) and reconnaissance mapping. The program identified the source area of rhyolitic Zn-Pb-Cu-Ag float boulders on the south side of Lahte Creek; these boulders are derived from the historic "Leftover" Showing (just west of the Lahte property boundary). Extensive "sheared volcanics" with lenses of felsic(?) porphyry were roughly mapped.

In 1989, Dolly Varden Mineral Inc., as part of a base-precious metal volcanogenic massive sulphide (VMS) program, collected pan con silts (4) rocks (9) and conducted prospecting, and reconnaissance mapping all on the now "Lah-8" claim (6 man days from a fly camp). Significant Au and base metal values were returned from outcrop, skree and float. Gold values ranged up to 20240ppb in float from "narrow veins". A number of gossans were identified, including a Ba-Zn-Pb showing within a 40m thick intermediate tuffaceous package marked by 2m thick quartz-sericite-pyrite horizons. Samples returned 433ppm Zn and 447ppm Pb from grab samples and 48295ppm Zn and 14471ppm Pb from selected high grade mineralization. Pan con silts returned 2430ppb and 4040ppb Au from the northwest fork of Lahte creek, however, these samples were not plotted on the assessment maps. Significantly, many gossans were not prospected or sampled from the northwest drainage due to difficulties in crossing the creeks. Although Dolly Varden interpreted the showing as stratiform mineralization, they expected more felsic stratigraphy than was observed (using the Dolly Varden VMS Deposit Model). Follow-up work was recommended.

## **2.5 Exploration Work in 1995**

Cyprus Canada Inc. and Rubicon Minerals Corporation staked 148 units during June 1995 based on a Au regional gold silt geochem release and collected rocks (140 all for ICP and Au; and 54 for whole rock analysis - XRF), silts (13), moss mats (3) and soils (1) and conducted prospecting.

## **3.0 Geology**

### **3.1 Regional Geology**

The region southeast of Stewart is predominantly underlain by volcanic and volcaniclastic rocks of the lower Jurassic Hazelton Group and similar upper Triassic to older rocks. These strata are intruded by an Early Jurassic to mid-Cretaceous plutonic rocks and younger mid Tertiary dykes and related intrusions of the Portland Canal Dyke swarm. Farther to the east and southeast, the region is underlain by Late Jurassic to mid Cretaceous clastics of the Bowser Group.

### **3.2 Property Geology**

The west portion of the property is mainly underlain by Hazelton Group volcaniclastics typified by purple and green agglomeratic units. Triassic Stuhini Group sediments lie to the east of the Hazelton Group and consist of mainly argillites and cherts. The east most portion of the property is underlain fine-grained clastics of the Bowser Group that dip shallow to moderately to the east and that may be in thrust fault contact with these sediments. The Hazelton and Stuhini Group rocks are locally intruded by Jurassic(?) feldspar porphyry intrusions that are locally extensively altered and pyritic. All units throughout the property are cut by fresh hornblende-feldspar porphyry Tertiary dykes.

## **4.0 Geochemistry**

### **4.1 Prospecting and Geochemistry Results**

Field work on the property by Rubicon has identified a large area of sheared, altered and pyritized "Porphyry" that trends northwest on Lah-5 and Lah-6 and may have a strike length of up to (at least?) five kilometers. Sampling from part of this zone returned one gold value (320ppb) an elevated silt sample (225ppb Au) and several elevated base metal values. Only a restricted portion of this zone has been sampled, and it therefore warrants more prospecting.

In the northwest part of the property, one sample located twenty metres to the northwest of a barite-base metal showing returned 1.01g/t Au. On strike to the northwest of this sample is a large gossan that is evident from the helicopter and is noted on Dolly Varden's assessment map, but was not sampled. Two silt samples collected from the north Lahte drainage in this area returned values of 625ppb and 125ppb Au. These results precipitated the acquisition of an additional claim by Rubicon to cover this prospective area which requires more work.

In the main Lahte Creek area just north of Lah-1 and onto Lah-5 a number of silicified and/or felsic boulders were sampled during prospecting and returned highly elevated Zn, Pb, Ag values. The boulders are interpreted to have been derived from just southwest of the Lah-5 claim where the historic "Leftover" showing is located.

## **5.0 Conclusions and Recommendations**

The Lahte Creek Gold property has a geological setting similar to the Premier Mine and the Red Mountain Gold Deposit. The 1995 geochemical release by the BCGS for gold and additional elements, and follow-up work by Rubicon shows a cluster of adjacent drainages with elevated gold values in silts. Previous work was mainly focused on the base metal potential even though significant gold values were returned (eg Dolly Varden). Rubicon's work has established that a favourable geological and geochemical setting for a Red Mountain or Premier-Type gold target exists on the property.

It is recommended that systematic lithogeochem and contour soil sampling, in conjunction with detailed prospecting, geological mapping, be conducted on selected areas of the property to explore the gold potential of the "sheared pyritic intrusion and to explore the base and precious metal potential of the north portion of the property with known showings.

## CERTIFICATE

I, MICHAEL GRAY, of 3442 Church Street, North Vancouver, do certify that:

1. I am a Consulting Geologist, registered with the Association of Professional Engineers and Geoscientists of British Columbia since 1993.
2. I am a graduate of the University of British Columbia with a B.Sc (Geology 1985), and Laurentian University of Ontario with an M.Sc. (Mineral Deposits Geology, 1995).
3. I have practiced by profession throughout Canada and the United States continuously since 1985.
4. The foregoing report on the Lahte property is based on personal experience and observations made on the project while on the property employed by Rubicon Minerals Corporation (later name changed to Rubicon Management Ltd.)
5. I own shares and am a director and senior officer of Rubicon Minerals Corporation.

submitted to our lab in Vancouver, BC.  
 Report was printed on 7-SEP-95.

LAHTE AREA

## SAMPLE PREPARATION

NUMBER SAMPLES	DESCRIPTION
6	Dry, sieve to -80 mesh
6	save reject
6	ICP - AQ Digestion charge

element ICP package is suitable for metals in soil and rock samples. Those for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti,

## ANALYTICAL PROCEDURES
