APPENDIX

TABLE OF GEOCHEMICAL DATA

INTRODUCTION

The Armour claims are 40 km west of Kimberley, adjacent to Office creek, a south flowing tributary of the west fork of Saint Mary River (Fig. 1). The claims were staked to cover airborne electro-magnetometer anomalies obtained in the BCGS airborne East Kootenay Geophysical survey of this portion of the Purcell mountains. Most of this ground was heavily prospected around 1900 however has not been covered by mineral claims for many decades. The most recent regional mapping of this area is by J. Reesor (1983). This mapping is also summarized in a more recent compilation by Reesor (1995). Rocks of the middle Proterozoic Dutch Creek Fm. underlie the entire claim block and are complexly folded and in places faulted (Fig. 2). The south side of the claim block can be accessed by foot from a logging road, however helicopter is required to effectively access the central and northern parts of the claim block. Terrain is rugged however most parts can be reasonably accessed for exploration. There are cirques at high elevations. Mid to low elevations are mostly well forested.

OBJECTIVES

The objective of exploring these claims is to locate a base metal sulphide deposit. The anomalies obtained in the airborne survey may be the direct response from such a deposit, or they may be a response from distal mineralization related to such a deposit. The first step taken to explore this property was to obtain geochemical coverage where the geophysical anomalies are indicated.

THE WORK

A total of 228 soil samples were collected along contour and base of slope lines from the Armour claims, primarily west of Office Creek at lower elevations as well as around the upper reaches of the creek. The samples were dug using narrow spades, placed in kraft paper bags, dried and shipped to Cominco's Exploration Research Laboratory. The samples were analyzed using ICP, with which data for 27 elements was obtained. The data are listed in the Appendix; values less than detection limit are plotted as detection limit. Sample locations are plotted on a 1:10,000 scale map (Fig. 3). 1:10,000 scale plots of Pb and Zn data are in Figs. 4 and 5 respectively. Topography at the same scale is shown in Fig. 6.

RESULTS

2

A small number of anomalies consisting of several anomalous points in clusters were obtained. A coincident Zn-Pb anomaly occurs at lower elevations near the west side of the claim block, just above the road. A Pb anomaly occurs south of the upper, southerly branch of Office Creek. Background levels of soils over Dutch Creek Fm strata are not established, however none of the anomalies, nor individual anomalous points would be considered exceptional.

CONCLUSIONS

Results of the geochemical survey over the Armour claims are disappointing because base metal values to a large extent are low and anomalies are restricted to relatively small areas. It appears that the airborne electro-magnetic anomalies are not caused by extensive sub-cropping base metal mineralization. However the possibility that both the geophysical and geochemical anomalies are related to mineralization distal to a deeply buried deposit must still be evaluated.

COST SUMMARY

Labour	6 field, 2 office days @ \$130.00	\$1040
Supervision and reporting		300
Helicopter	1 return flight	1686
Truck	3 days @ \$60.00	180
Analyses	228 samples @ \$9.00	2052
Supplies		100
Shipping		80
TOTAL		<u>\$5438</u>

AUTHOR'S QUALIFICATIONS

As author of this report, I, P.W. Ransom, certify that:

I am a geologist active in minerals exploration.

I am a graduate of McGill University with a degree of Bachelor of Science.

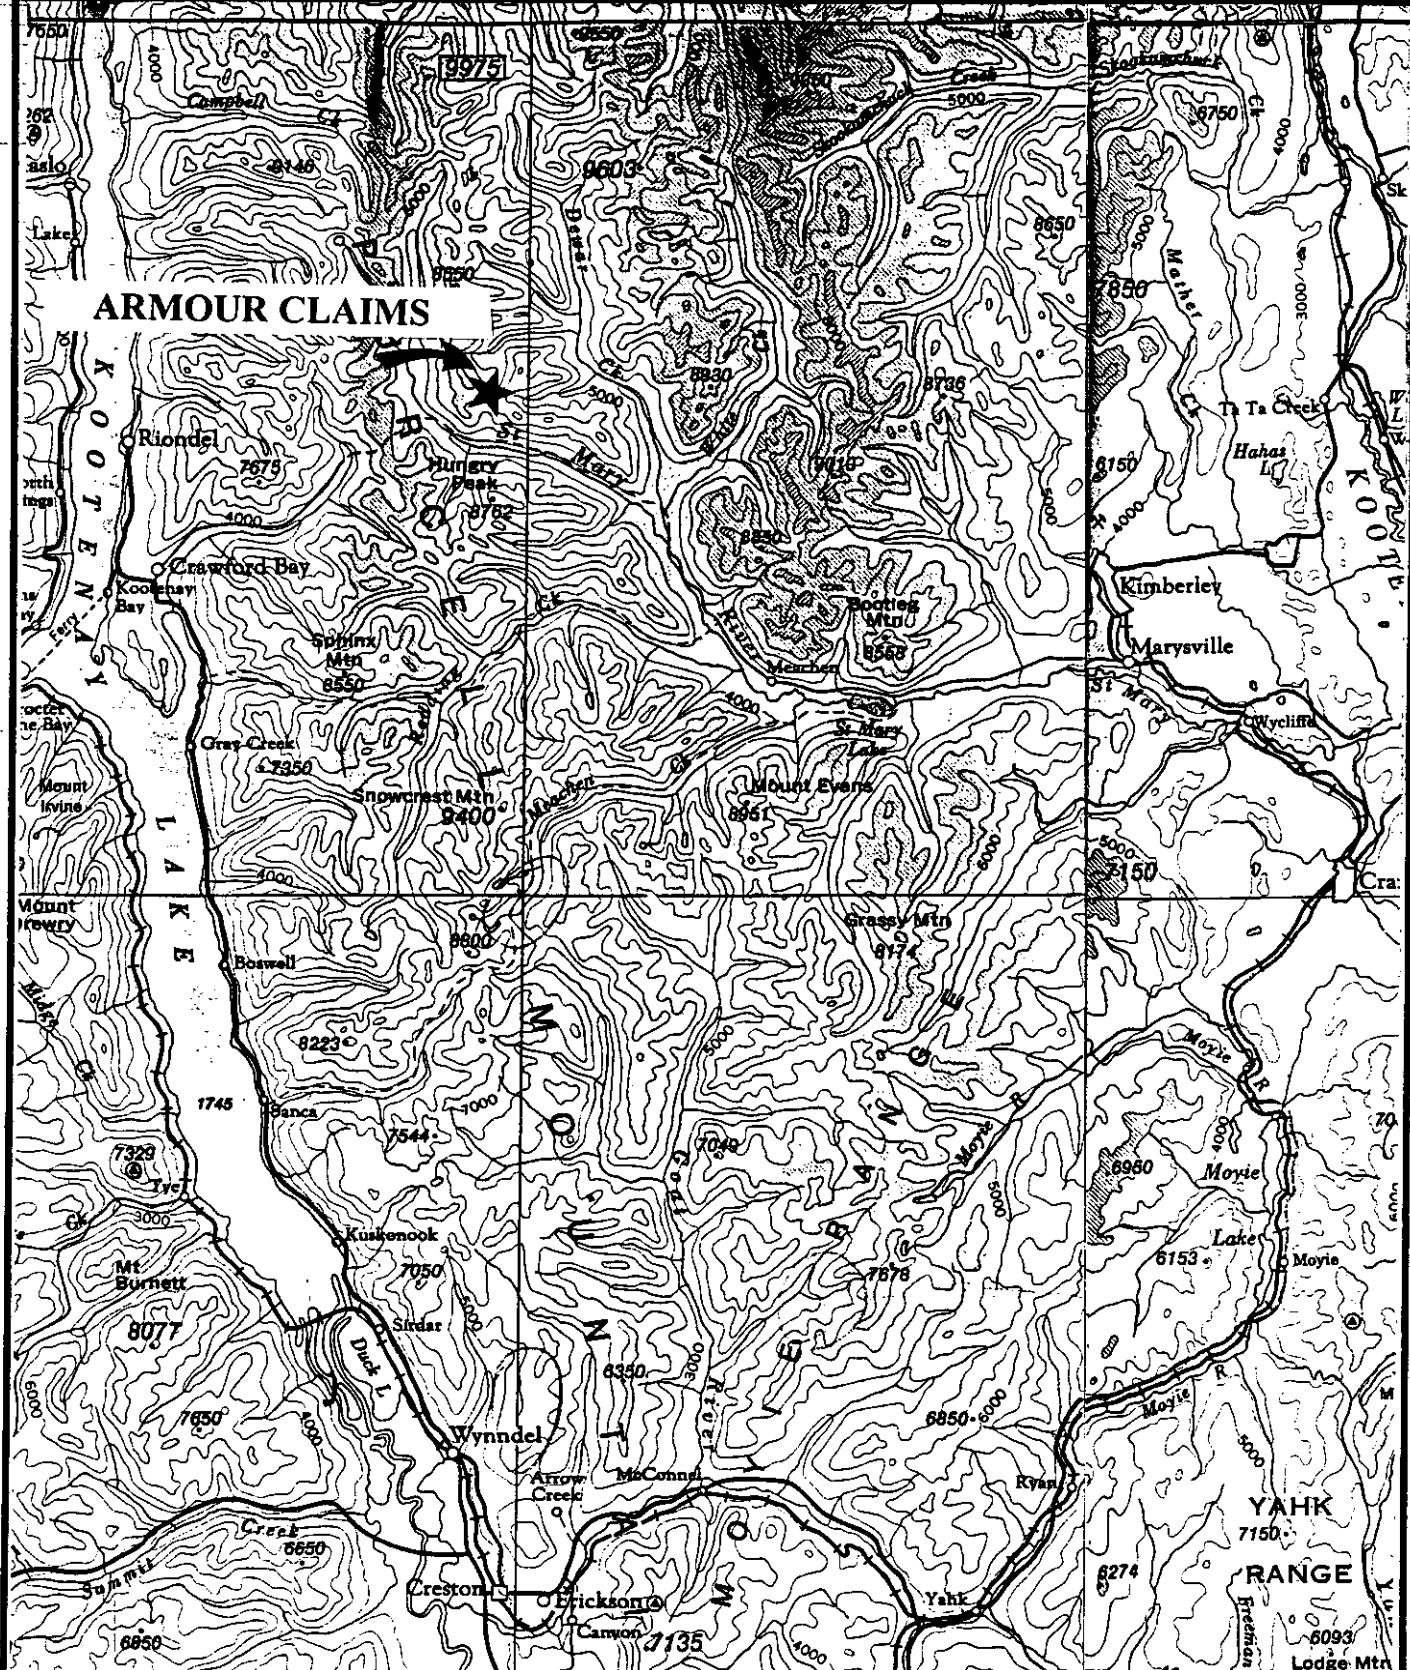

I have been continuously engaged in mining and exploration since 1966.

I am a member of the Geological Association of Canada and of the Canadian Institute of Mining and Metallurgy.

I supervised Cominco Ltd's exploration on the Armour property in 1997.

P. W. Ransom
